CONVICT CRIMINOLOGY

STEPHEN C. RICHARDS

GREG NEWBOLD

University of Canterbury, New Zealand

JEFFREY IAN ROSS

University of Baltimore

Convict criminology (CC) is a relatively new and controversial perspective in the practical field of criminal justice and the academic field of criminology. It provides an alternative view to the way crime and criminal justice problems are usually seen by researchers, policymakers, and politicians—many of whom have had minimal contact with jails, prisons, and convicts.

In the 1990s, CC started because of the frustrations that a group of ex-convict professors felt when reading the academic literature on crime, corrections, and criminal justice. For example, much of the published work on prisons reflected the views of prison administrators or university academics and largely ignored what convicts knew about the day-to-day realities of imprisonment. These former prisoners, who had since obtained higher university degrees, along with some allied critical criminologists, wanted research that reflected the observations and critical assessments of men and women who had done real time.

The emerging field of CC consists primarily of essays, articles, and books written by convicts or ex-convicts studying for or already in possession of PhDs, some of whom are now employed as full-time academics. A number of other scholars sympathetic to the CC view also contribute. Convict criminologists often critique or challenge existing precepts, policies, and practices, thus contributing to a new perspective in the general field of criminology.

What Is a Convict Criminologist?

Some areas within the academic study of crime and corrections have shifted little from the pre-20th-century perspectives of Bentham, Beccaria, and Lombroso. These scholars of criminology's "classical" period saw crime as pathological and failed to consider the social and political contexts within which criminal behavior is defined. Although many academic criminologists today hold more enlightened theoretical views, there is a tendency to identify with state-sponsored anti-crime agendas that target marginal populations for arrest, conviction, and incarceration. The result of such traditional approaches is that, of the approximately 2.2 million Americans currently behind bars, the majority belong to ethnic or racial minority groups and are disproportionately poor. Notwithstanding Edwin Sutherland's breakthrough research into white-collar crime in 1940, the monumental crimes against property, the environment, and humanity that are committed by corporations and governments still go largely unprosecuted and unpunished. Identifying, explaining, and critiquing class-based inequalities of this type are of considerable interest to members of the CC group.

This is one of the reasons that some ex-convict and "non-convict" criminology and criminal justice professors self-identify as "convict criminologists" and join the CC fraternity. An academically qualified ex-convict who merges his or her real life experience and the perspectives

derived from it with scholarly research into crime or prisons is generally referred to as a *convict criminologist*. However, having a criminal record is not a precondition of CC membership. So-called “cleanskin” researchers, with publications and work in the field, may also choose to join the group. Together, the collective intention is to conduct research that incorporates the experiences of defendants and prisoners and attempts to balance the representations of media and government. The value of this knowledge is that it may open the door to crime control strategies that are enlightened, humane, and, it is hoped, more effective than what is currently in place.

Historical Background

Historically, there have been numerous ex-convicts who have worked at universities in a variety of disciplines. Most of them have chosen to “stay in the closet,” so to speak, perhaps because their criminal histories were not relevant to their studies or because they were afraid of negative reactions from their colleagues or employers. One early exception was Frank Tannenbaum, sometimes referred to as the “grandfather of labeling theory,” political activist, former federal prisoner, professor at Columbia University in the 1930s, and one of the first to openly self-identify as an ex-convict. Tannenbaum served 1 year in prison, but he had a successful career first as a journalist, then as a celebrated scholar.

The modern-day intellectual origins of CC began with the published work of John Irwin, especially his books *The Felon* (1970), *Prisons in Turmoil* (1980), and *The Jail* (1985). Irwin served 5 years in prison for armed robbery in the 1950s. In the late 1960s, he was a student of David Matza and Erving Goffman when he completed his PhD at the University of California at Berkeley. Still, even as he became a prominent prison ethnographer, and although many of his colleagues knew his background, his ex-convict history was apparent only to the close reader of his texts. Nevertheless, Irwin was out of the closet, conducting inside-prison research, but still nearly alone in his representation of the convict perspective.

On the heels of Irwin came Richard McCleary, who wrote *Dangerous Men* (1978), a book that came out of his experience and doctoral research when he was on parole from prison in Minnesota. McCleary has gone on to develop a well-respected career as a quantitative criminologist at the University of California at Irvine.

Ten years later, in Canada, an influential academic journal began that specialized in publishing the work of convict and ex-convict authors. Robert Gaucher, Howard Davidson, and Liz Elliot started *The Journal of Prisoners on Prisons* (*JPP*) in 1988. These Canadian criminologists were disappointed with presentations at the International Conference on Penal Abolition III held in Montreal in 1987, and they were concerned with the lack of prisoner

representation. Twelve months later, *JPP* published its first issue, and to date it has published more than 20 issues featuring convict authors and other critical writers.

Despite these developments, through the 1980s there were still too few ex-convict professors to support Irwin, McCleary, or *JPP* in establishing an agenda based on convict research literature. Although in the 1970s and 1980s, the prison population was growing significantly, only a handful of ex-convicts were completing PhDs in sociology, criminology, and criminal justice. By the late 1980s, however, John Irwin was aware of a growing number of convicts who were gaining higher degrees while in prison or after they got out. At the 1989 American Society of Criminology (ASC) meetings in Reno, Nevada, he spoke to ex-convict professor Greg Newbold, who was attending his first conference, about the need for educated former prisoners to get together and start producing material that reflected their unique experience. He spoke about it regularly from that time forward.

It was at the ASC meetings that the CC concept was finally born. In 1997, Charles S. Terry (then a PhD student at the University of California at Irvine) was complaining to his professor Joan Petersilia about the failure of criminologists to recognize the dehumanizing conditions of the criminal justice system and the lives of those defined as criminal. Petersilia suggested that Terry put together a session for the 1997 ASC conference. Terry invited ex-convict professors John Irwin, Stephen Richards, Edward Tromanhauser, and PhD student Alan Mobley to participate in a session entitled “Convicts Critique Criminology: The Last Seminar.” This was the first time a collection of ex-convict academics had appeared openly on the same panel at a national academic conference. The session drew a large audience, including national media. That evening, over dinner, Jim Austin, Irwin, Richards, and Terry discussed the importance and possibilities of ex-convict professors working together to conduct inside studies of prisons and other criminological matters. Thus the group that became known as “convict criminologists” was eventually formed.

In the spring of 1998, Richards spoke with Jeffrey Ian Ross, a scholar (then working at the National Institute of Justice) and a former correctional worker about the possibility of editing a book using manuscripts produced by ex-convict academics. Almost immediately, Ross and Richards sent out formal invitations to individuals, including ex-convict professors and graduate students and well-known critical authors of work on corrections. In short order, a proposal was written that would eventually result in the 2003 book *Convict Criminology* (Ross & Richards, 2003).

At the ASC’s 50th annual meeting in 1998 in Washington, D.C., Richards, Terry, and another ex-convict professor, Rick Jones, appeared on a panel honoring the famous critical criminologist Richard Quinney. Meanwhile, the group used the conference as an opportunity to find and recruit additional ex-convict professors and graduate students. Jones and Dan Murphy joined the informal discussion. The following year, at the ASC meeting in Toronto, Ontario, Canada, Richards

organized the first official sessions entitled “Convict Criminology.” The two sessions, called “Convict Criminology: An Introduction to the Movement, Theory, and Research—Part I and Part II,” included ex-convict professors Richards, Irwin, Tromanhauser, and Newbold (invited from New Zealand); ex-convict graduate students Terry, Murphy, Warren Gregory, Susan Dearing, and Nick Mitchell; and “non-con” colleagues Jeffrey Ian Ross, Bruce Arrigo, Bud Brown, Randy Shelden, Preston Elrod, Mike Brooks, and Marianne Fisher-Giorlando. A number of the papers presented at these two sessions were early versions of chapters that would later be published in *Convict Criminology* (Ross & Richards, 2003). From here the activities of the group have continued to expand, with nearly 30 CC sessions having been recorded at major criminology and sociology conferences as of 2008.

Richards and Ross coined the term *convict criminology*. In 2001, they published the article “The New School of Convict Criminology” in the journal *Social Justice*; in it, they discussed the birth and definition of CC and outlined the parameters of the movement and its research perspective. In 2003, they published the edited book *Convict Criminology* (Ross & Richards, 2003), which included chapters by the founding members of the group. The book’s foreword was written by Todd Clear, the preface was written by John Irwin, and it contained eight chapters by ex-convict criminologists as well as a number of supporting contributions from non-con colleagues writing about jail and prison issues. This was the first time ex-convict academics had appeared in a book together that included discussions of their own criminal convictions, their time in prison, and their experiences in graduate school and as university professors. In 2008, an ASC Presidential Plenary Convict Criminology Session was held, featuring Dave Curry, Irwin, Richards, and Ross.

Convict Criminologists in 2008

The CC group is informally organized as a voluntary writing and activist collective. There is no formal membership or assignment of leadership roles. Different members inspire or take responsibility for assorted functions, for example, lead author on academic articles, research proposals, or program assessments; mentoring students and junior faculty; or taking responsibility for media contact. The group continues to grow as more prisoners exit prison to attend universities, hear about the group, and decide to contribute to its activities. New members typically resolve to “come out” when they are introduced to the academic community at ASC or Academy of Criminal Justice Sciences conferences.

Today, the former prisoners of the CC group can be roughly divided into four categories. The first consists of the more senior members, all full or associate professors, some of whom already have distinguished research records. The second group consists of newly graduated

PhD candidates who have recently entered the academic profession or are still looking for jobs. This group is just beginning to contribute to the research field. Within the third group are graduate student ex-convicts, some still in prison but nonetheless anticipating academic careers. The fourth group consists of men and women behind bars who already hold advanced degrees and publish academic work about crime and corrections. A number of them have authored or coauthored books and refereed articles with “free world” academics and are more frequently published than many professors. About the time that *Convict Criminology* (Ross & Richards, 2003) first appeared in print, several book publishers began taking the risk of publishing manuscripts written by prisoners assisted by established academics (e.g., Johnson & Toch, 2000).

At present, the CC group includes men and women ex-convict academics from Australia, Canada, Finland, New Zealand, Sweden, the United Kingdom, and the United States. The United States, with the largest prison population in the Western world, continues to contribute the most members.

Although such individuals provide CC with its core membership, some of the most important contributors may yet prove to be scholars who have never served prison time. A number of these authors have worked inside prisons or have conducted extensive research on the subject. The inclusion of these non-cons in the new school’s original cohort provides the means to extend the influence of the CC while also supporting existing critical criminology perspectives.

Convict criminologists, of course, are not the first to critique prisons and correctional practices. Many authors in the past have raised questions about prisons and suggested realistic reforms. Clear, in his foreword to the second edition of McCleary’s *Dangerous Men* (1992), wrote, “Why does it seem that all good efforts to build reform systems seem inevitably to disadvantage the offender?” (p. ix). The answer is that, despite the best intentions, reform systems have often ended up producing the opposite effects of what was intended. While recognizing that prisons are not built for the benefit of criminals, to achieve a desired outcome, a prudent social policy architect should surely consult members of the client group. One of the objectives of CC is to provide heuristically informed research and expertise of this type.

As is usually the case in academia, CC builds upon the foundations provided by chosen intellectual mentors. Erving Goffman, for example, made an enormous contribution with the insightful analysis of asylums (1961) and the development of the notion of stigma (1963). The scholarly work of Frank Tannenbaum (1938) on the dramatization of evil is also significant, as is the prolific work of critical criminologists such as Richard Quinney and William Chambliss. Many others, far too numerous to mention here, who have deconstructed myths, challenged

the taken-for-granted, and searched for alternative meanings have impacted what people do and the way they think.

Dealing With Discrimination and Providing Mutual Support

In America, perhaps more than in other Western nation, felons suffer discrimination nearly everywhere they go in respectable society, in particular when applying for employment. Many end up giving in, opting instead for marginal lives and/or a return to crime.

Like other released prisoners, educated ex-convicts have also suffered discrimination when they enter universities. Academia, for all its liberal pretense, quest for diversity, and support for affirmative action, is often a hostile environment for ex-convict students and faculty. Many universities ask criminal history questions on student admission forms, and students may be denied financial aid, campus housing assignments, and employment because of their past convictions. Ex-convicts can legally be denied admission to graduate programs or graduate assistantship stipends in some states.

In a similar fashion, faculty appointments, promotions, and tenure may be subject to criminal background checks. Ex-convicts with PhDs may find it hard getting jobs or, if given jobs, they may be passed over for tenure, promotion, or consideration for administrative positions. Some university administrators may feel uneasy about having their photos taken with ex-convict professors. Other universities may be concerned that employing ex-convict professors will tarnish the image or reputation of their institutions. At some schools, ex-convict students and junior professors have reported faculty advising them to hide their past, conceal their identity, or simply keep a low profile, for example, by refusing media interviews, or publishing without discussing their criminal histories.

Senior members of the CC group ruminate over these matters frequently and consider responses to them. Matters relating to appointment, promotion, tenure, relationships with staff and students, and the problems people with criminal records have with international travel are all discussed within the group, and knowledge about how to deal with such issues is shared. As a convicted drug dealer, for example, Newbold is prohibited from entering many countries including (and especially) the United States. Yet he has entered the United States legally on a large number of occasions and travels regularly around the world. He readily shares with the group the lessons he has learned and the knowledge he has gained about obtaining foreign entry visas. Many ex-convicts in the group are concerned they will not be allowed to clear customs when attempting to enter foreign countries.

A number of convict criminologists have discussed the treatment they have experienced since being released from prison in the chapters they wrote for *Convict Criminology*. Some members have also talked of discrimination when

interviewed by the media. Conversely, others have acknowledged the assistance they received from faculty and other persons sensitive to the pressures they are under.

As noted, problems with negative discrimination may be greater in the United States than in other nations. The United States is notoriously unforgiving where crime is concerned, being the only nation in the West that practices capital punishment and having a prison population approximately 4 times the size, on a per capita basis, of any other Western jurisdiction. The experience of non-American convicts is different from those in the United States. Newbold, for example, who served a 7½-year sentence in New Zealand for selling heroin in the 1970s, has felt no obvious university discrimination at all. Paroled from prison, he won a prestigious doctoral scholarship, had no problem getting a job, has been rapidly promoted, and is now the most senior ranked member of the sociology department at the University of Canterbury. Although his criminal record is well-known, he has become one of New Zealand's leading criminologists, and he moves easily within both criminal and law enforcement circles without comment or disadvantage. His experience, which is typical of ex-criminals in his country who have made efforts to get ahead, is that people judge an individual on his or her merits and go out of their way to help.

In America, however, where the situation is different, there are numerous ex-convict graduate students and faculty in the social sciences who choose to hide their criminal pasts for fear of professional recriminations, including losing their jobs, being denied research support, and exclusion within their communities. Some may even teach criminology or criminal justice courses, and publish on jails and prisons, yet still feel compelled to continue the deception.

The Activities of the Convict Criminology Group

Members of the CC group mentor students; organize sessions at regional and national conferences; collaborate on research projects; coauthor articles and monographs; help organize and support numerous groups and activities related to criminal justice reform; provide consulting services; and organize workshops for criminal defense attorneys, correctional organizations, and universities. For example, some members of the group have worked on major prison research projects in California, Illinois, Iowa, Kentucky, and Ohio. In New Zealand, Newbold has served a total of 13 government policy agencies either as a consultant or as a bona fide member. Collectively, the group has published books, journal articles, and book chapters using autoethnographic or insider perspectives. Private foundations, including the Soros Foundation Open Society Institute, have supported CC activities, including conference presentations and research. Individuals may serve as consultants or leadership for community groups working on prison issues or legislation.

The local and national media are interested in how convicts become professors and in their insider expertise, and they frequently interview group members. This is a powerful way of dispelling popular myths about criminals, making it important that convict criminologists become media savvy and learn how to answer questions in a clear, direct, informed, and concise way. The media love “good talent,” and journalists will continually return to contacts who provide them with useful copy. The media may also ask ex-convict professors to provide contacts for other stories. Ex-convict professors may also engage friendly journalists to assist with media promotion of CC work in universities, academic programs, and/or correctional programs. Media stories about the group have appeared in print in many countries.

All CC members mentor students with felony records at their respective universities. In doing so, they assist these students with the difficult job of adjusting to how having a criminal record may effect their expectations for deciding on academic programs and careers. Assistance may include parole board appearances, academic advising, emotional support, and/or preparation for employment or admission to graduate programs. Many group members also act as role models or advisors for convicts or ex-convicts who might be thinking about attending university. This mentoring of convicts, both young and old, recidivist or naive, is one of the convict criminologist’s most important roles. In a country like the United States, where more than 500,000 men and women get out of prison every year, there is a large potential population of former prisoners who will attend universities.

As a consequence of this work, CC is now being taught in universities as well as in prisons, providing a perspective that may be used as part or all of a course, or simply integrated throughout. In Wisconsin, a program called “Inviting Convicts to College” has been in place since 2004, training pairs of undergraduate intern instructors to go inside prisons to teach a free college programs entitled “Convict Criminology.” The course uses the book *Convict Criminology* (Ross & Richards, 2003), donated by the publisher, to inspire the prisoners. The course is taught 2 hours a week, for 14 weeks, and is supervised by ex-convict professors. Prisoners exiting prison use the course as a bridge to entering college, with the final weeks of the course including instruction on completing and submitting admission and financial aid forms. The prisoners soon learn that admission to college and financial aid grants and loans can be a viable parole plan. The program has already helped a number of prisoners to enter universities, where they receive advice and mentoring from members of the CC group.

Important Contributions

CC continues to grow as numerous articles and books are added to the literature and the perspective is discussed in textbooks. The CC group emphasizes the use of direct observation and real-life experience in understanding the

different processes, procedures, and institutional settings that comprise the criminal justice system. The methodology includes correspondence with prisoners, face-to-face interviews, retrospective interpretation of past experiences, and direct observation inside correctional facilities. The group is especially skilled in gaining entry to prisons, writing research questions, composing interview questionnaires in language that convicts can understand, and in analyzing prison records and statistics.

Much of the academic literature to date has discussed “the prison” abstractly, with little detail or differentiation between security levels, state or federal systems, or location within the country. When details were provided—for example, on prison conditions or social groups within the prison—the sources were often outdated. In addition to failing to identify the facility, state, or system, other articles have been written without interviewing the prisoners.

The CC perspective has contributed to the updating of studies on corrections and community corrections by remedying these deficiencies. CC scholars name the research sites so that the conditions they observe, and the concerns they raise, can be addressed. Although they are trained as scientists, they do not forget their duty to report what they find and help translate it into policy recommendations. With nearly 7 million Americans currently in the custody of correctional supervision, this is a critically important function.

Ethnographic Methodologies: Insider Perspectives

CC specializes in on-site ethnographic research, in which a researcher’s prior experience with imprisonment informs his or her work. Investigators are comfortable interviewing in penitentiary cellblocks, in community penal facilities, or on street corners, using a method that may include a combination of survey instruments, structured interviews, informal observation, and casual conversation. As former prisoners, convict criminologists know the “walk” and “talk” of the prisoners, how to gain the confidence of men and women who live inside, and how to interpret what they say. They also know prison rules and regulations and require less prison staff time for orientation and supervision. As a result, they have earned a reputation for collecting interesting, useful, and sometimes controversial data.

A number of significant ethnographic studies have emerged from this research. Irwin, for example, who served prison time in California, drew on his experience to write *The Felon* (1970), *Prisons in Turmoil* (1980), *The Jail* (1985), and *It’s About Time* (Austin & Irwin, 2001). McCleary, who did both state and federal time, wrote his classic *Dangerous Men* on the basis of his participant observation of parole officers. Terry, a former California and Oregon state convict, wrote about how prisoners used humor to mitigate the managerial domination of penitentiary authorities. Newbold wrote the New Zealand

bestseller *The Big Huey* (1982) about his 5 years inside, followed by *Punishment and Politics* (1989), *Crime in New Zealand* (2000), *The Girls in the Gang* (Dennehy & Newbold, 2001)), and *The Problem of Prisons* (2007), all of which have analyzed crime and corrections in his country. Richards and Jones, both former prisoners, used inside experience to inform their studies of prisoners returning home. Finally, Ross and Richards coauthored *Behind Bars* (2002) and coedited *Convict Criminology* (2003).

In their writing, group members are deliberately careful about the type of terminology they use, recognizing the powerful effect that certain forms of language may have. Official terms, such as *correction* (imprisonment), *adjustment* (segregation), *behavior management* (solitary confinement), and *control and restraint* (bashing/gassing/electrocuting/handcuffing) is a way that prison administrators sanitize some of the less savory functions they perform. Convict criminologists are conscious of this and try not to use what they believe are misleading euphemisms in their writing. Conversely, there is also a lexicon of negative terminology of which we are equally aware. Referring to someone as a “robber,” a “burglar,” a “murderer,” or a “rapist,” for example, conjures up misleading stereotypical images created by sensationalistic fiction. The world is not easily dichotomized into “bad guys” and “good guys” as some television law-and-order shows or action movies might imply. In the real world, people who work or have lived with felons are often surprised at the reserve, sensitivity, gentility, and good humor of people who may have been convicted in the past of serious crimes. Working on the principle that a person is more than the worst thing he or she ever did, convict criminologists try to avoid referring to people in terms of the crime of which they were convicted, as if this were their master status. Instead, if they do allude to a person’s offending, it is usually in terms of the act itself rather than as a component of identity. In prison, they learned that you have to take some time to get to know a person, and when you do, you find that person’s crime may indicate very little about him or her.

Convict Criminology Policy Recommendations

In terms of policy initiatives, CC has two general orientations. First, convict criminologists wish to see a cessation of what Austin and Irwin (2001) called the “imprisonment binge” in America, which began in the 1980s and has caused the national prison population to more than double since 1990. The result has seen millions of citizens incarcerated, with immense cost to the taxpayer in terms of prison construction, operation and maintenance, overcrowded courts, overworked parole and probation authorities, and overburdened welfare agencies to which falls the task of supporting families whose primary breadwinner has been removed.

The reasons for the hike in prison numbers are well-known and have little to do with crime rates. At the base of the problem are certain elements within the mass media that exaggerate and sensationalize crime in the quest of increasing their market share of reader- or viewership. Citizens startled by the false specter of a “crime wave” are then preyed on by politicians who, trying to outbid their opponents for votes, attempt to allay public fears by promising to lock criminals up for long periods of time. Cruel sentencing laws have caused millions of petty offenders to receive extraordinarily long sentences. These laws have been complemented by the imposition of long parole periods after release, with strict conditions, rigorous monitoring, and hair-trigger violation components. By these mechanisms, released prisoners may be summarily returned to prison for supervision rule violations as trivial as having a beer, living at an unapproved address, failure to secure employment, or a bad drug test. U.S. prisons are increasingly being filled up by petty violators of this type, who, after years of crime-free liberty, can suddenly lose their jobs, marriages, and homes as a result of an unexpected visit from a gung-ho parole officer. Living with the Sword of Damocles dangling so precariously over their heads adds markedly to the stressful lives of prison parolees and decreases their ability to adjust to civil life though winning good jobs, getting married, and creating stable families.

The second orientation of the CC group concerns prison conditions themselves. Partially as a result of burgeoning prison populations, rising incarceration costs, crowded prison conditions and a thinning of resources, prison conditions have deteriorated (Ross, 2008). Budgets have tightened, and many prison programs have disappeared. An article written by Robert Martinson in 1974, which argued strongly that “nothing works” in prison reform, added weight to arguments that spending money on programs is a waste of time. This encouraged many American jurisdictions, already struggling under rising populations, to abandon programs and invest instead in expensive high-tech surveillance and security to manage prisoners. Thus, many prisons became warehouses for felons, where criminals are essentially kept in cold storage until they are paroled or their sentences expire. Unprepared for life in the real world after years of stagnation in the artificial environment of the prison, it is little wonder that so many are unable to survive on release and end up back inside.

These kinds of critical issues are the grist to the mill of the convict criminologist. Convict criminologists are committed to understanding and attempting to remedy the processes that have given the “land of the free” the largest and fastest-growing prison population in the history of the Western world. Within the context of the prison itself, they share a determination to expose and address a carceral environment that, although ostensibly created to prevent a prisoner from future offending, in fact produces social cripples whose return to a felonious lifestyle and further incarceration is virtually ensured.

In pursuit of the first objective, the CC group advocates dramatic reductions in the national prison population through a review of the kinds of crimes that get people sent to prison, shorter sentences, and an examination of the parole system. They argue for imprisonment only as a last resort for serious crimes, a return to more extensive use of diversion to community programs, and restrictions on parole length and reimprisonment for petty violations.

In pursuit of the second objective, convict criminologists support the closing of large-scale penitentiaries and reformatories where prisoners are warehoused in massive cellblocks. Over many decades, the design and operation of these “big house” prisons has dehumanized inmates and resulted in high levels of intimidation, serious assault, and sexual predation. A reduced prison population housed in smaller institutions could be accomplished by constructing or redesigning prison housing units with single cells or rooms, as is the case in many other advanced industrialized countries. In small prisons where prisoners are held in single-celled units of no more than 60, maintaining control and security is easier, and the incidence of sexual predation is close to zero. A number of European countries follow a similar model.

In addition to the preceding, legislators and policymakers need to listen carefully to prisoner complaints about bad food, old uniforms, lack of heat in winter or air-conditioning in summer, inadequate vocational and education programs, and institutional violence. The list grows longer when one takes a careful look at how these conditions contribute to prisoners being poorly prepared to reenter the community and the large number who return to prison.

Programs that were dissolved after the population boom began in the 1980s need to be reactivated. Prisoners should be provided with opportunities for better-paid institutional employment, advanced vocational training, higher education, and family skills development. Although it is true that most institutions have token programs that serve a small number of prisoners—for example, a prison may have paid jobs for 20% of its prisoners, low-tech training, a GED program, and occasional classes in life skills or group therapy—the great problem is that these services are dramatically limited in scope and availability.

Another matter that concerns convict criminologists is voting rights. The United States is one of the few advanced industrial countries that continues to deny prisoners and felons voting rights. If convicts could vote, many of the improvements suggested here might become policy, because politicians would be forced to campaign for convict votes. State and federal government will begin to address the conditions in prisons only when prisoners and felons become voters. One would not expect prisoners to be any less interested than free persons in exercising their right to vote. To the contrary, if polling booths were installed in jails and prisons, voter turnout would likely be higher than in most outside communities.

To prevent relapses into offending caused by desperation, convict criminologists advocate that prisoners released from prison should have enough “gate money” to allow them to pay for up to 3 months of rent and food. They could

earn some of this money working in prison industries, with the balance provided by the state. All persons exiting correctional institutions should have clothing suitable for applying for employment, eyeglasses (if needed), and identification (social security card, state ID or driver’s license, and a copy of their institutional medical records).

The final and perhaps most controversial policy recommendation is eliminating the “snitch” system in prison (i.e., using inmates as informants). The snitch system is used by guards in old-style institutions to supplement their surveillance of convicts. It is used to control prisoners by turning them against each other and is therefore responsible for ongoing institutional violence. If our recommendations for a smaller population, single-cell housing, better food and clothing, voting rights, and well-funded institutional programming were implemented, the snitch system would become redundant. Small units are easier to manage and the demoralizing and dangerous cooptation of snitching inmates to assist in operational functions is unnecessary.

Conclusion

Since the conception of the CC group more than a decade ago, there has been a steady increase in the number of ex-convict academics willing to step forward and become a part of it. In doing so, they show a willingness to challenge the taken-for-granted and offer fresh insights into some of the oldest questions in sociology and criminology/criminal justice. As the group grows and these observations accumulate, a more complete and relatively current picture of modern prisons begins to emerge (see Irwin, 2005; Jones & Schmid, 2000; Newbold, 2007; Ross & Richards, 2002; Terry, 2003). Members of the group are able to write with authority about what they have observed or experienced in prisons located in different states and different countries.

The CC literature is now being cited regularly in textbooks and academic journals. There is a greater appreciation for first-person (auto-ethnographic) and retrospective accounts. Like Marx standing Hegel on his head, a social scientist needs to invert the musing of the philosopher. The CC collective encourages the exploration of alternative explanations and remedies that emanate from different perspectives drawn from extraordinary experiences. If academics wish to have a truly rounded picture of what happens in criminal justice, they need to listen to the victims of the system as well as to its architects and operators. It is only with the benefit of full and comprehensive knowledge that effective public policy can be drafted.

PART IV

MEASUREMENT AND RESEARCH IN CRIMINOLOGY

DRUG ABUSE WARNING NETWORK (DAWN) AND ARRESTEE DRUG ABUSE MONITORING (ADAM)

DENISE HERZ

California State University, Los Angeles

CHRISTINE CROSSLAND

U.S. Department of Justice

At the turn of the 20th century, the U.S. government began instituting laws to reduce the availability of illicit drugs and to criminalize their use. The passage of laws continued and eventually culminated in 1971, when the first war on drugs was declared by President Nixon. As a result, stricter anti-drug laws were passed at the state and federal levels, and the Drug Enforcement Agency was created to enforce federal laws throughout the nation. Legislative reaction to illicit drug use primarily originated from concerns about marijuana, cocaine, and opiate use; however, the use of methamphetamine, club drugs (e.g., Ecstasy, LSD), and the illegal use of prescription drugs has garnered substantial attention from policymakers and law enforcement over the last 10 to 20 years.

Despite increased concerns over the use of these drugs, accurately documenting the extent of the drug problem was impossible until the 1970s because there were no standardized surveillance systems to measure the type or extent of drug use across the nation. To address this issue, the U.S. government began funding national data collection systems. Two primary data systems established during this time were the Drug Abuse Warning System (DAWN) and the Arrestee Drug Abuse Monitoring Program (ADAM, originally known as the Drug Use Forecasting Program).

Drug Abuse Warning Network

DAWN was established in 1972 as a national surveillance system to measure drug-related morbidity and mortality using data from hospital emergency departments (EDs) and medical examiners/coroners. Originally, DAWN was administered by the Drug Enforcement Agency and the National Institute on Drug Abuse, but federal law, Section 505 of the Public Health Service Act (42 U.S.C. 290aa-4), now requires the Substance Abuse and Mental Health Services Administration (SAMHSA), an agency of the U.S. Department of Health and Human Services, to collect nationwide data on morbidity and mortality. Currently, oversight of DAWN is managed by SAMHSA's Office of Applied Studies.

For over a decade, DAWN data were collected from a convenience sample of hospital EDs, medical examiners, and coroners from across the United States. Sampling design limitations, however, rendered the data useless for producing national estimates of drug morbidity or mortality. To address this problem, DAWN data in 1988 were drawn from a representative sample of 24-hour hospital EDs in nonfederal short-stay general medical/surgical hospitals throughout the coterminous United States. Data collection from medical examiners/coroners, on the other hand, continued to be based on a nonprobability sample.

The primary purpose of DAWN was to be a first indicator of the serious consequences of drug use. In serving this purpose, it was anticipated that DAWN would help quantify the nation's drug problem; monitor drug use trends over time; and guide resource allocation decisions at the local, state, and federal levels. Unfortunately, the realization of these goals fell short. In reality, DAWN was not able to produce results in a timely manner, its focus was too limited and did not consider broader issues of health, the quality of its data was questionable because of methodological limitations, and its methodology did not account for changes in the health care system. Consequently, the future of DAWN was questionable until a 1997 expert review panel convened by SAMHSA validated the importance of DAWN and recommended that it continue with substantial revision.

A 2-year evaluation of DAWN was commissioned in 1999 to identify how the program should be revised; specifically, the evaluation addressed whether (a) DAWN was collecting the right type of data to meet its goals, (b) the data DAWN collected were valid and efficiently collected, and (c) whether DAWN information could be delivered to policymakers and communities more effectively. The results of the evaluation (published in 2001) resulted in the development of New DAWN in 2003. In particular, New DAWN was born with a new sampling design, new case criteria, expanded data collection, and improved quality control.

A New Sampling Design

To collect data on drug-related ED visits, New DAWN uses a longitudinal, probability sample of nonfederal, short-stay, general surgical and medical hospitals with at least one 24-hour ED in all 50 states. More metropolitan sites were included in sample selection, and the boundaries for 13 of 21 original DAWN metropolitan areas were redrawn. Hospitals eligible to participate in DAWN were initially drawn from the 2001 American Hospital Association Annual Survey Database, which is a national registry of U.S. hospitals. The DAWN sampling frame (i.e., hospitals eligible for DAWN participation) is annually updated with newly established hospitals using this database.

New DAWN hospital samples were (and continuously are) drawn using a stratified simple random sampling approach. Stratification was based on (a) geography (i.e., Metropolitan Statistical Areas and the remainder of the nation) and (b) hospital ownership and size. This process was used to identify 54 geographic units. Fifty-three of these units represent metropolitan areas (e.g., 48 metropolitan areas, 2 subdivisions each for 3 of these metropolitan areas, and 3 subdivisions for 1 of these metropolitan areas). The 54th unit of the New DAWN sample is also known as the *supplemental sample*, which is intended to augment the metropolitan samples in order to yield a more complete national sample.

Sampling changes were less dramatic for medical examiners/coroners. As indicated earlier, a nonprobability sample of participating medical examiners/coroners was used for DAWN data collection even after probability sampling was implemented in 1988 for hospital EDs. A critical problem for improving sampling methods for drug-related mortality was the variability in criteria for death investigations across jurisdictions, which prevented the use of a probability sampling design. However, because DAWN is currently the only large-scale surveillance system that collects data directly from medical examiners and coroners, it was retained in New DAWN with sampling improvements rather than a redesign. To improve the sample of medical examiners/coroners, all medical examiners/coroners were recruited from the ED target areas and six statewide systems (Maine, Maryland, New Hampshire, New Mexico, Utah, and Vermont) were added to the sample. Because probability sampling was not possible for drug-related mortality, it is important to remember that national estimates for drug mortality are not possible.

New Case Criteria

Under Old DAWN, inclusion of ED cases required designated DAWN recorders at each site to infer the patients' intent of use from medical charts; specifically, they were required to identify cases that were "induced by or related to" drug abuse; consequently, a range of visits related to drug use was excluded from data collection. New DAWN criteria no longer limit inclusion of ED cases to drug abuse. The program now requires a systematic review of all ED charts to identify any type of drug-related visit. Medical examiner/coroner data now also include any type of drug-related death. Thus, New DAWN data comprise episodes and deaths that result from drug abuse and misuse, suicide attempts/completed suicides, overmedication, adverse reactions, accidental ingestions, malicious poisoning/homicide by drugs, underage drinking, patients seeking detoxification or drug abuse treatment (ED only), and other deaths related to drugs (medical examiner/coroner only).

Expanded Data Collection

In revising DAWN, data items without purpose were eliminated, and new data items were added to improve the description of cases and help distinguish different types of drug-related visits. Currently, DAWN data for ED visits capture patient demographics, the type of drug involved, the route of administration, the type and disposition of the case, presenting complaint, diagnosis, and case narrative. DAWN data for deaths include the demographics of the deceased, the type of drug involved, the route of administration, the involvement of the drug in the death, the manner of death,

and the cause of death. The following types of drugs are included in data collection:

- Illegal drugs, such as heroin, cocaine, marijuana, and Ecstasy
- Prescription drugs, such as Prozac, Vicodin, OxyContin, alprazolam, and methylphenidate
- Over-the-counter medications, such as aspirin, acetaminophen, ibuprofen, and multi-ingredient cough and cold remedies
- Dietary supplements, such as vitamins, herbal remedies, and nutritional products
- Psychoactive, nonpharmaceutical inhalants
- Alcohol in combination with other drugs
- Alcohol alone, in patients aged less than 21 years

Ultimately, the data changes expanded New DAWN's coverage to include any ED visit or death "at any age, for any drug, for any reason." This substantially increased the utility of the data and expanded New DAWN's focus from documenting drug abuse to documenting drug use, misuse, and abuse and relating these dimensions of use to health consequences.

Improved Quality Control

One of the most debilitating criticisms of Old DAWN was that of poor data quality. As mentioned, identification of eligible cases was previously subject to reporter assessments about the drug-related nature of the visit or death, and training for reporters did not assure consistency across sites. Missing data was often a problem, reducing the usefulness of the data. Data reporting was done using outdated methods, substantially delaying the production and distribution of results.

To address these issues, New DAWN eliminated reporter assessments of intent and instituted rigorous training for reporters. In addition, strict quality assurance mechanisms were instituted, including data validation at data entry, automatic prompts for reporters, the use of a drug look-up database, and performance feedback for individual sites. Data are now submitted electronically, and de-identified data related to ED visits are made available to participating sites in real time via the Internet.

These changes substantially change the nature and strength of New DAWN data. They address the criticisms lodged at Old DAWN and help the program accomplish its original goals. These changes, however, make comparisons between Old DAWN data and New DAWN data impossible. Scholars must remember the incompatibility of the two iterations when reviewing, assessing, and reporting DAWN results across different time periods.

Selected Results for Emergency Department Visits

In 2005, hospitals in the United States delivered a total of 108 million ED visits, of which an estimated 1.4 million were related to the misuse or abuse of drugs:

- 31% involved illicit drugs only
- 27% involved pharmaceuticals only
- 7% involved alcohol only in patients under the age of 21
- 14% involved illicit drugs with alcohol
- 10% involved alcohol with pharmaceuticals
- 8% involved illicit drugs with pharmaceuticals
- 4% involved illicit drugs with pharmaceuticals and alcohol

As just shown, about one third of visits involved one type of drug (e.g., illicit drugs only), whereas the remaining two thirds of visits involved some combination of drug types. Although the majority of drug misuse/abuse visits were associated with a single drug type, the typical drug-related visit included multiple drugs within that type. In other words, an illicit drug only visit (i.e., not combined with alcohol or pharmaceuticals) often involved the use of multiple illicit drugs (e.g., cocaine and heroin).

Alcohol and Illicit Drug Use

Among all the drugs on which information is collected by DAWN, alcohol is unique. An ED visit related to alcohol use qualifies as a DAWN case under only two conditions: (1) The alcohol is found in combination with other drugs, regardless of patient age, or (2) the alcohol is found alone (i.e., not in combination with other drugs) in a patient under age 21. DAWN estimates that, for 2005, about one third (34%) of ED visits involved either alcohol in combination with another drug (all ages), or alcohol alone for patients under age 21. Of all these ED visits involving alcohol, about 7% involved patients under age 21 who used alcohol alone.

As indicated earlier, DAWN records ED patient demographics, such as gender, age, and race/ethnicity. In 2005, the male rate for visits involving alcohol in combination with other drugs was higher than the female rate. The rates between age groups varied little, but younger and older patients had lower rates. The data for race/ethnicity groups are more precarious than other demographic characteristics because of problematic levels of missing data (11%); however, on the basis of available data, 54% of alcohol-related visits involved white patients, 39% involved African American patients, and 12% involved Hispanic patients.

Over half of all drug-related ED visits were related to an illicit drug alone or in combination with another drug type. Of all visits involving illicit drugs, the drugs most often implicated were cocaine (55%), marijuana (30%), heroin (20%), and stimulants (17%; 13% methamphetamine and 4% amphetamines). Other illicit drugs were involved in less than 5% of cases. Rates per 100,000 also indicate that cocaine was the most likely drug involved in ED visits, followed by marijuana, heroin, and stimulants.

According to 2005 DAWN data, male rates (361.2 per 100,000) for all illicit drug visits were almost twice as high as female rates (192.1 per 100,000). In particular, male rates were double those of females for cocaine, heroin, and

marijuana; however, the difference was much smaller for stimulants (57.8 compared with 36.2). In fact, the female rate for visits related to stimulants was equal to the female rate for heroin visits (36.2 and 36.9, respectively). With regard to age, the rates for all illicit drug visits were highest among 21- to 24-year-olds (581.5), but similar rates were found for 18- to 20-year-olds (517.5), 25- to 29-year-olds (528.5), and 35- to 44-year-olds. Rates were slightly lower for 30- to 34-year-olds (490.9) and substantially lower for 12- to 17-year-olds (197.9). As expected, the rates for patients less than 12 were 3.0 or fewer per 100,000. In general, rates for marijuana were highest for younger patients, whereas rates for cocaine were highest for older patients. The point at which this change in rates occurs appeared to be in the 21-to-24 age group. In addition, stimulant rates were higher than heroin rates for patients between the ages of 12 and 29. After age 29, the rates for heroin exceeded those for stimulants.

Similar to trends related to alcohol, the race/ethnicity data for illicit drug use visits are somewhat uncertain because of missing data: 13% for all illicit drug-related visits. On the basis of available data, however, 46% of the visits related to any illicit drug use involved patients who were white, 27% involved patients who were African American, and 12% involved patients who were Hispanic.

Selected Results for Drug-Related Deaths

The most recent DAWN data published for drug-related deaths are from 2003. In 2003, 122 jurisdictions in 35 metropolitan and 6 states participated in DAWN, and the response rate for medical examiners/coroners in these areas ranged from 9% to 100%. The 2003 DAWN mortality report focused on deaths attributed to suicides, homicides by drug, overmedication, all other accidental causes, and undetermined causes.

Overall, drug-related deaths ranged from 56.1 to 205.6 (per 100,000 population). The rates were lowest for children and adolescents, higher for 21- to 34-year-olds, and, with few exceptions, highest for 35- to 54-year-olds. More than half of the deaths occurred at home. Almost half of drug-related deaths involved alcohol or the use of an illicit drug (e.g., cocaine, heroin, and/or stimulants), and these deaths were typically attributed to multiple use of drugs rather than the use of a single drug. Single-drug deaths, however, were most likely to involve opiates, cocaine, or stimulants.

Significance of DAWN

DAWN contributes significantly to our knowledge of drug misuse and abuse in the United States. Since the revision of DAWN in 2003, it is better suited to be a first indicator of the health consequences of drug misuse and abuse while simultaneously providing an improved baseline for monitoring trends related to alcohol, illicit drug use, and nonmedical use of pharmaceutical drugs. Importantly,

New DAWN allows for more accurate cross-site comparisons of drug use, identification of emerging drug use patterns, and investigation of suspected misuse/abuse patterns in particular areas. DAWN data are available quickly through DAWN Live! to participating sites and eligible public health organizations, and SAMHSA regularly publishes special reports using DAWN data. In turn, the availability of DAWN data capitalizes on its potential to inform policy and program development, document problems to support local initiatives, identify the link between drug abuse and other public health problems (e.g., sexually transmitted diseases), evaluate local anti-drug efforts, and contribute to academic research on drug abuse.

Given the improved utility of DAWN data, its desirability to a variety of entities has grown. At the local level, consumers of DAWN information include community epidemiology work groups, treatment agencies, prevention coalitions, and member hospitals. At the state level, state health and human services and law enforcement agencies utilize DAWN data, and at the federal level, several agencies rely on DAWN data, including the Food and Drug Administration, the Centers for Disease Control, the White House Office of National Drug Control Policy, the Drug Enforcement Administration, and the National Institute on Drug Abuse. In addition, the pharmaceutical industry utilizes DAWN data to monitor the use (or misuse) of its drugs.

Arrestee Drug Abuse Monitoring

From 1987 to 2003, the National Institute of Justice (NIJ) sponsored two innovative and ambitious efforts to provide needed information to local communities grappling with the issue of drugs and crime: (1) the Arrestee Drug Abuse Monitoring (ADAM) program and (2) its predecessor, Drug Use Forecasting program (DUF). The primary goals of these programs were to uncover national trends in drug use, provide local communities with early evidence of drug epidemics, support local planning officials with data linking crime to drug use, and measure the impact of efforts to reduce drug use and crime.

DUF and ADAM represent unique drug use surveillance systems compared with other national drug use indicators for several reasons. DUF/ADAM were the only programs that used recently booked arrestees—a population thought to comprise mostly hardcore or heavy drug users—as the target population. In addition, they were the only programs to collect self-reported drug use behavior and then confirm those reported drug use behaviors with bioassay results conducted on urine samples provided by the same respondents. Also, although DUF and ADAM played an important role in assembling a national picture of drug use and abuse in the arrestee population, both programs were both designed primarily as local information tools that would provide local users (law enforcement, treatment, prevention, and public health policymakers) with reliable estimates of the prevalence of drug use and related

problems in their communities. Thus, DUF/ADAM data did not provide, and were not intended to provide, national estimates of arrestee drug use; instead, their purpose was to capture trends related to arrestee drug use in various communities across the United States.

Overview and Background

Beginning in 1987, the DUF program began collecting information on drug use among urban arrestees in 10 geographically dispersed cities. Data were collected quarterly for a 1- to 2-week period using a convenience sample drawn from newly booked arrestees in the largest booking facility (i.e., jail) at each site. The target sample size for each site was approximately 225 interviews and urine specimens from adult male arrestees and 100 interviews and specimens from adult female arrestees. To collect DUF data, interviews were conducted with arrestees who had been arrested no more than 48 hours prior to the time of data collection. In addition to the interview, participating offenders were asked to provide a urine specimen, which was later tested for the presence of amphetamines, barbiturates, benzodiazepines, cocaine, marijuana, methadone, methaqualone, opiates, PCP, and propoxyphene. In cases where a specimen screened positive for amphetamine, the specimen was subjected to confirmation testing to detect whether a specific form of amphetamine—methamphetamine—was used.

Data collection under the DUF program was voluntary and confidential. In most sites, more than 80% of the arrestees approached agreed to be interviewed, and more than 80% of participating arrestees agreed to provide a urine specimen. A study-generated identification number was assigned to each interview instrument and its corresponding urine specimen container so that the data from each could be linked at a later date. Collection of the urine specimens allowed for comparison of the self-reported indicators of drug use and indicators of drug use based on urinalyses.

DUF data collection was conducted quarterly, for several reasons. Quarterly data collection generated new information more frequently than other national data collection programs. Quarterly collection and the timely release of findings allowed policymakers and analysts to view trends as they developed, potentially permitting earlier intervention into problems. Finally, quarterly collection helped adjust data for seasonal changes in arrest and crime patterns that occurred in some sites.

The DUF questionnaire was designed to collect information on demographic information, criminal offenses, the types of drugs used by arrestees, and their perceived need for alcohol and drug treatment. For more than a decade, baseline statistics were collected that detected trends in drug use that were then used to guide public health and safety policies. As is often the case with large-scale programs, though, important changes were made to the program during this 10-year period. An additional 13 sites were added as the program evolved, and in 1991, the composition of the DUF sample expanded to include juveniles

in selected sites. Juvenile data were collected in 13 sites until 2002, when this part of the program was indefinitely suspended because of legal obstacles related to collecting information from juveniles.

In addition to the expansion in the number of DUF data collection sites and the population targeted, the original DUF instrument underwent three revisions. These revisions included slight changes in wording of existing questions, the exclusion of some questions, and the inclusion of new ones. Although DUF remained a rich, consistent data source for examining trends in arrestee drug use, it continued to receive criticism for its sampling limitations. To address this issue, the NIJ embarked on an ambitious agenda to increase the generalizability of data collected in its DUF program in 1996. In 1997, this effort resulted in the redesign of the DUF program into the ADAM program. Major changes included the expansion of sites from 23 to 35, the implementation of a new sampling design, the development of a new survey instrument, new quality assurance protocols, and expanded use of addenda for research purposes.

New Sampling Design

Under the ADAM program, a standard catchment (i.e., geographic) area for site data collection was defined as the entire county and applied in all selected sites. For example, in Los Angeles, under DUF, data collection occurred at one facility. ADAM expanded that sample to six locations to include a representative sample of facilities from all adult detention facilities in Los Angeles County. This change made it possible for local officials to make assertions about the entire county's arrestee population based on ADAM data.

Changes in the sampling of arrestees at each site were also made. Like DUF, ADAM protocol still required trained interviewers to approach recently booked arrestees and administering a short voluntary and confidential interview; however, the ADAM program implemented probability-based sampling plans for male arrestees. Unlike the DUF samples, which were based on convenience samples, ADAM arrestees were selected for an interview and tested for drugs using disproportionate, stratified sampling plans tailored to each facility that accounted for several characteristics related to arrests, including day of week of the arrest, time of day of the arrest, reason for the arrest, and where the arrestee was booked.

New Data Collection Protocol

To improve the quality of the data collected, a new survey instrument was developed, and crosswalks from ADAM to other major drug and crime indicators were included. The new questionnaire expanded ADAM's focus from self-reported drug use to the need for drug treatment and information related to drug markets in the area. Specifically, the ADAM questionnaire (a) preserved the key drug use measures while placing greater focus on five

primary drugs (i.e., cocaine, marijuana, methamphetamine, opiates, and PCP) and their patterns of use over the prior year; (b) incorporated a validated drug use dependency and abuse screener; (c) included self-report information related to offender participation in inpatient, outpatient, and psychiatric treatment over the prior year and prior arrest history; and (d) added a section on drug acquisition and recent use patterns that provided greater insight into the dynamics of drug markets, use, and sharing. Also, questions (e.g., crosswalks) were included to directly link ADAM data to data produced by other national indicators, such as the National Survey on Drug Use and Health (formally known as the National Household Survey on Drug Abuse), the Treatment Episode Data Set; the Uniform Facilities Data Set; the System to Retrieve Information from Drug Evidence; Uniform Crime Report and National Incident-Based Reporting System; and the State Needs Assessment Household Telephone Surveys. Other surveys used during the questionnaire redesign were those conducted by the Center for Substance Abuse Treatment and the U.S. Census Bureau.

Improved Quality Assurance

To ensure that the program performed according to its mission and within a cost-efficient manner, the NIJ funded and directed all ADAM program operations with the assistance of a national data collection contractor and a national laboratory contractor. This structure provided the program with a centralized system of oversight that included fiscal management, rigorously standardized data collection procedures, minimum requirements for staff, and an ongoing accountability (operational and fiscal) from all data collection sites.

Whereas the NIJ was responsible for developing, shaping, and overseeing the infrastructure and methodology of ADAM to ensure accuracy and consistency across the different localities, the national data collection contractor maintained and implemented the technical and operational infrastructure for the program, including project management; communicating, defining, and enforcing the methodology and procedures; ADAM data entry, verification, and dissemination; and overall system support (technical support for the Web site, software, and standard programming systems). A Department of Health and Human Services certified laboratory contractor conducted analyses on all ADAM urine specimens. An immunoassay system was used to screen for the presence of drugs in urine. All ADAM specimens were analyzed using the same procedures with corresponding cutoff levels and detection periods.

The national data collection contractor was ultimately responsible for receiving and processing all data from participating sites and the national laboratory, which were then subjected to the same data management procedures by means of automated editing and entry programs. These data were then analyzed and disseminated in quarterly and

annual reports by the national data collection contractor. These controls made it possible to compare findings from site to site.

Each research site in the ADAM network entered into subcontracts with the national data collection contractor and was held to minimum performance standards that included staffing, data collection, and fiscal performance requirements. Data collection at each site was managed by a local research team that included a site director and site coordinator. Site management teams were responsible for key operational issues, including directing and supervising data collection, establishing and maintaining contact with booking facility representatives, hiring and maintaining professionally trained interviewers and other site staff, overseeing data collection performance and monitoring site adherence to national data collection standards (meeting established data collection targets and minimum interview error rates), coordinating communication with the NIJ and the national contractors, and overseeing proper invoicing and fiscal monitoring of the site budget. Each site was evaluated every quarter and informed of any programmatic and/or administrative problems in the form of a feedback report and compliance letter.

The NIJ's national standards for site staff involved the completion of a formal training schedule that used standardized materials. These materials covered training on interviewing techniques and on administration of the ADAM interview instrument. All site staff were required to attend and successfully complete 20 hours of training before they were permitted to interview arrestees. Interviewers were then required to demonstrate minimum levels of ability through their initial formal training and startup training, which was considered a probationary period. Contingent upon satisfactory completion of a minimum period of formal and on-site training, interviewers were then accepted for work on ADAM.

By and large, ADAM training was conducted just before data collection occurred at a site so that interviewer skills would be immediately applied to field conditions and so interviewers could be regularly observed and evaluated by national trainers. However, ongoing monitoring of the quality of their work determined their continued acceptability as ADAM interviewers. In addition, all interviewers were required to participate in a minimum of 6 hours of in-service training every year to maintain interviewer skills.

Research site staff was also responsible for disseminating local ADAM findings to a Local Coordinating Council composed of local, state, and federal law enforcement; representatives from the courts and corrections; social services professionals; treatment providers; policy-makers; community-based organizations; the local research community; and other stakeholders. In turn, the Local Coordinating Council was responsible for focusing its efforts on integrating the data into local planning processes, meeting unique local information needs, and creating a local research agenda.

Use of Research Addenda

In addition to strengthening the program's foundation, a greater utilization and recognition of the program as a research platform was supported. By appending specialized questionnaires to the ADAM instrument, several communities began exploring a wide range of topics that local policymakers wanted to investigate or address. The first of these studies focused on methamphetamine in five sites. Another study, conducted in partnership with the Centers for Disease Control, collected information on HIV testing, risk behaviors, and health care access among the arrestee populations at three sites. Another group of sites began collecting information on interpersonal violence and service needs among female arrestees, and two other sites began exploring the nature, patterns, and consequences of pathological gambling among the arrestee population. Ultimately, these studies and many others (e.g., acquisition and use of firearms by arrestees) helped improve the nation's knowledge base about the social and behavioral correlates and consequences of drugs and alcohol among an arrestee population.

In sum, all of the enhancements made to the ADAM program resulted in a more comprehensive, nationwide source of information on drug use. Using ADAM data, the NIJ as well as local communities were able to identify levels of drug use among arrestees, track changes in patterns of drug use, identify specific drugs that were used and abused in each jurisdiction, alert officials to trends in drug use and the availability of new drugs, provide data to help understand the drug-crime connection, help evaluate law enforcement and jail-based programs and their effects, and serve as a research platform for a wide variety of drug-related initiatives. In short, ADAM provided reliable and valid information that helped develop evidence-based policies to assist both local and national policymakers.

Unfortunately, the ADAM program was discontinued in early 2004. This action was taken in response to the significant reduction in appropriations received by the NIJ in that fiscal year for social science research. However, the Office of National Drug Control Policy, Executive Office of the President, introduced a modified version of the ADAM program in 2007. This program is called ADAM II, which is appropriate given that it uses the same research protocols introduced by the ADAM program. The only changes in ADAM II are the number of sites funded to collect data; a sole focus on adult male arrestees; and the questionnaire used, which was modified slightly to address issues surrounding the rising use and abuse of methamphetamine. Results from the new program are still awaiting release.

Selected Findings From ADAM

Over the years, the ADAM program collected drug use data from more than 89,000 adult male arrestees and from more than 17,000 adult female arrestees in 42 fully or partially funded sites. The level of drug use among the respondents was substantial in all years and at all sites. Every site

reported that a majority of its arrestees tested positive for at least one drug. In more than half of the ADAM sites, almost 2 of every 3 arrestees tested positive for at least one of five drugs, including cocaine, marijuana, methamphetamine, opiates, or PCP. With only a couple of exceptions, marijuana percentage-positive rates, along with self-reported use, were higher among adult male arrestees, followed by cocaine, opiates, and methamphetamines. Female arrestees tested positive more often for cocaine, followed by marijuana, methamphetamine, and opiates.

In half of the sites, nearly 40% or more of all adult male arrestees reported that during the past 30 days, they had consumed drugs on 13 or more days. In 50% of the sites, almost 40% or more of adult male arrestees needed drug treatment, and nearly 30% needed alcohol treatment. Adult female arrestees also showed high rates of dependence, with 40% indicating a need of drug treatment and 23% in need of alcohol treatment. However, in no site did more than 20% of adult arrestees experience inpatient or outpatient drug or alcohol treatment. Potentially affecting this participation rate could be that nearly 60% of the adult male arrestees and 50% of the adult female arrestees reported having had no health insurance.

These consistently high percentages of overall drug use, however, masked the important differences in trends for specific drugs and specific segments of the arrestee population. In the late 1980s and early 1990s, the DUF data indicated serious problems with methamphetamine use in western sites. The problem of methamphetamine has shifted over time as evidenced by ADAM data, which showed that the southwestern and midwestern sites were reporting and testing positive for methamphetamine for the first time in the mid- to late 1990s, including areas considered more rural. In areas where urine screens had indicated virtually no use in the mid-1990s, methamphetamine rose dramatically and continued to grow into 2000 and beyond.

From 2000 to 2003, ADAM data showed that the percentages of adult male arrestees testing methamphetamine positive across sites increased and remained relatively high up until the program was decommissioned. Of the adult male arrestees who were tested by urinalysis for the presence of drugs, only 1.6% tested methamphetamine positive in 2000. The proportions increased to 2.6% in 2001 and to 5.3% in 2002, and in 2003, 4.7% tested methamphetamine positive. For the years 2000 through 2003, methamphetamine rates remained higher in western and most southwestern areas than in midwestern and eastern areas.

When asked by ADAM interviewers if they had acquired specific drugs in the past 30 days, large percentages of adult male arrestees in 2000 through 2003 admitted that they had acquired marijuana shortly before being arrested. Although much smaller proportions reported acquiring methamphetamine in the past 30 days, the percentage more than doubled from 2000 to 2002 (from 3.0% to 6.5%). In 2003, 4.9% of the adult male arrestees said they had acquired methamphetamine in the 30 days prior to arrest. In each of the 4 years (2000–2003), there were substantial

increases in the percentages of adult male arrestees in states near the U.S.–Mexico border who reported having acquired methamphetamine in the 30 days prior to arrest. Once again, these differences suggest that appropriate policy responses to the drug problem vary widely from one community to the next and from one cohort to another, illustrating the need to tailor drug prevention, treatment, and enforcement strategies to local environments.

Significance of the Drug Use Forecasting Program and the Arrestee Drug Abuse Monitoring Program

Throughout the evolution from DUF to ADAM, a few characteristics distinguished these programs from other research programs. First, the DUF/ADAM programs focused on arrestees, a group that is more likely than other populations to be drug involved. Consequently, program data presented a different picture of drug use from that of studies that focused on household (National Survey on Drug Use and Health) or other populations (Monitoring the Future) and provided timely information to criminal justice policymakers and practitioners. They also provided a significant opportunity to conduct research on the association of drug use and criminal activity. Second, these programs were the only national research program studying drug use that used interviews and drug testing, providing a way to assess the validity of self-report data. By relying on the combination of self-report data and urinalyses of arrestees at the time of booking, these data were less susceptible to either exaggeration or denial of drug use than many other surveys. Finally, and perhaps most important, the DUF/ADAM programs were the only national drug use research programs built to specifically document and report the drug problem at the local level. Over the years, program data revealed that there was no single national drug problem; instead, there were different local drug problems that varied from city to city. This information was important, because communities often lack tools to monitor problems in a consistent, comprehensive manner and therefore have difficulty formulating appropriate policy responses.

Taken together, DUF/ADAM provided communities struggling with emerging and long-standing substance abuse problems with critical research tools to measure and understand the local drug problem and to evaluate programs and interventions that targeted the criminally active population. In addition, the DUF/ADAM programs provided a network of local drug use data that formed a foundation for understanding drug use across the country.

Conclusion

Attention to national drug use trends data has been important in the United States since the turn of the 20th century. In an age where communities face imminent, substantial budget cuts, understanding the drug problem in one's community

and sharing that information with policymakers and practitioners is essential, especially when an increase in service demand is coupled with a decreasing resource supply. Both the DAWN and DUF/ADAM programs have significantly contributed to the nation's ability to document such information for over 20 years.

The history of the DAWN and DUF/ADAM programs underscores the difficulties in trying to measure drug use and its consequences across the United States. In particular, both programs received criticisms over their limitations and underwent significant revision in an effort to make the data they collect more reliable and valid. The data from these programs, in turn, improved in quality and usefulness to federal, state, and local policymakers and governments. As a result, the DAWN and DUF/ADAM data have been used in a variety of capacities to influence policymaking, program implementation, resource allocation, and an overall understanding of drug use and its consequences. The future of DAWN is promising, with substantial hope and resources devoted to the continued development of a strong national indicator of drug-related morbidity and mortality. The future of DUF/ADAM, on the other hand, is less certain. Without ADAM or something similar, national indicators of drug use will remain silent on the trends and patterns of drug use among criminal offenders.

CRIME CLASSIFICATION SYSTEMS

NCVS, NIBRS, and UCR

LYNN PAZZANI AND GEORGE TITA

University of California, Irvine

When asked about their top concerns for their country, Americans have consistently rated crime as a significant concern. Anyone who has been a victim of even a minor crime can attest to the impact it has on his or her life, both emotionally and in terms of time and inconvenience dealing with the aftermath. To reduce crime and the impact it has on individuals and society, criminologists must be able to measure and understand it. Without an organized means of recording information about crimes that have occurred, law enforcement agencies would not have the benefit of social science research in determining who is likely to be victimized so they can provide protection, who is likely to become an offender so they can provide alternatives, and where crime is most likely to occur so they can increase patrol.

In the United States, there are three main systems in place to measure and track crime. The Uniform Crime Reports and the National Incident-Based Reporting System use police report data to determine the scope of crime within particular areas and to provide detail about individual criminal incidents. The National Crime Victimization Survey measures crime on the basis of interviews in which people are asked about their experiences with crime. Each of these systems has been carefully constructed and modified over time to increase detection and improve the amount and depth of information that is collected.

This chapter describes each of these three crime databases. It provides information about how data are collected

and discusses what types of crimes might be missed, as well as any issues with the quality or use of the data. It also compares the three systems in terms of their ability to detect crime and in the types of uses to which they may be best suited.

Uniform Crime Reports

In the 1920s, the crime problem in the United States, especially the fear of organized crime being perpetrated by infamous criminals, such as Al Capone and the various New York Mafia families, was seen by officials in government and the U.S. Department of Justice to be a pressing social issue. As a result, in 1929 the Department of Justice implemented a system whereby it could “measure” crime in the United States. This device, the Uniform Crime Reports (UCR), was designed to assess the type and magnitude of crime in U.S. communities. Data from the UCR are used to produce several yearly publications, such as *Crime in the United States*, *Hate Crime Statistics*, and *Law Enforcement Officers Killed and Assaulted*.

Uniform Crime Reports Data Collection

Data for the UCR are based on crimes reported to the police. Each month, every law enforcement agency is asked to submit data about certain crimes to the Federal

Bureau of Investigation (FBI). These data are released yearly and allow for the calculation of rates of crime by place and type of crime. The UCR originally asked law enforcement agencies for the number of seven serious offenses that were committed in their district during the month. These crimes, known as *Part I* or *index crimes*, include murder, rape, robbery, aggravated assault, burglary, larceny–theft, and the theft of an auto vehicle. An eighth index crime, arson, was added under congressional directive in 1978. The UCR also records the number of 21 less serious crimes, known as *Part II crimes*: simple assault, curfew offenses and loitering, embezzlement, forgery and counterfeiting, disorderly conduct, driving under the influence, drug offenses, fraud, gambling, liquor offenses, offenses against the family, prostitution, public drunkenness, runaways, sex offenses, stolen property, vandalism, vagrancy, and weapons offenses.

Reporting crime data to the FBI is not mandatory. During the first years of the data collection, 43 states participated, although that does not mean that every police department within that state reported data. More recently, participation has been very high, with police departments accounting for about 93% of the population and 47 states reporting. Statistical techniques allow criminologists to estimate the number of crimes committed in nonreporting districts on the basis of the numbers reported in areas with similar population characteristics. These estimates are part of the calculation of crime rates for the United States as a whole, but nonreporting districts are not listed in more detailed reports.

One particularly useful aspect of the UCR is that because the definitions of particular crimes are uniform across police departments, accurate comparisons of rates of these crimes can be made across different counties and states. The laws determining how to classify a criminal action may not necessarily be the same in every state, so if it were left to individual law enforcement agencies to classify crimes it, might be more difficult to make comparisons across agencies. For example, in some states, rape would be defined only as sexual intercourse against a woman's will, whereas others might have broader definitions, including other sexual acts or offenses against men. If the rape rates from two states were compared, a state with a very narrow definition of rape would have a much lower rate than a state with a broad definition, even if the actual rates of particular actions were about the same. To prevent this from happening, the UCR produces a handbook with very detailed instructions about how to classify a crime. Even if one law enforcement agency considers an act a rape, if it does not meet the UCR definition—carnal knowledge of a female forcibly and against her will—it would be recorded as the Part II crime of sexual assault. Each criminal incident is only reported in the UCR once, so even if there were several crimes committed by the same person at once only the most serious of those crimes would be listed in the UCR data.

In recent years the government has developed an interest in hate crimes. In addition to reporting crimes to the

FBI in the usual manner, law enforcement agencies are asked to provide detailed information about any crimes that might be related to prejudice against the victim based on race, religion, sexual orientation, disability status, ethnicity, or national origin. In cases when a bias crime has been committed, the hierarchy rule does not apply, so all crimes that occurred during the incident will be reported. Crimes against persons and against property can be considered hate crimes. This separate report about hate crimes is used to produce the yearly publication *Hate Crimes*, which lists the crimes and circumstances surrounding hate crimes in all reporting cities.

In addition to the counts of crime, the UCR also records arrests. Crimes can be reported to the UCR regardless of arrest or prosecuting decisions, but crimes that have associated arrests are also tabulated to create what is called a *clearance rate*. A crime is considered cleared if there is an arrest, but not necessarily a criminal charge or conviction, associated with the crime. Of course, it is possible for the police to make an arrest when they have not accurately identified the offender, which would mean that crime is not solved, but it would be recorded as cleared. The UCR also records when a crime has been cleared by the arrest of only offenders under the age of 18. Another way that the UCR categorizes crimes that have been reported to the police is on the basis of whether the police determine that a crime has truly occurred. People can report a crime to the police that they have made up or about which they were mistaken, and those reports of crime should not really be counted toward the crime rate. If the police determine that a crime did not really occur, the report is considered *unfounded*. On the basis of all the ways to classify the crimes that were reported, the UCR reports numbers of crimes in several columns: crimes reported, crimes unfounded, actual offenses, offenses cleared, and clearances involving only juveniles. Clearance rates can vary greatly by state and county, which makes collecting this information very interesting.

The UCR also pays special attention to crimes committed against law enforcement officers and injuries sustained by law enforcement officers. Although a crime committed against a law enforcement officer could be recorded as a crime just like any other, police departments are asked to provide the number of crimes in which officers were victimized while on duty or as a result of their job. A police officer's house being burglarized would not be recorded in this manner; however, an assault on an officer that occurred during a traffic stop would be recorded in this separate listing. Deaths and injuries that are not a result of a crime are also reported. If a firearm were accidentally discharged, either by the officer or another officer or person, and an injury or death resulted, this would be included in the report to the FBI. On the basis of these reports, the FBI publishes an annual report called *Law Enforcement Officers Killed and Assaulted*. This publication not only lists the number of these assaults or injuries but also describes weapons used during the incident; the

type of injury; whether body armor was used by the officer; and other circumstances surrounding the assault, injury, or murder of law enforcement officers.

Crimes Excluded by the UCR

All crimes that are reported to the police that include an offense that meets the definition of a Part I or Part II crime should be reported to the FBI for inclusion in the UCR. This leads to the obvious exclusion of crimes that are not reported to the police. Although it may seem surprising that a crime victim would not report a crime to the police, there are certain situations in which this decision is quite common. For instance, many physical assaults are not reported, especially when both parties may be acting criminally or when the parties know each other. Burglaries in which items of little value are stolen may not be reported because the victim may not believe it is worth the time and trouble. Rape also has a particularly low reporting rate (estimates range between about 10% and 40%) because the victim may be embarrassed, fear that the police will not take her seriously, does not want to get the offender in trouble with the law, or does not identify the incident as a crime herself. It is possible that the proportion of crimes that are not reported to the police might be different depending on the location, which could make comparisons of crime rates between locations slightly inaccurate.

Crimes that are not reported to the police clearly will not end up being counted in the UCR; however, there are several ways that a crime that is reported may also not be included. First, the UCR does not collect data for all types of crimes. Kidnapping, for instance, occurs very infrequently, so it is not as useful to put resources into detailed tracking of kidnapping rates as it would be for a more commonly occurring crime. The same would apply for the crime of treason. There are also numerous other types of crimes that are so minor or frequently occurring—violating a dog leash law or exceeding the speed limit, for example—that detailed tracking would be a misuse of resources.

When two or more crimes are committed during the same criminal incident, the UCR records only the most serious crime. A rape–homicide would be recorded only as a homicide, and an assault that also resulted in an auto theft would be recorded only as an assault. For the purposes of recording and prosecuting crime within a particular district, all of the crimes that occurred during a single incident would be used.

In addition to just not counting certain crimes, the way some crimes are classified in the UCR compared with most legal systems is similar to excluding some crimes from the report. As discussed earlier, the UCR defines rape as the carnal knowledge of a female by force and against her will. Most states have now defined rape such that sexual attacks against males also are included. In this case, it is not that the UCR does not include a criminal incident as a crime at all, but it would label sexual attacks with male victims as assaults, or possibly even simple assaults, depending on the

circumstances of the crime. The UCR considers rape and assault Part I crimes, meaning they are more severe than other types of crimes. A sexual attack against a male that could be legally considered a rape in the district where it occurred could be listed as a simple assault, which is a Part II (i.e., less serious) crime. When computing the rate of serious crime, the exclusion of some sexual attacks against males would lead to lower rates of crime that would be reported if such attacks were considered rapes or assaults as opposed to the less serious crime of simple assault.

National Incident-Based Reporting System

In the late 1970s, many law enforcement agencies felt there was a need for an examination of the UCR system in order to meet the challenges of a changing world and criminal justice system. The data collected, they felt, needed to be enhanced and expanded so it would be more useful in the areas of crime prevention and the study of crime. In March 1988, after much deliberation, the National Incident-Based Reporting System (NIBRS) was created. The NIBRS is an improvement over the original UCR data collection format both in the detail of information about each criminal incident and in that it increased the number of crimes on which information was gathered.

NIBRS Data Collection

NIBRS data are collected on the basis of reports to the police, just as UCR data are collected. For this data set, police are asked to record not only a count of crimes and some basic information but also detailed information about each criminal incident. For the NIBRS, the hierarchy rule that was discussed earlier does not apply. Whereas for the UCR only the most serious crime is recorded, the NIBRS allows for recording up to 10 different crimes per criminal incident. It also allows for information on up to 999 victims, 99 offenders, and 99 arrestees to be collected and associated with a particular criminal incident. Nearly all criminal incidents recorded in NIBRS have 3 or fewer offenses, victims, offenders, or arrestees, which means that sorting through the data for a particular incident is not hugely complicated. In cases where there are many offenses, victims, or offenders, only the first three records are made available for later data analysis. In this case, a hierarchy rule does apply, so that the three most serious criminal offenses are recorded and lesser offenses are excluded.

The NIBRS collects numerous details about each crime, victim, and offender, which, in addition to listing all the crimes and people involved in an incident, increases the depth of information that is available. For each offense, data are collected regarding whether the offense was completed or just attempted, the type of location involved, the time of day when the incident occurred, if force or weapons were used, if the crime may have been motivated by bias, the value of

property stolen or destroyed and if property was recovered (if applicable), and whether the incident was cleared by an arrest. For each offender, the age, sex, race/ethnicity, relationship to the victim, and whether the offender was suspected of using drugs or alcohol during or shortly before the incident are recorded. Very similar data are recorded for any arrestees involved in the incident. If a victim is identified in a particular incident, the type of victim is recorded. For NIBRS data collection, a victim can be an individual, business, financial institution, government, law enforcement officer, religious organization, or society in general. If the victim is an individual or law enforcement officer, that person's age, race/ethnicity, residency status, and any injury sustained as a result of the incident are recorded.

In addition to greater detail about each incident, the NIBRS adds several more crimes to the record database. These crimes are divided into Group A and Group B crimes, similar to how the UCR classifies incidents as Part I or Part II crimes. Group A includes all of the UCR's Part I crimes as well as most of the Part II crimes, although in many cases, there are slightly different definitions. Group A crimes include arson, assault (aggravated, simple, and intimidation), bribery, burglary and breaking and entering, counterfeiting and forgery, property crimes (destruction, damage, and vandalism), drug offenses, embezzlement, extortion and blackmail, fraud (false pretenses, swindle, confidence game, credit card or ATM fraud, impersonation, welfare fraud, and wire fraud), gambling, homicide (murder, negligent and nonnegligent manslaughter, and justifiable homicide), kidnapping and abduction, larceny and theft, motor vehicle theft, pornography and obscene material offenses, prostitution (including assisting and promoting prostitution), robbery, forcible sex offenses (forcible rape and sodomy, sexual assault with an object, and forcible fondling), nonforcible sex offenses (incest and statutory rape), stolen property, and weapons laws violations. Group B offenses, which are considered less serious and more common, include writing bad checks; curfew, loitering, and vagrancy violations; disorderly conduct; driving under the influence; drunkenness; nonviolent family offenses; liquor law violations; peeping tom; runaway (not a criminal offense but still a police matter); trespassing; and all other offenses. For Group B offenses, only arrest data, not reports, are recorded. For each crime, the NIBRS identifies whether it is an offense against persons, property, or society.

Crimes Excluded by the NIBRS

The NIBRS is an improvement over the UCR because it includes nearly all known offenses. It has the same limitation as the UCR in that crimes that are not reported to the police cannot be recorded. Just like the UCR, some types of crimes are less likely to be reported to the police, so whereas all homicides, for example, will likely be recorded, only a small percentage of rapes will be. The NIBRS also

includes many more crimes than the UCR, even within a particular category. The UCR includes forcible rape against a female only in the Part I sex offense category of "rape," whereas the NIBRS includes rape and sodomy, as well as sexual assault with a foreign object and forced fondling in the Group A sex offense category "forcible sex offenses."

The Group B category, all other offenses, may make it seem that every crime would be included in the NIBRS. It is important to remember that Group B offenses are recorded only if there is an arrest related to the incident. Thus, an individual could call the police to report a trespasser or a peeping tom, but the incident will be included in the NIBRS only if there is an arrest. A crime may have truly occurred, but without an associated arrest there will be no record of that crime in the NIBRS. Many minor crimes such as these occur frequently, and detection and arrest rates are fairly low, so the majority of these offenses probably would not be recorded. Some minor crimes may also be left out of the database in the few cases where more than three crimes were committed in one incident. Because the hierarchy rule applies, if a criminal incident included murder, rape, robbery, trespassing, and credit card fraud, the trespassing and fraud incidents would be excluded from the data made available for analysis.

Methodological Issues

Collecting data for the NIBRS is a very expensive and resource-intensive process. Because of the resources needed to collect the data, individual cities or law enforcement agencies tend not to be able to send their data to the FBI. Instead, data are processed through each state, which then submits the data to the FBI. Participation in the NIBRS is voluntary and is therefore still relatively low. Whereas agencies reporting to the UCR cover about 95% of the population, agencies reporting to the NIBRS cover only about 20% of the population. Despite the low degree of participation, rates of crime calculated by the UCR and by the NIBRS tend to be very similar. If only agencies with low crime rates had the time and resources to submit data to the NIBRS and high-crime agencies put their resources toward something else, the rates calculated by the NIBRS would be much lower than those calculated by the UCR. This indicates that although there is a low participation rate, the agencies that do participate are fairly good approximation of agencies throughout the United States. Although the rates are similar, the UCR tends to be used when calculating rates of crime rather than NIBRS, because of the greater participation and coverage. The use of a small sample of the population to represent the whole is discussed in greater detail in the "National Crime Victimization Survey" section.

Although the percentage of law enforcement agencies that report to the NIBRS is very low, there is still a lot that can be learned about crime using this system. The depth of the information allows social scientists to learn when and

where crime is most likely to occur, who is most likely to be victimized, under what circumstances this victimization occurs, and how likely intoxicating substances are to be involved. It also allows for an examination of some of the outcomes of crime. We are able to determine the circumstances under which a victim is most likely to become injured; what types of crimes, victims, and offenders are more likely to lead to an arrest; and when property is more likely to be recovered. Because so many different types of information are collected, social scientists can do more than just count crimes; they can make predictions about them based on social information. Although a particular state or city may not have reported data to the NIBRS, social scientists can still use the information about crime produced by the NIBRS to help reduce crime in their own jurisdiction. Especially because the crime rates produced by the UCR and the NIBRS are so similar, there is no reason to think that in one state certain types of people are more likely to be victimized whereas in another state there is a completely different type of victim. That information alone can be very useful to law enforcement agencies.

National Crime Victimization Survey

In 1973, another system to attempt to measure crime was put into place by the Department of Justice; this was dubbed the National Crime Survey (NCS). The main difference between the UCR and the NCS was that the UCR measured crime using police report data, whereas the NCS measured crime by surveying households about victimization regardless of whether it had been reported to the police. Although the NCS was a great step toward measuring unreported crime, it underwent some significant revision to increase disclosure of previously undetected crime. Some changes to the survey were introduced in 1986, but the bulk of the changes were completed in the 1992–1994 release of the data. At that time, the survey was renamed the National Crime Victimization Survey (NCVS) to reflect the intended purpose of the survey and to signify the important differences between the old and new versions. The wording of questions was changed to increase reporting of crimes such as simple assault and rape or sexual assault. The rates of those crimes calculated from this new survey are higher than the previous year's NCS rates, but that is an artifact of increased disclosure of crime rather than an actual increase in victimization.

NCVS Data Collection

Data for the NCVS are collected twice yearly by census officers who visit a small group of U.S. households. During these visits, the census officers interview one or more adults in the household and ask about crimes that have been committed against any member of the household over the

age of 12 during the past 6 months. Respondents are asked about rape and sexual attack, robbery, aggravated and simple assaults, and purse-snatching and pocket-picking. This survey also covers property crimes, including burglary, theft, motor vehicle theft, and vandalism. The data gathered from the sample are used to estimate rates of crime overall and in specific states, cities, and types of neighborhoods. These estimates can also be made for each type of crime.

The NCVS collects information about crimes of which household members have been victims, regardless of whether they were reported to the police. When respondents indicate that someone in the household has been the victim of a particular crime, they are asked if the crime was reported to the police. They are also asked for details about the crime, such as whether the victim did anything to protect himself or herself or resist; if he or she was injured and, if so, how severely; what time of day the crime occurred; the type of location (home, outside, etc.) where the crime occurred; and how many people were involved. Details about the offender are also collected if the victim had enough interaction with the perpetrator to answer such questions. In many property crimes, such as vandalism, this would not be possible, because it is unlikely the victim would have seen the crime occur and may not know who is responsible. Details about the offender include race/ethnicity, approximate age, whether the offender may have been intoxicated, and possible motives for committing the crime. All of this information allows social scientists to determine the types of circumstances under which crimes are most likely to occur and aids in the development of effective prevention strategies.

This NCVS also collects other information about the household and the crime that may be useful to social scientists. Respondents are asked to provide information about household income, race/ethnicity and age of household members, level of education, type of household (apartment, house, etc.), household composition, and vehicle ownership. This type of information is known as *demographic information*. These data allow social scientists to determine what types of people and households might be particularly vulnerable to victimization.

The use of a crime survey that does not rely on police reports is very informative, because not all crimes are reported. Victims' decisions to report a crime to the police may depend on many factors, such as whether they were doing something illegal themselves or whether the perpetrator was someone they knew and whom they may not want to report to the police. Teenagers in particular may not want to report crimes committed against them for fear of their parents becoming upset. Some types of crimes are also less likely to be reported to the police, such as rape and sexual assault and domestic violence, but these crimes may still be disclosed during administration of the NCVS. Although a victim may not seek out the police to report a crime, if someone comes to him or her and asks about victimization, promising to keep any disclosure confidential

and stating that no legal action will be taken as a result of the disclosure, it may not seem as difficult or upsetting to discuss the victimization. Over time, as more has been learned about crime, the NCVS has been redesigned in an attempt to increase the disclosure of crimes that are particularly unlikely to be reported to the police. Specific questions have been added to find out whether the respondent has been victimized by someone he or she knows and to find out if it is possible that certain crimes were motivated by prejudice of some kind (i.e., hate crimes).

Crimes Excluded From the NCVS

Despite constant efforts to improve the survey and increase the disclosure of crime, there are some types of crimes that the NCVS either cannot collect information about or that have a lower chance of being disclosed during the survey. The NCVS is unable to collect data about homicide, for example, because the survey is designed to ask individuals about crime they have experienced themselves. Obviously, a homicide victim would not be able to disclose the crime to the census officers conducting the survey. Respondents would be able to tell the census officers if anyone in their household had been the victim of homicide, but it is important to remember that not everyone has other members of his or her household. All homicides committed against people living alone, or in which all household members were victims, would go undisclosed, while homicides against people with remaining household members would be disclosed. This would lead to a very inaccurate count of homicides. Although NCVS homicide data would be very inaccurate, homicide is one crime for which UCR data can be considered very accurate, so it is not a great loss that it is excluded from the NCVS.

The NCVS also does not ask about crimes committed against children under age 12. The census officers conducting the survey are able to interview children as young as 12 with the permission of a parent or guardian, but children younger than that would probably not be able to provide accurate information about victimization, both because they may not understand it and because they would have a more difficult time disclosing crimes within the 6-month time period being discussed. They might report serious crimes that happened some time ago if the event was very traumatic to them, or they may forget crimes that occurred toward the beginning of the 6-month window if the crimes were not very noteworthy. It would be possible for parents to answer questions about the victimization of their children; however, assaults against children often are committed by parents. It is very unlikely that a parent would disclose this information to a census officer, both out of embarrassment and fear of prosecution. Just as with homicide, data about crimes committed against children would end up being inaccurate and not very useful to social scientists.

Although homicide and crimes against children are intentionally excluded from the NCVS, other crimes are

undisclosed for a variety of reasons. Just as not every crime is reported to the police, some people may simply not feel like disclosing their victimization to the census officers conducting the NCVS. They may believe that their victimization was minor and therefore not worth disclosing or that it is embarrassing and therefore difficult to disclose. In addition, respondents can disclose only crimes of which they are aware. For instance, they may have been the victim of a burglary that did not disturb enough of their property for them to notice. Also, when asked about whether other members of the household had been victimized, they are able to disclose only what each household member had told them about. Teenagers especially may not tell their parents about any crimes of which they have been a victim that might indicate they were drinking, out past curfew, or engaging in sexual activity. In cases where household members are not family members and may not be very close with one another, minor or embarrassing victimization may not be discussed. This can cause a respondent to believe that he or she is truthfully reporting that a household member has not been victimized when in fact crimes have occurred about which the respondent simply does not know.

The NCVS asks respondents to report about crimes in which a member of their household was victimized. Of course, crimes can occur in which no individual is victimized. Burglaries of businesses, for example, would not have an individual victim and thus would not be reported in the NCVS. If, in the previous example, there were an employee present who was assaulted during the burglary, that employee would report that he or she was the victim of a crime, but only the assault and not the burglary would be recorded for the purposes of crime reported by the NCVS. Crimes against businesses with no individual victim may be reported to the police, but they would not end up in the crime rate calculated by the NCVS.

Methodological Issues

Rates of crime are generally reported as the number of crimes per 100,000 people over the course of 1 year. To create this rate accurately, the respondents must be able to correctly recall how long ago their victimization occurred and must be able to remember all victimization that occurred within the specified time period. To collect accurate information about the types of crimes that occur, the respondent must also be able to remember details such as the time of day, the number of offenders involved, any injury, and other specific information covered in the NCVS questionnaire. The NCVS asks about crimes that occurred over the last 6 months. This time period was chosen as one that would be short enough to facilitate accurate recall of the number of crimes that occurred and specific details about each but also long enough that resources for data collection would not be wasted. Data collection that occurs in person requires an enormous amount of resources. Census officers need to be paid; travel is expensive; data collection materials are used;

and data must be entered, which requires computers and people to perform the data entry. Collecting data twice a year as opposed to three or four times a year saves money without, ideally, sacrificing the quality of the data.

The NCVS is used, among other reasons, to discern rates of crime in specific locations. Of course, not every household in the United States is surveyed. Instead, a smaller sample of households is used to represent the whole country. The technique of sampling to make estimates or predictions about larger groups can be used with great accuracy and is employed in many types of research. For example, predicting election results is done with a sample of voters, not all of the voters. Election polling, when done well, tends to very accurately predict the results of elections. This is a particularly good example because in the case of elections, one can see both the prediction and, shortly afterward, the actual result. If these are very close, as they generally are, we know that social scientists and statisticians are able to use a small sample to fairly accurately represent the views of the whole population.

Sampling leads to accurate results when one has what is called a *representative sample*. That means that a researcher has in his or her sample approximately the same proportion of people or households that fall into various categories as exists in the larger population. For instance, one might consider factors such as income, education level, number of people in the household, and type of dwelling. If the households in the NCVS sample look very similar to the population on those characteristics, then it is likely that the sample will lead to a good estimate of the true crime rates in the population. In general, the NCVS is carried out in about 50,000 households that would hold approximately 80,000 people. The method is a *rolling* one, in which the households are kept in the study for 3 years. During any given year, approximately 160,000 individuals over age 12 are surveyed. The NCVS's use of a nationally representative sample means that rates of crime for certain types of people can be discerned. For instance, rates of crime can be computed for certain age groups or for a particular racial or ethnic group.

Although sampling is done very carefully, there are still a few situations that can lead to slight inaccuracies in the measurement of crime. For instance, if a surveyed individual is a victim of a crime while he or she is far away from home, the victimization will be recorded as though it had occurred in the same area as the respondent's home. Although the survey does ask about the type of location where the crime occurred—for instance, a park—it does not ask whether it occurred in a park near home or a park in a different state. This would not lead to inaccuracies in the rate of crime for the entire United States, but it can slightly alter the rates for specific places. If this same situation were to occur and be recorded in the UCR, the police department where the crime occurred would be the one reporting the incident, not the department near the victim's home. Another way the estimates of the crime rate can be slightly inaccurate is if two (or more) people who do not

live together are victims of the same crime. If two people walking together are mugged, the police would record this as only one criminal incident. However, because there are now two households that could disclose this victimization in the NCVS, that crime is twice as likely to be included as a crime committed against two people who did live together, or against only one person. These types of situations are not the norm, but it is important to understand that no estimate of criminal victimization is going to be perfect. Slight inaccuracies tend not to make a large difference when data are used for large scale analyses.

Comparison of the UCR, the NIBRS, and the NCVS

The main difference between the UCR and NIBRS compared with the NCVS is the use of police data versus victim self-reports. The UCR and NCVS were designed to complement each other in this way, and the NIBRS was added to give a greater degree of detail to the UCR, similar to the type of detail the NCVS collects. It would be impossible to determine which data source is the best, simply because there are so many different uses for crime data. Depending on the purpose of the request for information, whether it is academic research, or news reporting, or something else, the data set that would be most ideal may differ. News reporting agencies with interest in crimes reported to the police on local level may be best off using the UCR because of the NIBRS's lower participation rate. Individuals with an interest in specific detail about crime on a national level may be best served by the NIBRS because of the amount of information collected and not having a need to get this detail about a very specific location. Academics who study underreported crimes, such as rape or domestic violence, tend to use the NCVS because of the much higher disclosure of these crimes there as compared with police reports.

Perhaps one of the easiest ways to compare the three data sources is to walk through a few hypothetical examples of crimes committed and how they would be recorded in each of the data sources. For an easy example, assume that a woman who lives alone is robbed at gunpoint and reports this incident to the police. The UCR would report a robbery. If there was an arrest, it would report that the incident had been cleared. The NIBRS would also report the robbery but may also include other offenses, such as a weapons violation. The NIBRS would also collect detailed information about the crime, victim, offender, and whether an arrest was made. The NCVS would report information that is very similar to what is reported in NIBRS, although it would also ask the victim about whether the crime was reported to the police, because the NCVS does not require an incident be reported to the police in order for it to be counted as a crime.

A very simple modification of this scenario shows how easily reporting to the various data sources can change. Now assume this same woman is the victim of the same crimes as just described, but now she is living with her

elderly mother instead of living alone. She did not want to worry her mother, so she did not tell her about the crime, although she did report it to the police. Both the UCR and NIBRS would have the crime recorded in exactly the same way as described earlier. The NCVS may actually not report the crime at all. Assume that the robbery victim is not home when the census officers come to administer the NCVS questionnaire, so they interview the mother instead. The victim's mother is unaware of the incident and, although she intends to be truthful with the census officer, she is unable to report an incident she did not know occurred. Thus, the survey that is often thought to be better at detecting crime because it does not rely on police reports actually misses a crime that was reported to the police.

Another slight modification to the original story can also change which data sources end up recording the crime. This time, the woman recognizes the boy who robbed her from the neighborhood. She knows he is having a hard time right now, and she did not lose anything valuable during the robbery. Therefore, she decides not to report the incident to the police. Under these circumstances, neither the UCR nor the NIBRS would have a record of the crime at all. When the census officer administering the NCVS comes to ask about victimization, the woman is assured that no legal action will be taken as a result of her participation, so she discloses the robbery, and it is recorded in the NCVS.

Each of these three examples is fairly straightforward. If one adds additional offenders or victims, the differences between what is reported in the UCR and in the NIBRS increase. If one changes the crime to one that is more difficult to define, such as a sexual assault of some kind, it is less clear how the incident would be reported in each of the three data sources. An incident of sodomy against a male, for instance, would be recorded as an assault, or perhaps even a simple assault, in the UCR; it would be recorded as a forcible sex offense in the NIBRS; and it would be counted as a rape in the NCVS. Males are even less likely to report sexual assaults than females, and they tend to have even more stigma associated with the event. Even if the victim did report the incident to the police, allowing it to be recorded in some fashion in the UCR and NIBRS, the victim may not want to talk about the incident again and may not disclose it to someone administering the NCVS, or he or she may not have disclosed the assault to household members who may be interviewed in his or her stead.

No data source recording crime is going to capture all the details about every crime that occurs. As participation in the NIBRS increases, efforts to increase the reporting of

crimes to police may be the most helpful in increasing knowledge about crime. The redefinition of certain crimes in the UCR may also lead to the capture of more detail using a data source that already has a very high participation rate. The NCVS tends to show higher rates of crime than the other two sources, so we assume it yields more complete disclosure of crimes; however, as shown earlier, it is possible for even crimes that were reported to the police to be excluded from the NCVS. Improvements have been made to both the UCR and NCVS over the last 40 years, and the addition of the NIBRS also serves to increase social scientists' understanding of crime. As time goes on, each of these data sources will continue to be improved, but there will never be a way to perfectly measure and describe crime.

CRIME REPORTS AND STATISTICS

CALLIE MARIE RENNISON

University of Missouri–St. Louis

The purpose of this chapter is to provide an overview of crime reports and statistics. Crime reports and statistics convey an extensive assortment of information about crime to the reader and include topics such as the extent of crime and the nature or characteristics of criminal offenses, as well as how the nature and characteristics of crime change over time. Aside from these big-picture topics related to crime, crime reports and statistics communicate specific information on the characteristics of the criminal incident, the perpetrator(s), and the victim(s). For example, crime reports and statistics present information on the incident, such as weapon presence, police involvement, victim injury, and location of the crime. Details such as the age, race, gender, and gang membership of the offender are also available in many of these reports. Also, details gleaned from statistics regarding the victim, such as, but not limited to, income, race, age, relationship with the offender, education, and working status, are made available. Crime reports can convey information that affects the complete population of individuals and/or businesses, or they can convey crime-related information on a subset of victims, such as males, the elderly, businesses, or the poor. Crime reports and statistics can focus on a short period of time, such as a month, or they can cover longer periods, such as 1 year or many years. In addition, these reports can offer change in crime and its elements over time. Statistics offered in crime reports may describe crime as it pertains to a small geographical region, such one city; one region, such as the West or the Northeast; or the entire nation. Finally, on the basis of statistics, these

reports can describe crime in a static, point-in-time way, and they can provide a dynamic perspective describing how crime, its characteristics, or risk change over time.

Topics covered in this chapter include a discussion on what crime reports and statistics are as well as why they are important. Information presented includes what agencies publish crime reports and statistics as well as a brief history of these bureaus. Because crime reports and statistics are social products, it is imperative to present information on the data used to generate them. Two major data sources are used to generate crime reports and statistics: (1) the Uniform Crime Reports (UCR) and (2) the National Crime Victimization Survey (NCVS). The data these reports yield, as well as the methodology and measurement they use, are described. Because no data are perfect, a description of their advantages and disadvantages are presented. Because these data are the two primary sources of crime information in the United States, the chapter explores a comparison of these data. Given that entire textbooks can be devoted to the topic of crime reports and statistics, this chapter provides readers with a relatively short overview of the major topics related to these important items. For readers who wish to delve into the topic in greater detail, a list of recommended readings is provided at the close of the chapter.

To fully appreciate the information found in crime reports and the statistics used to summarize them, one must be aware of what is meant by *crime reports* and *statistics*, why this topic is important, who is responsible for the creation of reports and statistics, and how the reports

and statistics are created. To address these important issues, the chapter is structured around these significant questions. It first addresses the question “What are crime reports and statistics, and why are they important?” Next, it asks, “What agency is responsible for crime reports and statistics?” In answering this question, the chapter presents past and current information about the Federal Bureau of Investigation (FBI) and the Bureau of Justice Statistics (BJS). Next, the chapter moves to addressing the closely related question “How are crime reports and statistics generated?” This portion of the chapter is the lengthiest, because it offers information on the nuts and bolts of the UCR and the NCVS, including a look at the history of the programs as well as future directions. Included also is a discussion of the methodology, advantages, and disadvantages of each program.

What Are Crime Reports and Statistics, and Why Are They Important?

Crime reports describe information about crime and cover an almost endless array of crime topics. They can focus on specific crimes, types of victims, types of offenders, and/or characteristics of the offenses. A useful tool in conveying information about crime in crime reports is by using statistics. *Statistics* are merely numerical measures used to summarize a large amount of information—in this case, information on crime. For example, if one noted that on average in a particular year that 50% of violent crime was reported to the police, that person has simply summarized crime data and presented a simple meaningful number (50%) about that particular phenomenon (crime reporting).

Crime reports and statistics are vital to the study of criminology. Without these tools, our understanding about what kind of crime is occurring, how often crime is being committed, who is committing crime, who is being victimized, and the characteristics of offenses would be little more than guesses. Aside from a pure information utility, crime reports and accompanying statistics serve as an important indicator of the “health” of society. A rising crime rate suggests that society is ailing. Unequal victimization risk among groups of individuals suggests a societal ill in need of attention. Conversely, a reduction in crime conveyed by these reports and statistics is one indicator of an improved quality of life. An equally important function served by crime reports and statistics is to assist researchers in the development of and testing of crime and victimization theories. Another important function of crime reports is providing policymakers valuable, empirically based information so they can design policies to further reduce crime, better assist crime victims, and effectively deal with offenders. Without reliable information on crime, policies designed to reduce all crime and victimization would not only be ineffective but would also represent misappropriated or wasted valuable resources.

Who Publishes Crime Reports and Statistics, and How Do They Do It?

In general, the federal government publishes crime reports and statistics. The department within the federal government responsible for these publications is the U.S. Department of Justice. And within the Department of Justice, publications are generated by two bureaus: (1) the FBI and (2) the BJS. Because these documents are generated using taxpayer dollars, more recent crime reports (i.e., since about 1995) are available free to the public online at the respective bureaus (<http://www.foi.gov> and <http://www.ojp.usdoj.gov/bjs>).

The Federal Bureau of Investigation and the UCR Program

Most individuals are aware of the crime-fighting responsibilities of the FBI. Fewer know that the responsibilities of the FBI include those of crime data compiler, crime data analysis, and publisher of crime reports for the United States. These responsibilities are accomplished through the UCR program, which compiles crime reports submitted voluntarily either directly by local, state, federal, or tribal law enforcement agencies or through centralized state agencies across the country. Although there are some exceptions, in general, UCR data are submitted to the FBI on a monthly basis. The crime information gathered via the UCR program comprises the nation’s oldest unified national crime data. Although the crime data may be the nation’s oldest, it took approximately 50 years of calls for such data before the UCR program started collecting crime data in 1930, and even then the crime report collection did not occur in the Bureau of Investigation (the precursor to the FBI); instead, a collective of police chiefs are responsible for the commencement of one of the nation’s two major crime information sources.

Calls for unified national statistics on crime were first made first in the 19th century. Although crime data had been collected for a long time, this collection was conducted at the state and local levels by some jurisdictions only. This was problematic, because no two states defined crimes in the same way. Neither did each jurisdiction necessarily collect information on the same crimes. Because of this, there was no way to aggregate this information in any meaningful way to get a unified picture of the national crime situation, and without standard offenses, officials could not make comparisons across jurisdictions. In 1870, the Department of Justice was established. At this time, Congress mandated the reporting of annual crime statistics. A short time later, in 1871, an appeal for unified national crime information was made at the convention of the National Police Association, an organization that later became known as the International Association of Chiefs of Police (IACP). Unfortunately, neither the establishment of the Department of Justice nor the call of police chiefs resulted in the collection of national crime information.

About 50 years later, in the late 1920s, the IACP established a Committee on the Uniform Crime Records to resolve this gap in crime information. The purpose of the committee was to develop a program as well as procedures for collecting information about the extent of crime in the United States. The product of this work was the UCR. Initiated in 1927, this program was designed to provide unified, reliable, and systematic information on a set of serious crimes reported to law enforcement agencies across the country. Using these data, police chiefs could compare crime across jurisdictions and time. The IACP managed the UCR program for several years, until the responsibility moved to FBI in 1935.

The UCR program initially included crime reports from 400 law enforcement agencies from 43 states, describing crime for approximately 20% of the population. Over time, the program has grown, and it now gathers crime reports from approximately 17,000 law enforcement agencies from all states, the District of Columbia, and some U.S. territories. Furthermore, the UCR program now describes crime as it occurs in almost the entire nation. The purpose of the UCR program started as, and continues to be, serving the needs of law enforcement agencies.

What Crimes Are Measured in the UCR?

The UCR program gathers information on a wide variety of criminal offenses. Since 1985, these crimes have been partitioned into Part I and Part II crimes. *Part I* offenses include eight crimes that are considered to be serious and occur regularly. The frequency of these offenses means that enough information can be gathered to enable comparisons regarding crime across time and across jurisdiction. The eight Part I offenses include the following: (1) murder and nonnegligent manslaughter, (2) forcible rape, (3) robbery, (4) aggravated assault, (5) burglary, (6) larceny–theft, (7) motor vehicle theft, and (8) arson.

Part II crimes are also considered serious offenses; however, they differ from Part I offenses in that they occur relatively less frequently. Because of the infrequent nature of these events, reliable comparisons between jurisdictions or over time for these offenses are not often possible. The following are Part II criminal offenses:

- Other assaults (simple)
- Forgery and counterfeiting
- Corporate fraud
- Embezzlement
- Buying, receiving, and possessing stolen property
- Vandalism
- Possession and carrying of a weapon
- Prostitution and commercialized vice
- Drug abuse violations
- Gambling
- Nonviolent and unlawful offenses against family and children

- Driving under the influence
- Liquor law violations
- Drunkenness
- Disorderly conduct
- Vagrancy
- All other violations of state or local laws not specified (except traffic violations)
- Suspicion, that is, arrested and released without formal charges
- Curfew violations and loitering
- Runaways

The UCR program offers more than simply counts of each crime. Depending on the crime, it also offers details of the criminal incident. The crime for which there is greatest detail in the UCR is murder and nonnegligent manslaughter. Using Supplemental Homicide Reporting forms, the FBI gathers information on the homicide victim's age, sex, and race; the offender's age, race, and sex; weapon type (if any); victim and offender relationship; and the circumstances that led to the homicide. For other crimes, some, but not many, details are available. For instance, one can ascertain whether a rape was completed or attempted, whether a burglary involved forcible entry, the type of motor vehicle stolen, and whether a robbery included a weapon.

The Future of the UCR Program: The National Incident-Based Reporting System

Since the UCR program was launched, little has changed in terms of the data collected. One exception is the addition of arson as a Part I crime. Over time, it became clear that change was needed in the UCR program. For example, the lack of incident-level detail for offense data gathered was viewed as a significant limitation. In fact, most scholars refer to the UCR program as the *UCR summary program*, because it collects only aggregate-level information on the eight Part I index crimes over time. Another problem is that some crime definitions had become dated. In response to these and other concerns, evaluations by the FBI, the Bureau of Justice Statistics, the IACP, and the National Security Agency in the late 1970s and early 1980s concluded that the UCR program was in need of modernization and enhancements to better serve its major constituency: law enforcement. The final report of these evaluations and recommendations are available in *Blueprint for the Future of the Uniform Crime Reporting Program*.

The resulting redesign, introduced in the mid-1980s, is the UCR program's National Incident-Based Reporting System (NIBRS). As the name indicates, data submitted to the FBI include the nature and types of crimes in each incident, victim(s) and offender(s) characteristics, type and value of stolen and recovered property, and characteristics of arrested individuals. In short, the NIBRS offers much more comprehensive and detailed data than the UCR.

The NIBRS, like the traditional UCR summary program, is voluntary, reflects crimes known to the police and gathers data on the same crimes as the summary program. Although the two systems share some characteristics, major differences exist. A significant difference is that the NIBRS has the capacity to collect incident-level details for *all* crimes covered. Another difference in the two programs is that the nomenclature of Part I and Part II offenses was discarded in favor of Group A and Group B classes of offenses in NIBRS. Group A crimes are substantially more inclusive than Part I offenses and consist of 22 crimes covering 46 offenses, some of which are listed here:

- Homicide (murder and nonnegligent manslaughter, negligent manslaughter, justifiable homicide [which is not a crime])
- Sex offenses, forcible (forcible rape, forcible sodomy, sexual assault with an object, forcible fondling)
- Robbery
- Assault (aggravated, simple, intimidation)
- Burglary/breaking and entering
- Larceny–theft
- Motor vehicle theft
- Arson
- Bribery
- Sex offense, nonforcible
- Counterfeiting/forgery
- Destruction/damage/vandalism of property
- Drug/narcotic offenses
- Pornography/obscene material
- Prostitution
- Embezzlement
- Extortion/blackmail
- Fraud
- Gambling offenses
- Kidnapping/abduction
- Stolen property offenses
- Weapon law violations

Group B comprises 11 offenses and covers all crime that does not fall into Group A offenses:

- Bad checks
- Curfew/loitering/vagrancy
- Disorderly conduct
- Driving under the influence
- Drunkenness
- Family offense/nonviolent
- Liquor law violations
- Peeping tom
- Runaway
- Trespass of real property
- All other offenses

In the NIBRS, law enforcement agencies are categorized as *full-participation* agencies or *limited-participation* agencies. Full-participation agencies are those that can submit

data without placing any new burden on the officers preparing the reports and that have sufficient data-processing and other resources to meet FBI reporting requirements. Full-participation agencies submit data on all Group A and B offenses. Limited-participation agencies are unable to meet the offense-reporting requirements of full-participation agencies. These agencies submit detailed incident information only on the eight Part I UCR offenses.

Yet another departure from the traditional UCR summary system is that although the NIBRS collects data on many of the same crimes, it uses some revised and new offense definitions. For example, in the traditional UCR summary program, only a female can be a victim of a forcible rape. The NIBRS redefines forcible rape as “the carnal knowledge of a *person*,” allowing males to be victims of these offenses. A new offense category of crime included in the NIBRS is called *crimes against society*; these include drug/narcotic offenses, pornography/obscene material, prostitution, and gambling offenses. An important difference between the UCR and the NIBRS is that the NIBRS enables one to distinguish between an attempted versus a complete crime. Previously, no distinction was available. A significant improvement of NIBRS data is the ability to link attributes of a crime. For instance, in the traditional system, with the exception of homicide, one could not link offender information, victim information, and incident victim information. With the NIBRS, one can link data on victims to offenders to offenses to arrestees.

In the NIBRS, the hierarchy rule was changed dramatically. In the traditional system, the hierarchy rule prevented one from counting an incident multiple times due to multiple offenses within the same incident. Using the hierarchy rule, law enforcement agencies determined the most serious offense in an incident and reported only that offense to the FBI. With the NIBRS, all offenses in a single incident are recorded and can be analyzed. Some researchers have reported that the hierarchy rule has been completely suspended in the NIBRS, but this is incorrect. Two exceptions to the hierarchy rule remain. First, if a motor vehicle is stolen (motor vehicle theft), and there were items in the car (property theft), only the motor vehicle theft is reported. Second, in the event of a justifiable homicide two offenses are reported: (1) the felonious acts by the offenders and (2) the actual nonnegligent homicide. In the NIBRS, the *hotel rule* was modified as well. The hotel rule states that where there is a burglary in a dwelling or facility in which multiple units were burglarized (e.g., a hotel) and the police are most likely to be reported by the manager of the dwelling, the incident is counted as a single offense. In addition, the NIBRS has extended the hotel rule to self-storage warehouses, or mini-warehouses.

Advantages and Disadvantages of UCR Data

The traditional UCR summary reporting system is characterized by many advantages. First, it has been ongoing

for more than eight decades with remarkably stable methodology. This aspect allows meaningful trend analysis. Second, the UCR allows analyses at a variety of levels of geography. One can ascertain crime information for cities, regions, or the nation. Third, this system offers broad crime coverage, ranging from vandalism to homicide. Fourth, instead of focusing only on street crimes (i.e., homicide, robbery, and assault), the UCR offers information on other crimes, such as embezzlement, drunkenness, and vagrancy. Fifth, the UCR summary system has broad coverage from law enforcement agencies. All 50 states, the District of Columbia, and some U.S. territories report data to the FBI. Sixth and last, the UCR collects crime information regardless of the age or victim or offender. Some crime data collection systems (e.g., the National Crime Victimization Survey) gather crime data on restricted ages only. The NIBRS enjoys many of the UCR's advantages and more. The greatest additional advantage of the NIBRS is that it offers incident-level details for every crime reported. With greater detail, one can disaggregate data by multiple victim, offender, and incident characteristics. One also can link various components of the incident.

Both the traditional summary system and the NIBRS have limitations that are important to recognize. First, both systems reflect only crimes reported to the police. Evidence is clear that many crimes are reported to the police in low percentages. For example, only about half of all violent crime comes to the attention of the police. In some cases, such as rape, fewer than 30% of the crimes are reported to the police. Second, because the data come from law enforcement agencies, they can be manipulated for political and societal purposes. Although this is not considered to be a widespread problem, it can and has happened. Third, because the UCR reporting systems are voluntary, they are subject to a lack of, or incomplete, reporting by law enforcement agencies. When information is not submitted or the submitted information does not meet the FBI's guidelines for completeness and accuracy, the FBI uses specific protocols to impute data to account for this issue. The degree to which UCR data are imputed at the national level is sizeable and varies annually.

The NIBRS is characterized by some disadvantages not shared with the traditional UCR system. First, the NIBRS has limited coverage. It requires a lengthy certification process, and scholars have suggested that a result of this is slow conversion to the system. As of 2007, 31 states were certified and contributing data to the program. This represents reporting by 37% of law enforcement agencies and coverage of approximately 25% of the U.S. population. Furthermore, not all agencies within certified states submit any NIBRS data. In 2004, only 7 states fully reported NIBRS data. The agencies that do participate tend to represent smaller population areas. As recently as 2005, no agency covering a population of over 1 million participated in the NIBRS. Given this, it is clear that the NIBRS does

not utilize data that constitute a representative sample of the population, law enforcement agencies, or states.

The Bureau of Justice Statistics and the NCVS

The second major publisher of national crime reports and statistics is the BJS, the primary statistical agency in the Department of Justice. This bureau was established under the Justice Systems Improvement Act of 1979. Prior to this, the office was recognized as the National Criminal Justice Information and Statistics Service, which was a part of the Law Enforcement Agency within the Law Enforcement Assistance Administration. Currently, the BJS is an agency in the Office of Justice Programs within the Department of Justice. The mission of the BJS is to gather and analyze crime data; publish crime reports; and make available this information to the public, policymakers, the media, government officials, and researchers.

Although the BJS collects a wide variety of data related to all aspects of the criminal justice system, its major crime victimization data collection effort is currently the National Crime Victimization Survey (NCVS). The NCVS is the nation's primary source of information about the frequency, characteristics, and consequences of victimization of individuals age 12 and older and their households in the United States. The survey was first fielded in 1972 as the National Crime Survey (NCS). The NCS was designed with three primary purposes. First, it was to serve as a benchmark for UCR statistics on crime reported to police. Second, the NCS was to measure what was called "the dark figure of unreported crime," that is, crime unknown by law enforcement. Third, the NCS was designed to fill a perceived need for information on the characteristics of crime not provided by the UCR.

Shortly after the fielding of the NCS, work toward improving the survey began. Beginning in 1979, plans for a thorough redesign to improve the survey's ability to measure victimization in general, and certain difficult-to-measure crimes, such as rape, sexual assault, and domestic violence, was started. The redesign was implemented in 1992 using a split-sample design. It is at this time that the NCS changed names to the NCVS. The first full year of NCVS data based on the redesign was available in 1993. Following the redesign, the NCVS measured almost the identical set of crimes gathered in the NCS. The only exception is that, after the redesign, data on sexual assault were collected.

In general, and as anticipated, the NCS redesign resulted in an increase in the number of crimes counted. Increases measured were not uniform across crime types, however. For example, increases in crimes not reported to the police were greater than the increases in crimes reported to the police. One reason for this is that improved cues for certain questions caused respondents to recall more of the less serious crimes—those that are also less likely to be reported to law enforcement officials. As a

result, the percentage of crimes reported to police based on the redesigned survey is lower than the percentage calculated based on data collected with the previous survey design. This difference is particularly significant for crimes such as simple assault, which does not involve the presence of weapons or serious injury.

NCVS Methodology

NCVS crime data come from surveys administered at a sample of households in the United States. Households are selected via a stratified, multistage, cluster sample. The samples are designed to be representative of households, as well as of noninstitutionalized individuals age 12 or older in the United States. The NCVS is characterized by a very large sample size. In recent years, approximately 80,000 persons in 40,000 households were interviewed. The NCVS is also characterized by a rotating-panel design in which persons are interviewed every 6 months for a total of seven interviews. Interviews are conducted in person and over the telephone throughout the year.

NCVS surveys are administered via two survey instruments. The first is a screening instrument that is used to gather information to determine whether a respondent was a victim of a threatened, attempted, or completed crime during the preceding 6 months. If the screening instrument uncovers a possible victimization, a second incident-focused instrument is administered to gather detailed characteristics about all victimizations revealed. These details include the victim characteristics, offender characteristics, and characteristics of the incident.

The details gathered on the incident instrument are used in two very important ways. Detailed incident information is used to determine *whether* the incident described by the respondent was a crime and, if the incident is deemed a crime, the *type* of crime that occurred. These assessments are made not by the field representative or the survey respondent but by statisticians using incident details during data processing at the U.S. Census Bureau, the agency responsible for collecting the data on behalf of the BJS.

Crimes Measured in the NCVS

Because one of the major purposes of the NCVS was to serve as a benchmark for UCR summary program statistics on crime reported to police, and to measure the “dark figure” of unreported crime, the offenses measured by the NCVS are analogous to Part I crimes measured by the UCR. NCVS criminal offenses measured include rape, sexual assault, robbery, aggravated assault, simple assault, pocket-picking and purse-snatching, property theft, burglary, and motor vehicle theft.

The NCVS gathers far more than merely information on the types of personal and property crimes in the United States against persons age 12 or older. For each victimization revealed, extensive detailed information is collected. This includes the outcome of the victimization (completed, attempted); time and location of the incident; the number

of victims, bystanders, and offenders; victim demographics; victim–offender relationship; offender demographics; offender drug and/or alcohol use; gang membership; presence of weapon(s); injuries sustained; medical attention received; police contact; reasons for or against contacting the police; police response; victim retaliation; value of retaliation; and so on.

The Future of the NCVS

Currently, the future of the NCVS is unclear. During 2007 and 2008, the Committee on National Statistics, in cooperation with the Committee on Law and Justice, reviewed the NCVS to consider options for conducting it. This need for review grew on the basis of evidence that the effectiveness of the NCVS has recently been undermined via the demands of conducting an expensive survey in a continued flatline budgetary environment. Given this situation, the BJS has implemented many cost savings strategies over time, including multiple sample cuts. Unfortunately, the result of sample cuts (in conjunction with falling crime rates) is that, for the last several years, the sample size is now such that only a year-to-year change of 8% or more can be deemed statistically different from no change at all. On the basis of the review, the panel concluded that the NCVS as it currently stands is not able to achieve its legislatively mandated goal of collecting and analyzing data. The review panel provided multiple recommendations regarding a redesign of the NCVS that are currently being studied. At this time, it is unclear what a redesign would entail, or even if a redesign will happen. One possibility—not embraced by the review panel—is the termination of the NCVS. Such an outcome would be unfortunate given that the survey provides the only nationally representative data on crime and victimization with extensive details on the victim, the offender, and the incident.

Advantages of the NCVS

A major advantage of the NCVS is that it provides data on reported and unreported crimes. As stated previously, many crimes (and in some cases, e.g., rape, most crimes) are not reported to police. A second advantage of NCVS data is that they offer a wide range of criminal victimization variables, including information about crime victims (e.g., age, gender, race, Hispanic ethnic origin, marital status, income, and educational level), criminal offenders (e.g., gender, race, approximate age, drug/alcohol use, and victim–offender relationship), and the context of the crime (e.g., time and place of occurrence, use of weapons, nature of injury, and economic consequences). A third advantage of NCVS data is the high response rates. Like all surveys, response rates in the NCVS have declined a bit in recent years; nonetheless, they continue to be relatively high. For example, between 1993 and 1998, NCVS response rates varied between 93% and 96% of eligible households and between 89% and 92% of eligible individuals. A fourth advantage of NCVS data is that the survey has been

ongoing for over three decades with a stable sample and methodology. This makes trend analysis possible, and it allows one to aggregate data in an effort to study relatively rare crimes, such as rape, or relatively small populations, such as American Indians.

Disadvantages of the NCVS

The NCVS performs very well for the purposes designed; however, like all surveys, it has some limitations. First, the NCVS is designed to generate national estimates of victimization. Because of this, the data cannot be used to estimate crime at most other geographic levels, such as the state, county, or local level. In 1996, a region variable was added to the NCVS data, enabling crime estimates for the Northeast, South, West, and Midwest. On rare occasions, special releases of NCVS data have provided insight into crime in major cities. Limited age coverage is a second limitation of NCVS data. Because the data do not include victimizations of persons age 11 or younger, findings are not generalizable to this group. A third limitation is limited population coverage. Because one must live in a housing unit or group quarter to be eligible for the NCVS sample, persons who are crews of vessels, in institutions (e.g., prisons and nursing homes), members of the armed forces living in military barracks, or homeless are excluded from the NCVS sample and data. The fourth and final limitation is limited crime coverage. The NCVS collects data on the few personal and property crimes listed earlier and excludes many others. NCVS data tend to focus on street crimes, excluding other offenses, such as arson, crimes against businesses, stalking, vagrancy, homicide, embezzlement, and kidnapping. A limitation of the NCVS data stems from the fact that they are derived from a sample. Like all sample surveys, the NCVS is subject to sampling and nonsampling error. Although every effort is taken to reduce error, some remains. One source of nonsampling error stems from the inability of some respondents to recall in detail the crimes that occurred during the 6-month reference period. Some victims also may not report crimes committed by certain offenders (e.g., spouses), others may simply forget about victimizations experienced, and still others may experience violence on a frequent basis and may not view such incidents as important enough to report to an NCVS field representative. A final limitation is associated with what are referred to as *series victimizations*. Series victimizations are defined as six or more similar but separate victimizations that the victim is unable to recall individually or to describe in detail to an interviewer. Recall that crime classification in the NCVS is based on the respondent's answers to several incident questions. Without information on each incident, crime classification cannot occur. To address series victimization, a specific protocol is used. This protocol states that if an individual was victimized six or more times in a similar fashion during the 6-month reference period, and he or she cannot provide the details about each incident, then one report is taken for the entire series of victimizations. Details of the most recent incident are obtained, and the victimization is counted as a

singular incident. It is clear that the series protocol results in an underestimate of the actual rate of victimization.

UCR Data and the NCVS Compared

Because of the similarities between the UCR and the NCVS, it is generally expected that each data source will provide the same story about crime in the United States. Although that does often happen, many times it does not. Since 1972, year-to-year violent crime change estimates from the NCVS and UCR moved in the same direction, either up or down, about 60% of the time. Property crime rates have moved in the same direction about 75% of the time. Given that the NCVS and the UCR have different purposes and different methodologies, study different populations, examine different types of crimes, and count offenses and calculate crime rates differently, a lack of congruence on occasion should not be surprising. This section of the chapter looks at some of the reason the two series do not always track together.

Perhaps the largest difference between the UCR and NCVS is that the UCR measures only crimes reported to law enforcement agencies; that is, if the crime was not reported to the police, that crime can never be reflected in UCR data. In contrast, the NCVS interviews victims of crime and collects information on crimes that were and were not reported to the police. A second major difference in the two systems is found in the population coverage. UCR data include all reported crimes regardless of victim characteristics. This includes crimes against young children, visitors from other countries, and businesses or organizations. In contrast, the NCVS provides data on reported and unreported crimes against people age 12 or older and their households. Not included in the NCVS data are crimes against persons younger than age 12, businesses, homeless people, and institutionalized persons. A third significant difference in the two systems is crime coverage. The Part I UCR summary reporting system includes homicide and arson, neither of which is measured by the NCVS. In contrast, the NCVS collects information on simple assault—the most frequent violent crime—whereas the UCR traditional Part I crimes excludes it. In addition, the NCVS and UCR define some crimes differently and count some crimes differently. As stated earlier, the UCR defines forcible rape as “the carnal knowledge of a female forcibly and against her will” and excludes rapes of males and other forms of sexual assault. The NCVS measures rape and sexual assault of both women and men.

Yet another significant difference concerns the basic counting unit of the two data collection systems. In the NCVS, the basic counting unit is the victim. There are two types of victims in the NCVS: (1) the person and (2) the household. When considering personal or violent crimes, (i.e., rape, sexual assault, robbery, assault, purse-snatching, or pocket-picking), the number of victimizations is equal to the number of persons victimized. When considering property crimes (i.e., property theft, household burglary, and motor vehicle theft), the number of victims is equal to the number of households victimized. Therefore, crime reports

using NCVS data report rates of violent crime as the number of victimizations per 1,000 people age 12 or older. Likewise, property crimes are reported as the number of property victimizations per 1,000 households. In the UCR, the basic counting unit is the offense. For some crimes, such as assault and rape, an offense is equal to the number of victims. For other crimes, such as burglary or robbery, an offense is equal to the number of incidents. All UCR crime rates, regardless of the type of victim (i.e., individual or organization), are calculated on a per capita basis: the number of offenses per 100,000 people. For some crimes, the NCVS and UCR counting rules result in similar outcomes. For instance, if in a single incident two people were assaulted by a knife-wielding offender both programs would count two aggravated assaults. In contrast, other times counting rules result in different outcomes. For example, if in a single incident five people were robbed by a gun-toting offender, the NCVS would record five robbery victimizations, and the UCR would count a single robbery. If, however, a bank teller was threatened by an armed assailant during a bank robbery, the UCR would record this as a robbery with a weapon, whereas the NCVS, which measures only crimes against people and their households, would classify the same crime as an aggravated assault victimization (assuming that no personal property was stolen from the teller).

Conclusion

This chapter has provided an overview of crime reports and statistics, which are used to convey an extensive amount of information about crime. This includes topics such as the extent of crime and the nature or characteristics of criminal offenses, as well as how the nature and characteristics of crime change over time. Furthermore, official crime reporting systems, such as the UCR, the NIBRS, and the NCVS, allow insight into the experiences of crime and victimization for specific groups and how they may or may not differ from others or over time. Understanding what crime reports and statistics are requires an understanding of the agencies that gather the data and publish the reports. Furthermore, one must comprehend the intricacies of the data collection to fully appreciate the strengths and weaknesses of what the data (and resulting reports and statistics) offer.

Data from the UCR and the NCVS are essential to an understanding of crime. Because crime is not a directly observable phenomenon, no single measure can adequately convey or describe information about its extent and characteristics. Like other nonobservable events, such as the economy or the weather, no single measure suffices. One could not hope to understand the state of the economy by understanding only the unemployment rate. Neither could one fully realize the condition of the weather by understanding the percentage humidity only. Multiple measures are required for such phenomenon. These multiple measures are found in UCR data and the NCVS. Together, used in a complementary fashion, these

data provide a more complete understanding of crime in the nation than either could alone.

CITATION AND CONTENT ANALYSIS

ELLEN G. COHN

Florida International University

Citation and content analyses are two methodological techniques used by criminologists for a variety of purposes. *Citation analysis* is a way of evaluating the scholarly impact of a scholar, scholarly work, journal, book, or academic department within a discipline. *Content analysis* allows criminologists to systematically examine the contents of a book, article, television program, or other work. It is often used as a way of discovering patterns within individual works or bodies of work. Both are quantitative methods that are less likely to be affected by personal bias than other techniques. This chapter discusses each technique in detail, including a review of the advantages and problems of each method.

Citation Analysis

What Is Citation Analysis?

Citation analysis is a technique that is widely used to evaluate the impact and prestige of individual scholars, academic journals, and university departments within a discipline. The technique may also be used to determine the impact an individual scholarly work (a book or journal article) has on subsequently published research in the field. In addition to its application in criminology, citation analysis has been used in disciplines such as medicine, economics, physics, sociology, and psychology. The rationale for using citation counts as a measure of research eminence was best explained by

Rushton (1984): “If psychologist A’s work has been cited 50 times in the world’s literature that year, and psychologist B’s only 5, A’s work is assumed to have had more impact than B’s, thereby making A the more eminent” (p. 33).

Citation analysis first came to prominence in criminology in Wolfgang, Figlio, and Thornberry’s 1978 book *Evaluating Criminology*. The authors used the technique to determine the most-cited American books and journal articles in criminology between 1945 and 1972. Twenty years later, their research inspired Cohn, Farrington, and Wright to return to the topic in their 1998 book, *Evaluating Criminology and Criminal Justice*. In this book, they used citation analysis to examine the most-cited scholars and works in a variety of American and international journals in criminology and criminal justice over a 10-year period.

These books, and many other studies that use citation analysis in criminology and criminal justice, have resulted in a considerable amount of controversy over the acceptability of citation analysis as a scientific technique. Although many scholars find the results to be an interesting and important contribution to the field, others find this research threatening and may even actively oppose the publication of articles using citation analysis. However, recent research does suggest that the approach is both valid and reliable and is an important tool for measuring prestige and influence in criminology.

Citation analysis provides researchers with an objective and quantitative method for determining the impact on the field of a scholar, journal, work, or department. It assumes

that if a specific article or book is frequently cited, many scholars find that work important and valuable. In addition, citation analysis assumes that citations reflect the influence of a given work on the field, so that if two researchers were working independently on the same problem, they would both cite the same material. Although there is some question as to whether citation counts accurately measure the quality of a highly cited work, they are used to measure that work's influence or prestige.

Currently, there are two main methods commonly used for gathering citation data. The first method is to use citation indexes, especially those produced by the Institute for Scientific Information. These include the *Science Citation Index*, the *Social Sciences Citation Index (SSCI)*, and the *Arts and Humanities Citation Index*. These indexes list literally millions of bibliographic references made in thousands of journals published throughout the world. For the purposes of criminological research, the SSCI clearly is the most useful of the three.

The second method of gathering citation data involves examining reference lists of journals, scholarly books, textbooks, and other works in a given field and counting the number of citations made of a given scholar, scholarly work, or journal. Although this method is considerably more labor-intensive and time-consuming, it does permit researchers to avoid a number of problems that are inherent in the use of SSCI and other citation indices (discussed later). This technique was pioneered by Cohn and Farrington (1990) and has since been used successfully, both by them and by other researchers in criminology.

Alternatives to Citation Analysis

Unlike citation analysis, most other measures of scholarly prestige and influence do tend to be vulnerable to personal bias. One of the most commonly used methods is *peer review*. In this method, a researcher may survey directors or chairs of criminology departments, or survey members of a scholarly society, such as the American Society of Criminology or the Academy of Criminal Justice Sciences, and ask them to rank academic journals, books, or PhD programs in criminology and criminal justice. However, it is clear that the results of this type of survey may be affected by the respondents' personal opinions. For example, scholars who have served as an editor or member of the editorial board of a particular journal may be more likely to give that journal a higher ranking because of their familiarity with it. Similarly, when ranking PhD programs, scholars may be inclined to give the program from which they graduated or where they currently are employed a higher ranking, or they may be inclined to give a rival department a lower ranking. In essence, regardless of the respondent's desire to be objective, personal preferences or knowledge may creep in and affect his or her responses to this type of survey.

A related method is to consider which individuals receive scholarly prizes or are elected to major offices in

scholarly societies. This method is similar to peer review, because in most cases, recipients are chosen or elected by members of the field. However, these methods all tend to identify the same individuals. They are also equally vulnerable to bias, because it is obviously easy to be influenced by personal likes or dislikes of the individual, department, or scholarly work under review.

Another method that is used to measure prestige and influence is to count the number of journal publications of an individual criminologist or of the entire faculty of a criminology department. This method clearly is far more quantitative and objective than that of peer review; however, it measures only productivity and does give a clear indication of influence. Just because an article is published in a journal does not mean that it will be read and/or cited or that other scholars will view the article as being important in any way. In addition, many of these studies attempt to weight the publications in some way, such as by the prestige of the journal. This often reduces the objectivity of the method, because journal prestige usually is determined by peer review. Finally, the rapidly increasing number of journals in the field of criminology is creating many additional outlets for publication and may serve to inflate publication rates, thus reducing the validity of this measure.

Overall, it appears that none of these methods provides as straightforward, objective, and quantitative measure of scholarly influence and prestige as citation analysis. Although citation analysis has its shortcomings, it appears to be more valid and reliable than any other method. "The overwhelming body of evidence clearly supports the use of citation analysis as a measure of scholarly eminence, influence, and prestige" (Cohn, Farrington, & Wright, 1998, p. 4).

Advantages of Citation Analysis

One of the most notable advantages of citation analysis is that, unlike other measures of scholarly influence or prestige, such as peer rankings, citation analysis is objective and quantitative and is not affected by any personal bias. Whether the data are obtained from a citation index such as SSCI or from the reference lists of journals and other scholarly publications, they are readily and publicly available and cannot be affected by any personal bias, even that of the researcher.

The question of reliability and validity of citation counts has been examined by a variety of researchers. Research in a wide variety of academic disciplines supports the relationship between citation counts and other measures of scholarly influence, intellectual reputation, professional prestige, and scientific quality. Citation counts have been found to be highly correlated with scholarly productivity, peer ratings of professional eminence, scholarly recognition (e.g., election to the National Academies of Science), and the receipt of scholarly prizes (e.g., the Nobel Prize in physics). There also appears to be a strong correlation between citation counts and ratings of the prestige of university departments and doctoral programs. Researchers also have found citation

counts to be correlated with peer rankings and journal publications. Rushton (1984) stated, "It is fair to say that citation measures meet all the psychometric criteria for reliability," and concluded that "citation counts are highly valid indices of 'quality'" (p. 34)

Another concern frequently raised by those who oppose the use of this method is that it focuses on quantity rather than quality of citations. However, this appears to be an untenable position, given that citation counts are highly correlated with other measures of prestige and influence. Although it has been suggested that a high citation count may indicate a past contribution to the field, rather than a current or ongoing one, research suggests that, in general, scholars tend to cite more recent works rather than older ones. Researchers such as Cohn et al. (1998) have suggested that the influence of scholarly works tend to decay over time as they are supplanted by more recent work. One recent study estimated that social science research works have a half-life for citations of only about 6 years (Cohn & Farrington, 2008).

Problems With Citation Analysis

General Problems

Citation analysis is not a perfect measure of scholarly influence; the technique has a number of problems. One objection to citation analysis is that it may be biased against scholars who work in a narrow or less-populated specialty. If there are only a few researchers working in a particular area, there will be fewer articles published in which those researchers can and will be cited. As a result, these scholars, regardless of how influential they are in their area of expertise, are less likely to be frequently cited.

Another concern is that citation analysis counts all citations to a given work equally and does not distinguish among positive, negative, and neutral citations. In other words, just because a work is highly cited does not automatically mean that it is looked upon favorably by others in the field. However, a number of researchers have considered this and have found that the vast majority of citations appear to be positive or neutral. Very few citations appear to be critical or negative.

Several researchers have suggested that "recipe" articles, such as those outlining a new personality test or explaining a statistical technique, tend to be highly cited. However, in general this does not appear to be the case. Recent research into the most-cited scholars and works in criminology and criminal justice journals (see, e.g., Cohn & Farrington, 2007a, 2007b, 2008) has not found methodological works or their authors to be among the most cited.

Citation counts also may be affected by a scholar's productivity. In general, the most-cited criminologists tend to be older and more established in the field. They also tend to be fairly prolific writers and to have long publication records. However, Cohn and Farrington (2007a, 2007b) have found that a scholar's high ranking may be either a

function of the large number of different works cited (versatility) or a function of a large number of citations of one or two major works (specialization). Of course, it is possible for a scholar to be both versatile and specialized (e.g., to have a large number of works cited, with one or two of these receiving most of the citations).

Another concern is that an author's choice of which articles and/or authors to cite may be influenced by social factors, such as personal likes and dislikes, attempts to please journal editors, a desire to inflate individual or departmental citation counts, or even a preference for citing same-sex authors. For example, a scholar may cite others in the same department to boost overall departmental citation counts or may avoid citing faculty from a rival department to reduce their citation counts. Although it is difficult to constantly cite oneself (self-citation) as a way of inflating one's own citation count without being rather obvious about it, other more devious methods, such as "You cite me, I'll cite you," could be used. However, for such an approach to work, the scholars would still have to have a reasonably high publication rate in good quality journals.

Chapman (1989) discussed the issue of "obliteration by incorporation":

[Certain scholars may be] so eminent and prolific in their fields that, although their names appear in the body of an article, they can elude the ordinary counting process because the writer neglects to list them in the references at the end of the text. In psychology, textual mentions of Freud, for example, often are not referenced and are thus underrepresented in citation counts. (p. 341)

It has been suggested that a similar situation may occur in criminology with mentions of scholars such as Karl Marx.

However, despite these difficulties, citation analysis is generally accepted as a valid technique and is increasingly becoming more popular and more widely used in the sciences and social sciences.

Problems With Citation Indexes

The SSCI lists all bibliographic references made in an extremely large number of social science journals. The index is an extremely useful tool for general bibliometric research but has several problems when used for citation analysis.

First, the SSCI does not include references in all published works. According to the SSCI Web site, as of 2008, the SSCI fully indexes over 2,000 journals in 50 social science disciplines, as well as individually selected items from over 3,300 leading scientific and technical journals. However, not all criminology journals are included. For example, neither *Criminology and Public Policy* nor *Violence and Victims* currently are included in the SSCI.

In addition, although the SSCI includes citations of books and book chapters, works cited in books or book chapters are not indexed. It is possible that this may lead to a bias, because

books appear to be highly significant in criminology. Cohn and Farrington (2007a, 2007b, 2008) have examined the most-cited works of the most-cited authors and found that most were books, rather than journal articles.

Another problem with the SSCI is that it lists only the initials and surnames of cited authors, making it almost impossible to distinguish between different people with the same last name and first initial. For example, Cohn and Farrington repeatedly have pointed out the difficulty of determining which of the citations of "J. Cohen" belong to Jacqueline Cohen and which refer to other individuals, such as Jacob Cohen or Joseph Cohen. Similarly, it is difficult, if not impossible, to distinguish between the various R. Berks, P. Brantingham, and D. Smiths. This confusion is only increased if citations include or omit an author's middle initial (e.g., making it more difficult to distinguish between E. G. Cohn and E. S. Cohn) or use a "nickname" first initial (such as R-for-Robert vs. B-for-Bobby Brame). In addition, citations of married female scholars may appear under more than one surname (e.g., Ilene Nagel, Ilene Bernstein, Ilene Nagel-Bernstein). Other scholars who hyphenate or change their surnames create similar difficulties for the citation analyst attempting to use the SSCI.

The SSCI also creates a bias against junior authors in collaborative works, because it lists citations only under the name of the first author. Therefore, an individual who is not listed as the first author of scholarly work will not be found in the SSCI. This may penalize younger scholars, scholars whose names come later in the alphabet (for articles where authors are listed alphabetically), and wives (e.g., in research by Sheldon and Eleanor Glueck, Sheldon's name is almost invariably listed first).

Citation indexes such as the SSCI also may contain errors. First, because it assumes that all citations in the source journals are accurate, any clerical or other errors in the original reference lists, such as misspelled names, incorrect dates of publication, or incorrect initials, are transferred to the SSCI. There is considerable evidence to suggest that this assumption is, for the SSCI at the least, questionable. For example, Cohn and Farrington (1996) pointed out that "Farrington" is often misspelled as "Farringdon." Similarly, "Hirschi" is frequently misspelled as "Hirsch," "Hirsh," or "Hirshi." In addition, Hirschi's citations have been found under "P. Hirschi" and "L. Hirschi" as well as the correct "T. Hirschi." When dates of articles are incorrect in the original reference list, they are entered into the SSCI under the incorrect year. In general, studies of citation accuracy have found that between 25% and 30% of all citations contained errors. Of course, this does not include any errors that may be made by the staff at Institute for Scientific Information who compile the SSCI.

Finally, the SSCI includes self-citations. Self-citations occur when a scholar cites his or her own work. It is, of course, perfectly reasonable and justifiable for scholars to cite themselves, especially when their work is building on their prior research. However, self-citations do not indicate the influence of the cited work on other scholars, and a

study of citations as a measure of influence on others in the field should omit self-citations. Because only the first author of a cited work is included in the SSCI, it is extremely difficult to exclude self-citations when using the SSCI to obtain citation counts.

Other Sources of Citation Analysis Data

An alternative to employing citation indexes such as the SSCI is to examine reference lists of journals, textbooks, scholarly books, and other sources within a field and count the number of citations to a given scholar, work, or journal. This technique has been used successfully by Cohn and Farrington to produce a sizable body of citation analysis research in criminology. Although it is more time-consuming, this method is arguably more accurate and avoids many of the problems that are inherent in the use of the SSCI. For example, it allows the researcher to examine all authors of a cited work, not just the first author, and to exclude all self-citations. It also provides a knowledgeable researcher with an opportunity to correct at least some of the errors found in citation lists. For example, if the researcher sees a reference to a "T. Hirsch," he or she will be able to determine whether this citation is of a work by Travis Hirschi or that of a different author. This method also allows the researcher to attempt to distinguish between multiple authors with the same surname and first initial, because many journals list first names (not just initials) in their reference lists, or even scholars with the same full name (e.g., the Australian vs. the American Patrick O'Malley or the Australian vs. the British David Brown).

The technique developed by Cohn and Farrington is fairly straightforward, although admittedly somewhat tedious and time-consuming to carry out. For each journal that is used as a data source, they either download the reference pages for every article from an online full-text source into a word processing program or enter the pages into a computer from a printed copy of the journal using an optical scanner. For references with multiple authors, duplicate listings are made of the reference, with each coauthor listed first. Mistakes in reference lists are corrected when found. When all references for a given journal are entered into a computer file, they are sorted into alphabetical order, and this list is examined to determine the number of times each name appears. When known, citations of scholars with multiple names (e.g., Ilene Nagel/Bernstein) are amalgamated. If reference lists did not include first names or middle initials, Cohn and Farrington would, when necessary, check references against original publications to distinguish between, for example, the various D. Smiths (Douglas A., David D., David E., David J., etc.), the various J. Cohens (Jacqueline, Jacob, Joseph, etc.), and the various different scholars with the same name (David Brown, Richard Sparks, Richard Wright, Patrick O'Malley, etc.). In some journals, references occasionally specify "et al." rather than listing all authors. In these cases, the original works were checked, when possible, to obtain the names of all coauthors

and insert them into the data file. To maximize the accuracy of the data, this method requires an extensive and detailed knowledge of criminology authors and publications.

Concluding Remarks

Overall, citation analysis is an extremely quantitative, objective method of exploring trends in scholarly impact and prestige. The increasing availability of electronic journals and books throughout the world is helping to make this technique more accessible and may increase its use in the near future. Researchers may in the future use citation analysis to examine how changes in theoretical, empirical, and political issues affect research and scholarly influence. They may also use this method to determine patterns and trends in research topics and perhaps predict changes in key issues over time.

Content Analysis

What Is Content Analysis?

Content analysis, or *textual analysis*, as it is sometimes known, allows scholars to systematically study and classify the contents of an individual work or body of work, often to determine the presence of certain words or concepts. It is defined as “the identifying, quantifying, and analyzing of specific words, phrases, concepts, or other observable semantic data in a text or body of texts with the aim of uncovering some underlying thematic or rhetorical pattern running through these texts” (Huckin, 2003, p. 14).

Content analysis is applied not only to scholarly works (e.g., journals or books) but also to both the print and visual media (e.g., newspapers, television, movies). Other sources of data for content analysis include book chapters, interviews, conversations, speeches, historical documents, and so on. Content analysis may be applied almost anywhere communication occurs.

Content analysis has been used in criminology to study a wide variety of topics, ranging from how newspapers discuss community policing (Mastrofski & Ritti, 1999) to how television newscasts cover crime (Chermak, 1994). Wolfgang et al. (1978) used content as well as citation analysis when examining the field of criminology. They read, classified, coded, and rated more than 4,400 works, ranking them on scientific merit. More recently, Richard Wright (1995) conducted a number of content analyses of criminology and criminal justice textbooks, looking at topics such as the coverage of women and crime, the coverage of career criminals, treatment-of-choice theory, and the coverage of deterrence.

Content analysis allows researchers to study not only how messages are conveyed but also what meaning those messages convey. Like citation analysis, it is a primarily quantitative method of analyzing data. However, one of the key elements of content analysis is coding the concepts to

be studied, and this may involve some subjectivity. For example, if a researcher wants to examine all references to prisons, a wide variety of terms may be relevant, including not only *prisons* but also *jails*, *supermax*, *corrections*, and so on. Which terms are used will depend on the individual researcher and the research question.

Types of Content Analysis

There are two main types, or categories, of content analysis: (1) conceptual and (2) relational. These were described in detail by Busch et al. (2005).

Conceptual Analysis

Conceptual analysis is what most people think of when the term *content analysis* appears. It is occasionally referred to as *thematic analysis*. In essence, it involves selecting a concept to be studied and determining how often that concept appears in the material being examined. For example, conceptual analysis could be used to determine how often terms relating to youth gangs are mentioned on a local newscast, appear in a local newspaper, or are mentioned in speeches by key government officials (or candidates).

To increase objectivity, particularly if multiple individuals are involved in the research, it is necessary for the terms in question to be identified in advance, so as to ensure intercoder reliability (in other words, to make certain that all researchers focus on the same specific words or word patterns). For example, in a study of youth gangs, other terms might also be used to refer to the concept in the text being examined; the researchers must decide in advance which terms imply “youth gangs” so that they will know which terms to include when and if they appear (e.g., synonyms such as *juvenile gangs* or *teen gangs*, as well as the names of specific gangs, such as “Crips” or “Bloods”). This step also is necessary when there is only one researcher examining the data, to ensure consistency throughout the data coding process.

It is also necessary for the researchers to decide whether to study *presence* or *frequency*. When the researcher is looking only at the presence (or absence) of a concept, it does not matter how often the relevant term appears in the text; the researcher cares only whether the term appears at least once. Therefore, a newspaper article that mentions youth gangs only once would be considered equal to one that focuses on the topic and mentions youth gangs repeatedly throughout the article. In a frequency study, on the other hand, a key term will be counted each time it appears. Measuring frequency rather than simple presence allows the researcher to assign a level of importance to the term. For example, one might conclude that a political candidate who mentions youth gangs 25 times during the course of a campaign speech considers the problem to be more serious than a rival candidate who mentions youth gangs only once during a speech.

Content analysis in criminology has also focused on *manifest content*, looking at the amount of coverage, usually measured by column print inches or pages, given to specific topics or individuals. Manifest content analysis researchers in criminology, criminal justice, and deviance have used length-of-coverage measurements in a variety of different ways. For example, Cohn et al. (1998) used content analysis to examine the amount of coverage given to scholars in introductory criminology textbooks and identify the most influential scholars on the basis of page coverage. Other researchers have used the number of inches of print in newspaper columns as a way to measure the amount of publicity devoted to various news stories.

Relational Analysis

Relational analysis, which is also known as *semantic analysis* or *concept mapping*, examines the relationship among various concepts within a given text. Relational analysis not only identifies concepts within the text but also explores the relationships between the various concepts. For example, examining the terms that appear next to or near the phrase *community policing* in newspaper articles may give insight into community attitudes toward or views about community policing. The basic idea behind relational analysis is that the individual concepts have no inherent meaning in and of themselves but they instead gain meaning as a result of their relationship with other concepts in the text. Researchers generally look at three main aspects of the relationship among the concepts being studied: (a) the *strength* of a relationship shows how strongly the concepts are related, (b) the *sign* indicates whether concepts are positively or negatively related, and (c) the *direction* refers to the type of relationship (e.g., does one concept precede another?).

Advantages of Content Analysis

There are a number of advantages to content analysis. First, it is both quantitative, or objective, and qualitative, or impressionistic. Much of the process is clearly objective; counting the prevalence or frequency of occurrence of set of words or phrases in a television news program, for example, is strictly quantitative and does not consider any underlying semantic features that may be found from an examination of the context of those phrases. However, the technique also allows for more subjective operations, such as allowing the individual researcher to determine whether specific television programs are pro- or antiviolence. Simply counting the number of violence-related terms that appear in the programs may not make it clear whether the programs support or oppose violence. However, an examination of the context in which the terms are used, although more subjective and somewhat less reliable, may provide more insight into this research question.

Another advantage of content analysis is that it is an unobtrusive research method. Experiments and surveys

frequently require researchers to interact with research participants during the data collection process in an abnormal or unnatural way. This interaction may affect the responses of the participants, who may omit key pieces of information, either deliberately or inadvertently. Texts and other types of media, on the other hand, are not affected by being read and analyzed by the researcher. For example, if a researcher is studying politicians to determine their views on the problem of youth gangs, the researcher could interview each politician individually. However, it is possible that the politicians might respond to the interviewer's questions with answers that they believe the interviewer wants or that make the politician look better. On the other hand, an examination of each politician's speeches would provide a more unbiased record, because the transcripts of the speeches cannot be altered to appear more favorable. Therefore, content analysis allows the researcher to reduce bias during the data collection process.

An additional strength of content analysis, in particular conceptual analysis, is that it generally is highly replicable. In other words, a different researcher, using the same coding system, should be able to produce the same results.

Content analysis also is extremely flexible and convenient for researchers. There are no surveys to conduct, no experimental subjects to test, no focus groups to conduct. The researcher can perform the analysis on his or her own schedule, rather than having to coordinate with research participants. In addition, because this methodology does not involve human participants, there are fewer ethical issues to take into consideration.

Disadvantages of Content Analysis

There are also several problems with content analysis as a research method. First, it is often very time-consuming and labor-intensive. The process is not as simple and straightforward as it may appear at first glance. Defining the categories, for example, may be a difficult process when multiple researchers are involved, and pretesting is essential to ensure that nothing is overlooked and that there is no confusion of terminology. In addition, the process requires a considerable amount of time. A study of prime time television programs to study violent content does require the researcher to watch the programs; even with commercials deleted, this will require a large time investment.

Another criticism of content analysis is that it frequently focuses on only the surface issues. In an effort to be more quantitative, the researcher may simply conduct word counts without looking at the context in which those words appear. In other words, the researcher focuses on the individual words, rather than on their meaning, by ignoring the contextual aspects of the communication.

Some scholars have pointed out that when content analysis is more qualitative, such as when one is conducting various types of relational analysis, the coding used frequently becomes more subjective and open to interpretation. This has the effect of increasing error and reducing

reliability. To deal with this problem, multiple coders may be used, and interrater reliability measures may be applied.

Concluding Remarks

Overall, content analysis provides criminologists with opportunities to study, examine, and make inferences from a variety of print and other media. It allows researchers to expand their horizons and explore new concepts and new relationships among those concepts.

Conclusion

Both content and citation analysis have a variety of problems; however, these techniques also offer scholars many advantages that are not as readily available with other methods. They provide an objective method for studying both texts and the scholars who produce them. Both use existing documents, or other forms of communication, as sources of data for analysis, rather than involving human participants in research. Both have the potential to be cumulative; that is, as further documents become available for study, they may be incorporated into the research, allowing researchers the opportunity to study trends over time. Both methods are widely used in criminology, and both are somewhat controversial. However, although there is some controversy within the field as to their use, both approaches appear to be both reliable and valid, and both clearly have widespread uses within the field of criminology and criminal justice.

CRIME MAPPING

MARC L. SWATT

Northeastern University

Crime is not a random event. Criminological research suggests that certain psychological, social, or economic characteristics are associated with higher levels of criminal involvement. Furthermore, particular lifestyles and patterns of activity place individuals at a heightened risk for victimization. Crime fluctuates temporally as well: More crimes occur in the evening as opposed to the morning, on weekends as opposed to weekdays, and in summer months as opposed to winter months. It comes as no surprise that spatial patterns of crime exist as well. For example, Sherman and colleagues (Sherman, Gartin, & Buerger, 1989) found that approximately 50% of calls for service came from approximately 3% of addresses in Minneapolis, Minnesota.

Crime mapping is the process through which crime analysts and researchers use location information about crime events to detect spatial patterns in criminal activity. Early crime mapping efforts typically involved placing physical markers, such as pins, on maps to designate the locations where crimes occurred. Patterns of criminal activity were determined primarily through visual inspection of these maps. With the advances in computing, geographic information system (GIS) software, such as MapInfo and ArcGIS, enables researchers to convert geographic information (addresses or global positioning system [GPS] coordinates) into coordinates used with virtual maps. Researchers and crime analysts can then use a number of analytic software packages to examine and detect patterns of criminal activity from these virtual maps.

This chapter is designed to offer an overview of the field of crime mapping. First, the history of crime mapping is briefly discussed. After this, a brief overview of several theoretical perspectives that have been used to understand the spatial patterns of crime is provided. Following this, some of the major findings in spatial crime analyses are discussed, particularly in regard to the relevance of implementation strategies designed to combat crime. The chapter concludes with recommendations for future directions in crime mapping research.

A Brief History of Crime Mapping

Interestingly, the earliest efforts at crime mapping can be traced to the roots of the discipline of criminology itself. In the early 19th century, a number of studies examined the distribution of crime in France and England. Brantingham and Brantingham (1991a) provided an overview of some of the findings of the main studies from this era. Guerry and Quetelet mapped crimes in France at the department level and found that crimes were not distributed evenly across departments. They also found that there was stability over time in both areas with high crime and areas with low crime over time. These findings were echoed in England with studies by Plint, Glyde, and Mayhew.

In the United States, Shaw and McKay's (1942) seminal study of juvenile delinquency in Chicago made extensive use of crime maps. Shaw and McKay borrowed Park and

Burgess's (1924) ecological model and divided the city into five different zones. They found that the zone adjacent to the central business district, the *zone of transition*, perpetually suffered from the highest rates of juvenile delinquency and other social problems regardless of the specific ethnic group occupying the zone at the time. This research was instrumental in popularizing social disorganization theory and inspired a number of similar mapping projects in Chicago; Philadelphia; Richmond, Virginia; Cleveland, Ohio; Birmingham, Alabama; Denver, Colorado; Seattle, Washington; and other cities.

Accompanying these early efforts in crime mapping were developments in the profession of policing that provided additional opportunities for crime mapping. In the late 19th and early 20th centuries, the professionalization movement in policing encouraged police organizations to compile statistics documenting the extent of crime in their jurisdictions. In fact, one of the main justifications for the creation of Federal Bureau of Investigation was for the explicit purpose of documenting the extent of crime in the United States through the Uniform Crime Reporting program (Mosher, Miethe, & Phillips, 2002). During this time, many agencies began compiling crime statistics and conducting analyses of crime data. Crime mapping was primarily done using pin maps, which were very time-consuming and provided only a basic visualization of crime patterns.

The late 1960s and early 1970s were critical for the development of crime mapping. In 1966, the Harvard Lab for Computer Graphics and Spatial Analysis developed SYMAP (Synagraphic Mapping System), one of the first widely distributed computerized mapping software programs. The Environmental Science and Research Institute was founded in 1969 and in the subsequent decades emerged as one of the top distributors of GIS software, including the current ArcView and ArcGIS software packages. Also around this time, the U.S. Census Bureau began the ambitious GBF-DIME (Geographic Base Files and Dual Independent Map Encoding) project, which was used to create digitized street maps for all cities in the United States during the 1970 census (Mark, Chrisman, Frank, McHaffie, & Pickles, 1997). These advances were necessary for the development of GIS programs used in crime mapping.

The use of GIS programs for mapping has been the most important advance in the field of crime mapping. There are several important advantages in using virtual maps instead of physical maps. First, computers have dramatically reduced the time and effort required to produce crime maps. Given the relatively low cost and user-friendliness of many of these software programs, it no longer requires a substantial investment for agencies that wish to engage in crime mapping. Second, these GIS programs reduce the amount of error associated with assigning geographic coordinates to crime events. Third, virtual maps are much more flexible than physical maps, allowing researchers and crime analysts to compare the geographic distribution of crimes against other characteristics of the area under

investigation (e.g., census bureau information, city planning and zoning maps, and maps produced by other agencies). Finally, GIS and other spatial analysis software provide powerful statistical tools for analyzing and detecting patterns of criminal activity that cannot be detected through simple visual inspection.

In the mid-1970s and early 1980s, a crisis of confidence in traditional police practices emerged following the results of studies, such as the Kansas City Preventative Patrol experiment, that suggested that the police were not effective in combating crime (Weisburd & Lum, 2005). Goldstein's (1979) *problem-oriented policing* emerged as a response to this crisis and emphasized that policing should involve identifying emerging crime and disorder problems and working to address the underlying causes of these problems. Academic interests in the field of criminology also began to shift during this time. While many criminologists were concerned with causes of crime that were outside the sphere of influence of police agencies (e.g., economic deprivation, differential association, and social bonds), a number of researchers, such as Jeffery (1971), Newman (1972), and Cohen and Felson (1979), began discussing factors that contribute to the occurrence of crime that were more amenable to intervention. The combination of the shift in theoretical focus in criminology and the shift in the philosophy of policing yielded new opportunities for crime mapping and initiated a resurgence of research on both the geography of crime as well as crime prevention strategies involving crime mapping.

Although the first instances of computerized crime mapping occurred in the mid-1960s in St. Louis, Missouri, the adoption of computerized crime mapping across the United States remained relatively slow. Although a number of agencies, in particular in larger jurisdictions, became early adopters of computerized crime mapping technology, the large period of growth in computerized crime mapping did not begin until the late 1980s and early 1990s (Weisburd & Lum, 2005). The rate of adoption of crime mapping among departments greatly increased as desktop computers became cheaper and more powerful and GIS software became easier to use and more powerful. The Compstat program, which started in 1994 in New York City, emphasized crime mapping as a central component to strategic police planning and helped popularize crime mapping among police agencies. With assistance from the Office of Community Oriented Police Services and the National Institute of Justice, a large number of departments adopted computerized crime mapping practices. By 1997, approximately 35% of departments with more than 100 officers reported using crime mapping (Weisburd & Lum, 2005).

Theoretical Perspectives in Crime Mapping Research

As previously noted, the development of tools and techniques of crime mapping have been accompanied by an

expanding body of criminological theory oriented toward explaining the geographic patterns of crime. It is important, when discussing theories about the spatial distribution of crime, to distinguish between theories that explain *criminality* and theories that explain *criminal events*. Traditional criminological approaches tend to emphasize individual-level social and psychological characteristics as the main factors that lead to criminality, that is, the propensity toward committing criminal acts. These theories focus predominately on explaining why offenders engage and persist in criminal lifestyles. Alternatively, theories that discuss the spatial distribution of crime focus on explaining the patterns seen in criminal events, that is, the occurrences of crime. These theories focus less attention on the motivations of offenders and more attention on factors of the environment that promote crime.

Social Disorganization Theory

Although a number of theories have been proposed to explain why particular neighborhoods experience high crime rates, *social disorganization theory* has been the most influential. Social disorganization theory, as first proposed by Shaw and McKay (1942), can be seen as the first attempt to construct a criminological theory of place. The concept of social disorganization refers to “the inability of local communities to realize the common values of their residents or solve commonly experienced problems” (Bursik, 1988, p. 521). As such, disorganized communities suffer from diminished capacities to exercise social control and are unable to regulate the behavior of community members (see Bursik & Grasmick, 1993). As the capacity of a community to regulate the behavior of its members decreases, the potential for illegal activity increases.

A central tenet of social disorganization theory is that structural conditions within a neighborhood attenuate the social ties that promote social cohesion and enable community members to exercise social control. Economic deprivation creates undesirable living conditions that promote residential instability and population heterogeneity. Because social ties require time to form, high residential instability in neighborhoods prevents the development of social ties as residents frequently relocate (Bursik & Grasmick, 1993). In neighborhoods with high levels of population heterogeneity the extensiveness of friendship and acquaintance networks through which social control is exercised is limited because of social and cultural barriers between residents (Bursik & Grasmick, 1993). Structural factors such as these compromise the social integration of neighborhood residents and undermine perceptions of collective efficacy, that is, the collective sense of trust, social cohesion, and willingness to intervene on behalf of the public good (Sampson, Raudenbush, & Earls, 1997). Neighborhoods that have low collective efficacy are likely to experience high levels of crime.

Routine Activities Theory

Cohen and Felson’s (1979) *routine activities theory* has been applied extensively to research on spatial patterns of crime. To Cohen and Felson, crime is a predatory activity and, as such, can subsist only near patterns of legitimate activity. Therefore, to understand crime patterns it is necessary to understand the patterns of conventional routine activities around which crime is organized. Criminal victimization occurs where routine activities produce a convergence in space and time of the three necessary conditions for crime to occur: (1) a suitable target, (2) a motivated offender, and (3) the absence of capable guardians (Cohen & Felson, 1979). Felson (1998) explained that suitable targets have *value* to the offender, are *visible* to the offender, are *easily moved or removed*, and are *accessible* by the offender. The concept of guardianship has also been extended and includes *intimate handlers*, who are responsible for monitoring the behavior of offenders; *guardians*, who are responsible for protecting targets; and *place managers*, who are responsible for monitoring and controlling access to particular spaces (see Eck, 2001). In applications of this theory to spatial crime analysis, structural features of the city, patterns of land use, and the routine activities associated with particular locations can concentrate motivated offenders and suitable targets into areas with limited guardianship. This, in turn, fosters opportunities for criminal victimization.

Crime Prevention Through Environmental Design and Defensible Space Theories

A couple of important theories have been proposed to explain why criminal events occur more frequently at particular sites. Jeffery (1971) was one of the first criminologists to suggest that immediate features of the environment affected crime, with his Crime Prevention Through Environmental Design (CPTED) approach. This approach emphasizes target hardening and surveillance. Contemporaneously, Newman (1972) also emphasized the role of the environment in creating crime with his *defensible space theory*. Newman argued, in regard to public housing, that it is possible to design the use of space to enhance territorial functioning and to improve the natural surveillance in these environments. Crowe (2000) expanded on both Jeffery’s and Newman’s initial theories. In the current formulation of CPTED, Crowe discussed three strategies that are used to prevent crime: (1) access control to prevent contact between the offender and the target, (2) surveillance to monitor areas and discourage offenders, and (3) territorial reinforcement to promote feelings of ownership among users of the space. CPTED is usually employed along with situational crime prevention (discussed in the next section) to formulate practical strategies for reducing crime.

Rational Choice Perspective and Situational Crime Prevention

The *rational choice perspective* (Cornish & Clarke, 1986) is primarily concerned with understanding offender decision making. This approach assumes that offenders possess *limited rationality*, meaning that they make rational calculations of the costs and benefits associated with crime but are constrained in their decision making by time, information, context, ability, and prior experiences. This perspective seeks to understand the series of decisions made by the offender that result in a criminal event. Interestingly, unlike many other theories of offending, the rational choice perspective emphasizes that different decisions are involved in the production of different types of crime. Rational choice explanations of criminal offending differ by crime type, instead of ignoring these differences in favor of a general motivation toward engaging in crime, as is common in many other criminological theories. Spatial applications of the rational choice perspective emphasize offender movement, search patterns, and target selection processes that determine the spatial patterns observed in crime.

Situational crime prevention (Clarke, 1997) refers to the application of the rational choice perspective toward developing policy recommendations to reduce crime. Situational crime prevention emphasizes situational-level interventions toward increasing the efforts associated with committing a crime, increasing the perceived risks for engaging in crime, reducing the anticipated rewards from crime, and removing the excuses associated with crime (Clarke, 1997). As with the CPTED and defensible space theories, the policy applications of situational crime prevention focus on practical strategies that are customized to specific settings. Although the successes of this approach are well documented, rarely do the methods used in these studies permit broad conclusions regarding the effectiveness of this approach at reducing crime (see Clarke, 1997, for a discussion).

Crime Pattern Theory

Brantingham and Brantingham (1991b, 1993) developed a perspective referred to as *crime pattern theory* that incorporates elements of the rational choice, routine activities, and other spatial perspectives on crime. According to this perspective, individuals create a cognitive map of their spatial environment with which they are familiar through their routine activities. The action space of an individual consists of (a) *nodes*, the destinations of travel, such as work, home, and entertainment locations, and (b) *paths*, the travel routes that individuals take to move from one node to another. Through repeated movement along paths to various nodes, individuals develop an *awareness space* consisting of the areas in a city with which they are familiar. According to this theory, offenders search for suitable targets primarily within this awareness space by comparing potential targets against *templates*, or mental conceptualizations of the characteristics of

appropriate targets. The likelihood of a particular target being selected by an offender dramatically decreases as an offender moves away from his or her awareness space, a process often referred to as *distance decay* (see Rengert, Piquero, & Jones, 1999). One interesting application of this theory is geographic profiling, which attempts to narrow the scope of police investigations by using information on repeated crimes to identify the awareness space of a repeat criminal (see Rossmo, 2000).

Spatial Crime Research and Planning Interventions

Hot Spots

As previously indicated, a large number of studies have demonstrated that criminal events are spatially concentrated. Although the extent of concentration differs between studies, all empirical evidence suggests that a small number of places account for the majority of crime within any given city. Sherman and colleagues (1989) popularized the term *hot spot* to describe these areas where crime is concentrated. The detection and explanation of these hot spots is a major concern of research in crime mapping. Hot-spot analysis is currently very popular among police agencies because it provides a method to coordinate interventions in emerging problem areas.

A number of studies have demonstrated the benefits of hot-spot analysis to help coordinate police responses to crime. For example, in a randomized experiment in Minneapolis, Sherman and Weisburd (1995) found that concentrated patrol efforts in hot-spot areas produced a significant decline in calls for service. Police responses to crime are not limited to enhanced patrol. In another randomized experiment in Jersey City, New Jersey, Weisburd and Green (1995) found that after identifying drug market hot spots using crime mapping, a coordinated policy of engaging business owners and community members coupled with police crackdowns yielded substantial decreases in disorder calls for service. In fact, a recently conducted meta-analysis on street-level drug enforcement indicated that approaches that focus on community-police partnerships in drug market hot spots were more effective than enforcement-only approaches (Mazerolle, Soole, & Rombouts, 2006). This suggests that the best approach is a coordinated strategy between police officers and community members toward reducing crime in identified hot spots.

Community-Level Factors Affecting Crime

When designing strategies to address crime in hot-spot areas, it is important to consider the community context that contributes to emergence and maintenance of hot spots. Neighborhood-level research on spatial crime patterns helps illuminate the factors associated with heightened levels of

crime. As previously mentioned, economic deprivation, residential mobility, and population heterogeneity all contribute to higher levels of crime in a neighborhood by impeding the development of social ties between residents (Bursik & Grasmick, 1993). Family dissolution and inadequate supervision of adolescents also contribute to increased levels of crime. In fact, the presence of unsupervised adolescents in a community is an important predictor of violent crime in a neighborhood (Veysey & Messner, 1999). Rose and Clear (1998) suggested that prior crime policies that result in mass incarceration may also impair community functioning, because in some communities this represents a substantial loss in the social and human capital on which informal social control depends.

Although many of the structural factors contributing to social disorganization remain outside the control of police agencies, such as concentrated disadvantage and high residential mobility, it remains possible to design interventions to increase social integration and improve collective efficacy. Community policing emphasizes community involvement in responding to crime problems through the creation of police–community partnerships, which should both increase community access to public social control and foster improved trust between community members and police officers. Furthermore, programs designed to increase community integration through increasing resident involvement in local agencies should be helpful in fostering the development of social ties and increasing perceptions of collective efficacy. Finally, if Rose and Clear (1998) are correct, community corrections and offender reintegration efforts should alleviate some of the impact of the mass incarceration policies that have removed offenders from the community. Bursik and Grasmick (1993) provided an extensive discussion on various community-based interventions and provided suggestions for how to improve these programs.

In addition to the previously discussed factors, a fair amount of research has examined the effects of incivilities on crime and the fear of crime within a community. Incivilities, such as poorly tended residences, the accumulation of refuse, graffiti, and public loitering and drunkenness, are signs of disorder. A number of studies have demonstrated that the presence of incivilities in a neighborhood is associated with increased levels of serious crime and with heightened fear of crime among community residents (see Skogan, 1990). Sampson and colleagues (1997), however, suggested that this relationship is spurious and that crime and incivilities result from the same underlying causal process, namely, a lack of collective efficacy. Although the causal role of incivilities in producing crime is in doubt, they may still function as leading indicators of potential crime problems, meaning that mapping incivilities may provide information on communities where hot spots may be emerging.

City Features and Crime Locations

In truly comprehensive strategies for addressing crime in hot-spot areas, it is important not only to examine neighborhood-level factors that contribute to the emergence

of a crime hot spot but also to consider microlevel place characteristics that promote crime. As Sherman and colleagues (1989) noted, even within high-crime neighborhoods there is substantial variability in the levels of crime. Some places within these neighborhoods experience very low levels of crime, whereas other places are responsible for a substantial amount of the crime.

A number of studies have demonstrated that hot spots of crime tend to emerge around particular features of the urban environment, such as bars and taverns (Roncek & Maier, 1993), fast food restaurants (Brantingham & Brantingham, 1982), schools (Roncek & Faggiani, 1985), public housing (Roncek, Bell, & Francik, 1981), vacant buildings (Spelman, 1993), and public transportation (Block & Davis, 1996). These locations may promote crime by juxtaposing motivated offenders and suitable targets in the absence of capable guardians. Furthermore, the pattern and timing of criminal events in these areas follow the rhythm of legitimate social activity in these areas. For example, crime around bars is more common during evenings and weekends, because more legitimate patrons visit bars during this time. Crime is more common around schools during the school year and after school, because many students interact at this time near school grounds without teacher or parental supervision. Understanding the relationship between the pattern of legitimate social activity and criminal activity around these areas allows researchers and policymakers to design suitable crime prevention strategies.

In addition to identifying the location and timing of criminal events at particular sites, it is important to discern the mechanism through which these areas produce criminal opportunities. Brantingham and Brantingham (1993) discussed the differences between crime generators and crime attractors. *Crime generators*, such as transit stations, foster criminal activity by bringing both victims and offenders into a location. On the other hand, *crime attractors*, such as bars and taverns, tend to bring higher proportions of offenders into an area because these locations are tied to patterns of illicit activity. It is important to discern whether a given location functions as a crime generator or a crime attractor, because the appropriateness and effectiveness of intervention strategies may differ by type of location.

There is no shortage of practical policy recommendations for reducing or eliminating criminal opportunities around hot-spot areas. Clarke's (1997) situational crime prevention model offers a set of 16 different opportunity-reducing strategies. Among those most applicable to location-based interventions are controlling access and entry/exit screening; improving surveillance by officers, civilians, and citizens; deflecting offenders by disrupting routines that promote crime; and facilitating compliance with rules. Use of these strategies to control opportunities for crime may help reduce the risks of victimization in hot-spot areas.

Crime Displacement

Unanticipated consequences are always a concern when designing an intervention. For interventions in crime hot

spots, crime displacement is of particular importance. After the intervention is implemented and crime opportunities are reduced, it is possible that offenders simply relocate their activities to areas outside the intervention site. For example, if a police crackdown on drug trafficking is initiated at a particular intersection that is a hot spot for drug dealing, it is possible that offenders will simply move to a nearby intersection, and drug sales will continue. Other types of crime displacement, such as offenders committing crime during different times, offenders selecting different targets, or even offenders committing different types of crimes, also are possible. Given the wide ranges of different responses that might constitute crime displacement, it is difficult to conclusively demonstrate that crime displacement did not occur during a particular study. For this reason, any researchers or policymakers implementing place-based intervention strategies should be keen to the possibility of crime displacement. Fortunately, the empirical literature on crime displacement is decidedly mixed, and it appears that many interventions do not lead to appreciable crime displacement effects (see Clarke, 1997, for a discussion).

Future Directions and Challenges in Crime Mapping

On the basis of the current research on the spatial patterns of crime, a number of avenues of research in crime mapping are worth exploring. Obviously, a major focus for future research in this area will be further development and refinement of the tools needed in crime mapping studies. Although not discussed in this chapter, there are substantial methodological and analytic difficulties that remain in crime mapping research. Beyond this, however, there are a number of substantive research avenues in crime mapping that are worth pursuing.

A first avenue of research is the further development and integration of theories of the spatial distribution of crime. Although there have been some efforts at integrating social disorganization and routine activities theories (see Miethe & Meier, 1994), additional work remains. These theories share considerable conceptual overlap, and linking the two should provide a more comprehensive framework for understanding the relationship between crime at the macro- and microlevels. Furthermore, the criminal events perspective (Meier, Kennedy, & Sacco, 2001; Sacco & Kennedy, 2002) provides a mechanism to link other theories of criminality with theories of criminal events. To date, the implications of other theories of criminality for understanding the spatial distribution of crime remains unexplored and may provide useful insights into offender search patterns and the selection of targets and locations.

A second area of research that would be very helpful in regard to policymakers is expanding crime mapping to include additional justice agencies. The vast majority of research in crime mapping has used calls for service and crime report data, and most applications of crime mapping have been applied to police decision making. Researchers

should consider broadening the scope of crime mapping efforts to incorporate data from other justice agencies. In a practical sense, mapping efforts involving other agencies can provide assistance with managing caseloads and coordinating the distribution of services. For example, mapping the residences of parolees and probationers can help agencies optimize caseloads and improve the process of referring ex-offenders to nearby treatment facilities. In addition, novel data can provide new measures of concepts that are commonly used in geographic research, raise interesting research questions, and possibly introduce new avenues of research.

A third potentially fruitful area of research would involve increased attention to the differences between types of city features and the production of criminal events. As previously discussed, it is well established that certain city features tend to concentrate criminal events in adjacent areas. What remains to be seen, however, is how other spatial and community features contribute to differential spatial patterns of crime. For example, it is not entirely clear why some bars suffer from high levels of crime problems and others do not. Obviously, design features of the location itself should account for some of the differences, but other features, such as the level of community organization, adjacent land usage, and the level of concentration of other crime generators or attractors, may also be important for differentiating between problematic and nonproblematic bars.

A final recommendation for future research on spatial patterns in crime is to further examine the stability of crime in small areas. Specifically, as Weisburd, Bushway, Lum, and Yang (2004) recognized, few studies have examined the degree to which crime in microlevel areas is stable over time. In their study, conducted in Seattle over a 14-year period, Weisburd et al. found that there was a substantial amount of stability in the level of crime on street segments. Despite the high degree of stability in many places, some street segments exhibited either downward or upward crime trajectories. Obviously, additional research is needed to determine whether this pattern holds generally or is specific to the city of Seattle. This type of research will be very helpful in describing the factors that lead to the development, maintenance, and decline of crime in problematic areas.

Conclusion

The purpose of this chapter was to review some of the current research on crime mapping, the process through which crime analysts and researchers use location information about crime to detect spatial patterns in criminal activity. Although the history of crime mapping can be traced to the beginnings of the field of criminology, it is only recently that researchers and crime analysts have been able to engage in extensive mapping efforts, primarily due to the development of the desktop computer and GIS software. The emergence of the problem-oriented policing model,

along with advances in the theory of criminal events, created a niche for crime mapping in police agencies. The popularization of computerized crime mapping through the Compstat program in New York led to a period of rapid adoption of crime mapping that continues today.

Several theories that are widely used in crime mapping research were also discussed in this chapter. Social disorganization theory argues that structural factors can compromise the social networks needed for social integration, which in turn reduces the capacity of communities to regulate the behavior of its members. Routine activities theory states that crime can be understood through the convergence in time and space of suitable targets, motivated offenders, and the absence of capable guardians. Defensible space and CPTED focuses on how the design of a physical space can prevent crime through increasing territorial functioning and enhancing surveillance capabilities. The rational choice and crime pattern theories of crime focus primarily on explaining how patterns of offender routine activities and target-searching strategies can increase the level of crime in particular areas. Taken together, these theories provide the conceptual backdrop for understanding the spatial distribution of crime and designing strategies to combat crime in high-crime areas.

Finally, this chapter aimed to elaborate on some of the major findings in crime mapping and spatial crime research, with particular attention to designing strategies to combat crime problems. It was argued that the best strategy for eliminating crime hot spots requires consideration of causal factors operating at both the neighborhood and site levels. This chapter concluded with a number of suggestions for future researchers examining spatial crime patterns through crime mapping. In particular, crime mapping research may benefit from efforts at theoretical integration, using crime mapping with additional agencies, further examining the source of differences in the production of criminal opportunities between city features, and examining the stability of crime areas over time.

EDGE ETHNOGRAPHY

RICHARD TEWKSBURY

University of Louisville

E*dge ethnography* is an approach to the conduct of qualitative research that pushes the limits and tests the skills and tolerances of researchers in exploring marginalized populations and deviant and dangerous settings and groups, and requires researchers to voluntarily take risks. Edge ethnography is practiced by a small proportion of criminologists, criminal justice scholars, and all social scientists. The goals of edge ethnography are to gain an in-depth and detailed understanding of groups, settings, and activities that are not necessarily available or accessible to either empirically based quantitative researchers or traditional qualitative researchers (including ethnographers). Because of the marginalized status of the typical foci of edge ethnography, and the necessity of gaining and demonstrating full immersion in the world(s) being studied by the edge ethnographer, there is a de facto need for scholars who practice this approach to engage in behavior that is physically, legally, socially, or otherwise dangerous.

Edge ethnography is a method of social science that emphasizes understanding deviant groups and settings through the process of risk taking, researcher immersion in the culture or setting being studied. Edge ethnography is scholarship that is done on, in, and with populations and subcultures that are in some way physically, emotionally, psychologically, or socially dangerous and in which those persons involved in the social world being studied are at risk of (usually official or legal) sanctioning for their behavior.

Edge ethnography also is the qualitative data collection and analysis approach that is used by social scientists conducting edgework. As defined by Lyng (1990), *edgework* is the realm of activities that “involve a clearly observable threat to one’s physical or mental well-being or one’s sense of an ordered existence” (p. 857). Conducting edgework not only involves individuals (in this case, researchers) placing themselves in dangerous settings, actions, and interactions but also requires individuals to apply specialized skills for survival (or safe management of the dangers present). As such, edgework pushes individuals to test their limits, their skills at managing dangers, and their attempts to control dangerous situations so as to control what others may perceive to be uncontrollable situations.

For researchers, ethnographic projects regarding edgework mean that while experiencing and attempting to control some form/variety of danger, the individual needs to filter and navigate myriad relationships while charting the networks of relationships and interactional processes and products arising from culturally and situationally specific environments. The edge ethnographer seeks to use his or her methodological and insight skills to understand and explain worlds in which danger (of some form) is paramount and a defining element of the situation.

Edge ethnography methods are also one of the several approaches to research that make up the field of cultural criminology. As the study of stylized frameworks and experiential dynamics of marginal, deviant, and illicit subcultures

and practices, cultural criminology is focused on understanding, among other issues, the “subtle, situated dynamics of deviant and criminal subcultures” (Ferrell, 1999, p. 396). In this regard, as cultural criminologists attempt to define, delineate, and deconstruct the ways, ingredients, and products of such worlds, they find that it is necessary to study such from the inside. In this way, building on the anthropological traditions of ethnography, edge ethnography necessitates entry, immersion, movement, and experiencing of the dangerous, illicit, or marginal worlds that are studied. Ferrell (1999) explained the study of such worlds:

[It] necessitates . . . a journey into the spectacle and carnival of crime, a walk down an infinite hall of mirrors where images created and consumed by criminals, criminal subcultures, control agents, media institutions, and audiences bounce endlessly one off the other. . . . as part of this exploration, [cultural criminologists] in turn investigate criminal and deviant subcultures as sites of criminalization, criminal activity, and legal control. (p. 397)

Tying together the issues of cultural criminology and methods for studying them is the sociological concept of *verstehen*. As originally defined by Weber (1964), *verstehen* is the idea of knowing something from the inside. To achieve *verstehen* is to be able to have an appreciation of the subjective reality of some phenomenon. Rather than attempting to understand an experience, structure, process, or culture based on objective, external observations (or measurements), the focus in such an approach is to use experience, with an emphasis on understanding, not explaining. When applied to the conduct of research, sociological *verstehen* refers to researchers focusing on the subjective components of what is being studied (crime; criminals; and criminal, deviant, or marginalized subcultures). Put a bit differently, *verstehen* (as a goal of edge ethnographers) is the systematic process of achieving understanding by a researcher who, while initially and objectively is an outside observer of a setting or phenomenon, interacts with a subculture’s population and combines his or her scholarly training with the point of view of those on the inside of that subculture. Therefore, *verstehen* is typically used to refer to either a kind of empathic or participatory understanding of social phenomena rather than an ostensibly objective interpretation of such persons in terms and from the perspective of an outsider. In this regard, this means that the situational meanings of the ingredients of the people, places, and actions being studied and the emotions that are elicited for those being studied and conducting the study are assessed within situated environments.

In short, edge ethnography as a practice requires researchers to gain access to the inside of worlds that are typically thought best viewed from afar and controlled or eliminated rather than experienced. Edge ethnography strives to overcome the barriers perceived to keep respectable and reputable persons away and instead emphasizes the need and

importance of getting inside—to achieve understanding by means of *verstehen*. The edge ethnographer seeks to know the deviant, to know the deviant individual’s world, and to know how it feels not only to be a part of the deviant/illicit world and behavior but also to be known as a deviant by the outside world.

In regard to products, edge ethnography most often contributes case studies or analyses of limited generalizability. Because one of the foci of the edge ethnographer is the cultural world in which particular forms and mixes of people, places, experiences, and thereby yielded cultures are found, the traditional social science criteria of studies outputting findings, facts, and interpretations that can be similarly applied to other samples, populations, or settings is not necessarily appropriate. Instead, edge ethnographers, and cultural criminologists more generally, offer analyses and interpretations of very unique subcultural worlds. However, when accumulated and viewed as individual contributors to bouquets of studies, it becomes possible to identify conceptual and theoretical patterns across the case studies and sample-restricted analyses.

The focus of edge ethnography—understanding dangerous and socially marginalized groups, settings, and experiences from the perspective of an insider—builds on traditional ethnographic methods while also focusing on defining elements of the culture of such groups, settings, and experiences. As such, edge ethnography necessarily draws on the extremes of qualitative methods so as to access and gain understandings of precise meanings of symbols, language, behaviors, values, and experiences. Edge ethnographers look to understand these cultural ingredients within the cultural milieu that center on some form of danger whereby the various ingredients are produced, reproduced, experienced, and consumed. However, whereas traditional qualitative approaches may prioritize the ingredients and understandings of them, the edge ethnographer either dismisses this prioritization or complements it with an inverted prioritization, simultaneously prioritizing the cultural milieu as well as the situated ingredients. This is all done while experiencing and seeking to safely navigate and manage the dangers posed to the researcher as a participant in the world being studied.

Edge Ethnography Involves Voluntary Risk Taking

As a willing and active participant in the world being studied, the edge ethnographer voluntarily engages in risk-taking behaviors. This is typically conceptualized in terms of activities known as *edgework* (Lyng, 1990), a form of voluntary risk taking that involves individuals participating in high-risk forms of behavior and gaining the benefits of experiencing a (near) loss of control of situations and a blending of chaos and order. Edgework

includes activities such as skydiving, some forms of underwater diving, a range of types of vehicular “tricks,” experimentation with drugs, some forms of crime, and other extreme forms of behavior.

Scholars who study these forms of behavior, the people who engage in them, and the ways that these activities are experienced can do so in one of two general ways. First, they could take a traditional, positivist approach and construct a survey about the activity, people, and the experience and then try to find and administer surveys. These data could tell one about some predetermined aspects of the behavior and people but would probably be rather dry, superficial, and not very informative about the experience. The second way that scholars could seek to better understand such activities, people, and experiences is to actually find the activities/people and join in with them. In this way, the researcher would not only be engaging in ethnographic research, but, if he were to actually engage in the (dangerous/risky) behaviors, he also would be doing edge ethnography. The advantages of this approach over a more traditional, positivist approach to research are that, first, the researcher is able to get information about the activities and people that he did not anticipate before the study, and, second, the actual experience can be studied from the perspective of an insider. In addition, by fully immersing himself or herself in the setting and population being studied, and essentially becoming a new member of the group and social world that is the focus of the study, the edge ethnographer is able to access information at a depth and in detail that is highly unlikely to be available to scholars practicing more traditional forms of (qualitative) research.

The depth and detail that are available to the edge ethnographer is clearly seen in Tewksbury's (2002) study of men's sexual presentations and interactions in gay bathhouses. While not a criminal justice issue, but clearly a topic and issue in the study of social deviance, human sexuality, and public health, Tewksbury provided a discussion of depth and detail that would not be available to either empirical or traditional qualitative scholars. As a case in point, the discussion of how men initiate, negotiate, and move from no interaction to sexual coupling through “conversation” shows the detail to which an immersed edge ethnographer is privy:

The primary modes of communication among bathhouse patrons are nonverbal forms of communication. This includes gazes and looks, touch and gestures, and body language. Each of these communication modes is used to indicate interests, sexual preferences, and an individual's commitment to both current activities (or lack thereof) and desire for making sexual contact with particular others.

The most subtle, yet perhaps most constant, means by which men present messages and seek to establish “conversations” with other men in bathhouses is through directing, holding, and shifting of gazes. Where a man directs his gaze is an important means of communicating interest (or lack of interest) in another man, or sexual activity in general. When an individual is interested in another man he will look at him.

On the initial level it does not matter how one looks at another, or where on another's body one looks; to direct a gaze at another individual communicates an interest in communicating, and possibly sexually connecting.

While it may be sufficient for communicating a general interest in another (and possibly a sexual exchange) to simply gaze at or toward another man, the direction and placement of one's gaze communicates more specific messages. Gazes directed toward and held on another man's eyes or crotch are especially informative communications. When a man directs a held gaze at another man it conveys a message of either general or specific sexual interest. A gaze into another's eyes expresses a desire to make a connection, without specific sexual activities intended. However, when a man holds a gaze on another's eyes, and strokes, gropes, or otherwise draws the gazed-upon object's attention to a location on the gazer's body this is an indication of the type of sexual activity that one is seeking. Men also communicate specific sexual desires by where they direct their own gaze. A look directed and held at a specific location on another man's body indicates a desire to have sexual contact with that area of the gazed-upon individual's body.

Commonly accompanying communicative gazes are gestures and body language. Sexual interests communicated via gestures typically involve movements of a hand or the head. Meaningful gestures include hand waving for a man to come closer (or enter a private room into which he is gazing), rubbing or caressing of one's own body, and nods of the head indicating a direction for another to move.

Gestures are most commonly employed when an individual seeks to communicate with a specific man, but attempts to do so when in the presence of multiple others, or when he wishes to conceal his message from others. Gestures are silent and can be employed without the knowledge or notice of others nearby. (Tewksbury, 2002, pp. 102–104)

Details and depth of explanation are a key contribution that edge ethnography can make. It is only because of the researcher's total immersion, and acceptance by others as being a legitimate part of the setting, that the edge ethnographer is able to get to the depth and detail that are available.

A second hallmark of edge ethnography is that the research might involve activities that are not necessarily dangerous in and of themselves but that put the researcher (voluntarily) into risky situations (immediate and perhaps long-term, professional) and contexts. This may mean going to a cultural setting and therein interacting or being exposed to situated actors who may pose (potential) threats to the researcher in physical, psychological, emotional, and/or social ways, or it may mean studying topics that are unpopular or socially stigmatizing. Tewksbury (2004) showed how the study of men's participation in public sexual activities with other men has been limited by scholars avoiding the topic because of courtesy stigmas that are often attached to the people who show any degree of interest in the topic. This form of professional danger can have potentially serious impacts on the careers of scholars.

For some edge ethnographers, the dangers of their work has included having one's research materials seized and being arrested (Sonenschein, 2000), being jailed for failing

to disclose confidential information learned through edge ethnography (Scarce, 1995), physical danger of injury/death (Fleisher, 1989; Jacobs, 1999, 2000; Williams, Dunlap, Johnson, & Hamid, 1992; Wright & Decker, 1997), threat of sexual victimization (Inciardi, Lockwood, & Pottiger, 1993), pressure to use illicit drugs (Tunnell, 1998), high levels of emotional distress (Johnson, 1997), and professional stigmatization/ostracism (Israel, 2002).

Differences Between Edge Ethnography and Traditional Qualitative Research

Additional differences between edge ethnography and traditional qualitative research include that the practitioner is often seen as a person of questionable moral value, or at the very least “different” from the mainstream of social scientists. The edge ethnographer is one who acknowledges, usually accepts, and often embraces the stigma (as a form of social danger) that comes from being known as one who is comfortable with and at ease being in, around, and a part of the deviant and illicit worlds that provide him or her real data and perspectives. Scholars working with vulnerable, disreputable, and/or socially ostracized populations are often considered by other scholars as sharing in the stigma (and perhaps deviant activities) of those whom they study.

One important consequence of this stigmatization of scholars who engage in edge ethnography is that these topical foci may be avoided by scholars, or pursued only by those who do not see the stigmatization as a major restriction on their careers. Tewksbury (2004) showed this in his examination of research that built on the classic work *Tearoom Trade* (Humphreys, 1975). The study of men who have sex with men in anonymous, public encounters has been slow to be expanded and elaborated on, and, of the limited works that have pursued similar methodologies and foci, Tewksbury (2004) made an astute observation:

For researchers interested in impersonal sex, simply pursuing the issue gives rise to questions of ethics for some observers. If the researcher is immersed in a world of impersonal sex, why would the researcher not be expected to “get some” while there? Such are questions that many observers ask of those who do research in sexual environments. (pp. 49–50)

Although specific to sex research, this same questioning is common for scholars involved in any marginal topic research.

A second important difference of edge ethnographic work is that the work itself is recognized by practitioners as both a political pursuit and a personal endeavor. Because edge ethnographers emphasize cultural immersion and experience, their work is by definition a personal endeavor, one that may deeply influence their own sense of self and perspective on the world. Relatedly, edge ethnography is political in that the mere pursuit of understanding of some

worlds is defined by observers (and perhaps by practitioners) as a political pursuit. To grant the legitimacy of simply being worthy of study to deviant, illicit, and marginalized people and practices is to make a political statement. To approach such people and practices from a position that does not presuppose control, quarantine, or sanction is to be political. And, to present oneself to the world (or, at least to the academic world) as one who values such worlds enough to see merit in their investigation is to present oneself to the (academic) world in a political way.

Third, edge ethnography diverges from many (although not all, especially not feminist) qualitative methodologies in that the experience of the researcher himself or herself is of value and contributes to the theoretical and substantive understanding of the worlds studied. Edge ethnography is emotional in that one’s emotions not only are influenced by the practice of the research but also are seen as reciprocally influential on those worlds. In addition, emotions and the researcher’s emotional responses to the people and practices studied are informative for understandings. This is not to suggest that traditionally qualitative, especially ethnographic, methodologies are not emotional or do not draw on emotions, for anyone who has engaged in such work knows that they surely do. But, to a different degree, and in greater depth, for the edge ethnographer—much as is also the case for the feminist methodologist—emotions are important ingredients in the world of study.

This point was well illustrated by Kraska (1998) in his study of police paramilitary units, a population whose values Kraska rejected and believed he opposed when he began his work. However, as he reported, the experience was often enjoyable, and he came to question his original positions and perspectives on the paramilitary groups as he become more and more enmeshed:

My ethnographic experience is more complex than the characterization “enjoying militarism” might suggest. In actuality, I drifted back and forth between enjoyment and alarm. I felt enjoyment when I forgot myself and became fully immersed in the intensity of the moment, unintentionally bracketing my ideological filters. . . . Discomfort and sometimes distress came at those times of broader consciousness where even split-second moments of reflection allowed for impositions of meaning. . . . Several aspects of the research experience, then were pleasurable or satisfying. . . . Many of these men were repulsive ideologically, but (outside my research objectives) I enjoyed their approval as filtered through their hypermasculine standards. (p. 89)

A fourth way in which edge ethnography, in fact most ethnographic work in general, differs from traditional social science (e.g., quantitative methodologies) is that it tends to be an approach that is taken independently, by solo scholars and authors. A cursory look at the types of methodologies employed by collaborations of authors and authors working independently demonstrates this point well. First, a review of all 290 articles and review articles published in the *Journal of Contemporary Ethnography*

between 1998 and 2007 shows that fully 77% of articles are authored by one person, 18% of articles have two authors, and only 5% have three or more authors. In the *Journal of Quantitative Criminology* for the same 10 years, only 27% of articles are solo authored, 35% have two authors, and 38% have three or more authors. The mean number of authors per article in the *Journal of Quantitative Criminology* is 2.3, whereas in the *Journal of Contemporary Ethnography*, the mean number of authors per article is only 1.3. Similarly, Tewksbury, DeMichele, and Miller (2005) reviewed all articles published in the top five criminal justice journals between 1998 and 2002 and showed that articles about research in which qualitative methods were used have a mean of 1.96 authors, compared with a mean of 2.6 for quantitatively oriented articles. Although edge ethnographic works are not identified in either of these studies, the fact is that edge ethnography is relatively rare in the social sciences; however, the data about qualitative work in general make the point well that such work is typically done by individual authors (or at least by smaller collaborations of authors).

Publication of edge ethnography works can be a challenge for scholars who do this work. Because of the stigmas attached to the research topic (and sometimes the researcher); the difference from mainstream, quantitative studies; and the occasional questions about ethics, validity, reliability, and generalizability, many traditional social science outlets may be less than warmly welcoming to edge ethnography manuscripts. As a result, these types of works tend to appear as books; in “specialty” journals; and, more often than not, in lower-tier journals. This is not to suggest that there are inherent weaknesses or less value in such works. However, there are barriers that can make the publication of such works more challenging than for traditional works, whether ethnographic or quantitative in nature.

Because of the role that experience and emotions (as well as stigma) play in edge ethnographic work, it is challenging (although not impossible) to envision ways for research teams to engage in such work collaboratively. With immersion in dangerous, illicit, and marginal worlds that draw on how the ethnographic work is experienced, this is a style of scholarship best suited for the independent scholar. For these reasons (and certainly others), ethnographic work—especially edge ethnography—is differentiated from other scholarly pursuits and products by the norm of solo authorship.

How to Conduct Edge Ethnography

The actual conduct of edge ethnographic work builds on the processes of traditional qualitative, ethnographic processes but adds in the reflexive aspect of knowing an experience from the perspective of an insider. In this regard, the edge ethnographer needs to identify a group/place of study; enter and interact with the persons in the study site; establish a positive, productive relationship with “natives”; and be present

and interact with the study site population while carefully observing and recording the activities, processes, presented attitudes and values, and ways of life in the setting.

Some aspects of the conduct of edge ethnography are typically more easily accomplished than they are for traditional ethnography projects, and others may be more challenging. For many edge ethnographers the challenge of identifying and initially entering the study site precedes the initiation of the study. Many edge ethnographers study settings, people, and social worlds with which they already have some degree of familiarity and perhaps involvement. When the people and their activities are already known to the edge ethnographer, the challenges of entering and beginning interaction is likely to be easily completed. Establishing a positive; productive; and, one would hope, trusting relationship with the individuals being studied can be a significant challenge for any ethnographer. Regardless of whether one is conducting edge ethnography or traditional ethnography, there are likely to be suspicions, resistance, and wariness on the part of the people being studied when they learn that they are the subject of study. There are a number of ways to overcome such reactions and to establish rapport. Although there is no single recipe, there are a variety of approaches and roles that an edge ethnographer can pursue to facilitate this goal (see Tewksbury & Gagné, 1997).

The actual task of data collection—observing and assessing actions and interactions as they occur, and taking notes while doing so—is a challenge for all ethnographers and perhaps an especially significant challenge for the edge ethnographer. Whereas the traditional ethnographer is challenged by entering a world that is largely foreign, unknown, and “exotic,” the edge ethnographer usually operates in a world that is local; familiar; and, because the ethnographer knows it, mundane. As such, the tasks of observing and identifying important structural, process-related, and values-communicating aspects of the study site can be especially daunting. What edge ethnographer sees, she has seen before, she knows, and she is experiencing. To accomplish the scientific goals of an edge ethnography project, then, requires an ability to step out of one’s role as an immersed participant, maintain the appearance of being in the role, and essentially juggle the tasks of observing and recording while still “doing” the actions of the setting without allowing the doing to impede on the objective tasks of seeing and recording.

Edge ethnographers may conduct their research either overtly or covertly. When operating overtly, the other members of the settings where the research is being conducted know of the researcher’s role as a researcher and are aware that a study is being conducted. In other instances, especially in highly stigmatized groups or settings, and when the behaviors being studied could lead to legal or other formal sanctions against those engaged, edge ethnographers may find it more beneficial (although perhaps also more stressful) to do their research essentially undercover. Such covert practices, which are sometimes criticized as unethical for the failure to provide research subjects with full

disclosure of their role in a study, are debated among academics. A number of types of settings and situations where covert approaches are not only best, but perhaps the only available means of accessing information have been identified (see Jones, 1995, & Miller, 1995).

One alternative approach to data collection in edge ethnographies, which allow researchers to (somewhat) manage the stigmas and other negative fallouts that may accompany such projects, is to participate in the setting of study as a potential participant. Tewksbury (2006), explained the role of the potential participant:

[It] combines aspects of complete observation, complete participation and covert observational research designs. Whereas the researcher adopting a potential participant role seeks to appear to those being researched as a “real” setting member, the “science” activities are conducted in covert manners. To anyone noticing the potential participant, the researcher is a real member of the setting being studied. To the scientific community, the potential participant is a complete observer, acting in a covert manner *inside* the research environment. (p. 6)

In short, in the potential participant role, the researcher enters and immerses himself in the marginalized, dangerous, or otherwise stigmatized community, presenting himself as if he is a full participant, while actually only pretending to be participating. The role is important for simultaneously maintaining ethical standards (and perhaps personal safety, health, and psychological or emotional health) while also accessing the activities and interactions of the settings’ participants fully.

The potential participant role is not unique to the conduct of edge ethnography, but it is one available means of collecting data while also attempting to minimize and control the possible negative consequences (as discussed earlier) that may accompany such projects. Some edge ethnographers, however, believe and advocate that the only way to access valid and reliable data in edge ethnographic ways is to truly participate in study settings’ activities. This may mean stretching the researcher’s boundaries and limits and perhaps involve violating personal values and beliefs, or the law.

As an example of how such total immersion may be necessary and/or valuable for such approaches, Tunnell (1998) argued that, in order to establish rapport, gain trust, and access valid data, the edge ethnographer needs to “become” like those he is studying and with whom he is interacting:

There I was, in the living room of a twice-convicted felon, an ex-con, surrounded by electronic and decorative items collected from previous burglaries, smoking dope, and being made privy to this recent crime. There was something surreal about this, but also something deviant, for I was actively engaging in a crime of ceremony with him and hearing of his wrongdoings after prison. Perhaps turning off the tape recorder and turning on with him were necessities for establishing that level of trust, closeness, and rapport. After we

returned to the recorded interviewing, he seemed more relaxed, up front, reflective, and at the same time, less cautious than earlier. I felt that I came away with some excellent data made possible by a connection established through methods other than those promulgated by hard science, objectivity, and researcher neutrality—a connection lubricated by weed and drink. (p. 207)

Others have argued, and shown through reported findings, that participation in marginal types of activities may be important for demonstrating one’s commitment to a project and to the maintenance (rather than attempt to control or eliminate) of a subculture, at least in the eyes of those who are native to the study site. DeMichele and Tewksbury (2004) studied the role and activities of the bouncer in strip clubs and showed that as an immersed researcher, it is necessary to engage in violence, make derogatory (perhaps sexist, racist, ageist, and misogynistic) talk, and to conform to expected stereotypes in order to be accepted and gain access to desired and necessary data.

The same intellectual challenges that are posed to edge ethnographers in conducting data collection will also be present when the data are organized, managed, and analyzed. Whereas the edge ethnographer is presented with the task of seeing what is new and different in a world in which he or she has experience and is involved, so too do such filtering lenses intrude on the analysis and interpretation of the data during the final stages of the ethnographic process. Seeing and explaining what occurs in a setting where one is personally involved, in ways that discount idiosyncratic or personalized interpretations, can be an intimidating test for any observer. The edge ethnographer, however, needs to explain what normative society sees as deviant, wrong, odd, or strange while balancing his or her own views of such as (probably) fairly standard and normative environments. Also, he or she needs to accomplish this while recognizing that mainstream academics and perhaps official agents of social control see the population and setting being explained as a place that hosts persons in need of control or sanctioning. When preparing articles, books, or other forms of reports of the study’s findings, the edge ethnographer needs to be aware of the potential fallouts for his or her own career and social standings. Even if such concerns are not seen as serious or something about which the individual cares, recognition of them is important, and this recognition has the potential to influence what is reported, how it is reported, where it is reported, and the details about it that are reported. In short, the direct and courtesy stigmas that accompany most edge ethnography (and edge ethnographers) are likely to influence some research products.

Conclusion

Edge ethnography is the qualitative social science approach that emphasizes depth of understandings of socially marginal

and stigmatized populations and settings wherein the researcher undergoes dangerous and potentially threatening (personally, socially, professionally) exposures. Central to the conduct of edge ethnography is the researcher voluntarily exposing himself or herself to some form of danger through immersion in the culture or setting being studied.

In many respects, edge ethnography is an extreme form of ethnographic research. This explains (in part) why edge ethnography is often associated with newer and cutting-edge theoretical perspectives, such as cultural criminology. The focus and goals of edge ethnography and the theoretical aspirations of cultural criminology are highly similar, yielding a natural confluence of method and perspective.

Edge ethnography is not a commonly practiced social science method. In large part, the requirements of immersion in a cultural setting and the necessity of exposure to danger(s) divert many scholars from such approaches. However, as discussed in this chapter, edge ethnography can and does inform criminology—in fact, any social science—in ways that are both important and necessary for intellectual advancement and in contributions that go deeper and into more detail than either empirical or traditional qualitative approaches.

EXPERIMENTAL CRIMINOLOGY

ANTHONY A. BRAGA

Harvard University and University of California, Berkeley

Experimental criminology is a part of a larger and increasingly expanding scientific research evidence-based movement in social policy. In general terms, this movement is dedicated to the improvement of society through the utilization of the highest-quality scientific evidence on what works best (see, e.g. Sherman et al., 1997). The evidence-based movement first began in medicine and has, more recently, been embraced by the social sciences. Criminologists such as David Farrington, Lorraine Mazerolle, Anthony Petrosino, Lawrence Sherman, David Weisburd, and Brandon Welsh, and organizations such as the Academy of Experimental Criminology and the Campbell Collaboration's Crime and Justice Group, have been leading advocates for the advancement of evidence-based crime control policy in general and the use of randomized experiments in criminology in particular.

In an evidence-based model, the source of scientific evidence is empirical research in the form of evaluations of programs, practices, and policies. Not all evaluation designs are considered equal, however. Some evaluation designs, such as randomized controlled experiments, are considered more scientifically valid than others. The findings of stronger evaluation designs are privileged over the findings of weaker research designs in determining "what works" in criminological interventions. For instance, in their report to the U.S. Congress on what works in preventing crime, University of Maryland researchers developed

the Maryland Scientific Methods Scale to indicate to scholars, practitioners, and policymakers that studies evaluating criminological interventions may differ in terms of methodological quality of evaluation techniques (Sherman et al., 1997). Randomized experiments are considered the gold standard in evaluating the effects of criminological interventions on outcomes of interest such as crime rates and recidivism.

Randomized experiments have a relatively long history in criminology. The first randomized experiment conducted in criminology is commonly believed to be the Cambridge-Somerville Youth Study (Powers & Witmer, 1951):

In that experiment, investigators first matched individual participants (youths nominated by teachers or police as "troubled kids") on certain characteristics and then randomly assigned one to the innovation group receiving counseling and the other to a control group receiving no counseling. Investigators have continuously reported that the counseling program, despite the best intentions, actually hurt the program participants over time when compared to doing nothing to them at all. Although the first participant in the Cambridge-Somerville study was randomly assigned in 1937, the first report of results was not completed until 1951. (Weisburd, Mazerolle, & Petrosino, 2008, p. 4)

Relatively few randomized experiments in criminology were conducted during the 1950s, 1960s, and 1970s (Weisburd et al., 2008). However, the number of randomized

experiments in criminology started to rise in the mid-1980s. In their influential book titled *Understanding and Controlling Crime*, Farrington, Ohlin, and Wilson (1986) recommended the use of randomized experiments whenever possible to test criminal justice interventions. This book generated considerable interest in experimentation among criminologists and, more important, at funding agencies such as the U.S. National Institute of Justice, which sponsored a series of randomized controlled experiments in the late 1980s. In their examination of randomized experiments on crime and justice, Farrington and Welsh (2006) found that experiments with a minimum of 100 participants more than doubled between 1957 and 1981, when there were 37, and between 1982 and 2004, when there were 85. Although randomized experiments in criminology are more common now compared with the 1980s, they continue to represent a small percentage of the total number of impact or outcome evaluations conducted in areas relevant to crime and justice each year (Weisburd et al., 2008).

This chapter begins by describing the key features of experimental, quasi-experimental, and nonexperimental research designs. The strengths of randomized experiments in determining cause and effect in criminology are assessed relative to these other commonly used research designs. Next, systematic reviews of existing evaluations and meta-analytic methods to synthesize the effectiveness of criminological interventions are discussed. These techniques represent important new features of the evidence-based policy movement in criminology. The chapter concludes by reviewing the critiques of experimentation in criminology and then presents a series of recommendations to overcome the ethical, political, and practical barriers to experimentation in crime and justice.

Experimental, Quasi-Experimental, and Nonexperimental Research Designs

Randomized Experimental Designs

Randomized experimental designs allow researchers to assume that the only systematic difference between the control and treatment groups is the presence of the intervention; this permits a clear assessment of causes and effects (Campbell & Stanley, 1966; Cook & Campbell, 1979; Sechrest & Rosenblatt, 1987). The classical experimental design involves three major pairs of components: (1) independent and dependent variables, (2) treatment and control groups, and (3) pretesting and posttesting.

Experiments essentially examine the effect of an *independent variable* on a *dependent variable*. The independent variable usually takes the form of a treatment stimulus, which is either present or not. For instance, an experiment could examine the effect of an in-prison education program (the independent variable) on recidivism (the dependent

variable) when offenders are released from prison. Another important element of an experiment is the presence of *treatment and control groups*. The use of a control group allows the researcher to determine what would have happened if the treatment stimulus or intervention had not been applied to the treatment group (often referred to as the *counterfactual*). The treatment group (sometimes called the *experimental group*) receives the stimulus or intervention to be tested, and the control group does not. It is critical for the treatment and control groups to be equivalent; this means that there are no systematic differences between the two groups that could affect the outcome of the experiment. During the *pretest* period, treatment and control groups are both measured in terms of the dependent variable. After the stimulus or intervention is administered to the control group, the dependent variable is measured again, in the *posttest* period. Differences noted between the pretest and posttest period on the dependent variable are then attributed to the influence of the treatment.

Randomization is the preferred method for achieving comparability in the treatment and control groups. After subjects are recruited by whatever means, the researchers randomly assign those subjects to either the treatment or control group. Although it cannot be assumed that the recruited subjects are necessarily representative of the larger population from which they were drawn, random assignment ensures that the treatment and control groups will be reasonably similar (Babbie, 2004). If randomization is done correctly, the only systematic difference between the two groups should be the presence or absence of the treatment. Experiments that use randomization to create equivalent groups are often called *randomized controlled trials*.

In designing experiments, evaluators need to ensure that the research design is powerful enough to detect a treatment effect if one exists. The *power* of a statistical test is the probability that the test will reject a false null hypothesis (Lipsey, 1990) that there is no statistically significant difference in the outcomes of the treatment and control groups. Statistical power is a very complex problem, especially in experimental research. Power estimates are often based simply on the number of cases in the study, with the general observation that larger numbers of subjects increases the power of statistical tests to detect treatment effects (Lipsey, 1990). However, as Weisburd (1993) pointed out, the number of cases is often a misleading measure. He found that the smaller the experiment, the better control of variability in treatment and design. Statistical power may, in fact, be larger than expected.

Randomized controlled trials are known for their high degree of internal validity. The problem of *internal validity* refers to the possibility that the conclusions drawn from the experimental results may not accurately reflect what has gone on in the experiment itself (Cook & Campbell, 1979). The main threats to internal validity are well-known and, when executed properly, randomized controlled trials will

handle each of eight internal validity problems (Farrington & Welsh, 2006, p. 59):

1. *Selection*: The effect reflects preexisting differences between treatment and control conditions.
2. *History*: The effect is caused by some event occurring at the same time as the intervention.
3. *Maturation*: The effect reflects a continuation of pre-existing trends.
4. *Instrumentation*: The effect is caused by a change in the method of measuring the outcome.
5. *Testing*: The pretest measurement causes a change in the posttest measure.
6. *Regression to the mean*: When an intervention is implemented on units with unusually high scores (e.g., areas with high crime rates), natural fluctuation will cause a decrease in these scores on the posttest, which may be mistakenly interpreted as an effect of the intervention.
7. *Differential attrition*: The effect is caused by differential loss of units (e.g., people) from experimental compared to control conditions.
8. *Causal order*: It is unclear whether the intervention preceded the outcome.

External validity problems involve the generalizability of the experimental findings to the “real” world (Cook & Campbell, 1979). Inferences about cause–effect relationships based on a specific scientific study are said to possess *external validity* if they may be generalized from the unique and idiosyncratic experimental settings, procedures, and participants to other populations and conditions. Causal inferences said to possess high degrees of external validity (also referred to as *population validity*) can reasonably be expected to apply to the target population of the study from which the subjects were drawn and to the universe of other populations across time and space.

The well-known Minneapolis Domestic Violence Experiment and its subsequent replications offer a cautionary tale on the external validity of experimental findings when interventions are applied to other subjects and in other settings (Sherman, 1992). The Minneapolis experiment was undertaken to determine the best way to prevent the risk of repeated violence by the suspect against the same victim in the future. Three approaches were tested. The traditional approach was to do very little, because it was believed that the offenders would not be punished harshly by the courts and that the arrest might provoke further violence against the victim. A second approach was for the police to undergo special training enabling them to mediate ongoing domestic disputes. The third approach was to treat misdemeanor violence as a criminal offense and arrest offenders in order to teach them that their conduct was serious and to deter them from repeating it. The experiment revealed that, in Minneapolis, arrest worked best: It significantly reduced repeat offenses relative to the other two approaches (Sherman & Berk, 1984). The results of the experiment were very influential; many police departments adopted mandatory misdemeanor arrest policies, and a

number of states adopted mandatory misdemeanor arrest and prosecution laws. However, replications of the Minneapolis domestic violence experiment in five other cities did not produce the same findings. In his review of those differing findings, Sherman (1992, p. 19) identified four policy dilemmas for policing domestic violence:

1. Arrest reduces domestic violence in some cities but increases it in others.
2. Arrest reduces domestic violence among employed people but increases it among unemployed people.
3. Arrest reduces domestic violence in the short run but can increase it in the long run.
4. Police can predict which couples are most likely to suffer future violence, but our society values privacy too highly to encourage preventive action.

This experience suggests that experimental findings need to be replicated before enacting mandatory interventions that could, in fact, have varied effects across different settings and subjects.

Quasi-Experimental Designs

The quasi-experiment is a research design that has some, but not all, of the characteristics of a true experiment (Cook & Campbell, 1979). As such, quasi-experiments do not have the same high degree of internal validity as randomized controlled trials. Although there are many types of quasi-experimental research designs, the element most frequently missing is the random assignment of subjects to the treatment and control conditions. In developing an equivalent control group, the researcher often uses matching instead of randomization. For example, a researcher interested in investigating the effects of a new juvenile curfew on crime in a particular city would try to find a city with similar crime rates and citizen demographics in the same geographic region. This matching strategy is sometimes called a *nonequivalent group comparison design* because the treatment and control cities will not be exactly the same. In the statistical analysis of quasi-experimental data, researchers will often attempt to isolate treatment effects by including covariates to account for any measurable factors that could also influence observed differences in the dependent variable (e.g., poverty levels, youth population size, and the like). This results in less confidence in study findings than true experimental approaches because it is possible that the difference in outcome may be due to some preexisting difference between the treatment and control groups that was not taken into account by the evaluators.

Quasi-experimental *interrupted time series analysis*, involving before-and-after measurements for a particular dependent variable, represents a common type of evaluation research found in criminology and criminal justice. One of the intended purposes for doing this type of quasi-experimental research is to capture longer time periods

and a sufficient number of different events to control for various threats to validity and reliability (Cook & Campbell, 1979). Long series of observations are made before and after the treatment. The established before-treatment trend allows researchers to predict what may have happened without the intervention. The difference between what actually happened after the intervention and the predicted outcome determines the treatment effect. These approaches are often criticized for not accounting for other confounding actors that may have caused the observed differences. It can also be difficult to model the trend in the time series so the treatment effect can be properly estimated. For instance, in their evaluation of the 1975 Massachusetts Bartley–Fox gun control law that mandated a year in prison for illegal carrying of firearms, Deutsch and Alt (1977) used an interrupted time series quasi-experimental design and found that the passage of the law was associated with a statistically significant reduction in armed robbery in Boston. However, Hay and McCleary (1979) reanalyzed these data using a different quasi-experimental time series modeling approach and found no statistically significant reduction in Boston armed robberies associated with the passage of the law. In contrast, Pierce and Bowers (1981) found statistically significant violence reductions associated with the passage of the law using quasi-experimental interrupted time series analysis with multiple control group comparisons.

Although these designs are still likely to have lower internal validity than randomized experimental evaluations, quasi-experiments that combine the use of a control group with time series data can sometimes produce results that are of similar quality to randomized controlled trials (Lipsey & Wilson, 1993). Some researchers, however, have found that even strongly designed quasi-experiments produce less valid outcomes when compared with well-executed randomized controlled trials (see Weisburd, Lum, & Petrosino, 2001). In general, the persuasiveness of quasi-experiments should be judged on a case-by-case basis (Weisburd et al., 2001). For experimental criminology, the implication is that randomized controlled trials are necessary to produce the most valid and unbiased estimates of the effects of criminal justice interventions.

In their evaluation of the Operation Ceasefire gang violence reduction strategy, Braga and his colleagues (Braga, Kennedy, Waring, & Piehl, 2001) used a quasi-experimental interrupted time series analysis with multiple comparison groups to compare youth homicide trends in Boston with youth homicide trends in other major U.S. cities. They found a statistically significant 63% reduction in youth homicides associated with the implementation of the Ceasefire strategy. The evaluation also suggested that Boston's significant youth homicide reduction associated with Operation Ceasefire was distinct when compared with youth homicide trends in most major U.S. and New England cities (Braga et al., 2001).

The National Academies Panel on Improving Information and Data on Firearms (Wellford, Pepper, & Petrie, 2005)

concluded that the Ceasefire evaluation was compelling in associating the intervention with the subsequent decline in youth homicide (see also Morgan & Winship, 2007). However, the panel also suggested that many complex factors affect youth homicide trends and that it was difficult to specify the exact relationship between the Ceasefire intervention and subsequent changes in youth offending behaviors (see also Ludwig, 2005). Although the Ceasefire evaluation controlled for existing violence trends and certain rival causal factors, such as changes in the youth population, drug markets, and employment in Boston, there could be complex interaction effects among these factors not measured by the evaluation that could account for some meaningful portion of the decrease. The evaluation was not a randomized controlled experiment; therefore, the nonrandomized control group research design cannot rule out these internal threats to the conclusion that Ceasefire was the key factor in the youth homicide decline. Other quasi-experimental evaluations face similar critiques when attempting to unravel cause and effect associated with the implementation of specific criminal justice intervention.

Another type of quasi-experimental design is known as a *natural experiment*, whereby nature, or some event, has created treatment and control groups. In contrast to laboratory experiments, these events are not created by scientists, but they yield scientific data nonetheless. The classic example is the comparison of crime rates in areas after the passage of a new law or implementation of a crime prevention initiative that affects one area and not another. For instance, the 1994 Brady Handgun Violence Prevention Act established a nationwide requirement that licensed firearms dealers observe a waiting period and initiate a background check for handgun sales. To assess the impact of the Brady Law on violence, Ludwig and Cook (2000) examined trends in homicide and suicide rates, controlling for population age, race, poverty, and other covariates, in the 32 “treatment” states directly affected by the Brady Act requirements and compared them with the 18 “control” states and the District of Columbia, which had equivalent legislation already in place. They found that the Brady Act appeared to be associated with reductions in the firearm suicide rate for persons age 55 years or older but not with reductions in homicide rates or overall suicide rates.

Nonexperimental Designs

Studies that rely only on statistical controls are often seen as representing the weakest level of confidence in research findings (Cook & Campbell, 1979; Sherman et al., 1997). These studies are typically called *nonexperimental* or *observational research designs*. In these studies, researchers do not vary treatments to observe their effects on outcomes; instead, they examine natural variation in a dependent variable of interest, such as crime, and estimate the effect of an independent variable, such as police staffing levels, on the basis of its covariation with the dependent variable. Additional covariates related to variation in the

dependent variable will be included in the model as statistical controls to isolate the effect of the key independent variable of interest. The difficulty of this approach is that there could easily be excluded factors related to both the key independent variable and dependent variable that bias the estimated relationship between these variables. Unfortunately, for some sensitive areas in crime and justice, nonexperimental research designs are the only method of investigation possible. Although some scholars argue that it is possible to develop statistical models that provide highly valid results (e.g., Heckman & Smith, 1995), it is generally agreed that causes unknown or unmeasured by the researcher are likely to be a serious threat to the internal validity of nonexperimental research designs (Cook & Campbell, 1979).

Systematic Reviews and Meta-Analytic Methods in Criminology

There is a consensus among those who advocate for evidence-based crime policy that systematic reviews are an important tool in this process. In *systematic reviews*, researchers attempt to gather relevant evaluative studies in a specific area (e.g., the impact of correctional boot camps on offending), critically appraise them, and come to judgments about what works “using explicit, transparent, state-of-the-art methods” (Petrosino, Boruch, Soydan, Duggan, & Sanchez-Meca, 2001, p. 21). Rigorous methods are used to summarize, analyze, and combine study findings. The Campbell Collaboration Crime and Justice Group, formed in 2000, aims to prepare and maintain systematic reviews of criminological interventions and to make them electronically accessible to scholars, practitioners, policymakers, and the general public (Farrington & Petrosino, 2001; see also <http://www.campbellcollaboration.org>). The Crime and Justice Group requires reviewers of criminological interventions to select studies with high internal validity, such as randomized controlled trials and well-designed quasi-experiments with comparison groups (Farrington & Petrosino, 2001).

Meta-analysis is a method of systematic reviewing and was designed to synthesize empirical relationships across studies, such as the effects of a specific crime prevention intervention on criminal offending behavior (Wilson, 2001). Meta-analysis quantifies the direction and the magnitude of the findings of interest and uses specialized statistical methods to analyze the relationships between findings and study features (Lipsey & Wilson, 1993; Wilson, 2001). Although the methods are technical, meta-analysis provides a defensible strategy for summarizing the effects of crime prevention and intervention efforts for informing public policy (Wilson, 2001). For instance, Farrington and Welsh (2005) carried out a series of meta-analyses of criminological experiments of the last 20 years and concluded that prevention methods in general, and multisystemic therapy in particular, were effective in reducing offending. They

also reported that correctional therapy, batterer treatment programs, drug courts, juvenile restitution, and police targeting of crime hot spots were effective. However, “Scared Straight” programs and boot camps for offenders were not effective at preventing crime.

Critiques of Experimentation in Criminology

Randomized experiments present many challenges. For instance, there are often problems of getting permission and cooperation from policymakers and practitioners that lead to case flow problems and difficulties in successfully achieving randomization. Although there is a large literature examining the barriers to experimentation (e.g., Baunach, 1980; Heckman & Smith, 1995; Petersilia, 1989), Clarke and Cornish (1972) raised several concerns with experimentation in crime and justice that had a major chilling effect on the development of experimental research in England during the 1970s (Farrington & Welsh, 2006). Although several experimental criminologists have responded to these concerns (e.g., Farrington, 2003; Weisburd, 2003), and the number of crime and justice experiments have increased in England and the United States over the last 25 years (Farrington & Welsh, 2006), the issues raised by Clarke and Cornish (1972) continue to be influential in resisting experimental methods in crime and justice today (see Pawson & Tilley, 1997).

Clarke and Cornish’s (1972) critique of experimentation is based on their experience in implementing a large-scale randomized experiment to evaluate a therapeutic community at a training school for delinquent boys in England. One major concern was that practitioners undermined the experiment by limiting the number of boys who could be considered for random allocation. Practitioners were very concerned that the boys would not receive the treatment that was most suitable for them. They felt that it was unethical for the boys to receive anything less than the most appropriate treatment. This led to the research being extended for a much longer time period and eventually stopped before the desired number of cases for the study was achieved. However, in response, experimental criminologists suggested that the ethical questions raised by the practitioners had more to do with contrasting belief systems between practitioners and researchers rather than the ethics of experimentation in crime and justice (Weisburd, 2003). The practitioners believed they knew which treatments worked best for the boys. Researchers, however, thought that the effectiveness of treatment was not clear and implemented a randomized study to determine what worked. As a result, the practitioners undermined the experimental evaluation.

Another concern put forth by Clarke and Cornish (1972) referred to the difficulty of generalizing from experimental studies (i.e., the problem of external validity). They argued that the unique institutional settings at

the training school were difficult to disentangle from the treatment itself. Clarke and Cornish further argued that institutions that agree to experimentation are a self-selected group that are not representative of the general population of institutions; as such, experiments that include them tell one little about the workings of the treatment and their outcomes in the real world. In response, experimental criminologists argue that support for experimentation from larger governmental agencies, such as the U.S. National Institute of Justice, would encourage broader involvement of institutions in experimentation (Weisburd, 2003). Although this larger group is still likely to be self-selected and generalizability may still be limited, encouragement rather than discouragement of experimental study in crime and justice by funders would lead to the development of more generalizable experiments (Weisburd, 2003).

The strongest criticism of randomized experiments raised by Clarke and Cornish (1972) was that experimental studies are too rigid to address the complexity of crime and justice contexts. The treatment at the training school involved many components that varied over the course of the experiment; thus, it was impossible to clearly define the treatment being tested. Whatever evaluation results were obtained would not have explainable. In essence, the experiment might have been able to say *what* happened, but not be able to answer *how* or *why* it happened (Weisburd, 2003, p. 349). Pawson and Tilley (1997) argued that experiments tend to be inflexible and use broad categorical treatments; as a result, experimental designs miss the important interaction between the nature of the treatment and the nature of the subjects being studied. Experimental criminologists acknowledge that the use of experimental approaches in complex social settings requires the development of experimental methods that are capable of addressing the complexity of crime and justice treatments, settings, and subjects (Weisburd, 2003). Of course, this requires a commitment to institutionalize experimental methods in the crime and justice field.

Weisburd's Principles to Overcome Ethical, Political, and Practical Problems in Experimentation

Randomized experiments are often excluded in criminal justice and criminological research for either ethical, political, or practical concerns. However, in reality randomized experiments are possible and appropriate in many circumstances. For experimenters, the challenge is to identify the conditions under which experiments can be successfully implemented in criminal justice settings. Weisburd (2000) identified eight principles to help practitioners and researchers assess when experimentation is most feasible. This section presents Weisburd's principles and summarizes his discussion of each. The first two principles involve ethical concerns, the next three principles involve political concerns, and the final three principles involve practical problems in criminal justice experimentation.

Principle 1: In the case of experiments that add additional resources to particular criminal justice agencies or communities or provide treatments for subjects, there are generally fewer ethical barriers to experimental research (Weisburd, 2000, p. 184). It is important to differentiate the nature of the criminological intervention to be evaluated at the outset of the evaluation. Ethical problems are not likely to be raised when researchers provide new resources to offenders, such as rehabilitative services, or to communities, such as additional police patrols. The assumption is that the control group will continue to receive traditional levels of criminological intervention. Criminal justice experiments are often framed as tests of whether a new intervention is better than an existing one. However, when treatment is withdrawn from control subjects, serious ethical questions will arise; thus, Weisburd suggested that crime and justice experiments can often be defined as including treatment and *comparison* groups, rather than treatment and *control* groups.

Principle 2: Experiments that test sanctions that are more lenient than existing penalties are likely to face fewer barriers than those that test sanctions more severe than existing penalties (Weisburd, 2000, p. 185). So-called sanctioning experiments have produced the most serious ethical problems in criminal justice experimental study. In these evaluations, random allocation rather than the traditional decision-making power of criminal justice practitioners is used to make decisions about the processing of individual offenders (Weisburd, 2000). Arrest, sentence, and imprisonment decisions are based on random allocation. It is important to remember that sanctioning experiments allocate sanctions that are legally legitimate to impose on offenders. Ethical concerns are raised in connection with how the sanction is applied rather than to the harshness of the sanction itself. Clearly, there needs to be a balance between the criminal justice system's need to find answer to important policy questions and its commitment to equity in allocating sanctions. Weisburd suggested that, when designing sanctioning experiments, questions be framed in a way that allows ethical barriers to be removed—for instance, by using the experiment to test whether the criminal justice can be lenient in the allocation of sanctions rather than being harsh. The California Reduced Prison Experiment released some offenders from prison earlier than their sentenced release date (Berecochea & Jaman, 1981). Leniency for a few generated no major ethical objections despite thousands of offenders who were left in prison for longer periods of time on the basis of a random allocation scheme. However, the end result was two distinct groups that received more or less punitive sanctions.

Principle 3: Experiments that have lower public visibility will generally be easier to implement (Weisburd, 2000, p. 186). Obviously, in addition to ethical concerns there are political costs to criminal justice experimentation. Although reducing penalties for certain offenders may not generate ethical objection, the approach may generate strong political resistance to the experiment. Citizens may not want offenders to return to the community before their natural

sentence expiration date. Citizens may also exert political pressure to halt an experiment if additional criminal justice resources are randomly allocated. For instance, in the Jersey City Drug Market Analysis Experiment (Weisburd & Green, 1995), citizens in comparison drug market hot-spot areas were very concerned that they were not receiving the increased police attention given to the treatment drug market hot-spot areas. As Weisburd (2000) observed, this problem is similar to those encountered in medical research where interest groups fight to have experiments abandoned so medication will be provided to all who might benefit from it. These political problems are less likely to emerge when experiments are less visible to the public. As such, researchers should resist the temptation to publicize experiments before they are completed.

Principle 4: In cases where treatment resources are limited, there is generally less political resistance to random allocation (Weisburd, 2000, p. 186). There are circumstances in which it can be easier for researchers to defend random allocation in the context of the politics of the allocation of treatments (Weisburd, 2000). Often, treatments and new programs can be applied to only a few areas or a small number of individuals. When communities or individuals understand that they have not been systematically excluded from additional resources, experiments do not provide larger political problems when compared with nonexperimental evaluation designs. For instance, in the High Intensity Drug Trafficking Area drug treatment experiment (Weisburd & Taxman, 2000), practitioners were much less resistant to an experimental design because they could not provide treatment to all eligible subjects. As Weisburd suggested, random allocation can serve as a type of pressure valve in the allocation of scarce criminal justice resources. Random allocation can be a politically safer basis on which to apply treatment when compared with other criteria.

Principle 5: Randomized experiments are likely to be easier to develop if the subjects of the intervention represent less serious threats to community safety (Weisburd, 2000, p. 187). When the potential risks to the community are minimized, it is much easier for policymakers and practitioners to defend the use of randomization (Weisburd, 2000). Very few experiments have involved high-risk violent offenders that would generate serious threats to community safety.

Principle 6: Experiments will be most difficult to implement when the researcher attempts to limit the discretion of criminal justice agents who generally operate with a great degree of autonomy and authority (Weisburd, 2000, p. 187). Relative to ethical and political concerns, practical barriers have generally been more significant in explaining resistance to criminal justice experimentation (Weisburd, 2000). Even though there is a wide range of methodological issues facing experimenters, it can be very difficult to get practitioners to agree to random allocation. Although this problem is related to the ethical and political concerns already discussed, it is important to recognize that random allocation interferes with the daily operations of the affected agencies. Judges are generally more resistant to random allocation

when compared with other criminal justice practitioners. They have been known to subvert experiments by not properly assigning subjects even when they have agreed to random allocation of sanctions and programs. For example, in the Denver Drunk Driving Experiment (Ross & Blumenthal, 1974) judges were supposed to randomly allocate fines and two different types of probation to convicted drunk drivers. Unfortunately, in more than half the cases judges circumvented the randomization process in response to defense attorney pleas for their clients to receive fines rather than probation. Weisburd observed that the likelihood of success in randomization is linked to the nature of the decisions being made. He suggested a subprinciple in developing randomization procedures: "Where treatment conditions are perceived as similar in leniency to control conditions, it will be easier to carry out a randomized study involving high-authority and high-autonomy criminal justice agents" (Weisburd, 2000, p. 188).

In Project Muster, a probation experiment in New Jersey, Weisburd (1991) found that the judges correctly randomized nearly all study subjects. In this evaluation, judges were asked to sentence selected probationers who violated release conditions by not paying their fines to a program that involved intensive probation and job counseling. No restraint was placed on their sentencing decisions for other violated probationers. Because few violated offenders would have been sentenced to jail for failure to pay fines, judges did not feel that their discretion was overly compromised in selecting Muster instead of traditional probation.

Principle 7: Systems in which there is a strong degree of hierarchical control will be conducive to experimentation even when individual actors are asked to constrain temporarily areas where they have a considerable degree of autonomy (Weisburd, 2000, p. 188). Weisburd suggested that, in militaristic hierarchical agencies, such as the police and certain correctional agencies, it is often easier to execute experimental designs because such agencies have rigid organizational structures. This is particularly true when the discretion is limited for the targets selected rather than the choice of action or decision. Experiments in Minneapolis, Minnesota (Sherman & Weisburd, 1995), and Jersey City, New Jersey (Braga et al., 1999; Weisburd & Green, 1995), were executed with success when police officers were focused on treatment crime hot spots and restricted from operating in control hot spot areas. In policing, hierarchical control also explains why it has been possible to implement experiments in which treatment and control conditions vary significantly and the line-level agent has traditionally exercised considerable autonomy (Weisburd, 2000). This was evident in the six domestic violence experiments supported by the National Institute of Justice in which misdemeanor spouse abusers were randomly assigned to either arrest or nonarrest conditions (Sherman, 1992). These studies did not show the extensive subversion to randomization seen in other criminal justice experiments, such as the Denver Drunk Driving Experiment.

Principle 8: Where treatments are relatively complex, involving multiple actions on the part of criminal justice

agents or actions that they would not traditionally take, experiments can become prohibitively cumbersome and expensive (Weisburd, 2000, p. 190). Once randomization has been successfully achieved, maintaining the integrity of the treatment is the most difficult task for experimenters (Boruch, 1997; Weisburd, 2000). Experiments cannot be simply a before-and-after effort by researchers; it is very important to document and analyze what is actually happening in the treatment and control groups (Weisburd, 2000). Developing methods to monitor and ensure the integrity of the treatment is crucial. If the treatment is not implemented properly, it would not be surprising to find that the intervention did not generate an effect. For studies that involve one-shot interventions, this process can be relatively simple (e.g., documenting whether a subject was properly placed in a condition such as arrest, violation, or incarceration). However, if experimental treatments are complex, it will be correspondingly more difficult, time-consuming and costly to track and ensure the integrity of the treatment.

There is now a large, and growing, literature indicating that ethical, political, and practical barriers can be overcome and that randomized experiments are appropriate in a very diverse group of circumstances and across many aspects of decision making in the criminal justice system (Boruch, Snyder, & DeMoya, 2000; Petrosino et al., 2001; Weisburd, 2000, 2003). To some observers (e.g., Weisburd, 2003), the failure of crime and justice funders and evaluators to develop a comprehensive infrastructure for experimental evaluation represents a serious violation of professional standards:

A related line of argument here is that a failure to discover whether a program is effective is unethical. That is, if one relies solely on nonrandomized assessments to make judgments about the efficacy of a program, subsequent decisions may be entirely inappropriate. Insofar as a failure to obtain unequivocal data on effects then leads to decisions which are wrong and ultimately damaging, that failure may violate good standards of both social and professional ethics. Even if the decisions are "correct" in the sense of coinciding with those one might make based on randomized experiment data, ethical problems persist. The right action taken for the wrong reasons is not especially attractive if we are to learn anything about how to effectively handle the child abuser, the chronically ill, . . . and so forth. (Boruch, 1975, p. 135)

According to Weisburd (2003), the key question is why a randomized experiment should not be used: "The burden here is on the researcher to explain why a less valid method should be the basis for coming to conclusions about treatment and practice" (p. 352).

Conclusion

As the 21st century unfolds, the available evidence suggests that the number of randomized experiments in

criminology will continue to grow (Farrington & Welsh, 2006). As Weisburd, Mazerolle, and Petrosino (2008) observed, there is a growing consensus among scholars, practitioners, and policymakers that crime control practices and policies should be rooted as much as possible in scientific research. The findings of randomized experiments are considered more scientifically valid than the findings generated by quasi-experiments and observational research studies. Experimental findings are usually privileged over the findings of these weaker research designs in determining effective crime control practice and policy. Implementing randomized experiments in field settings can be very difficult for a number of ethical, political, and practical concerns. However, many of these barriers to experimentation can be overcome; thus, randomized experiments will continue to become ever-important components of criminological inquiry.

FIELDWORK

Observation and Interviews

WILSON R. PALACIOS

University of South Florida

Fieldwork has always been a cornerstone of American social science. It was the definitive approach for the first 40 years in its history for the study of social life. It was an intellectual break for “armchair” sociologists who were content with simply theorizing and offering little more than speculative reasoning for the many unparalleled social changes occurring at the time. In these early days, circa 1890 to 1940, fieldwork was both an intellectual movement and a methodological prescription for the sociological analysis of both the community and the individual, with an emphasis on developing a holistic understanding of related social processes. By applying basic anthropological principles, fieldwork in the United States was very much an applied sociological endeavor that has been integral to the evolution of criminology.

Qualitative Research

It is rather common for individuals to seek out a “cook-book” approach when attempting to apply qualitative research methods in the field while failing to realize that no method can truly be separated from its philosophical and theoretical underpinnings. In general, researchers are guided by a certain worldview and set of beliefs about exactly how the social world functions, (i.e., a paradigm); specifically, qualitative research embodies an interpretive approach to how one interacts and comes to understand the

social world. It is from this particular epistemological standpoint that qualitative researchers view the nature of reality as being something highly interpretive, malleable, and situational (i.e., constructionism). Under this particular ontological view, the subjective is emphasized, research subjects are considered social actors, and the social/cultural context is paramount in the research enterprise. Unfortunately, individuals seeking “how-to” manuals for qualitative research methods are often perplexed, and at times frustrated, by what seems to be a lack of standardization across the field, leading them to conclude that such methodological steps comprise nothing more than a pseudo-social science. However, the people who make such attributions are often not well versed in its history and/or the impact qualitative research has made throughout the history of the social sciences.

Qualitative research has ubiquitously influenced social science research in the United States for well over 100 years. Throughout the social sciences, qualitative research has been implemented either sequentially (Zimbardo, 1969) or simultaneously (Milgram, 1974) with quantitative designs. Of particular note is the rich history that qualitative methods (e.g., the collection of observational and interview data) share with quantitative (experimental) research designs (see Campbell, 1955; Campbell & Stanley, 1963; Scriven, 1976; Sherman & Strang, 2004).

One can note similar common methodological linkages, especially in related subspecialties, across anthropology,

education, communications, urban planning, business, social work, economics, political science, and the health sciences. Of particular note, in terms of American sociology and criminology, are the contributions made, both theoretically and methodologically, by the Chicago School and classical anthropology.

The Chicago School represents a significant cohort of sociologists at the University of Chicago's department of sociology whose research foci emphasized urban living, deviancy, community/neighborhoods, social structure, social disorganization, social worlds/subcultures, human agency, and social order (see Fine, 1995; Tomasi, 1998). Cohort members of the first Chicago School (roughly from 1892 through the early 1950s) were Albion Small, W. I. Thomas, Louis Wirth, Georg Simmel, Ellsworth Faris, Robert E. Park, and Ernest W. Burgess, along with noted social psychologists George H. Mead, John Dewey, and Charles H. Cooley. Around the same time period, noted anthropologists Margaret Mead, Frank Boas, Ruth Benedict, Gregory Bateson, Edward Evans-Pritchard, Alfred Radcliffe-Brown, and Bronislaw Malinowski, whose numerous studies highlighting the use of formal ethnography (fieldwork) as a methodological framework for studying non-Western societies and human behavior in their natural settings redefined the very concept of *doing* research across the American urban landscape.

Ethnography

The anthropological creed that embodied fieldwork at the time (i.e., the traditional/classical period for ethnography as defined by Denzin & Lincoln, 1994) cast ethnography as research to be done in foreign lands by a lone ethnographer, primarily men, and whose objective was to study exotic cultures, languages, customs, beliefs, and behaviors of "natives." It was through the systematic collection of observations, interviews, and cultural artifacts that the lone ethnographer would hope to come to understand and explain these bounded cultural systems and ascribed meanings therein while remaining detached, both physically and emotionally, from both the setting and the individuals studied. The admonishment of not "going native," which was typical for ethnographers of this time period, was instituted to preserve anthropology's tacit commitment to objectivism and its parochial stance concerning one's role in the field. However, Chicago School researchers rejected the degree of formalism promoted by anthropological ethnography and sought to implement a form of fieldwork, *street ethnography*, that encapsulated the social-cultural milieu of Chicago neighborhoods and its residents. A careful reading of some of these earlier works reveals vestiges of interpretive ethnography (Geertz, 1973).

Through a serial combination of life history and case study approaches, from techniques characteristic of the voluminous studies published by members of the first Chicago School to

the more germane ethnographies of the second Chicago School (roughly from the mid-1950s through the 1970s), urban ethnography became theoretically eclectic, contextually driven, and analytically sophisticated. Specifically, studies conducted by members of the second Chicago School, including Gary A. Fine, Howard S. Becker, Everett Hughes, Herbert Blumer, William F. Whyte, Erving Goffman, and Anselm Strauss, made significant advancements in terms of theoretical and methodological frameworks. For instance, innovative ways of thinking about qualitative research and edgier attitudes, if you will, concerning fieldwork were promulgated by inter- and transdisciplinary developments in phenomenology, critical theory, symbolic interactionism, narrative inquiry, ethnomethodology, feminism, focus group research, standpoint epistemology, intersectional theory, interpretive ethnography, naturalism, social action theory, dramaturgical analysis, grounded theory, case study, hermeneutics, and biographical research.

As a result, the intellectual ingenuity and methodological rigor that coalesced during this transformative time for qualitative research in general and for ethnographic (field) research in particular, transfixed American street ethnography for generations of scholars. Moreover, street (urban) ethnography (i.e., fieldwork) throughout American cities was no longer about maintaining relational distance between researcher and researched; the caricature of the classical lone ethnographer was forgotten, and observing social life and interviewing its participants became more of dyadic process.

Street (Fieldwork) Ethnography

American sociology has always had an interest in the marginalized, a "sociology of the underdog" (Becker, 1967) and of the so-called "underworld." In particular, urban ethnography—or, as it is commonly called, *fieldwork*—originated in the United States on the basis of a natural curiosity about certain aspects of urban social life and its participants. Urban ethnography's interest in the "other" during the early part of the 20th century focused on marginalized groups, such as the homeless person, the drug user/addict, the prostitute, the juvenile delinquent and his gang, the immigrant and his family, the pick-pocket and his "fence," the dancehall girl, and so on, with an expressed objective of developing a theoretical-cultural framework based on an inductive approach to social research while maintaining the often delicate balance between an emic (insider) and etic (outsider) perspective, a balance that over the years has been more a matter of the degree to which it reflects academic politics and culture rather than empirical reality.

For street ethnographers, fieldwork is about working within, giving prominence (a voice) to people who are often characterized and devalued by outsiders as nothing more than street people. The street becomes the ethnographer's sociological environment; it is a place that holds specific

yet dynamic cultural systems, meaning, and practices. The street ethnographer's working attitude in the field is that of an intimate stranger, a personal confidant to the many people he or she befriends in the field (the street), yet always an outsider because of the research objectives and specific aims that guide him or her. Whereas many people view social life conveniently through partitions such as the legitimate and illegitimate ("under") world, the legal and illegal ("underground") economy, and the criminal offender from the law-abiding citizens, street ethnographers recognize a social world that defies linearity in terms of how such worlds are created, practiced, and sustained. For the street ethnographer, social life is more a constellation of behavioral norms and expectations, a social system of differing styles, methods, and modes of communication, all of which reveal a high degree of convergence between seemingly opposing social worlds and its members.

As such, the qualitative task, for most street ethnographers, becomes implementing the most appropriate research practices, such as a research design and method that encourage naturalistic engagement (Lincoln & Guba, 1985), albeit systematically, throughout diverse, "hidden" social worlds, for example, sex workers, drug dealers and users, armed robbers, homeless families, street children, migrant workers, hotel chambermaids, doormen, political dissidents, bouncers, taxicab drivers, and female gang members, to name a few. Therefore, for street ethnographers the research enterprise is best practiced *in situ*, as it unfolds in and throughout urban social settings.

In addition to an intellectual commitment to building a theoretically and culturally driven understanding of street cultures and a profound, sometimes personal, commitment to providing a voice to the individuals often socially, politically, and economically disenfranchised therein, street ethnographers purposively embrace the complexity inherent in studying people in their natural social settings.

Fieldwork has typically been conducted in an open or nonexperimental environment; the empirical milieu of a street ethnographer has traditionally been any setting, physical or social, where people socialize. However, in the study of deviancy and criminal behavior fieldwork has always focused on the kinds of communities, environments, and people connected with illegal and deviant activities and their concomitant lifestyles. Although the history of deviant/criminological fieldwork has been diverse in terms of settings and research participants/informants (e.g., street corners, brothels, housing projects, methadone clinics, criminal justice training academies, adult video stores, halfway houses, drug smugglers, psychiatric hospitals, and jails/prisons) an enduring methodological link in the field has been the systematic use of observation and interviewing.

Methods

The methodological core of fieldwork has always consisted of participant observation and interviewing. Although it is

not uncommon to supplement such work with documentary research, archival data, survey methods, and multimedia techniques (e.g., photography and video), the cornerstone of fieldwork has always rested with the street ethnographer's interpersonal abilities in and style of collecting observational and interview data while in the field. In general, street ethnographers view the social world through an interpretive/constructionist lens, thereby placing an emphasis on the subjective, the cultural, and the situational. Guided by a philosophical tradition rooted in American pragmatism with linkages in symbolic interaction and phenomenology and a break from naive realism, an idealist-internal ontology, and a healthy obsession for self-reflexivity, street ethnographers engage both a setting and the people therein in their quest to understand those people's everyday reality. By purposively situating themselves in the local culture of study and by taking a risk in making themselves accessible, both physically and emotionally, street ethnographers strive to create an empirical representation that is as nuanced as life. Through "thick descriptions" (Geertz, 1973) of observed social events, interactions, and individuals' emotions, street culture is enlivened, defined not by a composite measure, an attitudinal scale, or as a caricature in a journalist's column but rather by the ethnographer who is trained in the method of observation and its power for preserving in writing observable aspects of the human condition, a condition that is often veiled to outsiders.

The diversity of human experiences in the street is of great importance for the ethnographer. The range of perceptions, the existence of a variety of perspectives, the unspoken as well as what is articulated, and one's emotional self make up the street ethnographer's currency. Conversations in the field are never casual or happenstance but are guided and topical and serve as an opportunity to learn more about the research participants. Through the use of interviews, which range in format depending on the research setting and its purpose, the ethnographer presents accounts of lived experiences that, when coupled with field observations, become archetypes of street culture.

Observation

Observation in social science research has a long-standing history as an unobtrusive method. In fieldwork, *participant observation*, however, has had a much shorter yet controversial existence. Its legitimacy as an appropriate data-gathering technique and a methodological approach for creating more ethical dilemmas (see Goode, 1999; Kulick & Wilson, 1995) in the field than not has been reviewed, debated, and at times vehemently defended throughout the social sciences, in particular in the field of anthropology, although such theoretical and methodological introspection did not occur until the 1940s, with a significant treatise concerning participant observation not published until the 1950s. Resolution of such matters should never be expected because of what participant

observation embodies, both as a research method and as a theoretical framework for fieldworkers.

The social context has always been the fulcrum for observations in the field. For fieldworkers, the central issues have always been defined around the meaning, practice, and utility in making participant observations *in situ*. Therefore, participant observation is as much a personal orientation for the fieldworker as it is a professional approach for studying social life. Raymond Gold's classic 1958 article "Roles in Sociological Field Observations" exemplifies the near-obsessive nature of fieldworkers in their contemplation of the myriad social roles required of the participant observer. Gold's classic field role typology (*complete observer*, *participant-as-observer*, *observer-as-participant*, and *complete participant*) should be interpreted not as a static categorical template but as a barometer that enables fieldworkers to make informed choices concerning their own tolerance level for inherent ethical challenges. These challenges are especially heightened when fieldworkers are studying deviant and/or illegal communities and their members, according to the degree of their involvement in the lives of participants, and in relation to other tangential field decisions (e.g. access/entrée, reciprocity, time, confidentiality, personal biography, rapport, resources, etc.) that may impact the scope and duration of the study.

Participant observations are primarily recorded through the use of *field notes*, a tradition of note taking used for contextualizing field events, meanings, and social interactions. The recording of field notes is a method for preserving the social-physical environment of a study's setting and its people and their respective behaviors. It facilitates both the immersion of the fieldworker in the local culture and an understanding of human relationships, in terms of both the researcher and research participants, unfolding in the setting. From jottings to more formal entries consisting of analytical memos, taxonomies, social network mapping, journals, blogs, and video, field notes facilitate the systematic collection and analysis of participant observations. They also offer a medium for preserving the nature of informal, often unscripted field conversations, a rather common occurrence in the field. Field conversations are just another form of interviews that are part and parcel of the fieldworker's toolkit.

Interviews

For fieldworkers, understanding how one has lived and managed a life throughout a series of lived experiences is central to the interpretive/constructivist ethos. Qualitative interviewing is paramount in helping the fieldworker tap into these emotional and interpretive (personal) states; it is a dialectical process whereby both the interviewer and interviewee are actively involved in the reconstruction of the past, the accounting for the present, and the foretelling of the future. Qualitative interviewing serves as a guide, if you will, for a skilled qualitative interviewer navigating

troubled and/or triumphant stories that are revealed while he or she develops a culturally holistic interpretation of these experiences. Qualitative interviewing therefore becomes an interpersonal journey for all involved.

At a fundamental level, all interviews are, in essence, conversations. In the field, these casual conversations are often a prelude to specific types of themes to be formally explored at a later point in time. Such casual conversations are often useful in developing rapport with prospective interviewees, establishing social boundaries concerning the appropriateness to the setting of certain topics/themes, highlighting potential ethical dilemmas not previously considered, identifying key informants who may later facilitate the recruitment of interviewees, and creating a qualitative interview approach that is appropriate for the research setting, its scope, and the objectives.

Qualitative interviewing can range from a series or combination of open-ended yet topically guided questions to inquiries with more of a substantive frame, such as semistructured or structured interview protocols. Effective qualitative interviewing rests primarily on the interviewer's ability to actively listen for content and process, recognizing the impact the wording and sequencing of certain questions may have on the outcome and the use of interview probes in order to encourage dialogue. Typically, with permission from the interviewee, qualitative interviews are audio-recorded in order to develop full verbatim transcriptions of the interaction. However, if an interviewee declines having his or her session audio-recorded, then the fieldworker's only alternative is to take copious notes. Either way, qualitative interview data are recorded as transcriptions. Transcriptions are the textual representation of a person's life, a textual approximation, so to speak, of one's experiences.

Establishing and Enhancing Credibility

In general, qualitative researchers, fieldworkers in particular, obsess about credibility. The heightened focus on authenticity is due both to subject matter and to the dominance of the field by traditional positivist and post-positivist approaches. It is not uncommon for people to have some reservations about the ability of fieldwork to produce theoretically driven explanations; the very nature of fieldwork invites such apprehension. Fortunately, since the mid-1950s, fieldworkers have made great theoretical refinements and have methodologically advanced the field in terms of data management and analysis. Overall, transparency (i.e., being honest and clear about one's intentions) is a vital step in establishing credibility. Transparency of one's paradigmatic orientation, theoretical framework, methodological orientation, and choices (i.e., informant and subject selection, sampling design, setting, reciprocity, analytical constructs, etc.), as well as one's position in the research process enhances credibility by means of the comparability, transferability, and

external reliability of the results being reported. The key here is to provide a written account for every decision point in the field. The common use of multiple sources of data, called *triangulation*—for instance, the use of both participant observation and interviews—also enhances credibility.

The use of multiple researchers (observers), variations of collaborative ethnography, and the introduction of technology to help record and preserve qualitative data has enhanced fieldworkers' thinking and reporting of internal reliability.

Fieldwork is rather strong in terms of internal validity because of its interpretive orientation, its self-reflexivity, and its emphasis on collecting data in situ. Therefore, data based on participant observation and interviews are strong in terms of internal validity.

Applications

Fieldwork, and street ethnography in particular, is most appropriate for studying members of a "hidden" (vulnerable) population. They are hidden in terms of the inherent difficulty in locating them and establishing their true numerical estimates. The difficulty in deriving an accurate population count may be due to their transient nature, their involvement in deviant and/or illegal activities, and/or the fact that the members belong to a "closed" society. Members of a hidden population pose challenges for social researchers because appropriate sampling frames of such prospective respondents are nonexistent, although nonprobability sampling designs (e.g., convenience, snowball/chain referral, maximum variation, criterion based, venue based, extreme or deviant case, and stratified purposeful) offer an alternative. Examples of hard-to-reach groups include the homeless, runaway youth, drug users/addicts, sex workers, gang members, fraternity members, migrant workers, street corner men, people in psychiatric institutions, jail/prison inmates, HIV/AIDS patients, MSMs (men-who-have-sex-with-other-men), WSWs (women-who-have-sex-with-other-women), and transgender individuals.

Conclusion

Fieldwork continues to evolve and redefine itself along epistemic, methodological, and analytic standpoints. Contemporary fieldworkers, called *street ethnographers*, continue to write about dilemmas in the field concerning process and outcomes. For example, publications on the emotionality of initiating and sustaining a field study are becoming commonplace, largely because of an increased number of relevant publication outlets. Modifications made to traditional nonprobability sampling designs, such as respondent-driven sampling, have created opportunities for collaborative work among street ethnographers

and statisticians. Recent technological advances in the area of audio- and video-recording capabilities have transformed how such data are recorded and stored, thereby creating further collaborative opportunities across disciplines (e.g., communications, education, psychology, and sociology). On a related note, qualitative software, which was introduced in the early 1980s, has made great strides in being able to handle and manage an ever-larger assortment of qualitative data, including textual data, video, movies, and so on. Although the use of software for the analysis of qualitative data might seem out of step with fieldwork's philosophical roots, it is facilitating closer reviews of data integrity and structure, both of which may impact later analysis.

PROGRAM EVALUATION

JODI LANE

University of Florida

Program evaluation is one of the most important methods for assessing the process and impact of criminal justice programs and policies. In general, in program evaluations, researchers (e.g., university professors or people who work for private research organizations) work with practitioners (e.g., police or probation officers) to determine the effectiveness of programs designed to change offenders or people who might become offenders. This latter group of clients might be considered those at risk of committing crime; often, they are juveniles, but sometimes they are adults. In program evaluation researchers collect information, or data, about the program, staff, and clients; analyze it; and then report back to the program leaders and other important stakeholders regarding the results. Stakeholders might include policymakers, people who designed or developed the program, those who funded it, or interested community members. Sometimes evaluation results are then used by policymakers and practitioners to inform changes in their programs and policies.

Program evaluations have been increasingly important to criminal justice practice in the last few decades, in part because of limited resources. Criminal justice programs cost a lot of money (often millions of dollars), and decision makers, such as legislators, governors, county councils, or funding agencies such as the National Institute of Justice (NIJ) and the Office of Juvenile Justice and Delinquency Prevention, often have to make decisions about which programs to fund or continue to fund. There are typically many

more programs requesting money than there is money to fund them. One way to distinguish between programs is to use the scientific evidence provided in program evaluations to determine which programs are most effective at reaching their goals. For example, legislators might want to fund programs that are best at reducing crime, decreasing recidivism, or preventing youth from getting into trouble. It is now typical for funding organizations to require agencies to include an evaluation component in their program plan when asking for funding, especially if there is not hard evidence of success already. Evaluations conducted to determine whether programs are performing to expectations are called *summative evaluations* (Rossi, Lipsey, & Freeman, 2004, p. 36).

Evaluations are also useful in helping people involved in administering the program learn more about it. Although it might seem that those involved in administering the program would know the most about it, they often do not know everything that might be useful. Evaluators can often provide some of this information, such as how well they are meeting the goals of the program (e.g., preventing recidivism or increasing school attendance), whether the program is serving the people it is intended to serve, and whether staff members are providing the program to their clients in the way they are supposed to. Program evaluations that are conducted specifically to help programs improve are called *formative evaluations* (Rossi et al., 2004, p. 34).

Staff members who do the daily work in programs sometimes truly believe that they are making a difference in the lives of their clients but have no scientific evidence on which to base their opinions. Instead, they use their own personal experience with individual cases to judge the impact of their actions. For example, a staff member might remember that one of his clients stopped committing crime, went to college, and started a successful career, or he might remember that he spent many hours with a youth and that the girl said it changed her life. Individual instances of success can make staff members feel very good about doing their jobs and can convince them that the program is working. This might be enough information for them to want to continue implementing the program. Some might believe that changing one life is worth all the effort. Program decision makers, however, are often more interested in the effects of their program on clients more generally. They may wonder about the percentages of clients who are remaining crime or drug free, staying in school, maintaining jobs, and so on, and how their program compares to other programs on these measures. Program evaluations can answer these types of questions.

The results of program evaluations also help other jurisdictions make decisions about what types of programs to implement. For example, a county probation department might be interested in making program changes to help prevent its clients from progressing into juvenile correctional facilities (being locked up). The administration might look to other jurisdictions to determine what programs have been implemented for juveniles on probation, how well they worked, and for whom they worked. They might also look for specific details about how to implement the programs (e.g., what to include or not include as treatment components, the types of staff needed, or problems to anticipate when creating or putting a new program into operation).

Academic audiences, or university professors and their students, also learn from program evaluations. Professors teach students about which programs are effective and which are not. Just as important, members of the academic community contribute to the scientific understanding of criminal justice by conducting research on programs and policies to determine whether they work. Sometimes researchers conduct program evaluations because they want their unique research skills to apply to real-world issues—they want to make a difference. Researchers usually realize that the results they produce from their studies may have an effect on how staff, offenders, and others are treated in the programs they evaluate or on whether a program receives or continues to receive funding. Collaboration among researchers and policymakers and practitioners is critical, because policymakers and practitioners are rarely trained in the scientific method and often do not know where to look for scientific research. Researchers who work in the field with people in criminal and juvenile justice programs can make research accessible and understandable. Policymakers and practitioners, in turn,

provide academics with key details about the programs and their daily activities to help with the research. Sometimes, although not always, researchers also go beyond the purely practical reasons for conducting evaluations to test academic theories of crime, crime prevention, or offender treatment to see whether they work when applied in real situations.

Important Types and Components of Program Evaluation

According to Rossi et al. (2004), authors of one of the most important and widely used textbooks on program evaluation, there are generally five types of program evaluation that might occur: (1) needs assessment, (2) assessment of program theory, (3) process evaluation, (4) impact evaluation, and (5) efficiency analysis. Often, researchers conduct more than one type of evaluation when examining a particular program. This chapter discusses each of these types of program evaluation in more detail, including what they are and the types of research methods they might include. This chapter also describes examples of important evaluation studies that have been conducted regarding juvenile and criminal justice, to illustrate the types of results that these studies produce.

Needs Assessment

According to Rossi et al. (2004), *needs assessment* involves the activities that researchers use to “systematically describe and diagnose social needs” (p. 102). In terms of program evaluation, researchers conducting the needs assessment aim to answer questions such as “Is this proposed (or current) program needed?” and “If so, what specific services would fill the need?” In the case of ongoing programs, questions might include “Are the provided services meeting the needs of the clients?” In truth, programs are often implemented without conducting a systematic needs assessment, because the individuals implementing the program simply believe the program is needed.

One might begin a needs assessment by examining the character and degree of the problem a program plans to address. First, the researchers might want to determine how the people who are developing and implementing the program define the problem (see Rossi et al., 2004). For example, if the program staff believe they need to address juvenile crime, researchers might determine what the staff mean by *juvenile crime*. Do they mean all juvenile crime, from minor offenses to very serious ones; violent crime only; property crime only; status offenses (i.e., those offenses that would not be crimes if the youth were adults); or crimes committed by particular offenders (e.g., gangs)? Researchers often can determine the answer by repeatedly asking probing questions to prompt staff to be more specific. For example, if staff say “juvenile crime,” the researchers can ask “What do you mean?” If the staff say, “You know,

violent crime and property crime,” then the researcher can say “What do you mean by that?” Then, if the response is “Crimes like murder, burglary, and assault,” the researchers will know exactly what the staff hope to address with the program.

Another important component of needs assessment is helping program implementers articulate its target group; that is, whom the program intends to serve (Rossi et al., 2004). In other words, who will or should the program’s clients be? Targets are usually individuals with certain demographic and personal characteristics (e.g., at-risk youth, probationers, or prisoners), but sometimes the targets might be organizations (e.g., police or probation departments, or prisons). A program evaluator might help a program better define who the targets will be—for example, which at-risk youth or what type of police departments. It is very common for program evaluators to spend a lot of time talking to program developers and staff members to further define what might at first be discussed in general terms. Sometimes, different staff members disagree about the definition of their target group, even if they use the same words to describe the problem, and the evaluator can help them agree on a compromise definition. If the program developers decide that they want to help (or target) at-risk youth, a researcher might set out to determine how program developers and staff define *at risk* (do they want to focus on those who come from single-parent families, are skipping school, have been arrested for petty crimes, are gang members or associates, etc?). If the program is focusing on serving police departments (e.g., providing weapons training), the evaluator might ask the staff to further define the type of department on which they would like to focus. For example, would they like to focus on urban, suburban, or rural departments; large or small ones; or those that deal with a lot of crime or just a little? Does the program hope to target departments with certain types of policing styles or administrative structures? Do they want to focus on training all staff, only line officers, only administration, and so on?

Once the program has better defined the target group, evaluators might set out to determine the degree of the defined problem, or how much of it is out there and where it is located (see Rossi et al., 2004). So, if a program defines at-risk youth as those coming from single-parent families, evaluators might look to see whether they can determine how many single-parent families live in the community and whether they are concentrated in certain areas (e.g., particular neighborhoods or school districts) or are equally dispersed throughout the city. Learning where these families live will help the program determine where to deliver services. Evaluators might also try to determine the characteristics of people affected by the problem. For example, are there more girls or boys in single-parent families? What are the racial and ethnic origins of those living in these family structures? What are the average income levels of these families? What are the specific problems these people face that might lead the children to criminal behavior?

If the focus is on training police departments on the efficient use of weapons, the researcher might look to determine how many of them need this type of training module. For example, the evaluator might look to see whether relevant departments already have a training module on weapon use, how the content of the training in use compares with the content of that to be offered, whether some departments have more complaints about the misuse of weapons than others, and so on. Answering questions such as these will help determine whether a program is needed, who needs it, and what type of services would be most relevant to those who would need or use the program, as well as where the services might best be located (see Rossi et al., 2004).

Program Theory Assessment

Another type of evaluation that one might conduct involves determining whether the program itself is defined, thought out, and developed well (Rossi et al., 2004). Program theory is not the same as academic theory, although criminological or criminal justice theories are sometimes embedded in programs. Instead, program theory is typically practice driven, and program developers and staff often determine their theory from personal experience, training workshops or presentations they have attended, articles they have read in practitioner magazines, or other people to whom they have talked about the issues they face in their work. They often use laymen’s terms to discuss their program philosophy and thoughts, but well-versed evaluators can often find the propositions of academic theories in practitioners’ descriptions. For example, a probation officer might mention that children get into trouble when their parents or friends are also troublemakers and so might argue that the focus should be on removing children from negative peers or focusing on increasing parenting skills. After more discussion, an evaluator might see elements of learning theory or social control theory in the thoughts behind the program.

As Rossi et al. (2004) noted, “The program theory explains why the program does what it does and provides the rationale for expecting that doing so will achieve the desired results” (p. 134). To some people, it might seem obvious that programs would start with this sort of program description (or their reason for existing) before they started developing the particular service components they wanted to deliver. However, the program theory may or may not be well articulated, either in written or verbal form. Sometimes staff members go about their work without a clearly defined reasoning for doing so or at least without a reasoning that they can verbalize well. For example, staff may choose to provide services a certain way because they were trained to do so or because it is what they have been doing for a long time and is what they know and are comfortable providing. Sometimes the program theory is a good one, and sometimes it is not. Evaluators trying to assess program theory attempt first to understand what the program theory is and then to evaluate whether it is a good one (see Rossi et al., 2004).

Readers will notice an important theme emerging: that one of the most important tasks of evaluators throughout the process is asking questions. With regard to program theory, evaluators often look at program documents to see whether they can glean details from written information. Important documents might include annual program reports, notes from presentations given by staff, grant proposals written for the program, flyers or pamphlets, and so on. This is a good place to start, because it provides an evaluator with some context with which to ask more questions of the people involved in designing or implementing the program. Documents are rarely sufficient, though, because what is written down may or may not represent the reality for the program.

A lot of the ideas that guide programs are not written down but embedded in the design of program service components. Evaluators usually work to understand program theory by asking probing questions regarding ideas behind service plans and by visiting the program site to observe daily activities there. Example questions might include the following: (a) “Why do you do what you do?” (e.g., give youth individual counseling) (b) “How do you think doing this will change the clients’ behavior?” (e.g., Will it keep them from committing crime? Prevent angry outbursts?)” and (c) “Why do you think it will have this effect?” (e.g., Why will individual counseling keep youths from committing crime?). Researchers generally continue to ask probing questions until they feel they understand the rationale behind the program. When evaluators look for the assumptions regarding how a program changes clients’ behaviors (i.e., the cause and effect), they are examining the program’s *impact theory* (Rossi et al., 2004, p. 139). For example, program personnel might say something like “Allowing offenders to release their pain through individual counseling sessions will prevent them committing crime again.” Although this is not necessarily an uncommon sentiment expressed in social service programs, academic research indicates that this is an example of a faulty assumption, because less structured treatments (e.g., those that allow people to express their emotions) alone rarely prevent recidivism (Andrews et al., 1990). When evaluators examine assumptions about the process of service delivery (e.g., how it should work and what should be provided), they are looking at the program’s *process theory* (Rossi et al., 2004, p. 141).

In general, researchers ask questions of multiple people involved in the design and implementation of the program, in hopes of getting a more rounded, less biased view of what is driving service delivery. Yet talking to multiple people often illustrates important inconsistencies in key stakeholders’ views of why the program exists. Some of these stakeholders will have more power than others, and so their influence may be greater. Sometimes the evaluator may lead discussions among stakeholders to help them articulate their ideas and possibly compromise if there is disagreement. It is often the evaluator’s job to understand and synthesize this information into a coherent description

of the program theory, if one is not articulated already. Then, it is often helpful for the evaluator to draft a statement of the program theory to provide to the people working there to see whether what is written adequately and appropriately describes the philosophy behind their program (Rossi et al., 2004).

Program missions, goals, and objectives are important pieces of program theory, and these become critical later in evaluating the process and impact of the program (see Rossi et al., 2004). The mission, when written, is a brief statement of the organization’s philosophy and reason for existence (Sylvia, Sylvia, & Gunn, 1997). Program goals include broad statements of anticipated accomplishments. A goal for a new prison program might be to reduce recidivism among program clients. Objectives follow from the goals and are more specific statements about the goals that include measurable criteria to determine whether those goals and the related objectives are met. For example, an objective related to the goal of reducing recidivism might be to reduce the number of client rearrests for violent crime (e.g., murder, rape, robbery, and assault) within 1 year of being released from prison. Another related objective might be to reduce the number of reincarcerations among clients within 3 years of prison release. Programs may have many objectives related to each goal, but again, goals and objectives may not be enumerated by the program in measurable ways until a program evaluator works with staff to articulate them in these terms.

After the program theory and the more specific goals and objectives are determined, evaluators who are assessing program theory then might attempt to determine whether the program theory is a good one. There are different issues to consider. First, does the program theory address the needs noted in the needs assessment (if one was conducted)? Second, are the goals and objectives well defined and reasonable? In other words, can this program realistically accomplish the goals and objectives it wants to accomplish? Some programs indicate goals that are out of their reach. For example, they might wish to reduce the local crime rate, when they might do better if they focused on reducing crime among the clients they serve. Third, are the program’s plans for making changes in their clients’ behavior logical based on scientific research? Also, do the program theory and service plans make sense given the resources available to the program (e.g., are the plans too lofty based on the amount of money, staff, services, etc., that are available to the program?) An evaluation of program theory is important, because if the theory is faulty, then it may be impossible for the program to be successful no matter how well people follow the implementation plans (see Rossi et al., 2004).

Process Evaluation

The third and one of the most common types of evaluation is that focused on measuring the process or implementation of a program. The goal of this type of evaluation

is to determine how well the program is maintaining fidelity to the original program design and to describe what services are being delivered (see Rossi et al., 2004). This is a critically important piece of the puzzle when researchers are trying to understand the impact of a program. Consequently, it is often good to conduct a process evaluation and an impact evaluation together. Knowing what goes on in a program helps explain client results. For example, if people who participate in a program fail, is it because the program was delivered poorly or because there was something about the people involved that prevented the desired effects from occurring? (Rossi et al., 2004).

Usually, researchers conducting a process evaluation spend a lot of time observing the daily activities of the program and watching what people do, how they go about their jobs, how clients are treated, and what service components are actually being delivered and to whom. Researchers might sit in on treatment groups and write down what is being covered or taught and record attendance, for example. They might also observe normal activities of the program, being careful to see whether different staff members do things differently. This might involve “hanging out” and taking a lot of notes. Researchers might also interview staff and clients, asking detailed questions about their perceptions of what is delivered and how well. In addition, evaluators usually look at program records, such as case files, to determine what services are being delivered to each client (e.g., how often a probation officer is meeting with the client, to what services the client has been referred, or whether the client is being drug tested). Some of the questions evaluators might hope to answer by observing the program include the following: (a) Are the intended targets (e.g., at-risk youth) receiving the services, (b) are the services being delivered as designed, (c) does service delivery vary by site or staff member, (d) are clients happy with the services they receive, and (e) do staff believe they are delivering the services well (Rossi et al., 2004)?

Ideally, program monitoring occurs throughout the implementation of the program, because what goes on in a program can vary day by day. Sometimes events occur that make major changes in how programs work (e.g., people are hired, fired, or quit; program managers make different decisions about how people should deliver services; or referrals of clients to the program increase or decrease). Researchers prefer to have a solid understanding of the inner workings of programs over time, so they can describe what is really happening there rather than relying solely on what is supposed to be occurring. It is not uncommon for evaluators to find that program delivery is very different from the plan. For example, counselors might have a large binder of sequential lessons to use in their treatment groups, but they may not ever open the book and instead use their own knowledge and experience to guide what they discuss with clients. A process evaluation would attempt to find out the content the counselors were actually delivering and how it matched or varied from the curriculum in the

binder as well as whether the people served in the groups were those who were supposed to be treated.

A major goal of process evaluation, then, is to systematically record and document the activities of the program (including what is delivered and to whom it is delivered) and to determine whether the activities match the original plan for service delivery (or the program as it is described publicly in documents and presentations). The results of a process evaluation may most importantly help explain program results (e.g., client impact). For example, if a program is not showing the anticipated results with clients, the process evaluation may point to problems with program implementation that could explain the lack of impact. Process evaluations may also be useful purely for managerial purposes. Program managers might learn that certain services are not being delivered at all, some are being delivered poorly, and others are being delivered well—or they might learn that their targets are not being serviced. For example, a program might target school dropouts but find that the clients using the services are all good students who excel in school. This knowledge could then be used to help program leaders make management decisions about how to change the program and client recruitment and help mold staff guidance and training. In addition, process evaluation can help provide important information about service delivery to key stakeholders, such as those that funded the program or community members. The evaluation might tell them whether the program is delivering what it promised (see Rossi et al., 2004).

Impact Evaluation

Probably the most common form of evaluation (published) in criminology and criminal justice is impact or outcome evaluation, which is designed to determine whether a program creates positive change in its clients. Even if a program addresses the needs of its clients, has a good program theory, and is implemented the way it was designed, it is unlikely to continue or be funded if it cannot demonstrate that it can reach its goals and objectives and helps its clients. An *outcome* is the observable characteristic or behavior of the client that the program is supposed to change (e.g., self-esteem, crime commission, drug use, school attendance, employment, peer choices, etc.). Impact or outcome evaluations are designed to determine whether the program actually did change these key client characteristics. Sometimes clients change while in the program but because of something other than the program itself (e.g., getting older, or internal motivation changes not addressed by the program; see Rossi et al., 2004).

The characteristics that are considered outcomes usually can be measured in people not served by the program also, which can help determine whether the change was caused by the program itself. Researchers might collect the same measures (e.g., criminal behavior) for people in a comparison group to see whether these individuals are different than those in the program. In experimental evaluations,

which are considered the gold standard of evaluation methods, clients might be randomly assigned (in a method similar to flipping a coin) to either the program of interest (the experimental group) or to no treatment or a different treatment (a control group; see Boruch, 1997; Campbell & Stanley, 1963; Rossi et al., 2004). For example, the experimental group might be youth in a new juvenile prevention program, and the control group might be those sent to typical diversion programs or to no program at all. In the case of random assignment, the experimental and control groups as a whole should be similar on relevant characteristics at the outset (e.g., sex, race, prior criminal history), and any change demonstrated in the experimental group should be attributed to the program rather than something else (e.g., gender, different backgrounds, different living conditions, etc.). In theory, if the program is causing the change, the people in the control group should not change on the outcomes the program addresses but participants in the program should change (see Rossi et al., 2004). If both groups change, the evaluator must determine why. Sometimes random assignment to groups is not an option (e.g., people are already in prison or on probation), and so researchers use other methods to create study groups. For example, they might determine what the key background characteristics are (e.g., age, race, gender, criminal history, and family background) that might affect the outcomes of interest and match people in each group on these traits. One way to match is to make sure each group contains a certain percentage of people with each characteristic (e.g., half women and half men). Another, more difficult but better approach is to match individuals in each group. So, if one group has a 16-year-old black female who has committed a burglary, then the other group should include someone with those characteristics as well.

To determine which outcomes to measure, the evaluator usually looks to the program impact theory, mission, goals, and objectives (Rossi et al., 2004). For example, if goals of a program include reducing crime and increasing the number of prosocial (nondelinquent) friends among youth on probation, the evaluator might measure official records of arrest as well as interview youth about their participation in crime and the characteristics of their friends both before and after the program. Sometimes evaluators also measure outcomes of interest to program developers and stakeholders that are not written in the formal impact theory and goals of the program. For example, practitioners might indicate that they think a side effect of their program aimed at reducing delinquency among juveniles is that parents and their children have better relationships. An evaluator might measure the quality of these relationships either through observation or surveys of clients and their families. A third way to determine what outcomes to measure is to look at scientific studies of similar programs to see what they found to be relevant program impacts. Prior research might be especially instructive on the unintended consequences, or those the staff and program evaluators do not

naturally anticipate (see Rossi et al., 2004). For example, a side effect of intensive supervision probation (ISP) might be that clients are caught more for technical violations of probation (e.g., dirty drug tests or failure to get a job) because they are watched more (Petersilia & Turner, 1993).

Once an evaluator determines what outcomes he or she wants to measure (e.g., arrests, school attendance), he or she must determine what measures to use to gauge these client characteristics. For example, the evaluator must determine which arrests to measure (e.g., all arrests, arrests for violent crime, property crime, etc., and what offenses are included in each type) and how to gather the information (e.g., through official records from the police or probation or through interviews with staff and clients). The method of measurement may depend on what is available to the researcher. If the researcher cannot gain access to the official records, he or she might be forced to rely on self-reports by clients. In contrast, if the clients are not easy to track down, the researcher may be forced to rely solely on official records. Often, evaluators attempt to gather information on outcomes from multiple sources, to ensure that they can get a better understanding of the true impact of the program.

Efficiency Analysis

The final major type of program evaluation is what Rossi et al. (2004) called *efficiency analysis*, but these are not as common in criminal justice as process and impact evaluations. This may be in part because evaluators are already very busy collecting data for the process and impact studies or because the researchers do not have the expertise to conduct efficiency evaluations well. In addition, sometimes decisions about the continuation of projects are made without cost being the primary consideration (e.g., programs may be stopped because the outcomes are not as good as expected, or they may be continued because someone in power likes the program). Although the costs and benefits can be estimated before a program is implemented, it is more common to analyze this information after the information is known (e.g., the program knows how much money was spent and what the effects of the program were; see Rossi et al., 2004).

Rossi et al. (2004) discussed two basic types of efficiency analyses: (1) cost-benefit analysis and (2) cost-effectiveness analysis. The goal of this type of program evaluation is to determine whether the benefits gained from a program justify its costs. In a cost-benefit analysis, researchers put monetary values on the program effort (e.g., salaries, supplies, and other program costs) and on the effects (e.g., the medical and property replacement costs saved by preventing victimizations or corrections costs saved by preventing reincarceration in a prison facility). Often, cost-benefit analyses are difficult to conduct in criminal justice, because it is hard to put monetary values on some program effects (e.g., how much does a victimization cost, and

so how much was saved by preventing one?). In a cost-effectiveness analysis, researchers examine the costs of reaching certain outcomes but do not put monetary value on the outcomes themselves. For example, if the goal is to sanction offenders, a cost-effectiveness analysis might look at how much it costs per year to put a person in prison versus on probation in the community. In this case, the researcher probably would not try to put a monetary value on the “prevented” behaviors that occurred because the person was on probation or in prison.

To conduct these types of evaluations well, researchers must be able to get information on all of the costs and benefits related to programs, which is not simple (Rossi et al., 2004). Some of these monetary values are readily available (e.g., how much salaries, supplies, or space cost), but some are not (e.g., what is the monetary value of a potential life saved by incarcerating a murderer?).

Some Important Evaluation Studies in Criminology and Criminal Justice

Evaluation studies are regularly conducted in the field of criminology and criminal justice, and there is not sufficient space here to discuss all of them. Consequently, for illustration purposes, this section discusses important examples of impact evaluations that have been done in policing, corrections, and juvenile justice.

Policing

One of the first well-known evaluations in policing was the evaluation of the Kansas City Preventive Patrol Experiment, conducted during the early 1970s. The evaluation examined the effects of three different types of police patrols on crime, fear of crime, and opinions of the police in Kansas City, Missouri. The three types of patrol were (1) reactive, in which officers only responded to calls; (2) proactive, in which police visibility in the community was at least doubled; and (3) the normal level of patrol for the area (one car per police beat). The findings indicated that there were no significant differences in crime, fear of crime, or attitudes toward police across the different types of patrol (Kelling, Pate, Dieckman, & Brown, 1974). This study prompted police departments across the United States to reconsider how they approached neighborhood patrol.

One of the most famous evaluations in policing was Sherman and Berk's (1984) evaluation of the Minnesota domestic violence experiment, in which offenders who came into contact with the police for simple domestic assault were to be randomly assigned to either arrest, police advice, or an order to leave their residence for 8 hours. The authors reported that during the following 6 months, people who were arrested initially were less likely to get rearrested for violence than those who were just told to leave their place of residence. In addition, they noted that victims indicated that those who were arrested

were less likely to be violent again than those who received advice. However, the random-assignment portion of the study, which would have ensured that the results were more trustworthy, was not implemented correctly by the police officers, who did not always follow the researchers' directions (Sherman & Berk, 1984). Despite this and other methodological problems, this study led to important changes in policing, whereby many departments decided to mandate arrest in domestic violence cases (Binder & Meeker, 1988). Later researchers attempted to replicate the findings from this study, but their results were inconsistent, sometimes showing that arrest worked to reduce domestic violence and sometimes showing that it increased it or had no effect (see Garner, Fagan, & Maxwell, 1995). Because of inconsistent results over time, this study and its effects on policy continue to be regularly discussed.

A more recent evaluation of Boston's Operation Ceasefire experiment conducted by Braga and colleagues examined the impact of a Boston problem-oriented policing approach focused on stopping illicit firearm traffickers and deterring gang activities in order to reduce youth violence. A collaborative effort among many criminal justice and social service agencies included several efforts to decrease violence, including more police presence and enforcement in neighborhoods, prosecutors focusing on gang cases, increased probation checks and terms and conditions of probation, serving outstanding arrest warrants, and providing services to gang members. The results showed that youth homicide, calls to the police about hearing gunshots, and firearm-related assaults decreased in the area (Braga & Kennedy, 2002; Braga, Kennedy, Waring, & Piehl, 2001). This study has been widely discussed in academic and practitioner circles during the last few years because it shows some positive effects of collaborative policing strategies.

Corrections

There have been a number of evaluations in corrections in the past few decades. One of the most famous was conducted by Joan Petersilia and Susan Turner, who conducted a 14-site randomized experiment across nine states from 1985 through 1990 to evaluate the effects of ISP. Clients were randomly assigned to either ISP or a control group (they were on probation, parole, or in prison). Overall, the researchers found that ISP was associated with more technical violations and therefore more prison commitments, but there were no significant differences in arrests between those on ISP and in the control groups. They also found that ISP cost much more than routine probation because it involved more court appearances and returns to prison but that ISP cost less than prison itself. Finally, the results showed that ISP programs worked best when they provided both treatment and surveillance (Petersilia & Turner, 1993). This evaluation is one of the most respected, because it was the first to use random assignment in a field setting (in the criminal justice system) and because the results were interpreted by many scholars to

mean that ISP did not work, which eventually led to some programs being shut down and others being focused more on juveniles, for whom treatment was still considered a major goal (Lane, 2006).

Another well-respected evaluation study was conducted by MacKenzie and colleagues and examined correctional boot camps in eight states. Correctional boot camps have military-style programs with exercise, hard work, and stern discipline. The researchers compared people who completed boot camp programs with those who completed other types, such as probation, prison, and parole. The authors concluded that the military components of boot camp programs themselves do not reduce recidivism; specifically, they found no impact on recidivism in four states, worse results in one state, and some positive impact in three states. They noted that boot camps that focused on therapeutic components, intensive supervision after release to the community, longer time in the boot camp, and prison-bound offenders seemed to have better results. In addition, they speculated that those programs might have done as well without the particular military-style components (MacKenzie, Brame, McDowall, & Souryal, 1995). A later summary of many studies on boot camps concluded that boot camps did not substantially reduce recidivism but did often show good results in terms of in-program client attitudes and behavior and reduced need for prison space. In addition, the study noted that, because of this research, some boot camps had closed and some had added more treatment components and more post-release supervision (Parent, 2003).

The Amity Prison Therapeutic Community is another example of a correctional evaluation that has had academic and practical impact, probably in part because it used a strong design (random assignment) to assign inmates either to the therapeutic community or to no treatment. The therapeutic community was characterized by a three-part treatment. The first part focused on orientation, client assessment, and job assignments. The second part focused on inmates gaining more responsibility and participating in intensive treatment, such as individual and group counseling. The third part focused on preparing the inmates to re-enter society. The researchers found that inmates who participated in the therapeutic community and had strong aftercare were less likely to return to prison after 1, 2 (Wexler, De Leon, Thomas, Kressel, & Peters, 1999), and 3 years (Wexler, Melnick, Lowe, & Peters, 1999). Those who participated in the therapeutic community but not necessarily in aftercare did better with recidivism at 1 and 2 years but not at 3 years. The studies also found that parolees who were reincarcerated but spent more time in treatment stayed out of prison longer (Wexler, De Leon, et al., 1999; Wexler, Melnick, et al., 1999).

Juvenile Justice

One of the most widely used programs in juvenile justice is Drug Abuse Resistance Education (D.A.R.E.), a

school-based drug prevention program taught by police officers. The 17 lessons focus on teaching information (e.g., about specific drugs) and life skills (e.g., how to resist peer pressure) to elementary schoolers with the ultimate goal of preventing or delaying drug use. A number of individual evaluation studies have examined the effects of D.A.R.E. in different parts of the United States and have found mixed results. Some have found that there are some short-term positive impacts, but a meta-analysis (statistical comparison) of multiple studies showed that the effects of D.A.R.E. in the short term were not substantial (Ennett, Tobler, Ringwalt, & Flewelling, 1994). Studies of the longer-term impact of participating in D.A.R.E. also have shown that there are few long-term positive effects. For example, one random experiment that compared survey responses for youth who participated in D.A.R.E. versus those in a control group showed that after 1 year, D.A.R.E. had no significant effects on the use of alcohol or cigarettes or on school success or behaviors there (Rosenbaum, Flewelling, Bailey, Ringwalt, & Wilkinson, 1994). Another study that examined the long-term effects of D.A.R.E. after 6 years found that participation had no effect on the use of alcohol, cigarettes, or marijuana for 12th graders but did find some evidence that it was related to less use of hard drugs (e.g., cocaine) in some males (Dukes, Stein, & Ullman, 1997).

Gang Resistance Education and Training (GREAT) is another popular program focused on gang prevention but modeled after D.A.R.E. The police-led GREAT program focuses on teaching 7th graders nine life skills lessons, including information about how to resolve disputes, about cultural differences, and about the negative elements of gang membership in hopes of helping youth resist peer pressure. The larger goal is to reduce gang activity. The evaluators conducted posttest surveys (1 year after participation in GREAT) of youth who participated in GREAT as well as youth in comparison groups in 11 sites across the United States. Researchers asked students about their attitudes and behaviors, including criminal and gang behaviors. They found that students who participated in the program reported less gang affiliation and gang activity as well as many other positive attributes (e.g., fewer problematic friends, greater self esteem, and more attachment to their parents) during the year following participation in GREAT (Esbensen & Osgood, 1999).

A later longitudinal study that examined the effects of GREAT at 2-years and 4-years postprogram in six locations used better comparison groups (assigning some classrooms to get the program and some not to it), had pretests (surveys before the program), and surveyed youth multiple times during the follow-up period. After 2 years, the researchers found no significant differences between the groups (Esbensen, 2001). After 4 years, they again found some generally positive effects of GREAT compared with not getting the program (e.g., in attitudes about peers and the police), but these long-term results did not show less gang activity or criminal behavior over time (Esbensen, Osgood,

Taylor, Peterson, & Freng, 2001). Because of these results, the GREAT curriculum was modified (Esbensen, Freng, Taylor, Peterson, & Osgood, 2002).

Conclusion

Evaluations are increasingly important to help guide monetary and administrative decisions regarding criminal justice programs. As resources continue to decline in tough budget years, evaluations will likely become even more important. Evaluators can provide critical information about the need for a program, the soundness of the program's theory, and its implementation and impact, as well as whether the benefits outweigh the costs. Evaluators have provided this critical information to policymakers and practitioners for decades, and this chapter discussed some important examples of these studies.

QUANTITATIVE CRIMINOLOGY

ROBERT BRAME

University of North Carolina at Charlotte

Since its inception as a field of scientific inquiry, criminology and criminal justice (CCJ) researchers have used quantitative data to describe and explain criminal behavior and social responses to criminal behavior. Although other types of data have been used to make important contributions to criminological thought, the analysis of quantitative data has always played an important role in the development of knowledge about crime. This chapter discusses the various types of quantitative data typically encountered by CCJ researchers. Then, some of the logical and inferential issues that arise when researchers work with quantitative data are described. Next, the chapter considers different analytic frameworks for evaluating evidence, testing hypotheses, and answering research questions. Finally, a discussion of the range of methodological approaches used by contemporary CCJ researchers is provided.

Quantitative Data Sources

CCJ researchers commonly work with data collected for official recordkeeping by government or quasi-government agencies. Such data often include records of criminal events, offender and victim characteristics, and information about how cases are handled or disposed. Detailed information about crimes known to the police and crimes cleared by

arrest are available in the Uniform Crime Reports (UCR) and the National Incident Based Reporting System (NIBRS). In addition, for purposes of specific research projects, criminal justice agencies often make their administrative records available to criminologists—provided that appropriate steps are taken to protect individual identities. For example, the Bureau of Justice Statistics has conducted two major studies of recidivism rates for prisoners returning to the community in multiple states. Such projects require coordinated use of state correctional databases and access to criminal records, including arrests, convictions, and reincarceration.

More recently, researchers have also relied on information collected through direct interviews and surveys with various populations. In these surveys, respondents are asked about their involvement in offending activities, victimization experiences, background characteristics, perceptions, and life circumstances. Analyses from data collected through the National Crime Victimization Survey; the Arrestee Drug Abuse Monitoring program; the RAND inmate survey; the National Youth Survey; the National Longitudinal Survey of Youth; the Adolescent Health Study; Monitoring the Future (MTF); Research on Pathways to Desistance, and the Office of Juvenile Justice and Delinquency Prevention's longitudinal youth studies in Rochester, New York, Pittsburgh, Pennsylvania, and Denver, Colorado, have all made important contributions to criminological thought and public policy.

Researchers have also attempted, in some studies, to collect detailed quantitative databases composed of information from both administrative and direct surveys on the same individuals. Among other findings, this research has consistently shown that most crime victimizations are not reported to the police and that most offending activities do not result in an arrest.

Logical and Inferential Issues

The analysis of quantitative crime-related data, like any other type of analysis, depends primarily on the question one is asking and the capabilities of the data available. This section briefly discusses some of the most prominent issues that crime researchers consider when analyzing quantitative data.

Time Horizon

Regardless of the data source, research projects using quantitative data can generally be characterized as cross-sectional or longitudinal. *Cross-sectional* studies examine individuals or populations at a single point in time, whereas *longitudinal* studies follow the same individuals or populations over a period of time. Among longitudinal studies, an important consideration is whether the data will be collected prospectively or retrospectively. In *prospective studies*, individuals are enrolled in the study and then followed to see what happens to them. In *retrospective studies*, individuals are enrolled in the study, and researchers then examine historical information about them. Some studies include both prospective and retrospective elements. For example, the Research on Pathways to Desistance study enrolled adolescent offenders in Phoenix, Arizona, and Philadelphia to see how these offenders adapt to the transition from adolescence to adulthood. In that sense, the study is prospective; however, historical information about the individuals included in the study is available and has been collected retrospectively as well.

In most studies, it is clear whether the project is cross-sectional or longitudinal, but there are exceptions. For example, the MTF study repeatedly surveys nationally representative samples of high school seniors. This study can be viewed as cross-sectional because it does not survey the same individuals repeatedly, but it can also be viewed as longitudinal because the same methodology for drawing the sample and analyzing the data is repeated over time. Similar issues arise with UCR and NIBRS data. Often, specific studies using a repeated cross-sectional data source, such as MTF, UCR, or NIBRS, will tend to emphasize either cross-sectional or longitudinal features of the data.

Unit of Analysis

It is also useful to think about research projects in terms of the basic source of variation to be studied. For example,

some studies focus on variation in crime between communities, whereas other studies examine variation in criminality between individual persons. Still other studies attempt to describe and explain variation in behavior over time for the same community or individual. In some studies, the unit of analysis is unambiguous, whereas in other instances, there may be multiple logical analysis units (e.g., multiple observations on the same person and multiple persons per community). These studies are generally referred to as *hierarchical* or *multilevel* analyses. An important issue arising in these analyses is lack of independence among observations belonging to a logical higher-order group. For example, individuals who live in the same community or who attend the same school are not likely to be truly independent of each other.

Sampling

The list of all cases that are eligible to be included in a study is called the *sampling frame*. The sample included in the study will either be identical to the sampling frame or it will be a subset of the sampling frame. In some instances, the sampling frame is explicitly defined; at other times, the sampling frame is vague. Researchers generally describe the manner in which the sample was selected from the sampling frame in terms of probability or nonprobability sampling. In *probability sampling*, each case in the sampling frame has a known, non-zero probability of being selected for the sample. Samples selected in any other way are called *nonprobability samples*. The most basic form of probability sampling is simple random sampling, when each member of the sampling frame has an equal probability of being selected for the sample. More complicated forms of probability sampling, such as stratified random sampling, cluster sampling, and stratified multistage cluster sampling, are all commonly used in CCJ research.

The use of probability sampling allows researchers to make clear statements about the generalizability of their results. Although this is a desirable feature of probability samples, much CCJ research is based on nonprobability samples. The 1945 and 1958 Philadelphia birth cohort studies conducted by Marvin Wolfgang and his colleagues (Wolfgang, Figlio, & Sellin, 1972) focused on an entire population of individuals rather than a sample. Still, one can view the choice of the years 1945 and 1958 as a means of sampling. In fact, when populations are studied, there is almost always a way to conceive of them as nonprobability samples. In other studies, a researcher may survey all children in attendance at a school on a particular day. The resulting sample would be called a *convenience* or *availability sample*. Still other research projects rely on the purposive selection of certain numbers of people meeting particular criteria to ensure representation of people from different groups (i.e., males, females, blacks, whites, etc.). These samples are usually called *quota samples*. A key feature of nonprobability samples is that one is not able to

make explicit probabilistic statements about quantities in the population based on what one observes in the sample. Nevertheless, nonprobability samples are quite useful and necessary for addressing many interesting research and policy questions that arise in CCJ research.

Target Population

A key aspect of any scientific work is the identification of empirical regularities that transcend specific individuals, places, or times. Thus, the population to which the results of a study generalize is of considerable importance. In general, researchers tend to prefer studies that identify the target population and discuss how well the results are likely to generalize to that population. But the target population is sometimes ambiguous. If one studies all individuals in attendance at a particular school on a given day, one could argue that the sample is synonymous with the target population. The research community, however, is not likely to be interested in what is occurring at that individual school unless it somehow relates to what is occurring at other schools in other locations and at other times. This ambiguity means that one cannot make precise statements about the generalizability of the results to other settings. Thus, clear statements about the composition and boundaries of the target population are often the exception rather than the rule.

Concepts and Variables

Scientific theories describe relationships between concepts. In this sense, concepts represent the key elements of a well-developed theory. *Concepts* are verbal cues or symbols that sometimes refer to simple or complicated sources of variation. *Sex* (male vs. female), for example, refers to a simple, objective source of variation, whereas the meaning of concepts such as *delinquency* or *socioeconomic status* is potentially quite complicated. Still, reference to concepts for purposes of theory and hypothesis development can be sufficient. For purposes of conducting empirical tests of theories and hypotheses, however, more rigor and specificity are required.

Variables are the language of actual empirical work. A researcher's description of a variable explicitly defines how the concept in question is to be measured for purposes of an actual research project. An operational description or definition of a variable attends to how the variable was measured and what values the variable can take on. Variables such as sex and race are categorical, whereas variables such as age and income are quantitative. *Categorical variables* can be *nominal* (unordered categories) or *ordinal* (ordered categories, but the distance between categories is not well-defined). *Quantitative variables* can be *interval* (equal distance between categories) or *ratio* (existence of a true zero). Still another type of variable, of particular interest to criminologists, is a *count of events*. Event-count variables represent the number of times an event occurs within some

period of time. One way to think of an event-count variable is to consider a two-category variable: Either an event occurs or does not occur within some small time interval. If one adds up the number of times an event occurs over many of these small time intervals, one gets a total count of events.

Some concepts are too broad to be measured effectively with a single variable. Socioeconomic status, for example, is often linked to a combination of at least three subordinate concepts: (1) educational attainment, (2) income, and (3) occupational prestige. Often, variables associated with closely related subordinate concepts can be combined into a scale or index that measures the conceptual variation of interest. There are different ways to form scales and indexes. Some are driven by mathematical decision rules based on correlations between the items comprising the scale or index, and others are based on conceptual considerations.

Descriptive and Causal Inference

Still another important feature of any quantitative study is whether it emphasizes description or the identification of cause–effect relationships. *Descriptive inference* is a characterization or summary of important features of a population. For example, the main objective of the 1993 Bureau of Justice Statistics recidivism study was to estimate the percentage of offenders released from prison in 1993 who experienced subsequent involvement with the criminal justice system within 3 years of their release. No effort was made to explain variation in the recidivism rate; instead, the goal was pure description.

Causal inference is the process of distinguishing between a correlation or statistical association between two or more variables and a cause–effect relationship between those variables. In order for a variable x to be considered a cause of variable y , three criteria must be satisfied: (1) x precedes y in time, (2) x and y are statistically associated, and (3) the statistical association between x and y is not spurious (i.e., there is no other variable that can account for or explain the statistical association between x and y). It turns out that establishing the first two criteria is reasonably straightforward. Convincingly demonstrating nonspuriousness, however, is much more difficult. This issue is discussed in more detail in the “Analytic Methods for Causal Inference” section.

Validity

The word *validity* is often used in two broad contexts in CCJ research. It may be used to indicate whether (or to what extent) a specific measure is an accurate characterization of the concept being studied. For example, one might ask whether an IQ test is a valid measure of intelligence. The word *validity* is also used as a way of characterizing a study or particular methodological approach. In this case, the concern is whether the study or method is likely to faithfully present the world as it really operates or

whether it will distort the phenomena under study in some important way. As an example of this usage, one might consider whether a study with a pretest outcome measurement followed by an intervention and then a posttest outcome measurement but no control group (a group that does not experience the intervention) is a valid study.

A number of different types of validity appear in the CCJ literature. A few common types are discussed here. Assessments of *face validity* are subjective judgments about whether a measurement or methodology is likely to yield accurate results. If a measure successfully predicts variation in a logically linked outcome, one can say that it rates high on *criterion* or *predictive validity*. For example, if one has a parole risk assessment instrument that is designed to predict likelihood of recidivism and the instrument, in fact, does do a good job of recidivism prediction, then one can say that it exhibits criterion validity. Measures with good *construct validity* are correlated with well-established indicators of the phenomenon in question. Such measures should also be independent of indicators that are not relevant to the phenomenon in question.

Studies with high *internal validity* take convincing steps to ensure that the logic of the study as applied to the individuals actually being studied is sound. *External validity*, on the other hand, refers to the generalizability of the study's results to individuals other than those actually included in the study. Internal validity tends to be maximized when the researcher is able to exert a great deal of control over the study and the environment in which the study is conducted (i.e., a laboratory setting). Unfortunately, when the researcher exerts great control, the conditions of the study sometimes become more artificial and less realistic. This raises questions about how well the study results will generalize to other cases. To the extent that the researcher attempts to allow for more realistic study environments (and greater external validity), this will often lead to less control over the study, which produces threats to internal validity. Researchers desire studies that maximize both internal and external validity, but this is often difficult to achieve.

Reliability

Reliability refers to the consistency, stability, or repeatability of results when a particular measurement procedure or instrument is used. Researchers aspire to the use of instruments and procedures that will produce consistent results (provided that the phenomena under study have not changed). There are different ways of assessing and quantifying reliability. One approach is to take a measurement at a particular point in time and then repeat that same measurement at a later point in time. The correlation between the two measurements is called *test-retest reliability*. Another approach is to conduct multiple measurements with some variation in the precise measurement method; for example, multiple questionnaires with variations in the wording of various items can be administered to the same

individuals. The correlation between the various instruments is called *parallel forms reliability*.

In some instances, researchers need to code various pieces of information into quantitative research data. A concern often arises about whether the coding rules are written in such a way that multiple properly trained coders will reach the same coding decisions. *Interrater reliability* is considered to be high when there is a high correlation between the decisions of multiple coders who have reviewed the same information.

Reliability can also be assessed by examining correlations between multiple indicators of the same underlying concept. Assume, for example, that a researcher believes that a key influence on criminal behavior is an individual's level of self-control. Because there is no single definitive measure of self-control, the researcher might measure many indicators and characteristics of individuals that he believes to be manifestations of one's level of self-control (i.e., time spent on homework each day, grades in school, time spent watching television, etc.). One way of assessing the reliability of a scale or index that combines this information is to calculate the correlations between all of the indicators, which can then be used to calculate *internal-consistency reliability*. High levels of internal-consistency reliability imply that the various characteristics and indicators being studied are closely related to each other.

Relationship Between Reliability and Validity

Measures or procedures for capturing measurements can be highly reliable but also invalid. It is possible, for example, to obtain consistent but wrong or misleading measurements. Measures or procedures can also be both unreliable and invalid. In general, however, if a measure is valid it must also, by definition, be reliable.

Estimates and Estimators

An *estimate* is a person's guess about the value of some interesting quantity or parameter for a target population. Researchers obtain an estimate by applying a formula or estimator to observed data that can be used to develop inferences about the target population. The most straightforward case is when one studies observed data from a simple random sample drawn from a well-defined target population. The goal is to infer the value of a parameter or quantity in the population on the basis of what one observes in the sample. A researcher plugs the observed data into an estimator and then uses the estimator, or formula, to calculate an estimate of the quantity of interest in the population.

Estimator Properties: Bias, Efficiency, and Consistency

In the case of a probability sample drawn from a well-defined population, there is a true population parameter or quantity that researchers seek to estimate on the basis of what

they see in the sample. An important issue is whether the estimator applied to the sample will—over the course of drawing many, many probability samples—on average lead to the correct inference about the population parameter. If the average of the parameter estimates is different from the true population parameter, one says that the estimator is *biased*.

Sometimes there are different unbiased estimators or formulas that could be used to estimate a population quantity. An important question is how to choose one estimator over another. Generally speaking, in this situation researchers would prefer the unbiased estimator that exhibits the least amount of variation in the estimates generated over many samples drawn from the same population. The estimator that exhibits the minimum amount of sample-to-sample variation in the estimates is the most efficient estimator. For example, the sample mean, the sample median, and the sample mode (see “Measures of Central Tendency” section) are both valid estimators for the population mean of a normally distributed variable. The sample mean, however, is a more efficient estimator than the sample median, which is itself more efficient than the sample mode.

In some circumstances, an unbiased estimator is not available. When this happens, researchers typically try to use a *consistent* estimator. A consistent estimator is biased in small samples, but the bias decreases as the size of the sample increases. Many commonly used estimators in the social sciences, such as logistic regression (discussed later in this chapter), are consistent rather than unbiased.

Assessing Evidence

A *statistical model* is a description of a process that explains (or fails to explain) the distribution of the observed data. A problem that arises in quantitative CCJ research is how to consider the extent to which a particular statistical model is consistent with the observed data. This section describes several common frameworks for thinking about this correspondence.

Relative Frequency

In quantitative crime research, decisions about whether to reject or fail to reject a particular hypothesis are often of central importance. For example, a hypothesis may assert that there is no statistical association between two variables in the target population. A test of this hypothesis amounts to asking the following question: What is the probability of observing a statistical association at least as large (either in absolute value or in a single direction) as the one observed in this sample if the true statistical association in the target population is equal to zero? Put another way, assume that there is a target population in which the statistical association is truly equal to zero. If a researcher drew many simple random samples from that population and calculated the statistical association in each

of those samples, he or she she would have a sampling distribution of the statistical association parameter estimates. This theoretical sampling distribution could be used to indicate what percentage of the time the statistical association would be at least as large as the association the researcher observed in the original random sample.

Generally speaking, if the percentage is sufficiently low (often, less than 5%), one would reject the hypothesis of no statistical association in the target population. A concern that arises in these kinds of tests is that the hypothesis to be tested is usually very specific (i.e., the statistical association in the target population is equal to zero). With a very large sample size it becomes quite likely that the so-called test statistic will lead a person to reject the hypothesis even if it is only slightly wrong. With a very small sample size, the test statistic is less likely to lead one to reject the hypothesis even if it is very wrong. With this in mind, it is important for researchers to remember that hypothesis tests based on the relative frequency approach are not tests of whether the statistical association in question is large or substantively meaningful. It is also important to keep in mind that the interpretation of statistical tests outside of the framework of well-defined target populations and probability samples is much more ambiguous and controversial.

Bayesian Methods

Researchers often find the relative frequency framework to be technically easy to use but conceptually difficult to interpret. In fact, researchers and policymakers are not necessarily so concerned with the truth or falsehood of a specific hypothesis (e.g., that a population parameter is equal to zero) as they are with the probability distribution of that parameter. For example, it might be of more interest to estimate the probability that a parameter is greater than zero rather than the probability that a sample test statistic could be as least as large as it is if the population parameter is equal to zero. Analysis conducted in the *Bayesian tradition* (named after the Rev. Thomas Bayes, who developed the well-known conditional probability theorem) places most of its emphasis on the estimation of the full probability distribution of the parameter(s) of interest. In general, Bayesian methods tend not to be as widely used as relative frequency (or *frequentist*) methods in CCJ research. This is probably due to the training received by most criminologists, which tends to underemphasize Bayesian analysis. Because Bayesian analyses can often be presented in terms that are easier for policy and lay audiences to understand, it is likely that Bayesian methods will become more prominent in the years ahead.

Parameter Estimation and Model Selection

CCJ researchers typically rely on quantitative criteria to estimate parameters and select statistical models. Common criteria for parameter estimation include least squares (LS)

and maximum likelihood (ML). *LS estimators* minimize the sum of the squared deviations between the predicted and actual values of the outcome variable. *ML estimators* produce estimates that maximize the probability of the data looking the way they do. Provided the necessary assumptions are met, LS estimators are unbiased and exhibit minimum sampling variation (efficiency). ML estimators, on the other hand, are typically consistent, and they become efficient as the sample size grows (asymptotic efficiency).

Model selection involves the choice of one model from a comparison of two or more models (i.e., a *model space*). The most prominent model selection tools include *F* tests (selection based on explained variation) and likelihood-ratio tests (selection based on likelihood comparisons). An important issue with these tests is that they typically require that one model be a special case of the other models in the model space. For these approaches, tests are therefore limited to comparisons of models that are closely related to each other. Increasingly, model selection problems require researchers to make comparisons between models that are not special cases of each other. In recent years, two more general model selection criteria have become more widely used: (1) the Akaike information criterion (AIC) and (2) the Bayesian information criterion (BIC). These criteria can be used to compare both nested and non-nested models provided the outcome data being used for the comparison are the same. Like *F* tests and likelihood-ratio tests, AIC and BIC penalize for the number of parameters being estimated. The logic for penalizing is that, all other things equal, we expect a model with more parameters to be more consistent with the observed data. In addition to penalizing for parameters, the BIC also penalizes for increasing sample size. This provides a counterweight to tests of statistical significance, such as the *F* test and the likelihood-ratio test, which are more likely to select more complicated models when the sample size is large. As modeling choices continue to proliferate, it seems likely that use of AIC and BIC will continue to increase.

Methods for Descriptive Inference

This section briefly considers some descriptive parameters often studied in CCJ research. The first two subsections deal with parameters that are usually of interest to all social scientists. The final three subsections emphasize issues of particular importance for CCJ research.

Measures of Central Tendency

Central tendency measures provide researchers with information about what is typical for the cases involved in a study for a particular variable. The *mean* or arithmetic average (i.e., the sum of the variable scores divided by the number of scores) is a common measure of central tendency for quantitative variables. The mean has an advantage in that each case's numerical value has a direct effect

on the estimate; thus, the mean uses all of the information in the scores to describe the "typical" case. A problem with the mean is that cases with extreme scores can cause the mean to be much higher or much lower than what is typical for the cases in the study. In situations where the mean is affected by extreme scores, researchers often prefer to use the *median* as a measure of central tendency. The median is the middle score of the distribution; half of the cases have scores above the median, and the other half have scores below the median. The median can also be viewed as the 50th percentile of the distribution. Unlike the mean, the median does not use all of the information in the data, but it is also not susceptible to the influence of extreme scores. For categorical variables, the *mode* (i.e., the most frequently occurring category) is often used as a measure of central tendency. For dichotomous or two-category variables, the most commonly used measure of central tendency is the *proportion* of cases in one of the categories.

Measures of Dispersion

In addition to summarizing what is typical for the cases in a study, researchers usually consider the amount of variation as well. Several common summaries of variation, or *dispersion*, are commonly reported in the literature. The most common measure of dispersion for quantitative variables is the *variance* and/or its square root, the *standard deviation*. Many interesting social science variables are either normally or approximately normally distributed (i.e., the distribution looks like a bell-shaped curve). In these types of distributions, approximately two thirds of the cases fall within 1 standard deviation of the mean, and about 95% of the cases fall within 2 standard deviations of the mean. Thus, for variables with a bell-shaped distribution, the standard deviation has a very clear interpretation. This is particularly important because sampling distributions are often assumed to have normal distributions. Thus, the standard error calculation that appears in much quantitative CCJ research is actually an estimate of the standard deviation of the sampling distribution. It can be used to form confidence intervals and other measures of uncertainty for parameter estimates in the relative frequency framework.

For qualitative or categorical variables, a common measure of dispersion is the *diversity index*, which measures the probability that cases come from different categories. Some CCJ researchers have used the diversity index to study offending specialization and ethnic-racial heterogeneity in communities and neighborhoods. A generalized version of the diversity index that adjusts for the number of categories is the *index of qualitative variation*, which indicates the extent to which individuals are clustered within the same category or distributed across multiple categories.

Criminal Careers

Over the past three to four decades, criminologists have developed the concept of the *criminal career*. According to

researchers who study criminal career issues, within any given time period the population can be divided into two groups: (1) active offenders and (2) everyone else. The percentage of the population in the active offender category is the *crime participation rate*. Within that same time period, active offenders vary in several respects: (a) the number of offenses committed, (b) the seriousness of the offenses committed, and (c) the length of time the offender is actively involved in criminal activity. A key idea within the criminal career framework is that the causes of participation may not be the same as the causes of offense frequency, seriousness, or the length of time the offender is active.

There is an extensive body of research devoted to estimating these parameters for general and higher-risk populations, and more recent research has treated these criminal career dimensions as outcomes in their own right. For example, a large amount of research has been devoted to the study of *offense frequency distributions*. This literature shows that in both general and high-risk populations offense frequency distributions tend to be highly skewed, with most individuals exhibiting low frequencies and a relatively small number of individuals exhibiting high frequencies. Among the most prominent findings in the field came from Wolfgang et al.'s (1972) study of the 1945 Philadelphia male birth cohort, which showed that about 6% of the boys in the cohort were responsible for over 50% of the police contacts for the entire cohort.

Recidivism Rates

A particularly important parameter for criminal justice policy is the rate at which individuals who have offended in the past commit new crimes in the future (the *recidivism* or *reoffending* rate). Recidivism rates are based on three key pieces of information: (1) the size of the population of prior offenders at risk to recidivate in the future, (2) the number of individuals who actually do reoffend by whatever measure is used (i.e., self-report of new criminal activity, rearrest, reconviction, return to prison), and (3) a known follow-up period or length of time that individuals will be followed. Recidivism is also sometimes studied in terms of the length of time that lapses between one's entry into the population of offenders at risk to recidivate and the timing of one's first recidivism incident.

Trajectories and Developmental Pathways

With the advent of a large number of longitudinal studies of criminal and precriminal antisocial and aggressive behaviors, researchers have become increasingly interested in the developmental course of criminality as people age. To aid in the discovery of developmental trends and patterns, criminologists have turned to several types of statistical models that provide helpful lenses through which to view behavior change. The most prominent of these models are *growth curve models*, *semiparametric trajectory models*, and *growth curve mixture models*. These all assume that

there is important variation in longitudinal patterns of offending. Some individuals begin offending early and continue at a sustained high rate of offending throughout their lives, whereas others who begin offending early seem to stop offending during adolescence and early adulthood. Some individuals avoid offending at all, whereas others offend in fairly unsystematic ways over time. Growth and trajectory models provide ways of summarizing and describing variation in the development of criminal behavior as individuals move through the life span.

Analytic Methods for Causal Inference

The foundation of a sound quantitative criminology is a solid base of descriptive information. *Descriptive inference* in criminology turns out to be quite challenging. Criminal offending is covert activity, and exclusive reliance on official records leads to highly deficient inferences. Despite important challenges in descriptive analysis, researchers and policymakers still strive to reach a better understanding of the effects of interventions, policies, and life experiences on criminal behavior. Much of the CCJ literature is therefore focused on efforts to develop valid causal inferences. This section discusses some of the most prominent analytic methods used for studying cause and effect in CCJ research.

Independent Variables and Outcomes

CCJ researchers typically distinguish between *independent variables* and *dependent* or *outcome variables*. In general, researchers conceive of dependent or outcome variables as variation that depends on the independent or predictor variables. Thus, independent variables explain variation in dependent or outcome variables. Sometimes researchers use stronger language, suggesting that independent variables cause variation in dependent variables. The burden of proof for use of the word *cause* is very high, however, and many researchers are careful to qualify their results if they do not think this burden of proof has been met.

Contingency Tables

Contingency tables are a useful way of presenting frequency distributions for two or three categorical variables at the same time. For example, if a person wanted to create a measure of offending participation (either someone offends in a particular time period or he or she does not) and then compare the distribution of that variable for individuals who are employed and those who are not employed, a contingency table could be constructed to display this information. Several measures of the strength of the statistical association (analogous to a correlation coefficient) have been designed for contingency tables. Although contingency tables are not often used for studying cause-effect relationships (except in

randomized experiments), they are quite useful for exploratory data analysis and foundational work for more elaborate statistical models.

Measures of Association

Researchers often want to summarize the strength of the statistical association between two variables. Correlation coefficients and other measures of association are used for this purpose. In general, measures of association are arrayed on a scale of -1 to 1 or 0 to 1 , where 0 usually represents no association at all and -1 or 1 represents a perfect negative or positive association. Measures of association have been developed for categorical and quantitative variables. Some measures of association, such as the *relative risk ratio* and the *odds ratio*, are calibrated so that 1 implies no statistical association, whereas numbers close to zero and large positive numbers indicate strong association. Researchers often conduct tests of statistical significance to test the hypothesis of “no association” in the population.

Chi-Square, *t* Tests, and Analysis of Variance

CCJ researchers are able to draw on a wide variety of tools for conducting tests of statistical significance. In a contingency table setting, researchers often are interested in testing the hypothesis that two categorical variables are statistically independent. The *chi-square test of independence* is frequently used for this purpose. Sometimes, a researcher will want to test the hypothesis that the mean of a continuous variable is the same for two populations. The *independent samples t test* is most often used to conduct this test. In addition, researchers may need to test the hypothesis that the mean of a continuous variable remains the same at two time points. In this setting, the *paired samples t test* will most likely be used. Finally, if a researcher wants to test the hypothesis that a continuous variable has the same mean in three or more populations, then *analysis of variance* will be used. There are many statistical tests for many types of problems. Although these are among the most common applications, many others are available for more complicated situations.

Linear Regression

Linear regression models are a class of statistical models summarizing the relationship between a quantitative or continuous outcome variable and one or more independent variables. Careful use of these models requires attention to a number of assumptions about the distribution of the outcome variable, the correctness of the model’s specification, and the independence of the observations in the analysis. If the assumptions underlying the model are valid, then the parameter estimates can provide useful information about the relationship between the independent variable or variables and the outcome variable.

Regression for Qualitative and Counted Outcomes

Many outcome variables in CCJ are not continuous or do not meet some of the distributional assumptions required for linear regression. Statistical models for these variables, therefore, do not fit well into the linear regression framework. Examples of this problem include dichotomous and event-count outcomes. For dichotomous outcomes, researchers often estimate *logistic* or *probit regression models*; for counted outcomes, specialized models for event counts are usually estimated (i.e., binomial, Poisson, negative binomial).

Structural Equation Models

CCJ researchers sometimes have well-developed ideas about the relationships between a complex system of independent and dependent variables. These ideas are usually based on theories or findings from previous empirical research. *Structural equation models* can be used to investigate whether the relationships between the variables in the system are in accord with the researcher’s predictions.

Interrupted Time Series Analysis

A *time series analysis* is based on the study of a particular cross-sectional unit (e.g., a community or city) over a sustained period of time. Over that period of time, the study takes repeated measurements of the phenomenon of interest (e.g., the number of gun homicides each month). Sometimes, an intervention occurs (e.g., the introduction of a new law restricting access to handguns) and the researcher has access to both the preintervention time series and the postintervention time series. These time series can be combined into a single interrupted time series analysis to study the effect of the intervention on the series. Researchers conducting interrupted time series analysis usually include both a series in which the intervention occurs and a series in which there is no intervention (a control series). If there is an apparent effect of the intervention in the interrupted time series analysis and the effect reflects a genuine causal effect, then there should be no corresponding change in the control series.

Models for Hierarchical and Panel Data

As discussed earlier (see the “Unit of Analysis” section), some data sets have more than one logical unit of analysis. For example, the National Longitudinal Survey of Youth follows the same individuals repeatedly over a sustained period of time (panel data). Other studies, such as the MTF study, sample schools and then sample multiple individuals within each school. A variety of modeling tools (i.e., fixed effect, random effect, hierarchical, and multilevel models) exist for working these kinds of data. An important feature

of all of these tools is that they attend specifically to dependence within higher order units of analysis.

Counterfactual Reasoning and Treatment Effects

Increasingly, CCJ researchers are thinking about cause and effect in terms of *counterfactual reasoning*. Ultimately, this is an exercise in observing what actually occurs under a specific set of circumstances and then asking how things might have occurred differently if the circumstances had been different. The hypothetical aspect of the problem is a counterfactual, because it involves speculation about what might have occurred but actually did not occur. Counterfactual reasoning is particularly applicable to the problem of estimating treatment effects. For example, a researcher considers a group of people who received a particular treatment and observes their outcomes. What he would like to know (but cannot know for sure) is what outcomes these same people would have experienced if they had not received the treatment. The difference between the actual, observed outcome and the hypothetical outcome is the treatment effect. CCJ researchers usually look to the experience of a control group to estimate the hypothetical outcome. An important problem in CCJ research is the identification of appropriate control groups.

Randomized Experiments

A *randomized experiment* is a study in which individuals are randomly assigned to treatment or control groups prior to treatment. They provide a useful framework for estimating valid counterfactuals because random assignment to treatment and control conditions ensures that the groups are statistically comparable to each other prior to treatment. Thus, the experience of the control group provides a very convincing answer to the question of what would happen to the treatment group if the treatment group did not receive treatment.

Natural Experiments and Instrumental Variable Estimators

For a variety of reasons, randomized experiments are not possible in many instances, but sometimes conditions that closely approximate an experiment occur because of a key event or policy change. When researchers recognize these conditions, a *natural experiment* is possible—even when more conventional studies fail. Consider the problem of estimating the effect of police strength on crime rates. Estimating correlations and conventional regression models cannot help much with this problem. The critical ambiguity is that street crime almost certainly has an effect on police strength and that police strength almost certainly has some effect on street crime. Natural experiments can provide more convincing evidence. A recent study conducted in

Washington, D.C., is illustrative (Klick & Tabarrok, 2005). It was based on the insight that changes in terror alert levels lead to meaningful changes in the presence of police on the street. The researchers examined what happened to crime rates when street-level police presence increased and decreased as terror alert levels changed. Researchers sometimes refer to natural experimentally based treatments as *instrumental variable estimators*, and they can provide a powerful method for estimating treatment effects when randomized experiments cannot be conducted.

Matching

Another approach to developing valid counterfactuals is to identify a group of cases that receive treatment and then identify another group of cases—the control group—that are similar to the treatment cases but do not receive treatment. To ensure that the treatment and control groups are similar, researchers match the groups on characteristics that are thought to be important. The *direct matching approach* guarantees that the treatment and control groups look alike on the matched characteristics. A problem is that the groups may look different from each other on characteristics that were not matched. Thus, in general, counterfactuals produced by the matching approach will not be as convincing as those produced by a randomized or natural experiment. However, in instances where experiments are not possible, direct matching designs can still provide convincing evidence about treatment effects. A generalization of the matching design involves matching on indexes based on combinations of variables. *Propensity scores*, which increasingly appear in the CCJ literature, are one such index. It can be shown that matching on a properly created index can lead to treatment and control groups that look like each other on many characteristics. It is likely that CCJ researchers will rely more and more heavily on matching designs and propensity scores to study treatment effects, in particular when randomized experiments are not possible.

Conclusion

Some aspects of quantitative CCJ research have remained relatively constant throughout the field's history. Some CCJ research problems are very much like problems studied in other fields, and some are quite different, yet there has always been a major emphasis on description and learning about how much crime is occurring and what populations are at highest risk of criminal involvement and victimization. Other aspects, such as repeatedly and systematically following the same individuals over time and rigorously measuring the effects of changing policies, are more recent developments. CCJ is an interdisciplinary field that relies on insights from sociology, psychology, economics, political science, and statistics as well as its own rapidly emerging traditions. One thing is certain: Analytic methods in the field will

continue to evolve. It is critical that quantitative CCJ researchers monitor developments in their own field and stay well connected with developments in other allied fields to strengthen their efforts at descriptive and causal inference.

PART V

TYPES OF CRIME

CAMPUS CRIME

JOHN J. SLOAN III

University of Alabama at Birmingham

Illegal activities occurring within the boundaries of postsecondary institutions (PSIs), including assaults, rapes, and even homicide, are not new, nor have college campuses escaped various forms of “high-tech” offenses such as cyberstalking or illegal sharing of copyrighted material such as videos and music. However, until very recently, crime on college and university campuses was something college and university administrators in the United States were reluctant to discuss. Typically, criminal incidents occurring on campus that involved students were either handled internally via closed campus disciplinary proceedings, the results of which were not publicly available, or they were quietly handled by the local authorities. PSIs were not forthcoming about how much crime occurred within their institutional boundaries, nor were they forthcoming about their security policies, including whether they even existed. In short, campus crime was a “dirty little secret” that few schools were willing to discuss, let alone admit was problematic, and schools went to great lengths to keep the secret.

That reality changed in the early morning hours of April 5, 1986, when Jeanne Clery, then a sophomore at Lehigh University in Bethlehem, Pennsylvania, was raped, tortured, and strangled to death in her own bed in a campus residence hall by another student who had gained entry to her dormitory through a series of doors that had either been propped open or whose locks were defective. Ms. Clery’s death resulted in Lehigh being held civilly

liable, as well as nearly a 5-year lobbying effort by her parents to get Congress to pass legislation that forced PSIs to “come clean” with their campus crime statistics and security policies.

To better understand campus crime, one needs to realize that it involves several contexts—the legal, the social, and the security—and that each context is interrelated with the others (Fisher & Sloan, 2007). The legal context involves judicial and legislative efforts to address campus crime, including institutional liability for on-campus victimizations and Congressional and state legislative efforts to address the problem. The social context involves efforts to develop more accurate measures of the extent and nature of campus crime, identify its major correlates, and understand better its temporal and spatial distribution. Finally, the security context involves not only law enforcement and security efforts to reduce or prevent crime on campus, but also recently has involved efforts to address “high tech” crimes such as identity theft or network intrusions occurring on college campuses.

By understanding that campus crime involves the intersection of these three contexts, one can then understand that campus crime is not simply about answering basic questions such as “how much is there” at a particular school, but is rather a multidimensional phenomenon that touches the lives of members of the campus community—students, staff, and faculty members—in a variety of ways.

The Legal Context of Campus Crime

The legal context of campus crime focuses on two branches of government: the judicial and the legislative. The judicial side involves court rulings that PSIs can be held civilly liable for victimizations occurring on campus, while the legislative side includes efforts by Congress and state-level legislatures to pass laws designed to address the problem of campus crime. Both judicial and legislative attention to campus crime is relatively recent and is continuing.

Postsecondary Institutional Liability

Turning first to liability issues relating to campus crime (Burling, 2003), courts have repeatedly ruled that PSIs may be liable for criminal victimization occurring on campus. This interpretation arises primarily through the law of torts, specifically negligence, although some courts have used contract law as the basis for their rulings (Burling, 2003). Under a negligence action, a victim can shift to the institution some, if not all, losses he or she incurred, but only when the plaintiff (victim) proves the following: (a) The university or college owed him or her a duty; (b) the university or college acted (or failed to act) in such a way as to breach that duty; (c) as a result of the breach, the plaintiff was injured; and (d) if the PSI had not acted (or failed to act) as it had, the plaintiff would not have been injured. Under contract law, the plaintiff/victim must prove the existence of either an expressed or an implied contract, the resulting breach of which resulted in his or her personal injury or property loss.

Generally, in negligence cases involving PSIs, the key issue for the court is to determine whether the institution had a duty to the victim and, if so, the basis of that duty. In making this determination, courts first have to establish that the relationship between the parties was such that from it, the PSI had a duty to the victim to prevent the victimization. To establish this, the courts have relied on three theories. First, some courts have argued that the relationship between the institution and victim, especially if a student, is intrinsically “special.” Other courts have argued the relationship between the victim and institution is comparable to that of landowner–business invitee, and thus specific duties arise on the part of the PSI. Finally, still other courts have argued the relationship between the PSI and victim is more protective than that of a landowner–business invitee, and instead is comparable to that of a landlord and tenant, which again gives rise to specific duties on the part of the PSI (Burling, 2003). Crucial here is that no one consensus theory has emerged nor has a national-level standard been created. Rather, courts in various jurisdictions have used one or more of these theories in their rulings.

Finally, some courts have not relied upon theories of negligence in establishing PSI liability, but have instead used breach of express or implied contract to hold them

liable for campus crime–related victimizations. Courts using this theory have done so in cases where the PSI provided housing to students in dorms or university-owned apartments, and ruled the PSI may be liable for lax security under what is known as an “implied contract of habitability” that is included in the typical housing contract signed by the PSI and the student resident. In addition, because PSIs use advertising relating to housing as a way to attract prospective students, the courts have held that a PSI may, through its advertising, form either an express or implied contract with a prospective student to provide security measures to him or her in the dormitory, and if the measures are implemented incorrectly or are relaxed, the PSI may be held liable for damages under the theory of breach of contract.

Legislative Responses to Campus Crime

Beginning in the 1990s and extending into the present, Congress and nearly half of the states passed “campus crime” statutes. The first significant piece of federal legislation (Carter & Bath, 2007) was the Student Right-to-Know and Campus Security Act of 1990 (hereafter, “Security Act”), which for the first time mandated that all postsecondary institutions eligible to receive federal financial aid funds under Title IV of the Higher Education Act of 1965, annually report and make available to the public their campus crime statistics and security policies. Institutional noncompliance could result in civil fines of up to \$25,000 per violation, and in extreme cases, loss of eligibility to receive federal financial aid funds.

The significance of this legislation was its reporting requirements (Carter & Bath, 2007). Prior to passage of the Security Act, the only source of data on campus crime was available through the Federal Bureau of Investigation’s (FBI) Uniform Crime Reports (UCR) program, which annually compiles and presents statistical analyses of crimes reported to law enforcement agencies at the municipal, county, and state levels of government, and is probably the best known and most widely used source of information on crime in the United States. The UCR published data on campus crime, but prior to passage of the Security Act, less than 5% of all PSIs in the United States provided their data to the FBI for inclusion in the UCR. Further, there was variability from year to year in not only the total number of schools participating in the UCR reporting program, but also in whether a specific school participated every year. Not uncommon was the situation where a school would participate 1 year, then drop out for 2 or 3 years, then return to the program (Sloan, Fisher, & Cullen, 1997). This kind of movement into and out of the UCR program made it difficult, if not impossible, to identify overall national-level trends in campus crime as well as trends at a particular campus.

With passage of the Security Act, Congress mandated that all PSIs make available to the public, on an annual

basis, a compilation of crimes known to campus police/security and to publicly report the school's security policies, including whether the school had a campus police department with full arrest powers and the department's jurisdiction. The Security Act was subsequently amended several times during the 1990s, until in 1998 it was renamed the Jeanne Clery Disclosure of Campus Security Policy and Campus Crime Statistics Act (hereafter, "Clery") in remembrance of Jeanne Clery (Carter & Bath, 2007).

In its present form, Clery contains three key revisions to the original Security Act involving the reporting of campus crime data, dissemination of timely crime information to the campus community, and ensuring the protection of basic rights of both accuser and accused in sexual assault cases addressed using campus disciplinary mechanisms. As a result of these revisions, the security report now requires all PSIs, by October 1 of each year, to make publicly available a statistical compilation of serious violent and property crimes reported on their campuses, including hate crimes, by location of the incident, and violations involving drugs/alcohol/weapons that resulted either in an arrest or student disciplinary proceeding, as well as a description of the PSI's security policies, including those relating to sexual assault and the power/authority/jurisdiction of campus police or security. The requirement of timely dissemination of information involves making crime logs available to the public that include the date, time, nature, general location, and known disposition of each reported offense, and—through warnings issued to the campus community—providing notice of serious incidents on campus that pose an ongoing threat to members of the community. Finally, PSIs are required to disclose specific policies in place to ensure basic rights for both accuser and accused in sexual assault cases handled via campus disciplinary proceedings. Clery also requires postsecondary institutions to publicly disclose where the public can find information on registered sex offenders attending classes at the school.

State legislatures have also passed their own Clery-style legislation (Sloan & Shoemaker, 2007). As of 2006, over 50% of the states had passed some type of "campus crime" legislation that involved either enabling statutes allowing colleges or universities in a particular state to create a fully functional campus law enforcement agency whose officers had full arrest powers and could use deadly force should the situation arise, or statutes that required PSIs to report their crime statistics to a designated state agency, such as the attorney general's office, although there is a great deal of variation in the specific mandates of these statutes.

Proponents of Clery and similar state-type legislation argue that greater public awareness of campus crime will result in reduced levels of on-campus victimization, as people will take better precautions once they know the danger they face. Critics, however, argue that Clery and its state-level clones represent little more than symbolic efforts by Congress and the states to address campus crime because (a) the statutes' reporting requirements are based only on incidents actually known to campus police/security,

which victimization research shows accounts for only a small portion of all crime occurring on campus and as a result, seriously undercounts the true extent and nature of campus crime; (b) the statutes fail to include reporting requirements for the most common form of campus crime—thefts—and as a result, the reporting requirements *overemphasize* the reporting of violence while *underemphasizing* the reporting of property crimes like theft; and (c) sanctions for institutional noncompliance (civil fines of up to \$25,000 per violation in the case of Clery) are minimal and have rarely been implemented, while none of the current state-level statutes contains *any* sanctions for noncompliance.

In summary, the legal context of campus crime involves efforts by both the judicial and legislative branches of government to address such crime. These efforts have involved determining that PSIs can be held liable for on-campus victimizations, particularly of students, under several theories of negligence or under contract law. Legislative efforts, particularly those of Congress, resulted in statutes mandating that all PSIs annually report their crime statistics and security policies, thus breaking the "wall of silence" that had surrounded campus crime for decades. While proponents of such legislation argue that these statutes will reduce on-campus victimization by educating members of the campus community about the extent and nature of crime on a particular campus, critics argue that because of flaws in the legislation, including omission of any reporting requirements for certain commonly occurring crimes like theft, a lack of significant sanctions for noncompliance, and the fact that the reporting requirements rely only on data compiled from crimes actually reported to campus authorities, legislative efforts are little more than symbolic attempts to address the problem.

The Social Context of Campus Crime

The social context of campus crime includes research efforts in such areas as developing better measures of its extent and nature, identifying its major correlates, and exploring its spatial distribution. Two key areas here have involved social science efforts to accurately estimate the extent and nature of the sexual victimization of college women and to identify and examine the role students' lifestyles play in contributing to campus victimization.

During the past 15 years, four national-level surveys have gathered data on the victimization experiences of college students in general, and college women in particular (Fisher, Cullen, & Turner, 2000; Fisher, Sloan, Cullen, & Liu, 1998; Fisher & Wilkes, 2003; Gross, Winslett, Roberts, & Gohm, 2006; Koss, Gidycz, & Wisniewski, 1987). These studies reported that students generally had lower overall rates of criminal victimization compared to nonstudents of similar ages, including overall levels of violence. Further, the surveys showed the most common form of on-campus victimization involves the theft of property. In

addition, the surveys found that most students were victimized by other students who were known by (or at least familiar to) the victim, and that many victims had not taken any steps to prevent their victimization (e.g., asking someone to watch their property or not parking their vehicle in a dark lot). The surveys also reported that alcohol or drugs were involved in many instances of on-campus victimization. The surveys discovered that a large portion of all students who were victimized did not report the incident to any campus authority or law enforcement agency. Finally, the surveys almost universally found that a large minority of college women experienced a wide continuum of sexual victimization, ranging from harassment to rape, in a given year. In short, for the first time, surveys had accurately described *who* was being victimized; *where* victimizations were occurring (on- or off-campus); *what* had occurred; *who* was *perpetrating* the victimizations; what steps, if any, the victim had taken to try and *reduce* his or her chances of being victimized; once the victimization happened, *what* the victim had done about it; and what *role*, if any, alcohol or drug use had played in the victimization.

Studies of violence against college women, besides finding that a significant portion of women experienced some form of sexual victimization during their college years, also found that few female victims ever reported their experiences to the proper authorities and either blamed themselves for what had happened or did not even perceive themselves as victims and therefore sought no help (Koss & Oros, 1982). In addition, the studies reported strong links between alcohol or drug consumption and sexual victimization, including presenting evidence that college men often planned their assaults of women by trying to debilitate them with alcohol, drugs, or some combination of the two. Finally, the studies found that college women experiencing sexual victimization reported suffering higher levels of depression, anxiety, hostility, and other mental health problems than did nonvictims (Fisher et al., 2000).

Another key area of research has examined the role that students' lifestyles play in explaining campus crime, particularly the use of alcohol and drugs (Tewksbury & Mustaine, 2003). Students' lifestyles and their "routine activities" such as traveling to and from the campus, studying in the library, walking on the campus at night, parking in public lots, and socializing at both on- and off-campus locations where drugs or alcohol are available and consumed in large quantities, all create opportunities for criminal victimization (a) by exposing students to would-be offenders, (b) by making them desirable targets because of their possessions, or (c) because they failed to exert guardianship over their person or material possessions.

In general, victimization research shows that the people with whom one spends one's time are important to understanding one's exposure to potential offenders; this may be particularly relevant in the case of student victims, since many of them are victimized by other students. Campus victimization research shows that students attending a college or university with a greater proportion of minority students tend

to experience higher rates of victimization than students enrolled at schools with small numbers of minority students. Students who spend a great deal of their time at home alone have a decreased risk of experiencing a violent victimization, as do students who spend more time with strangers in public places (in contrast to spending time with friends, family, or acquaintances).

Where students spend their time and at what time of day are also important in determining students' proximity to potential offenders. Research shows, for example, that fraternity houses are an especially risky location for violent victimization, particularly for college women (Fisher et al., 2000). Students who spend their time away from home in the evenings are at generally higher risk for experiencing a violent victimization, while being away from home during the late afternoon seems to put students at the greatest risk for experiencing theft victimization at their homes.

Finally, students who spend time in activities that result in the victimization of others (typically involving a group-type setting) are, themselves, more likely to become crime victims. Engaging in risk-taking behaviors, such as being involved in a fight or being aggressive or threatening, increases students' risk for both violent and theft victimization, especially when these activities are combined with living in a dormitory.

Students' lifestyles also contribute to their attractiveness as targets. Research more generally shows the risk of victimization increases for those unable to mount effective resistance, who possess property that is valuable or desirable, who find themselves in circumstances inhibiting effective self-protective actions, or who are frequently exposed to potential offenders. In the case of students, those living in residence halls and possessing desirable property, such as computers and other electronic equipment, are more suitable targets than are students who live alone in an apartment or with their parents. Students who spend multiple nights per week out "partying"—especially if they are consuming alcohol—also increase their attractiveness as targets.

Beyond exposure to prospective offenders and being a suitable target, the absence of capable guardians is a third key aspect of how students' routine activities increase their risk for victimization. Generally, what little research that has been done on guardianship shows that students do not regularly employ tools or activities in their daily routines that reduce their chances for victimization. Further, college students who spend more time with strangers are seemingly more trusting and show lower levels of guardianship activities, and students who mainly rely on automobile transportation in the evening to get them to and from campus are less likely to employ effective guardianship activities.

One of the most important findings about students' campus victimization is the role of alcohol, a key factor in college students' lifestyles (Goldman, Boyd, & Faden, 2002). Evidence compiled by the Harvard School of Public Health's College Alcohol Study (CAS), based on four

national-level studies of college student drinking patterns conducted during the mid- to late 1990s, indicated that about 80% of students enrolled at 4-year colleges and universities on a full-time basis self-reported that they regularly drank alcohol; about 50% of these students routinely “drank to get drunk”; some 40% engaged in binge drinking (drank four or more drinks in a row at one sitting in the 2 weeks prior to completing the survey); and roughly 20% of students frequently binge drank—at least three times during a 2-week period.

A final component of the social context of campus crime involves recent efforts to use crime-mapping technology to identify “hot spots” of crime on college campuses (Paulsen & Robinson, 2004). Research on crime more generally shows that it is not randomly distributed in space. Rather, it tends to cluster in certain places and tends to involve specific kinds of offending. Using sophisticated mapping technology and calls-for-service data compiled by police departments, researchers have identified “hot spots,” that is, places—residences, bars, hotels, convenience stores, etc.—about which a disproportionate number of police calls for service arise. They have also been able to identify the specific offense(s) that characterize a particular hot spot—for example, domestic violence.

Crime-mapping technology and hot spots analyses are being used both by campus crime researchers and by campus police departments to better understand the spatial distribution of campus crime, including how crime clusters within a particular building (e.g., a residence hall or classroom building). Recent research confirms that “hot spots” of crime exist on college campuses and that student residence halls, in particular, are hot spots for such offenses as drug violations, breaking and entering, assault, and sexual assault. Areas of high pedestrian traffic, such as those that join two segments of a campus or that directly surround major parking lots or decks, have also been identified as hot spots for such offenses as breaking and entering of vehicles. Using hot spots analyses, researchers and police officials can help to design and implement interventions designed to “cool” campus hot spots. For example, installing closed-circuit television (CCTV) in parking lots or decks may help to reduce breaking and entering of motor vehicles or vandalism of them.

In summary, national-level studies of college students’ victimization patterns show that college students, compared to people of similar ages who are not students, have lower overall levels of victimization, particularly violent victimization. These studies show that theft, and not violence (despite media obsession with shootings and other violent acts on campus), is by far the most frequent type of victimization. The surveys also show that a significant percentage of college women are victims of various forms of sexual assaults and that many victims never report the incident to proper authorities. Victimization surveys also show that students’ lifestyles—their routine activities—contribute to their on-campus victimization, particularly when those activities involve consuming alcohol or taking

illegal drugs. Finally, recent research into the spatial distribution of campus crime shows that college campuses, like neighborhoods, have “hot spots” of crime—places where crime clusters and from which a disproportionate number of police calls for service originate. Using high-tech analyses, researchers and campus law enforcement officials can design and implement interventions to “cool” hot spots of crime on campus. Thus, while overall levels of on-campus victimization do not warrant describing PSIs as “ivory towers,” neither do they warrant characterizing them as “war zones” or “free fire zones” as some media sources have described them.

The Security Context of Campus Crime

The security context of campus crime is actually a sub-component of a larger set of activities relating to *campus safety*. Because of liability issues facing PSIs, many campuses have developed sophisticated policing and security agencies and activities to address a variety of issues involving campus safety including physical security (such as controlling access to campus, to buildings or offices in them, or to public areas such as parking decks or lots); law enforcement (which includes responding to and investigating alleged illegalities occurring on the campus); and information technology security (such as infrastructure protection from cyber attacks or hacking, and securing sensitive information such as student records).

Major Eras in the Development of Campus Police

While the first campus police officers were actually two off-duty City of New Haven (Connecticut) officers hired to patrol the campus in 1894, research shows the evolution of campus police agencies occurred over three specific eras, each of which had unique features (Sloan, 1992). For example, during the “watchmen era” of the 18th and 19th centuries, a variety of college or university personnel, from university presidents to custodians, performed security functions on campus that ranged from preventing fires, to ensuring property was protected, to enforcing disciplinary codes in the dorms.

Between 1900 and the late 1960s, a new era arose in which formal campus security departments were created whose “officers” had two primary duties: enforce campus disciplinary codes of conduct and protect university property from fire, theft, or vandalism. At some schools, these departments were organizationally affiliated with the school’s physical plant operations, while at others the department was organizationally linked to the Dean of Students. In either instance, PSIs often hired ex-municipal police officers to serve as “directors” of campus security, who then brought with them law enforcement experience and who tried to inject some of that experience into the daily operations of their departments. This change in

orientation planted the seed for what was to become the modern campus law enforcement agency.

The third era in the development of campus law enforcement occurred between the late 1960s and the 1980s. It was here that profound changes occurred in both the organizational structure and responsibilities of campus security departments. During the late 1960s, campus administrators, faced with the prospect of having armed, municipal police on their campuses in response to the social unrest that seemed to disproportionately touch college campuses, had to make a decision about how to best handle their law enforcement needs. Student protests, along with the emergence of radical groups bent on disrupting campus life through bombing campaigns and other activities, combined with the influx of recreational drug use among students, created an environment in which conflict between students and municipal police officers responding to campus unrest was inevitable and occasionally turned deadly. As a result, administrators realized that, on the one hand, while they needed a law enforcement presence on campus, they also realized a college campus needed a specialized type of agency to deal with its unique needs.

Out of this dynamic was born what some scholars (e.g., Sloan, 1992) have called the “modern campus law enforcement agency.” Led by progressive campus police executives who recognized the need for a professional law enforcement presence on campus but also that their agency had a special niche to fill, they systematically worked to create training for prospective campus police officers that combined traditional police academy training with additional training to help officers adapt to the unique campus environment and its dynamics. Soon, autonomous campus police agencies began to appear that resembled municipal police agencies in terms of their operational, tactical, and administrative dimensions. In short, during the 1970s and 1980s, campus law enforcement underwent a rapid and intense period of professionalization in which it adopted many of the common characteristics of municipal police agencies and thus gained “credibility” in the eyes of students, staff, and faculty members alike, since these campus officers were no longer “security guards,” but actual sworn law enforcement authorities who had undergone at least the same training as that experienced by municipal police officers. There has also been a decoupling of law enforcement from physical security under this model.

As campus law enforcement agencies evolved, they not only adopted organizational dynamics and characteristics similar to their municipal counterparts, but also embraced emerging technology as routine additions to their tactical and operational activities (Bromley & Reaves, 1998a, 1998b). For example, many campus police agencies now routinely use closed-circuit television to monitor such areas as parking decks, green space, or particular buildings seen as high-level security risks due to research or other activities occurring there. As mentioned earlier, campus police and security agencies have also begun using “hot spots” analysis to identify places on campus disproportionately

responsible for calls for service and are reallocating personnel accordingly. In addition, most campus police agencies have adopted nonlethal technology, such as pepper spray, for use in the field.

Finally, during the past 20 years, like their municipal counterparts, an increasing number of campus law enforcement agencies in the United States have adopted Community Oriented Policing (COP) as their new organizational model (Paoline & Sloan, 2003). This model involves decentralizing operations, reducing the level of specialization in the agency, reducing organizational distances created by rank structures, creating closer contact and bonds with the campus community via changes in tactical operations, and seeking greater emphasis on problem solving by patrol officers.

High-Tech Crime and Victimization

A recent challenge for the security context of campus crime involves the appearance of high-tech crime and victimization, including but not limited to writing and distributing *malware*, such as viruses; disrupting computer service capabilities; spying and network intrusions, including computer hacking; fraudulent schemes, including identity theft; illegal file sharing and downloading of copyrighted material such as music or software; academic and scientific misconduct, including purchasing academic papers online; and online harassment, including threats and cyberstalking, activities that McQuade (2007) describes as “information technology-enabled” (ITE) crime and victimization occurring on college campuses.

McQuade (2006, 2007) has argued that understanding ITE crime involves recognizing there is a *systems* component, which comprises the wired/wireless computer networks that allow computers and other types of electronic devices to send and receive data and which serves as the backbone of the university, and a *devices* component, which is specific electronic equipment such as personal computers (PCs), scanner/FAX/copier equipment, cell phones, and electronic pagers that are becoming progressively smaller, more affordable, and more powerful than previous-generation devices, and which allow users the extensive ability to multitask. College campuses possess both components and, as a result, create numerous opportunities for ITE crime and victimization.

McQuade (2007) has suggested that to understand how the two components combine to create opportunities for ITE campus crime, one must understand that motivated offenders adapt systems and device technology for purposes *other than* those for which they were originally designed. Such adaptations are then diffused throughout the campus community via electronic communication and the Internet, which in turn creates more opportunities for additional motivated offenders to engage in these behaviors, since they learn how to do so from the successes of others.

By their very design, according to McQuade (2007), college and university campuses create environments in

which illegal use of technology can be easily concealed and difficult to detect, except through the use of electronic monitoring. An illustration would be a student sitting in the school library, ostensibly studying, but using a cell phone to text someone else. The student may simply be responding to a previous message he or she received, but it is equally possible that he or she may be sending a threatening text message to a fellow student (cyberstalking). This illegal behavior is occurring “out in the open,” and yet no one is the wiser because no one is paying close attention to what the student is doing. As a result, ITE crime that is able to occur out in the open makes prevention or intervention all the more difficult. ITE crime is also problematic because many times victims do not even know they have been victimized; having your identity stolen or your academic records compromised is harder to detect than coming home and finding your residence has been burglarized. Such victimization is further facilitated by failure of members of the campus community to adequately protect sensitive information, such as their bank account or social security numbers; this exacerbates the problem and encourages offenders to exploit the opportunities they find.

McQuade (2006, 2007) points out that ITE crime does leave evidentiary traces—it does not occur “just” in cyberspace. Evidence of ITE crime is left on computer hard drives and in email communications. There is electronic evidence that can link a particular computer to a specific log-in to a secure network. All this evidence can be retrieved, analyzed, and used to pursue criminal investigations and prosecutions. Thus, a relatively new challenge for campus law enforcement is to have the necessary training and expertise to facilitate the retrieval, analysis, and presentation of evidence relating to ITE crime.

Recent surveys of college students at three major research and technical universities reveal the extent of self-reported student involvement in ITE crime as both victims and offenders (see McQuade, 2007). The results show that nearly half the students reported they had been harmed by malicious codes, such as computer viruses or similar destructive programs, while about 1 in 5 students reported they had experienced online harassment, including cyberstalking, and 1 in 10 students reported their computers had been “hacked.” Further, on the offending side, over three fourths of the students reported they had illegally shared music files, videos, or other copyrighted material more than once, with over half reporting they had illegally shared music files 31 times or more. Also fairly common were such behaviors as unauthorized software sharing, purchasing papers on the Internet, or using information technology to cheat on examinations. How well these data represent college students’ ITE criminal behavior more generally remains unknown, as no large-scale, national-level surveys of such behavior have been conducted to date.

One response by PSIs to ITE crime is to create Information Security Offices within the IT department of the college or university (McQuade, 2007). Staff working

in these offices are responsible for installing and maintaining technological safeguards; monitoring network traffic and activity; and preventing, detecting, and responding to instances of ITE crime. Personnel in Information Security Offices also work in tandem with campus law enforcement and other authorities (e.g., the FBI) to pursue investigations of ITE crime.

In summary, PSIs face a huge challenge in the realm of ITE crime and are increasingly devoting the time, energy, and resources necessary to help prevent, detect, and respond to such activities. As information technology becomes an ever-increasing lifeline for institutional functioning, PSIs’ ability to adequately safeguard sensitive information, design and implement safeguards to prevent behaviors such as network intrusions or denial-of-service attacks, and educate students about the responsible use of electronic devices and the ethical and legal choices they face when using such devices become a more and more important part of the security context of campus crime.

The security context of campus crime has undergone fundamental change over the past 100 years, and the pace of change is accelerating with each passing year. During the past century, campus security evolved from activities in which a variety of personnel engaged, to an agency in which highly trained and professional law enforcement officials now address the security and safety needs of PSIs in this country. Autonomous campus police agencies emerged, adapted to the unique needs of college and university campuses, and decoupled themselves from traditional kinds of security activities, such as issuing keys or identification credentials. More recently, campus security has come to include efforts to address high-tech opportunities for illegal behavior, and as a result, information technology security has become a key part of campus security operations.

Conclusion

Illegal behavior occurring on college campuses includes both traditional types of crime like burglary and rape, as well as emerging forms of crime that involve the use of technology, such as cyberstalking or hacking into computer networks. These behaviors involve at least three contexts: the legal, the social, and the security. Each context comes with its own set of basic issues, which touch the lives of members of the campus community—students, faculty members, and staff. For decades, however, postsecondary institutions (PSIs) treated campus crime as a “dirty little secret” and were less than forthcoming in revealing the extent and nature of the problem or in revealing how they would address the problem via security policies. As a result, members of the campus community and interested observers were literally “in the dark” about the problem.

For the past 20 years, PSIs have been forced to “come clean” about their crime problem. For example, in the legal

context, the courts have shown a willingness to hold PSIs liable for on-campus victimizations under legal theories of negligence and breach of contract. This litigation helped force PSIs to be more proactive in acknowledging and addressing the problem. In addition, through congressional and state-level actions, legislation was passed that forced PSIs to begin publicly reporting their crime statistics and security policies, and ensuring that in cases involving on-campus sexual assaults, both accuser and accused were guaranteed basic rights. Proponents of such legislation argue that greater dissemination of campus crime information would lead to reductions in on-campus victimizations because students, faculty members, and staff would begin taking better precautions to reduce their chances of victimization. However, critics suggest that the legislation is seriously flawed and represents little more than a symbolic effort by legislatures to address the problem.

In addition, the past 20 years have seen tremendous increases in social scientific research, resulting in several large-scale victimization surveys being conducted that have helped to uncover trends and patterns in campus crime, including the magnitude of the problem of violence against women on college campuses and the role played by students' lifestyles in contributing to their victimization, especially the role of alcohol (the social context). These studies have documented that college students' overall levels of on-campus victimization are lower than nonstudents' of comparable ages; that theft and not violence is the most common form of on-campus victimization facing students; that students victimize other students; that many victims do not report their victimization to any campus or law enforcement authorities; and that a significant portion of college women experience a wide range of sexual victimization during their college years, including harassment, stalking, assault, and rape. These studies further show that students' lifestyles result in their exposure to motivated offenders while simultaneously making them attractive targets for victimization, yet students routinely fail to take self-protective steps to reduce their risk of victimization.

Finally, in the past 20 years, the security context of campus crime has become increasingly important as PSIs have been forced by the courts, legislation, and pressure from members of the campus community to address safety and security issues on their campuses. As a result of these pressures, campus law enforcement agencies have emerged as an important component of the security context as these agencies have taken steps to become more "legitimate" in the eyes of the campus community and "user friendly" by focusing more attention on connecting with the needs of the campus community. PSIs and their security operations also have had to address a new form of campus crime involving the use of information technology, which threatens the very lifeline of the college or university through such activities as network intrusions or hacking into sensitive databases, or through such activities as cyberstalking or illegal file sharing.

The issue of campus crime is no longer simply about determining "how much is there," but is instead a multidimensional problem that poses challenges and opportunities on several fronts. How PSIs address these challenges and opportunities will certainly shape understanding of campus crime as well as the risks it poses to members of the campus community.

CHILD ABUSE

ELIZABETH ERHARDT MUSTAINE

University of Central Florida

Childhood serves as the basis for growth, development, and socialization. Throughout adolescence, children are taught how to become productive and positive, functioning members of society. Much of the socializing of children, particularly in their very earliest years, comes at the hands of family members. Unfortunately, the messages conveyed to and the actions against children by their families are not always the positive building blocks for which one would hope.

Child abuse is a very real and prominent social problem today. The impact of child abuse affects more than one's childhood, as the psychological and physical injuries often extend well into adulthood. Most children are defenseless against abuse, are dependent on their caretakers, and are unable to protect themselves from these acts.

In 2008, the Children's Defense Fund reported that each day in America, 2,421 children are confirmed as abused or neglected, 4 children are killed by abuse or neglect, and 78 babies die before their first birthday. These daily estimates translate into tremendous national figures. In 2006, caseworkers substantiated an estimated 905,000 reports of child abuse or neglect. Of these, 64% suffered neglect, 16% were physically abused, 9% were sexually abused, 7% were emotionally or psychologically maltreated, and 2% were medically neglected. In addition, 15% of the victims experienced "other" types of maltreatment such as abandonment, threats of harm to the child, and congenital drug

addiction (National Child Abuse and Neglect Data System, 2006). Obviously, this problem is a substantial one.

Estimates of Child Abuse: Methodological Limitations

Several issues arise when considering the amount of child abuse that occurs annually in the United States. Child abuse is very hard to estimate because much (or most) of it is not reported. Children who are abused are unlikely to report their victimization because they may not know any better, they still love their abusers and do not want to see them taken away (or do not themselves want to be taken away from their abusers), they have been threatened into not reporting, or they do not know to whom they should report their victimizations. Still further, children may report their abuse only to find the person to whom they report does not believe them or take any action on their behalf. Continuing to muddy the waters, child abuse can be disguised as legitimate injury, particularly because young children are often somewhat uncoordinated and are still learning to accomplish physical tasks, may not know their physical limitations, and are often legitimately injured during regular play. In the end, children rarely report child abuse; most often it is an adult who makes a report based on suspicion (e.g., teacher, counselor, doctor, etc.).

Even when child abuse is reported, social service agents and investigators may not follow up or substantiate reports for a variety of reasons. Parents can pretend, lie, or cover up injuries or stories of how injuries occurred when social service agents come to investigate. Further, there is not always agreement about what should be counted as abuse by service providers and researchers. In addition, social service agencies/agents have huge caseloads and may only be able to deal with the most serious forms of child abuse, leaving the more “minor” forms of abuse unsupervised and unmanaged (and uncounted in the statistical totals).

Child Abuse and Neglect: The Legalities

While most laws about child abuse and neglect fall at the state levels, federal legislation provides a foundation for states by identifying a minimum set of acts and behaviors that define child abuse and neglect. The Federal Child Abuse Prevention and Treatment Act (CAPTA), which stems from the Keeping Children and Families Safe Act of 2003, defines child abuse and neglect as, at minimum, “(1) any recent act or failure to act on the part of a parent or caretaker which results in death, serious physical or emotional harm, sexual abuse, or exploitation; or (2) an act or failure to act which presents an imminent risk or serious harm.”

Using these minimum standards, each state is responsible for providing its own definition of maltreatment within civil and criminal statutes. When defining types of child abuse, many states incorporate similar elements and definitions into their legal statutes. For example, neglect is often defined as failure to provide for a child’s basic needs. Neglect can encompass physical elements (e.g., failure to provide necessary food or shelter, or lack of appropriate supervision), medical elements (e.g., failure to provide necessary medical or mental health treatment), educational elements (e.g., failure to educate a child or attend to special educational needs), and emotional elements (e.g., inattention to a child’s emotional needs, failure to provide psychological care, or permitting the child to use alcohol or other drugs). Failure to meet needs does not always mean a child is neglected, as situations such as poverty, cultural values, and community standards can influence the application of legal statutes. In addition, several states distinguish between failure to provide based on financial inability and failure to provide for no apparent financial reason.

Statutes on physical abuse typically include elements of physical injury (ranging from minor bruises to severe fractures or death) as a result of punching, beating, kicking, biting, shaking, throwing, stabbing, choking, hitting (with a hand, stick, strap, or other object), burning, or otherwise harming a child. Such injury is considered abuse regardless of the intention of the caretaker. In addition, many state statutes include allowing or encouraging another person to

physically harm a child (such as noted above) as another form of physical abuse in and of itself.

Sexual abuse usually includes activities by a parent or caretaker such as fondling a child’s genitals, penetration, incest, rape, sodomy, indecent exposure, and exploitation through prostitution or the production of pornographic materials.

Finally, emotional or psychological abuse typically is defined as a pattern of behavior that impairs a child’s emotional development or sense of self-worth. This may include constant criticism, threats, or rejection, as well as withholding love, support, or guidance. Emotional abuse is often the most difficult to prove and, therefore, child protective services may not be able to intervene without evidence of harm to the child. Some states suggest that harm may be evidenced by an observable or substantial change in behavior, emotional response, or cognition, or by anxiety, depression, withdrawal, or aggressive behavior. At a practical level, emotional abuse is almost always present when other types of abuse are identified.

Some states include an element of substance abuse in their statutes on child abuse. Circumstances that can be considered substance abuse include (a) the manufacture of a controlled substance in the presence of a child or on the premises occupied by a child (Colorado, Indiana, Iowa, Montana, South Dakota, Tennessee, and Virginia); (b) allowing a child to be present where the chemicals or equipment for the manufacture of controlled substances are used (Arizona, New Mexico); (c) selling, distributing, or giving drugs or alcohol to a child (Florida, Hawaii, Illinois, Minnesota, and Texas); (d) use of a controlled substance by a caregiver that impairs the caregiver’s ability to adequately care for the child (Kentucky, New York, Rhode Island, and Texas); and (e) exposure of the child to drug paraphernalia (North Dakota), the criminal sale or distribution of drugs (Montana, Virginia), or drug-related activity (District of Columbia).

Corporal Punishment Versus Child Abuse

One of the most difficult issues with which the U.S. legal system must contend is that of allowing parents the right to use corporal punishment when disciplining a child, while not letting them cross over the line into the realm of child abuse. Some parents may abuse their children under the guise of discipline, and many instances of child abuse arise from angry parents who go too far when disciplining their children with physical punishment. Generally, state statutes use terms such as “reasonable discipline of a minor,” “causes only temporary, short-term pain,” and may cause “the potential for bruising” but not “permanent damage, disability, disfigurement or injury” to the child as ways of indicating the types of discipline behaviors that are legal. However, corporal punishment that is “excessive,” “malicious,” “endangers the bodily safety of,” or is “an intentional

infliction of injury” is not allowed under most state statutes (e.g., state of Florida child abuse statute).

Most research finds that the use of physical punishment (most often spanking) is not an effective method of discipline. The literature on this issue tends to find that spanking stops misbehavior, but no more effectively than other firm measures. Further, it seems to hinder rather than improve general compliance/obedience (particularly when the child is not in the presence of the punisher). Researchers have also explained why physical punishment is not any more effective at gaining child compliance than nonviolent forms of discipline. Some of the problems that arise when parents use spanking or other forms of physical punishment include the fact that spanking does not teach what children should do, nor does it provide them with alternative behavior options should the circumstance arise again. Spanking also undermines reasoning, explanation, or other forms of parental instruction because children cannot learn, reason, or problem solve well while experiencing threat, pain, fear, or anger. Further, the use of physical punishment is inconsistent with nonviolent principles, or parental modeling. In addition, the use of spanking chips away at the bonds of affection between parents and children, and tends to induce resentment and fear. Finally, it hinders the development of empathy and compassion in children, and they do not learn to take responsibility for their own behavior (Pitzer, 1997).

One of the biggest problems with the use of corporal punishment is that it can escalate into much more severe forms of violence. Usually, parents spank because they are angry (and somewhat out of control) and they can't think of other ways to discipline. When parents are acting as a result of emotional triggers, the notion of discipline is lost while punishment and pain become the foci.

Child Abuse Victims: The Patterns

In 2006, of the children who were found to be victims of child abuse, nearly 75% of them were first-time victims (or had not come to the attention of authorities prior). A slight majority of child abuse victims were girls—51.5%, compared to 48% of abuse victims being boys. The younger the child, the more at risk he or she is for child abuse and neglect victimization. Specifically, the rate for infants (birth to 1 year old) was approximately 24 per 1,000 children of the same age group. The victimization rate for children 1–3 years old was 14 per 1,000 children of the same age group. The abuse rate for children aged 4–7 years old declined further to 13 per 1,000 children of the same age group. African American, American Indian, and Alaska Native children, as well as children of multiple races, had the highest rates of victimization. White and Latino children had lower rates, and Asian children had the lowest rates of child abuse and neglect victimization. Regarding living arrangements, nearly 27% of victims

were living with a single mother, 20% were living with married parents, while 22% were living with both parents but the marital status was unknown. (This reporting element had nearly 40% missing data, however.) Regarding disability, nearly 8% of child abuse victims had some degree of mental retardation, emotional disturbance, visual or hearing impairment, learning disability, physical disability, behavioral problems, or other medical problems. Unfortunately, data indicate that for many victims, the efforts of the child protection services system were not successful in preventing subsequent victimization. Children who had been prior victims of maltreatment were 96% more likely to experience another occurrence than those who were not prior victims. Further, child victims who were reported to have a disability were 52% more likely to experience recurrence than children without a disability. Finally, the oldest victims (16–21 years of age) were the least likely to experience a recurrence, and were 51% less likely to be victimized again than were infants (younger than age 1) (National Child Abuse and Neglect Data System, 2006).

Child fatalities are the most tragic consequence of maltreatment. Yet, each year, children die from abuse and neglect. In 2006, an estimated 1,530 children in the United States died due to abuse or neglect. The overall rate of child fatalities was 2 deaths per 100,000 children. More than 40% of child fatalities were attributed to neglect, but physical abuse also was a major contributor. Approximately 78% of the children who died due to child abuse and neglect were younger than 4 years old, and infant boys (younger than 1) had the highest rate of fatalities at 18.5 deaths per 100,000 boys of the same age in the national population. Infant girls had a rate of 14.7 deaths per 100,000 girls of the same age (National Child Abuse and Neglect Data System, 2006).

One question to be addressed regarding child fatalities is why infants have such a high rate of death when compared to toddlers and adolescents. Children under 1 year old pose an immense amount of responsibility for their caretakers: they are completely dependent and need constant attention. Children this age are needy, impulsive, and not amenable to verbal control or effective communication. This can easily overwhelm vulnerable parents. Another difficulty associated with infants is that they are physically weak and small. Injuries to infants can be fatal, while similar injuries to older children might not be. The most common cause of death in children less than 1 year is cerebral trauma (often the result of shaken-baby syndrome). Exasperated parents can deliver shakes or blows without realizing how little it takes to cause irreparable or fatal damage to an infant. Research informs us that two of the most common triggers for fatal child abuse are crying that will not cease and toileting accidents. Both of these circumstances are common in infants and toddlers whose only means of communication often is crying, and who are limited in mobility and cannot use the toilet. Finally, very young children cannot assist in injury diagnoses. Children

who have been injured due to abuse or neglect often cannot communicate to medical professionals about where it hurts, how it hurts, and so forth. Also, nonfatal injuries can turn fatal in the absence of care by neglectful parents or parents who do not want medical professionals to possibly identify an injury as being the result of abuse.

Child Abuse Perpetrators: The Patterns

Estimates reveal that nearly 80% of perpetrators of child abuse were parents of the victim. Other relatives accounted for nearly 7%, and unmarried partners of parents made up 4% of perpetrators. Of those perpetrators that were parents, over 90% were biological parents, 4% were stepparents, and 0.7% were adoptive parents. Of this group, approximately 58% of perpetrators were women and 42% were men. Women perpetrators are typically younger than men. The average age for women abusers was 31 years old, while for men the average was 34 years old. Forty percent of women who abused were younger than 30 years of age, compared with 33% of men being under 30. The racial distribution of perpetrators is similar to that of victims. Fifty-four percent were white, 21% were African American, and 20% were Hispanic/Latino (National Child Abuse and Neglect Data System, 2006).

Explanations for Child Abuse

There are many factors that are associated with child abuse. Some of the more common/well-accepted explanations are individual pathology, parent-child interaction, past abuse in the family (or social learning), situational factors, and cultural support for physical punishment along with a lack of cultural support for helping parents here in the United States.

The first explanation centers on the individual pathology of a parent or caretaker who is abusive. This theory focuses on the idea that people who abuse their children have something wrong with their individual personality or biological makeup. Such psychological pathologies may include having anger control problems; being depressed or having post-partum depression; having a low tolerance for frustration (e.g., children can be extremely frustrating: they don't always listen; they constantly push the line of how far they can go; and once the line has been established, they are constantly treading on it to make sure it hasn't moved. They are dependent and self-centered, so caretakers have very little privacy or time to themselves); being rigid (e.g., having no tolerance for differences—for example, what if your son wanted to play with dolls? A rigid father would not let him, laugh at him for wanting to, punish him when he does, etc.); having deficits in empathy (parents who cannot put themselves in the shoes of their children cannot fully understand what their children need

emotionally); or being disorganized, inefficient, and ineffectual. (Parents who are unable to manage their own lives are unlikely to be successful at managing the lives of their children, and since many children want and need limits, these parents are unable to set them or adhere to them.)

Biological pathologies that may increase the likelihood of someone becoming a child abuser include having substance abuse or dependence problems, or having persistent or reoccurring physical health problems (especially health problems that can be extremely painful and can cause a person to become more self-absorbed, both qualities that can give rise to a lack of patience, lower frustration tolerance, and increased stress).

The second explanation for child abuse centers on the interaction between the parent and the child, noting that certain types of parents are more likely to abuse, and certain types of children are more likely to be abused, and when these less-skilled parents are coupled with these more difficult children, child abuse is the most likely to occur. Discussion here focuses on what makes a parent less skilled, and what makes a child more difficult. Characteristics of unskilled parents are likely to include such traits as only pointing out what children do wrong and never giving any encouragement for good behavior, and failing to be sensitive to the emotional needs of children. Less skilled parents tend to have unrealistic expectations of children. They may engage in role reversal—where the parents make the child take care of them—and view the parent's happiness and well-being as the responsibility of the child. Some parents view the parental role as extremely stressful and experience little enjoyment from being a parent. Finally, less-skilled parents tend to have more negative perceptions regarding their child(ren). For example, perhaps the child has a different shade of skin than they expected and this may disappoint or anger them, they may feel the child is being manipulative (long before children have this capability), or they may view the child as the scapegoat for all the parents' or family's problems. Theoretically, parents with these characteristics would be more likely to abuse their children, but if they are coupled with having a difficult child, they would be especially likely to be abusive. So, what makes a child more difficult? Certainly, through no fault of their own, children may have characteristics that are associated with child care that is more demanding and difficult than in the "normal" or "average" situation. Such characteristics can include having physical and mental disabilities (autism, attention deficit hyperactivity disorder [ADHD], hyperactivity, etc.); the child may be colicky, frequently sick, be particularly needy, or cry more often. In addition, some babies are simply unhappier than other babies for reasons that cannot be known. Further, infants are difficult even in the best of circumstances. They are unable to communicate effectively, and they are completely dependent on their caretakers for everything, including eating, diaper changing, moving

around, entertainment, and emotional bonding. Again, these types of children, being more difficult, are more likely to be victims of child abuse.

Nonetheless, each of these types of parents and children alone cannot explain the abuse of children, but it is the interaction between them that becomes the key. Unskilled parents may produce children that are happy and not as needy, and even though they are unskilled, they do not abuse because the child takes less effort. At the same time, children who are more difficult may have parents who are skilled and are able to handle and manage the extra effort these children take with aplomb. However, risks for child abuse increase when unskilled parents must contend with difficult children.

Social learning or past abuse in the family is a third common explanation for child abuse. Here, the theory concentrates not only on what children learn when they see or experience violence in their homes, but additionally on what they do not learn as a result of these experiences. Social learning theory in the context of family violence stresses that if children are abused or see abuse (toward siblings or a parent), those interactions and violent family members become the representations and role models for their future familial interactions. In this way, what children learn is just as important as what they do not learn. Children who witness or experience violence may learn that this is the way parents deal with children, or that violence is an acceptable method of child rearing and discipline. They may think when they become parents that “violence worked on me when I was a child, and I turned out fine.” They may learn unhealthy relationship interaction patterns; children may witness the negative interactions of parents and they may learn the maladaptive or violent methods of expressing anger, reacting to stress, or coping with conflict.

What is equally as important, though, is that they are unlikely to learn more acceptable and nonviolent ways of rearing children, interacting with family members, and working out conflict. Here it may happen that an adult who was abused as a child would like to be nonviolent toward his or her own children, but when the chips are down and the child is misbehaving, this abused-child-turned-adult does not have a repertoire of nonviolent strategies to try. This parent is more likely to fall back on what he or she knows as methods of discipline.

Something important to note here is that not all abused children grow up to become abusive adults. Children who break the cycle were often able to establish and maintain one healthy emotional relationship with someone during their childhoods (or period of young adulthood). For instance, they may have received emotional support from a nonabusing parent, or they received social support and had a positive relationship with another adult during their childhood (e.g., teacher, coach, minister, neighbor, etc.). Abused children who participate in therapy during some period of their lives can often break the cycle of violence.

In addition, adults who were abused but are able to form an emotionally supportive and satisfying relationship with a mate can make the transition to being nonviolent in their family interactions.

Moving on to a fourth familiar explanation for child abuse, there are some common situational factors that influence families and parents and increase the risks for child abuse. Typically, these are factors that increase family stress or social isolation. Specifically, such factors may include receiving public assistance or having low socioeconomic status (a combination of low income and low education). Other factors include having family members who are unemployed, underemployed (working in a job that requires lower qualifications than an individual possesses), or employed only part time. These financial difficulties cause great stress for families in meeting the needs of the individual members. Other stress-inducing familial characteristics are single-parent households and larger family size. Finally, social isolation can be devastating for families and family members. Having friends to talk to, who can be relied upon, and with whom kids can be dropped off occasionally is tremendously important for personal growth and satisfaction in life. In addition, social isolation and stress can cause individuals to be quick to lose their tempers, as well as cause people to be less rational in their decision making and to make mountains out of mole hills. These situations can lead families to be at greater risk for child abuse.

Finally, cultural views and supports (or lack thereof) can lead to greater amounts of child abuse in a society such as the United States. One such cultural view is that of societal support for physical punishment. This is problematic because there are similarities between the way criminals are dealt with and the way errant children are handled. The use of capital punishment is advocated for seriously violent criminals, and people are quick to use such idioms as “spare the rod and spoil the child” when it comes to the discipline or punishment of children. In fact, it was not until quite recently that parenting books began to encourage parents to use other strategies than spanking or other forms of corporal punishment in the discipline of their children. Only recently, the American Academy of Pediatrics has come out and recommended that parents do not spank or use other forms of violence on their children because of the deleterious effects such methods have on youngsters and their bonds with their parents. Nevertheless, regardless of recommendations, the culture of corporal punishment persists.

Another cultural view in the United States that can give rise to greater incidents of child abuse is the belief that after getting married, couples *of course* should want and have children. Culturally, Americans consider that children are a blessing, raising kids is the most wonderful thing a person can do, and everyone should have children. Along with this notion is the idea that motherhood is always wonderful; it is the most fulfilling thing a woman

can do; and the bond between a mother and her child is strong, glorious, and automatic—all women love being mothers. Thus, culturally (and theoretically), society nearly insists that married couples have children and that they will love having children. But, after children are born, there is not much support for couples who have trouble adjusting to parenthood, or who do not absolutely love their new roles as parents. People look askance at parents who need help, and cannot believe parents who say anything negative about parenthood. As such, theoretically, society has set up a situation where couples are strongly encouraged to have kids, are told they will love kids, but then society turns a blind or disdainful eye when these same parents need emotional, financial, or other forms of help or support. It is these types of cultural viewpoints that increase the risks for child abuse in society.

Consequences of Child Abuse and Neglect

The consequences of child abuse are tremendous and long lasting. Research has shown that the traumatic experience of childhood abuse is life changing. These costs may surface during adolescence, or they may not become evident until abused children have grown up and become abusing parents or abused spouses. Early identification and treatment is important to minimize these potential long-term effects. Whenever children say they have been abused, it is imperative that they be taken seriously and their abuse be reported. Suspicions of child abuse must be reported as well. If there is a possibility that a child is or has been abused, an investigation must be conducted.

Children who have been abused may exhibit traits such as the inability to love or have faith in others. This often translates into adults who are unable to establish lasting and stable personal relationships. These individuals have trouble with physical closeness and touching as well as emotional intimacy and trust. Further, these qualities tend to cause a fear of entering into new relationships, as well as the sabotaging of any current ones.

Psychologically, children who have been abused tend to have poor self-images or are passive, withdrawn, or clingy. They may be angry individuals who are filled with rage, anxiety, and a variety of fears. They are often aggressive, disruptive, and depressed. Many abused children have flashbacks and nightmares about the abuse they have experienced, and this may cause sleep problems as well as drug and alcohol problems. Posttraumatic stress disorder (PTSD) and antisocial personality disorder are both typical among maltreated children. Research has also shown that most abused children fail to reach “successful psychosocial functioning,” and are thus not resilient and do not resume a “normal life” after the abuse has ended.

Socially (and likely because of these psychological injuries), abused children have trouble in school, will have difficulty getting and remaining employed, and may commit a variety of illegal or socially inappropriate behaviors.

Many studies have shown that victims of child abuse are likely to participate in high-risk behaviors such as alcohol or drug abuse, the use of tobacco, and high-risk sexual behaviors (e.g., unprotected sex, large numbers of sexual partners). Later in life, abused children are more likely to have been arrested and homeless. They are also less able to defend themselves in conflict situations and guard themselves against repeated victimizations.

Medically, abused children likely will experience health problems due to the high frequency of physical injuries they receive. In addition, abused children experience a great deal of emotional turmoil and stress, which can also have a significant impact on their physical condition. These health problems are likely to continue occurring into adulthood. Some of these longer-lasting health problems include headaches; eating problems; problems with toileting; and chronic pain in the back, stomach, chest, and genital areas. Some researchers have noted that abused children may experience neurological impairment and problems with intellectual functioning, while others have found a correlation between abuse and heart, lung, and liver disease, as well as cancer (Thomas, 2004).

Victims of sexual abuse show an alarming number of disturbances as adults. Some dislike and avoid sex, or experience sexual problems or disorders, while other victims appear to enjoy sexual activities that are self-defeating or maladaptive—normally called “dysfunctional sexual behavior”—and have many sexual partners.

Abused children also experience a wide variety of developmental delays. Many do not reach physical, cognitive, or emotional developmental milestones at the typical time, and some never accomplish what they are supposed to during childhood socialization. In the next section, these developmental delays are discussed as a means of identifying children who may be abused.

Determining Abuse: How to Tell Whether a Child Is Abused or Neglected

There are two primary ways of identifying children who are abused: spotting and evaluating physical injuries, and detecting and appraising developmental delays. Distinguishing physical injuries due to abuse can be difficult, particularly among younger children who are likely to get hurt or receive injuries while they are playing and learning to become ambulatory. Nonetheless, there are several types of wounds that children are unlikely to give themselves during their normal course of play and exploration. These less likely injuries may signal instances of child abuse.

While it is true that children are likely to get bruises, particularly when they are learning to walk or crawl, bruises on infants are not normal. Also, the back of the legs, upper arms, or on the chest, neck, head, or genitals are also locations where bruises are unlikely to occur during normal childhood activity. Further, bruises with clean

patterns, like hand prints, buckle prints, or hangers (to name a few), are good examples of the types of bruises children do not give themselves.

Another area of physical injury where the source of the injury can be difficult to detect is fractures. Again, children fall out of trees, or crash their bikes, and can break limbs. These can be normal parts of growing up. However, fractures in infants less than 12 months old are particularly suspect, as infants are unlikely to be able to accomplish the types of movement necessary to actually break a leg or an arm. Further, multiple fractures, particularly more than one on a bone, should be examined more closely. Spiral or torsion fractures (when the bone is broken by twisting) are suspect because when children break their bones due to play injuries, the fractures are usually some other type (e.g., linear, oblique, compacted). In addition, when parents don't know about the fracture(s) or how it occurred, abuse should be considered, because when children get these types of injuries, they need comfort and attention.

Head and internal injuries are also those that may signal abuse. Serious blows to the head cause internal head injuries, and this is very different from the injuries that result from bumping into things. Abused children are also likely to experience internal injuries like those to the abdomen, liver, kidney, and bladder. They may suffer a ruptured spleen, or intestinal perforation. These types of damages rarely happen by accident.

Burns are another type of physical injury that can happen by accident or by abuse. Nevertheless, there are ways to tell these types of burn injuries apart. The types of burns that should be examined and investigated are those where the burns are in particular locations. Burns to the bottom of the feet, genitals, abdomen, or other inaccessible spots should be closely considered. Burns of the whole hand or those to the buttocks are also unlikely to happen as a result of an accident.

Turning to the detection and appraisal of developmental delays, one can more readily assess possible abuse by considering what children of various ages *should* be able to accomplish, than by noting when children are delayed and how many milestones on which they are behind schedule. Importantly, a few delays in reaching milestones can be expected, since children develop individually and not always according to the norm. Nonetheless, when children are abused, their development is likely to be delayed in numerous areas and across many milestones.

As children develop and grow, they *should* be able to crawl, walk, run, talk, control going to the bathroom, write, set priorities, plan ahead, trust others, make friends, develop a good self-image, differentiate between feeling and behavior, and get their needs met in appropriate ways. As such, when children do not accomplish these feats, their circumstances should be examined.

Infants who are abused or neglected typically develop what is termed *failure to thrive syndrome*. This syndrome is characterized by slow, inadequate growth, or not "filling out" physically. They have a pale, colorless complexion

and dull eyes. They are not likely to spend much time looking around, and nothing catches their eyes. They may show other signs of lack of nutrition such as cuts, bruises that do not heal in a timely way, and discolored fingernails. They are also not trusting and may not cry much, as they are not expecting to have their needs met. Older infants may not have developed any language skills, or these developments are quite slow. This includes both verbal and nonverbal means of communication.

Toddlers who are abused often become hypervigilant about their environments and others' moods. They are more outwardly focused than a typical toddler (who is quite self-centered) and may be unable to separate themselves as individuals, or consider themselves as distinct beings. In this way, abused toddlers cannot focus on tasks at hand because they are too concerned about others' reactions. They don't play with toys, have no interest in exploration, and seem unable to enjoy life. They are likely to accept losses with little reaction, and may have age-inappropriate knowledge of sex and sexual relations. Finally, toddlers, whether they are abused or not, begin to mirror their parents' behaviors. Thus, toddlers who are abused may mimic the abuse when they are playing with dolls or "playing house."

Developmental delays can also be detected among abused young adolescents. Some signs include the failure to learn cause and effect, since their parents are so inconsistent. They have no energy for learning and have not developed beyond one- or two-word commands. They probably cannot follow complicated directions (such as two to three tasks per instruction), and they are unlikely to be able to think for themselves. Typically, they have learned that failure is totally unacceptable, but they are more concerned with the teacher's mood than with learning and listening to instruction. Finally, they are apt to have been inadequately toilet trained and thus may be unable to control their bladders.

Older adolescents, because they are likely to have been abused for a longer period of time, continue to get further and further behind in their developmental achievements. Abused children this age become family nurturers. They take care of their parents and cater to their parents' needs, rather than the other way around. In addition, they probably take care of any younger siblings and do the household chores. Because of these default responsibilities, they usually do not participate in school activities; they frequently miss days at school; and they have few, if any, friends. Because they have become so hypervigilant and have increasingly delayed development, they lose interest in and become disillusioned with education. They develop low self-esteem and little confidence, but seem old for their years. Children this age who are abused are still likely to be unable to control their bladders and may have frequent toileting accidents.

Other developmental delays can occur and be observed in abused and neglected children of any age. For example, malnutrition and withdrawal can be noticed in infants

through teenagers. Maltreated children frequently have persistent or untreated illnesses, and these can become permanent disabilities if medical conditions go untreated for a long enough time. Another example can be the consequences of neurological damage. Beyond being a medical issue, this type of damage can cause problems with social behavior and impulse control, which, again, can be discerned in various ages of children.

Determining Abuse: Interviewing Children

Once child abuse is suspected, law enforcement officers, child protection workers, or various other practitioners may need to interview the child about the abuse or neglect he or she may have suffered. Interviewing children can be extremely difficult because children at various stages of development can remember only certain parts or aspects of the events in their lives. Also, interviewers must be careful that they do not put ideas or answers into the heads of the children they are interviewing. There are several general recommendations when interviewing children about the abuse they may have experienced. First, interviewers must acknowledge that even when children are abused, they likely still love their parents. They do not want to be taken away from their parents, nor do they want to see their parents get into trouble. Interviewers must not blame the parents or be judgmental about them or the child's family. Beyond that, interviews should take place in a safe, neutral location. Interviewers can use dolls and role-play to help children express the types of abuse of which they may be victims.

Finally, interviewers must ask age-appropriate questions. For example, 3-year-olds can probably only answer questions about what happened and who was involved. Four- to five-year-olds can also discuss where the incidents occurred. Along with what, who, and where, 6- to 8-year-olds can talk about the element of time, or when the abuse occurred. Nine- to 10-year-olds are able to add commentary about the number of times the abuse occurred. Finally, 11-year-olds and older children can additionally inform interviewers about the circumstances of abusive instances.

How Can Society Help Abused Children and Abusive Families?

Child advocates recommend a variety of strategies to aid families and children experiencing abuse. These recommendations tend to focus on societal efforts as well as more individual efforts. One common strategy advocated is the use of public service announcements that encourage individuals to report *any suspected* child abuse. Currently, many mandatory reporters (those required by law to report abuse such as teachers, doctors, and social service agency

employees) and members of communities feel that child abuse should not be reported unless there is substantial evidence that abuse is indeed occurring. Child advocates stress that this notion should be changed, and that people should report child abuse even if it is only suspected. Public service announcements should stress that if people report suspected child abuse, the worst that can happen is that they might be wrong, but in the grander scheme of things that is really not so bad.

Child advocates also stress that greater interagency cooperation is needed. This cooperation should be evident between women's shelters, child protection agencies, programs for at-risk children, medical agencies, and law enforcement officers. These agencies typically do not share information, and if they did, more instances of child abuse would come to the attention of various authorities and could be investigated and managed. Along these lines, child protection agencies and programs should receive more funding. When budgets are cut, social services are often the first things to go or to get less financial support. Child advocates insist that with more resources, child protection agencies could hire more workers, handle more cases, conduct more investigations, and follow up with more children and families.

Continuing, more educational efforts must be initiated about issues such as punishment and discipline styles and strategies; having greater respect for children; as well as informing the community about what child abuse is, and how to recognize it. In addition, Americans must alter the cultural orientation about child bearing and child rearing. Couples who wish to remain child-free must be allowed to do so without disdain. And, it must be acknowledged that raising children is very difficult, is not always gloriously wonderful, and that parents who seek help should be lauded and not criticized. These kinds of efforts can help more children to be raised in nonviolent, emotionally satisfying families, and thus become better adults.

CYBERCRIME

GEORGE E. HIGGINS

University of Louisville

SCOTT E. WOLFE

Arizona State University

Computer crime has been an issue in criminal justice and criminology since the 1970s. In this venue, the types of computer crimes have been categorized in two ways. First, a prevalent activity is that of criminals stealing computers. Second, criminals use computers to commit crimes. The recent development of the Internet has created a substantial increase in criminals using computers to commit crimes. Thus, an emerging area of criminal behavior is *cybercrime*.

Cybercrime is a criminal act using a computer that occurs over the Internet. The Internet has become the source for multiple types of crime and different ways to perform these crimes. The types of cybercrime may be loosely grouped into three categories of cybercrimes. First, the Internet allows for the creation and maintenance of cybercrime markets. Second, the Internet provides a venue for fraudulent behavior (i.e., cyberfraud). Third, the Internet has become a place for the development of cybercriminal communities. The purpose of this chapter is to outline and exemplify these different forms of communities. The chapter then shifts into a discussion of policy steps to reduce some forms of cybercrime.

Cybercrime Markets

The Internet allows for illicit markets to be created and maintained. The Internet provides its users with an opportunity to

hide their identities and to be in remote locations to create and be part of illicit markets. For instance, cybercriminals can use different Web sites to trade (i.e., buy or sell) merchandise illegally through legitimate sources (e.g., eBay) or through illegal sites. Some of these Web sites are not able to be traced back to their original sources. While a host of illicit markets exists (e.g., illegal adoptions, surrogate mothers, egg donors, obtaining banned substances, organ donors thieves, forbidden animals, endangered species, and illegal gambling), four markets will be discussed here.

One of the most pervasive forms of cybercrime is digital piracy (Gopal, Sanders, Bhattacharjee, Agrawal, & Wagner, 2004). Digital piracy is defined as the illegal act of copying digital goods, software, digital documents, digital audio (including music and voice), and digital video for any reason without explicit permission from and compensation to the copyright holder (Gopal et al., 2004; Higgins, Fell, & Wilson, 2006). The Internet has facilitated an increase in digital piracy in recent years. Wall (2005) notes four characteristics of the Internet that have enabled individuals to easily commit criminal activity: It allows anonymous communication, it is transnational, it has created a shift in thinking from the ownership of physical property to the ownership of ideas, and it is relatively easy. In addition, Wall contends that the Internet facilitates piracy because it allows the offense to take place detached from the copyright holder, which provides the offender with the perception that the act is victimless.

Several researchers have acknowledged subforms of digital piracy (i.e., audio and video piracy) as being increasingly pervasive (Gopal et al., 2004; Hinduja, 2003). Higgins et al. (2006) defined audio and video piracy as the “illegal act of uploading or downloading digital sound or video without explicit permission from and compensation to the copyright holder” (p. 4). Technological advancements are partly responsible for the increased ease and accessibility of digital piracy. The International Federation of Phonographic Industries (IFPI) (2006) estimates that one in three music discs purchased around the world is an illegal copy. The IFPI further estimates that 37% of all CDs purchased in 2005 were pirated, resulting in 1.2 billion illegal copies purchased worldwide. In fact, the IFPI concludes that pirate CD sales outnumbered legitimate CD sales in 30 markets across the world and resulted in a loss of \$4.5 billion from the music industry.

Similar issues take place in the context of the movie industry. To be clear, industry figures indicate that the costs of unauthorized copying and redistribution of movies via physical media (e.g., video cassettes, DVDs, VCDs, etc.) exceed several billion dollars annually. In 2005, the Motion Picture Association of American (MPAA) reported that over 90% of the movies that are initially pirated are due to the use of camcording in movie theaters. The Internet has allowed movie pirates to be able to illegally download movies (MPAA, 2004). In 2004, the MPAA reported that \$2.3 billion were lost due to Internet piracy.

Several researchers have argued that college students are likely to pirate almost all forms of digital media (Hinduja, 2003; Higgins et al., 2006). This includes software piracy. According to the Business Software Alliance (BSA, 2007), the trend of piracy among college students has been going up slightly compared to 2003 and 2005 rates. Importantly, two thirds of the students surveyed still believe that it is okay to swap or illegally download software without paying for it (BSA, 2007).

Since the Copyright Act of 1976, digital piracy has been a criminal act (Higgins et al., 2006). Mass copyright violations of movies and music were made a felony offense in 1982 by the Piracy and Counterfeiting Amendments Act, which was amended to include the distribution of copyrighted materials over the Internet via the No Electronic Theft Act (Koen & Im, 1997). That is, when an individual proceeds to burn an extra copy of a music CD, download music from the Internet without paying, or use a peer-to-peer network to download music information, he or she is pirating music. This is especially true for digital music piracy that is committed through a multitude of modi operandi (e.g., CD burning, peer-to-peer networks, LAN file sharing, digital stream ripping, and mobile piracy [see <http://www.IFPI.org> for a discussion of these techniques]). The penalties for these acts may be civil (e.g., \$10,000 per pirated copy) as well as criminal (e.g., possible jail sentences) (Koen & Im, 1997).

Cybercrime includes the promotion and the distribution of pornography. When done over the Internet, this is known as *cyberpornography*. While viewing pornography may not be criminal for those who are of age, the Internet does not discriminate based on age. That is, teenagers’ fantasies about nudity may easily be replaced by hardcore pornographic images of every conceivable sexual activity.

In the academic literature, some researchers have shown that access to and viewing of cyberpornography is a behavior that is increasing. Ybarra and Mitchell (2005) used data from kids and young adults to examine exposure to cyberpornography. They showed that individuals that sought out cyberpornography were likely to be male, 14 years old and older, and more depressed, whereas those younger than 14 were more likely to be exposed to pornography through traditional means—movies and magazines.

Others have shown that cyberpornography is not just for teenagers, making the behavior non-age specific. Stack, Wasserman, and Kern (2004) used the General Social Science Survey to examine who viewed pornography using the Internet and the reasons why. They showed that individuals that had weak religious ties, unhappy marriages, and past sexual deviance are more likely to view pornography via the Internet. Buzzell (2005) examined the factors that influence access to cyberpornography. The study showed that when employment status increases, technology does play a role in the access to cyberpornography.

The Internet allows cybercriminals to participate in underage liaisons. One form of this particular type of cybercrime is the online solicitation of children for sex. This is exploitation that involves an adult who engages in discussion with a child online and uses his or her manipulation skills to coerce the child to meet in person for sexual purposes. Importantly, the number of children that are approached on the Internet for these types of offenses is staggering. Finkelhor, Mitchell, and Wolak (2000) showed that 1 out of every 5 youths is solicited by someone online for sexual relations.

The anonymity of the Internet allows cybercriminals to disguise their postings, responses, and identities. This affords the cybercriminals the opportunity to disappear at a moment’s notice. In short, the Internet allows cybercrimes to be performed more easily and simply while making criminals’ detection, apprehension, and prosecution more difficult. Therefore, the Internet makes cybercrimes through illicit markets more difficult to examine.

Cyberfraud

Cyberfraud includes behaviors that occur with guile and deceit. An example of this behavior is identity theft that may lead to identity fraud. Hoar (2001) argues that identity theft is a criminal activity for the new millennium. Unfortunately, the definition of identity theft varies. For instance, one definition of identity theft is “the unlawful

use of another's personal identifying information" (Bellah, 2001, p. 222). Others have defined identity theft as "involv[ing] financial or other personal information stolen with intent of establishing another person's identity as the thief's own" (Identity Theft, 2004). The Federal Trade Commission (FTC, 2006) sees identity theft as "occur[ring] when someone uses your personally identifying information, like your name, social security number, or credit card number without your permission, to commit fraud or other crimes." The present article adopts the FTC's definition of identity theft, although some may regard this definition as identity fraud. In one sense, identity fraud involves financial or other private information stolen, or totally invented, to make purchases or gain access to financial accounts (Higgins, Hughes, Ricketts, & Fell, 2005).

The FTC's definition clarifies some of the potential forms of personal information that may be used in identity theft. Other forms of personal information include address, date of birth, alien registration number, and government passport. While these forms of personal information and the definition of identity theft provide some context, identity theft can be summed up as constituting the unauthorized use of someone else's personal information for criminal activity.

The crime of identity theft has received substantial coverage from a wide variety of legal mechanisms. A substantial number of federal and state statutes relate to the criminality of identity theft and those who suffer its victimization. In the federal arena, the laws relating to identity theft are convoluted. They can, however, be divided into statutes that relate to criminality and penalties, and statutes that provide consumers with information or rights. The primary criminal statute in the federal system is the Identity Theft and Assumption Deterrence Act of 1998. Specifically, 18 U.S.C. § 1028 makes it a federal crime when anyone acts as follows:

Knowingly transfers or uses, without lawful authority, a means of identification of another person with the intent to commit, or to aid or abet, any unlawful activity that constitutes a violation of Federal law, or that constitutes a felony under any applicable State or local law.

In 2004, the Identity Theft Penalty Enhancement Act was enacted.¹ This act provides for enhanced punishments for identity thieves. For example, the act requires an additional 2 years of punishment for those violators using another's identity in the commission of a crime and 5-year sentences for the use of a false identity in the commission of a terror offense.² Sentencing discretion is also restricted in that sentences may not run concurrently for offenses, and probation is prohibited for those convicted under the statute.

Other federal statutes provide some aid for victims of identity theft.³ The Fair Credit Reporting Act establishes procedures for persons seeking to correct mistakes on their credit record and ensures that credit histories are

only provided for legitimate business needs.⁴ The Fair and Accurate Credit Transactions Act allows consumers to obtain free copies of their credit reports as well as restricts what information can be placed on a sales receipt. Similarly, the Fair Credit Billing Act establishes procedures for resolving billing errors on credit card accounts and establishes limits on a consumer's liability for fraudulent credit card charges.⁵ Finally, the Electronic Fund Transfer Act focuses upon transactions using debit cards or electronic means to debit or credit an account and limits the liability for unauthorized electronic fund transfers.⁶

Since the majority of all criminal prosecutions occur in state court systems, state legal schemes are critically important. All 30 states and the District of Columbia have criminal laws relating to identity theft (FTC, 2006). Thirty-one states have created freeze laws for persons fearing identity theft. These laws generally lock access to credit reports and credit scores.⁷ While these laws vary greatly, there is generally no charge for the creation, temporary lifting, or complete termination of a freeze (a so-called credit thaw) for the victim of identity theft. Others wishing to limit their risks may have to pay between \$5 and \$20 (see <http://www.consumersunion.com>). While these freezes will not completely shield a consumer from victimization, they will stop the creation of any new victimization where the issuer relies upon a credit report to provide credit. A few states have credit information-blocking statutes that require the credit reporting agencies to block false information from consumer victims' credit reports within a certain time frame or upon the receipt of a police report.

California was the first state to pass a mandatory disclosure law for persons whose information has been compromised. Currently, at least 35 states have some form of breach notification statute. These laws vary greatly by state (Krebs, 2007). The threshold for notification may be mandatory upon a security breach. For example, Massachusetts recently passed a mandatory notification law similar to California's.⁸ Other states have a risk-based analysis requiring notification only in cases of substantial risk of harm. These laws are based on three rationales. First, with timely notice, consumers can take preventive measures to limit or reduce the potential for identity theft. Second, reporting provides an ability to accurately measure the true number of breaches and thus aids in research on identity theft. Finally, the social and pecuniary costs associated with notification provide substantial motivation to protect consumer information (Schneier, 2006). Notification laws differ from fraud alert protections. An alert requirement forces notification if a person's credit file receives an inquiry. A breach notification law requires that a consumer be informed that his or her information has been compromised.

Identity theft or identity fraud is responsible for a large number of issues concerning the theft of information. Identity thieves commit fraudulent acts to obtain identities

of other individuals. For instance, identity thieves may *hack* (i.e., break into network databases) via the Internet to obtain personal information. Another form of fraudulent activity is the use of *phishing*. Phishing is when an identity criminal goes online and poses as a corporation (e.g., Western Union, Amazon, eBay, or PayPal) or an individual in need and requests personal information. Phishing schemes include travel scams, stock frauds, financial transfers, nondelivery of merchandise, Internet auction fraud, credit card fraud, and so forth. An emerging form of identity theft is *pharming*, which is when a hacker redirects an individual from a legitimate site to a fraudulent site without the user's knowledge.

These forms of identity theft over the Internet are costly to the economy and the victim. For instance, Allison, Shuck, and Lersch (2005) argue that the U.S. economy is particularly susceptible to identity theft. In the United States, identity theft has resulted in actual losses ranging from \$442 million to \$745 million over a span of 3 years (U.S. General Accounting Office, 2002, cited in Allison et al., 2005). Others have estimated that identity theft costs between \$53 billion and \$73.8 billion per year (Weingart, 2003). While this gives some perspective, the true extent of identity theft is unknown. Identity theft can also have profound individual costs. For instance, a victim can expect to pay up to \$3,000 and spend a substantial amount of time restoring his or her identity (FTC, 2006). Therefore, cyber-fraud is an important criminal activity that needs further exploration.

Cybercrime Communities

The Internet provides a place for cybercriminal communities to exist and flourish. The communities may be seen as *subcultures*. Subcultures are cohesive cultural systems that vary in form and substance from the dominant culture. To be clear, a subculture maintains its own values, beliefs, and traditions that differ from the dominant culture. Thus, the individual performs behaviors that are consistent with those of his or her subculture, but that differ from the dominant culture. Some subcultures may be based on ethnic groups, delinquent gangs, or religious sects. Subcultures may take place through the Internet or the cyber environment.

For instance, subcultures harbor some of the individuals that seek to understand computer operating systems (i.e., *hackers*), individuals that seek to destroy or do harm within a computer system (i.e., *crackers*), or individuals that seek to steal telephone services (i.e., *phreakers*). Other deviants or criminals may also be part of an online subculture (e.g., pedophiles, depressives, anorectics, and bulimics). Cybercrime communities function as the venue where the criminal activity is reinforced and encouraged. The cybercrime communities provide an opportunity for transmittal of knowledge that make the criminal behavior more

effective and legitimate. In short, the individual participating in these deviant subcultures learns new techniques for performing his or her behavior and how to handle potential issues (e.g., dealing with outsiders, securing legal or medical services). The cybercrime communities provide a place for the sharing of knowledge to take place on a level playing field. That is, in most other communities, individuals are alienated, rebuked, or ostracized based on age, race, sex, marital status, ethnicity, or socioeconomic status. However, in cybercrime communities, all that is required is a computer and an Internet connection and the individual is able to participate. The cybercrime communities provide an opportunity for individuals to be in touch with others from different geographical locations. Thus, someone in the United States can participate in a community in Australia.

Criminal Justice Response to Cybercrime

The criminal justice system response to cybercrime is the advent and development of the field of digital forensics, which has its roots in data recovery methods. That is, digital forensics has evolved into a field of complex, controlled procedures that allow for near real-time analysis leading to accurate feedback. Such analysis allows individuals in criminal justice to track the changes and key issues that are pertinent to good investigation of cybercrime.

Another method that criminal justice uses to combat cybercrime is through education of the public. This includes publishing important tips for reducing victimization. For instance, the National White Collar Crime Center's (NW3C) 2007 report suggested several ways that various forms of cybercrime may be reduced. For example, cyberstalking may be reduced by following these steps:

- Use a gender-neutral user name and email address.
- Use a free email account such as Hotmail (<http://www.hotmail.com>) or YAHOO! (<http://www.yahoo.com>) for newsgroups/ mailing lists, chat rooms, instant messages (IMs), emails from strangers, message boards, filling out forms, and other online activities.
- Don't give your primary email address to anyone you do not know or trust.
- Instruct children to never give out their real name, age, address, or phone number over the Internet without your permission.
- Don't provide your credit card number or other information to access or subscribe to a Web site with which you are not familiar.
- Monitor/observe newsgroups, mailing lists, and chat rooms before "speaking" or posting messages.
- When you do participate online, be careful—type only what you would say to someone's face.

- When communicating online, don't reveal personal things about yourself until you really and truly know the other person.
- The first instinct when someone attacks you online may be to defend yourself—Don't. This is how most online harassment situations begin.
- If it looks too good to be true, it probably is.

The National White Collar Crime Center's (2007) report indicates some tips to reduce instances of identity theft:

- Check your credit reports once a year from all three of the credit reporting agencies (Experian, Transunion, and Equifax).
- Guard your social security number. When possible, don't carry your social security card with you.
- Don't put your social security number or driver's license number on your checks.
- Guard your personal information. You should never give your social security number to anyone unless you can verify that the person is required to collect it.
- Carefully destroy papers you discard, especially those with sensitive or identifying information such as bank account and credit card statements.
- Be suspicious of telephone solicitors. Never provide information unless you have initiated the call.
- Delete any suspicious email requests without replying. Remember, if your bank or credit card company needs you to contact it, there are telephone numbers and Web site information on your statement. You do not have to click on unsolicited emails to contact the company.

Here are some steps to take if victimized:

- Contact the fraud departments of each of the three major credit bureaus and report that your identity has been stolen.
- Get a "fraud alert" placed in your file so that no new credit will be granted without your approval.
- Contact the security departments of the appropriate creditors or financial institutions for any accounts that may have been fraudulently accessed. Close these accounts. Create new passwords on any new accounts that you open.
- File a report with your local police or the police where the identity theft took place.
- Retain a copy of the police report because it may be needed by the bank, credit card company, or other businesses as evidence that your identity was stolen. (NW3C, 2007)

Notes

1. 18 U.S.C. § 1028A.
2. As enumerated in section 2332b(g)(5)(B).
3. The Fair Debt Collection Practices Act focuses on debt collectors' practices.

4. 15 U.S.C. § 1681 to 1681u.

5. 15 U.S.C. 1666i.

6. 15 U.S.C. 41, 1693.

7. Arkansas, California, Colorado, Connecticut, Delaware, District of Columbia, Florida, Hawaii, Indiana, Illinois, Kansas, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Minnesota, Mississippi, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, North Carolina, North Dakota, New York, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Dakota, Tennessee, Texas, Utah, Vermont, Washington, West Virginia, Wisconsin, and Wyoming. Other states have statutes that will go online in the next 2 years (Krebs, 2007).

8. In part the statute reads, "A person or agency that maintains or stores, but does not own or license data that includes personal information about a resident of the commonwealth, shall provide notice, as soon as practicable and without unreasonable delay, when such person or agency (1) knows or has reason to know of a breach of security or (2) when the person or agency knows or has reason to know that the personal information of such resident was acquired or used by an unauthorized person or used for an unauthorized purpose, to the owner or licensor in accordance with this chapter" (Chapter 93H).

DOMESTIC VIOLENCE

ANGELA R. GOVER

University of Colorado Denver

Domestic violence occurs when a current or former intimate partner exerts dominance and control in a relationship through physical, sexual, or psychological-emotional abuse, resulting in physical or emotional trauma to the victim. Other forms of domestic violence include stalking and dating violence. Other terms used for domestic violence include intimate partner violence, domestic abuse, family violence, spousal abuse, dating violence, wife abuse, and battering.

Domestic violence exists within all cultures, ethnicities, faiths, age groups, education levels, income levels, and sexual orientations. Domestic violence can occur between many different kinds of couples: married or unmarried couples, couples who live in rural areas and urban areas, those that cohabitate or live separately, couples that had been formerly married or had dated, and between heterosexual or same-sex couples. Furthermore, sexual intimacy is not required to be present in a relationship in order for domestic violence to occur.

While the statutory term for domestic violence in most states usually includes other family members besides intimate partners, such as children, parents, siblings, sometimes roommates, and so forth, practitioners typically apply the term *domestic violence* to a coercive, systemic pattern of physical, sexual, or psychological abuse between intimate partners. Victims of domestic violence can be women or men; however, the overwhelming majority of domestic violence involves women as victims and

men as perpetrators. For this reason, many organizations concerned with domestic violence focus their attention and services specifically on violence against women and their children.

The following section of this chapter discusses the types and prevalence of domestic violence. It also discusses domestic violence warning signs, stalking, dating violence, and domestic violence in the lesbian, gay, bisexual, and transgender (LGBT) community. The chapter concludes with a discussion of the judicial response to domestic violence such as domestic violence and family courts.

History

The *domestic violence movement*, also referred to as the *battered women's movement*, has a long history, although it picked up steam with the advent of the feminist movement of the late 1960s and early 1970s. In 1971, Erin Pizzey opened the first battered women's shelter in Chiswick, England. The first shelters in the United States opened their doors in Minneapolis-St. Paul, Minnesota; Pasadena, California; and Phoenix, Arizona, in 1972. Soon thereafter, a shelter opened in Boston, Massachusetts, and Casa Myrna Vasquez, also in Boston, opened its doors as the first shelter providing services primarily for Latinas. The first support group for battered lesbians began in

Seattle in 1985. Awareness and services have increased exponentially over the past three decades, and as of September 2007, a total of 1,949 domestic violence programs were operational across the United States (National Center for Victims of Crime, 2008).

Types of Abuse

The underlying commonality behind all types of abusive behaviors associated with domestic violence is the intent to gain power and control over one's partner or ex-partner through patterns of physical, sexual, or psychological abuse. As previously mentioned, physical, sexual, and psychological violence, stalking, and dating violence are different types of abuse experienced by victims of domestic violence on a daily basis. Each type of abuse is discussed below.

Physical Violence

Physical violence involves the use of force, possibly resulting in physical harm, disability, or death. Examples of physical abuse include hitting, scratching, shoving, grabbing, biting, throwing, choking, shaking, kicking, burning, physical restraint, use of a weapon, or otherwise causing intentional physical injury to the victim.

Sexual Violence

Sexual violence occurs when one forces or compels a person to engage in a sexual act or experiences sexual contact against his or her will. If a participant cannot communicate an understanding of and willingness to engage in a sexual act for any reason, including but not limited to disability, illness, and alcohol or drug intoxication, and the sex act is nonetheless attempted or completed by a perpetrator, an act of sexual violence transpires. In addition, sexual violence sometimes occurs within physically or emotionally abusive relationships where the victim agrees to sexual activity solely as a means to avoid additional abuse or intimidation. Examples of sexual violence include rape (including marital and date rape), attempted rape, inappropriate touching, unwanted voyeurism or exhibitionism, sexual harassment, or any other type of sexual activity to which one does not willingly agree.

Psychological Violence

Psychological violence is also commonly called emotional abuse and refers to behaviors of intimidation, control, or coercion resulting in emotional trauma. While a relationship does not need to include physical or sexual violence to be abusive, any prior acts or threats of physical or sexual violence do constitute psychological violence. Additional examples of psychological violence include

stalking; limiting or controlling the victim's activities or behaviors; isolating the victim from contact with friends or family; limiting or denying the victim's access to basic or financial resources; destroying the victim's personal property; abusive behavior toward a victim's loved ones; verbal threats; humiliation; put-downs; and any other behaviors intended to cause emotional pain, embarrassment, diminishment, or powerlessness.

A relationship does not have to include all of the above behaviors in order to be considered abusive; a partner who attempts to wield dominance and control within a relationship through any threat or act of physical, sexual, or psychological abuse is committing an act of domestic violence. It is also important to note that while a few of the above behaviors are not necessarily prosecutable in criminal court, they nevertheless constitute abuse.

Stalking

As defined by the National Center for Victims of Crime (NCVC, 2008), stalking is "a pattern of repeated, unwanted attention, harassment, and contact." Today, stalking is considered to be an example of abusive behavior within the framework of domestic violence because the dangers that victims face frequently continue even after they leave an abusive relationship. Research has indicated that many victims of domestic violence have experienced stalking behavior from a current or former intimate partner. Examples of stalking behaviors include following the victim, sending unwanted gifts and notes, repeated harassment such as phone calls or showing up at the victim's place of work, and other behaviors that a stalker uses to inappropriately invade the victim's life. These incursions may increase in frequency as a stalker tries to exert more control over a victim, sometimes in response to the loss of control he or she experienced at the end of the relationship. When stalking behaviors escalate, they may lead to outright threats or incidents of physical violence.

Nationally, all 50 of the United States have implemented anti-stalking laws and protective orders for victims. However, not all states treat the first offense of stalking as a felony; in most states, first-time offenders are charged with a misdemeanor. In some cases, a felony conviction occurs only after a third offense.

Dating Violence

Dating violence is a form of domestic violence that has been receiving much attention in recent years from the research and practice community (those who work with abuse victims). However, there are a few notable differences between dating violence within adolescent and young adult couples (high school and college age) and domestic violence within older couples who perhaps live together, have children in common, or are married. Many young people who are involved in dating relationships

experience unhealthy and abusive behaviors, but the problem is often overlooked because the relationship is less likely to be viewed as long-term or dependent in nature. Young people in relationships today do not necessarily view their relationships as long-term, as relationships were once assumed to be. In addition, both men and women view relationships as being more casual in general today, compared to previous generations. Finally, changing women's roles in society may have had an impact on how female adolescents conduct themselves in relationships today.

Statistics show that dating violence is a serious problem among youth. Research suggests that college students are highly vulnerable to dating violence because so many are involved in romantic relationships during these formative years. Dating violence research has produced interesting findings regarding the relationship between gender and victimization. Early research on adolescent dating violence suggested that females were more likely than males to be victimized by their dating partners (Roscoe & Kelsey, 1986). Some studies have reported similar dating violence victimization rates for males and females (Arriaga & Foshee, 2004). According to a recent study of approximately 2,500 college students attending two large southeastern U.S. universities, 24% of males perpetrated physical violence against a partner, 32% of females perpetrated physical violence against a partner, 57% of females perpetrated psychological abuse against a partner, and 50% of male respondents perpetrated psychological abuse against a partner (Gover, Kaukinen, & Fox, 2008). This is consistent with a Fact Sheet distributed by the National Coalition Against Domestic Violence (NCADV, 2008), which reports that 1 in 5 college students say they have experienced violence within a current dating relationship, about a third have experienced dating violence within a previous relationship, and over half of acquaintance rapes on college campuses occur within the context of a dating relationship. Overall, the relationship between gender and dating violence is one that needs to continue to be explored because there are many questions that current research is unable to answer. Specifically, while there are many studies that discuss the prevalence of different forms of dating violence, these studies very rarely also inquire as to the context in which this violence occurs. This makes it hard to understand the quantitative data, and it makes it difficult to move forward on the best way to educate the community and respond to the issue given the fact that nondating violence research indicates that women are significantly more likely to be victims of intimate partner violence compared to men.

In many states, the law simply overlooks victims of dating violence when it comes to protection. As reported by NCADV (2008), in many states the criminal and civil domestic violence laws only apply to victims who are married to, cohabitate with, or have a child in common with the perpetrator. Thirty-nine states and the District of Columbia allow victims of dating violence to apply for

orders of protection against a perpetrator. Eleven states do not recognize dating violence in their statutes.

Prevalence of Domestic Violence

The National Violence Against Women Survey indicates that 1 in every 4 women will experience domestic violence in her lifetime (Tjaden & Thoennes, 2000). In addition, the Bureau of Justice Statistics (2005, 2006) reports that females represent an overwhelming majority of family violence victims, spousal abuse victims, and dating violence victims, with women at the greatest risk for intimate partner violence between the ages of 20 and 24.

A few studies have reported that males are victims of domestic violence in similar numbers to women (Straus, 1999); however, it is often argued that domestic violence perpetrated by women toward male victims rarely result in injuries as serious as those experienced by female victims of male perpetrators (Stets & Straus, 1990). Many victim advocates suspect that the majority of violence committed by women in abusive relationships takes place for purposes of self-defense against an abusive male partner.

In September 2007, the National Network to End Domestic Violence (NNEDV, 2007) conducted a 24-hour point-in-time survey known as the National Census of Domestic Violence Services. With participation by 69% of domestic violence programs across the United States, results indicated that 52,203 victims of domestic violence were served within one 24-hour period. Of those served, about half sought shelter. Also during that time, 20,582 domestic violence hotline calls were answered across the country. The report also found that 7,707 requests for services were unmet due to lack of space or resources. Clearly, the pervasiveness of domestic violence across the United States is overwhelming, with a tremendous need for services for victims and their children on a daily basis.

Explaining Domestic Violence

Scholars have had a difficult time developing explanations for the occurrence of domestic violence. Yet, it is widely understood that perpetrators turn to abusive behaviors as a means to gain power and control over their partner. Behaviors of emotional, physical, and sexual abuse within a relationship typically increase in their severity over time, as the perpetrator seeks to dominate the victim more fully. But abusers may differ from one another when it comes to the reasons why they seek to increase their power through abuse.

Cycle of Violence

The majority of relationships characterized by domestic violence experience what is referred to as the *cycle of violence*, which consists of three stages: (1) the tension-building

stage, (2) the explosive stage, and (3) the honeymoon stage. The cycle is not the same for all victims in terms of duration, but there is evidence that the violence escalates as the cycle increases in frequency. Victims become so accustomed to the cycle that based on the behavior of their partner, they can usually anticipate when their batterer will become abusive. The first stage, the tension-building stage, is a time that can be characterized by extremely high stress. The batterer may vent this increased tension by taking it out on objects or by acting aggressively in other ways, and it is common for the batterer to act overly jealous of his partner and attempt to isolate the partner from family and friends more than normal. While this is happening, many victims feel like they are walking on eggshells and they try to do anything they can to stop their batterer from becoming physically abusive.

The tension-building stage is followed by the explosive stage. The term for this stage is appropriate because this is the point in the cycle when the batterer releases his accumulation of stress by perpetrating violence against his partner in an act of rage. This may consist of either physical or sexual violence. During this stage, the batterer believes that the victim has caused him to be violent and that she must be put in her place, which is the batterer's effort to control the situation. Law enforcement may or may not become involved at this stage, depending on whether the victim or a third party calls the police. If law enforcement does become involved during this stage, many batterers who remain at the scene often appear very calm and collected to the officer, since their stress was released through their perpetration of violence. On the other hand, victims often appear confused, hysterical, terrified, shocked, angry, afraid, and degraded. Batterers often use the victim's demeanor to manipulate the situation by lying about what had transpired and denying that they perpetrated violence.

The final stage is referred to as the honeymoon stage. This stage is composed of acts on the part of the batterer to convince the victim to stay in the relationship, including promises to the victim that things will change. The batterer will typically ask for forgiveness and shower the victim with various presents as an expression of love and commitment to the relationship. During this stage, batterers also may seek counseling or go to church to show the victim that they are committed to changing their behavior. Unfortunately, victims who have been through the cycle before want to believe the promises that are being made, but instead feel depressed, helpless, hopeless, and trapped. While the batterer may feel somewhat in control again, he is still fearful that the victim may leave or obtain the involvement of the criminal justice system. Although apologies are made, batterers tend to minimize the abuse they inflicted on the victim.

In sum, the honeymoon stage eventually cycles back to the tension-building phase, since the cycle of violence is a continual repetitious pattern. Many women find it difficult to break out of the cycle of violence because of the new

hope that comes out of the honeymoon stage, which is a reminder that their partner has the capability of also being a good person and isn't *always* a bad person.

Psychopathology

One explanation behind domestic abuse is that the perpetrator suffers from certain mental disorders that lead him to seek psychological gratification through dysfunctional relationships. Detractors of this theory point out that most domestic abusers manage to function normally in other relationships, not necessarily behaving aggressively toward others in their daily life. While some abusers probably do suffer from mental illness or exhibit some signs of personality disorders, it is difficult to claim psychopathology as the main cause of domestic violence.

Perceived Gender Roles

A more widely accepted theory from the feminist school of thought, gender role theory is a perspective that sees institutionalized patriarchy as an explanation for domestic violence. Abusers look to society's heterosexual behavior norms as reinforcing male power and control, and reflect them in their intimate relationships. As such, an abuser who expects his partner to fill a traditionally subservient feminine gender role may resort to power and control behaviors to assert his power in the relationship. While this explanation rings true for many couples in abusive relationships, it fails to explain the occurrence of domestic violence within lesbian and gay relationships. There are specific reasons for domestic violence between same-sex couples, which will be discussed later in this chapter. However, one may argue that gender role theory can apply to homosexual relationships as well, in that the abuser may be trying to achieve a perceived societal gender norm within the relationship.

It is difficult to pinpoint one distinct explanation for the epidemic of domestic violence; every relationship is unique, and abusers exhibit violent behaviors for a variety of reasons. Ultimately, it is most likely a combination of social, psychological, cultural, and individual factors that lead abusers to control their victims through domestic violence.

Domestic Violence and the GLBT Community

While the majority of research on domestic violence refers to heterosexual couples, studies focusing on intimate partner abuse within gay, lesbian, bisexual, and transgendered (GLBT) relationships show that it happens at the same rates (Renzetti, 1992). Since their inception, domestic violence shelters have become more inclusive in welcoming and assisting gay women. Nonetheless, as stated by the New York Anti-Violence Project,

Services are fraught with potentials for re-victimization that pivots on homophobia, transphobia and heterosexism. To this end, the deleterious effects of homophobia and heterosexism cannot be discounted in the lives of lesbian, gay, bisexual and transgender (LGBT) survivors of IPV [interpersonal violence].” (Fountain & Skolnik, 2006)

In addition to societal stereotypes in regard to homosexuality, myths also exist around intimate partner abuse within GLBT relationships. Stereotypical beliefs about gender roles and expectations may lead others to think that women are not capable of battering and that men cannot be labeled as victims. As with heterosexual couples, abuse in GLBT relationships is not always physical, does not only occur between couples who cohabit, and it happens between young dating partners as well as adults.

Legislation in regard to abuse within GLBT relationships is limited. According to the National Coalition Against Domestic Violence (2008), 30 states and the District of Columbia have domestic violence laws that are gender neutral and include dating partners as well as those living together. Conversely, three states (Delaware, Montana, and South Carolina) have language that explicitly excludes same-sex partners from legal protection in cases of abuse.

Domestic Violence: Myth Versus Fact

One of the major efforts of the domestic violence movement, from the beginning, has been to debunk commonly believed stereotypes and myths about domestic violence. This is important because an accurate awareness of the issue cannot occur within society if the general public believes that domestic violence is a problem that only affects certain groups of people and is therefore not in need of attention since it is not that common. In addition, one of the easiest ways to acquire an overall understanding of the basic elements of domestic violence is to debunk commonly believed stereotypes. For example, it is commonly believed that domestic violence only affects certain populations. As mentioned above, domestic violence occurs across all cultures, religions, ethnicities, income levels, sexual orientations, age groups, and education levels. Another myth is that domestic violence is not a common or serious problem when in fact, in the United States, a woman is battered every 9 seconds (NCVC, 2008). Another myth is that domestic violence is caused by substance abuse. In fact, many batterers abuse alcohol or drugs, but it is not an excuse for their violence, as not all abusers are alcoholics or addicts and not all alcoholics or addicts abuse their partners. While some substance abusers blame their addiction for their battering behavior, they mistakenly assume that if the substance abuse stops, so will the abuse. It is best to think of substance abuse as being *correlated* with the incidence of domestic violence.

Many believe that if a victim really wants to stop the abuse, she could easily just walk out. The fact is that it is often very difficult for an abuse victim to end the relationship. Victims stay with the batterer for many reasons, including but not limited to economic constraints, child issues, fear, and intimidation. People also assume that as soon as a victim leaves her abuser, she is safe. In reality, abuse victims are in the most danger after the relationship has ended. Another commonly accepted myth is that battering incidents are isolated behaviors. In reality, batterers use a cycle of power and control to keep their partner in the relationship. Abuse rarely happens just once. It can happen often, or only once a year, but most physical violence continues to escalate and happens more often as the relationship progresses.

Another commonly accepted myth is that domestic violence can only occur in instances of physical aggression. In fact, emotional and psychological abuse and control are just as damaging and dangerous to the victim as physical abuse. Finally, many believe the myth that abusers just have anger issues—that the battering can be stopped through anger management courses. The fact of the matter is that although many abusers batter when they are angry, they are using violence to maintain power and control over their partner. They do not batter just because their partner did something to make them mad. While there are intervention programs for batterers, anger management is only a small part of the process. Other issues such as the need for control; the misuse of power; and what constitutes a healthy, functioning relationship must be worked on as well. For this reason, batterer intervention treatment is much more comprehensive than anger management counseling.

Domestic Violence Legislation

While domestic violence has been criminalized in some way in every state, the degrees of the offense and penalties for offenders vary significantly from state to state. For a breakdown of the criminal code provisions, criminal procedure, and police and prosecutor training and guidelines as they vary among states, see *Domestic Violence: A Review of State Legislation Defining Police and Prosecution Duties and Powers* (N. Miller, 2004).

The criminal justice system has made substantial improvements and changes pertaining to domestic violence offenses over the past 15 years. According to Miller (2004), some of the more noteworthy changes include the adoption of anti-stalking laws in every state, the repeal or limitation of states' spousal exemption laws in rape cases, and the passage of new domestic violence laws that provide unique penalties in family-related assault cases. In addition, every U.S. state now allows law enforcement personnel to make an arrest without a warrant for domestic violence cases, and penalties that offenders' have to pay

have been increased for violations of protective orders. In many states, reduced court fees and protection for non-married couples have made court protection more accessible. While each of these changes is a step in the right direction, domestic violence legislation remains inconsistent across the nation. Significant variations exist from state to state in the degree to which new laws have been adopted and in prosecution rates for offenders.

The most obvious indicator of the way a particular state legislates domestic violence offenses can be seen in whether it categorizes the offense as a misdemeanor or a felony. At the time this chapter was written, 11 states have yet to adopt laws explicitly dealing with domestic violence. Within the other 39 states, the first domestic violence offense can be treated as a felony in 9 states; the second domestic violence offense is treated as a felony in 7 states; and in 18 states, the third domestic violence offense is a felony. In addition, 13 states have enhanced penalties for violations of domestic violence law committed in the presence of a minor, and 3 states have instituted enhanced penalties for the assault of a pregnant woman (N. Miller, 2004).

As the recent changes in domestic violence law have benefited the domestic violence movement to a great extent, advances within law enforcement policies and enhanced prosecutor training have also been making a positive difference. Across the nation, entry-level training for police in most states now includes a domestic violence requirement, with a few states including in-service instruction as well as entry-level training. Also, some states have begun to require knowledge of written policies and procedures as they pertain to domestic violence as a component of law enforcement training (N. Miller, 2004). While the current advancements in police training have yet to reach consistency across the nation, they do provide a stark contrast to such training in the past. For example, police training as it existed in Chicago 40 years ago provided no training for domestic violence; however, it did include 1 hour of instruction on dealing with disturbances in general, out of a total 490 hours of training (Parnas, 1967). Prosecutor training for domestic violence cases has seen a slight improvement, but it lags behind law enforcement. To date, a mere four states require training for prosecutors in handling domestic violence cases; three others offer domestic violence instruction for prosecutors, but not as a requirement (N. Miller, 2004).

Overall, great strides have been made in domestic violence legislation, enforcement, and prosecution. However, the vast inconsistencies among states reveal the need for comprehensive, nationwide policies pertaining to the arrest and prosecution of offenders.

Effects of Legislation

The Minneapolis Domestic Violence Experiment (MDVE) was conducted to determine whether arresting

offenders for domestic violence significantly reduced subsequent arrests (Sherman & Berk, 1984). Many in the legislative community and elsewhere interpreted the MDVE results, which suggested that mandatory arrest could reduce future arrests, as a strong support for mandatory arrest laws for the law enforcement response to domestic violence. In fact, most states soon passed pro/mandatory arrest statutes, and law enforcement agencies implemented pro/mandatory arrest policies for cases of domestic violence. It did not take long, however, for the practice community to realize that there were going to be several unintended consequences of mandatory arrest policies. For example, as a result of mandatory arrest policies, female arrests for domestic violence have increased dramatically because often, officers who respond to domestic violence calls are unsure which partner is the primary aggressor. If the perpetrator has wounds as well as the victim, the officer is often unable to conclusively identify whose wounds are offensive and whose are defensive. Having not witnessed the altercation, the responding officer has no choice but to arrest both parties (Parmley, 2004). Some feel that as a result of the increased risk for arrest, victims of domestic violence may be less likely to contact the police, thus risking their safety and further enabling the abuser.

Others point to the more hidden consequences that mandatory arrests pose in regard to issues of race and class. As previously discussed, dual arrest rates surged as a result of mandatory arrest policies. For example, the rates of female arrests for domestic violence rose from 12.9% to 21% in the state of Maryland; from 6% to 16.5% in a California study; and shockingly, in the city of Sacramento alone, there was a 91% increase in women arrested, and a 7% decrease in men arrested (Chesney-Lind, 2002). Concurrently, African American females were arrested at almost 3 times the rate of Caucasian women in 1998 (Chesney-Lind, 2002).

In addition, various forms of racial bias have come to light as a result of increased arrest for domestic violence. For example, Maxwell, Garner, and Fagan's (2001) reanalysis of the MDVE replication studies cites official arrest data showing that men of color are more likely to recidivate. On the other hand, victim interviews have shown that white men were more likely to batter again (Chesney-Lind, 2002). It is theorized that the disparity stems from a stronger likelihood for police to arrest suspects of color, as it has been shown that African American women are more likely to alert authorities when domestic violence has occurred. Accordingly, official data may reflect a disproportionate number of men of color as domestic violence offenders, which promotes racial stereotypes and leads to the over-policing of people of color (Chesney-Lind, 2002).

Mandatory arrest policies may have caused unintended consequences for victims of lower socioeconomic class as well. For example, victims with limited resources may look to law enforcement as their best option to keep them safe. However, mandatory arrest policies increase the chances

that the primary provider will be taken from the home, resulting in a loss of income. As a result, these victims may become less likely to call the police (S. Miller, 1989).

Others debate the issue of whether mandatory arrest policies have been helpful to victims or disempowered them. Many feminists profess ambivalence because they want to hold law enforcement accountable for keeping citizens safe, but they also feel that often a police officers' power comes at the expense of women, particularly women of color and women of lower socioeconomic status (Coker, 2000).

Coker (2000) also discusses the consequence of having resources focused on arrests to the detriment of other benefits to victims, such as social programs leading to empowerment through education and job training. Having fewer social systems in place to support change leaves the criminal justice system with increased responsibility to produce results. Consequently, a failure on the part of the criminal justice system may breed victims' antagonism toward the system, thus reducing their likelihood of using police and court assistance in the future, particularly if the consequences include dual arrest or even arrest of the offender against the victim's wishes (Smith, 2000).

It is important to reiterate that there are benefits to mandatory arrest. For example, a mandatory arrest policy takes the decision out of the hands of the victims, and therefore the batterer should not hold the victim responsible for his or her prosecution. In addition, mandatory arrest policies send a punitive message to batterers and to the community that the criminal justice system responds to the crime of domestic violence in a harsh manner and holds offenders accountable. However, the unintended consequences of mandatory arrest must also be weighed when determining the best policy approach to this crime.

Domestic Violence Courts

Victims of domestic violence have long endured a culture of ignorance on the subject of domestic violence. Thus, it is no surprise that until the late 1970s, a wife was not able to file a protection order against her husband unless she also filed for divorce. Even so, restraining orders offered little in the way of protection by law enforcement or the criminal justice system; they were rarely monitored or enforced. The problem of domestic violence was largely viewed as a dilemma best addressed through counseling or crisis intervention programs rather than through the legal system. Yet, as the domestic violence movement worked to increase public awareness on the subject, it began to receive more attention from the legal system. Finally, domestic violence gradually came to be seen more seriously as a crime that is more appropriately addressed through the courts instead of family counseling sessions. However, even though awareness improved, negative stereotypes persisted as an impediment to prosecution. Offenders were rarely sentenced, and courts continued to

turn toward family crisis intervention programs instead of taking punitive measures (Fagan, 1996).

The court system has seen a large influx of domestic violence cases since the implementation of mandatory arrest laws for offenders. Unfortunately, there is little conclusive research as to how these cases fared within the legal system (Henning & Feder, 2005). Advocates and the legal system began to grapple with an emerging need for across-the-board legal processes that could successfully resolve the social, human, and legal dilemmas pertaining to domestic violence cases. As a result, domestic violence cases are now commonly viewed as a distinctive legal phenomenon that should be handled similarly to drug or mental health cases that are handled in specialized drug courts or mental health courts (Mazur & Aldrich, 2003).

Although domestic abuse is a crime, the traditional court system is ill-equipped to deal with all of the complexities involved in domestic violence cases. Because these cases typically include extenuating concerns pertaining to children, property, finances, and victim safety, they necessitate legal services and procedures that are different from those in regular courts. As attention has turned to the unique circumstances of domestic violence cases, specialized courts have emerged in the United States to meet victims' needs.

Similar to drug courts, there is no particular model that has been determined to be the "example court" model. What has emerged over the years, however, are common programming aspects that are usually indicative of a more progressive specialized court. Examples of these include case assignment, specialized judges, screening for related cases, intake units and case processing, service provision, and case monitoring. Ideally, cases are assigned to specific judges who specialize in domestic violence cases. The screening process determines whether victims or families are involved in other open cases or have prior involvement in domestic violence court. Often, however, screening is hampered by poor technology or limited information exchange. Thus, current court models seek to simplify the screening process and open information channels in order to obtain documents pertaining to specific victims or families. Because victims and offenders require community resources that apply specifically to their situation, domestic violence courts and community programs must be able to work together in order to provide needed services. Efficient domestic violence courts also include case monitoring. Effective coordination of services among the legal system, treatment providers, and victim advocates is enhanced through frequent meetings to exchange thoughts and ideas for improvements (Mazur & Aldrich, 2003). Overall, a common theme among successful models for domestic violence courts seeks to meet two main goals: victim safety and offender accountability.

Tsai (2000) did a multisite study to evaluate domestic violence court models. One of the specialized courts Tsai evaluated is located in Quincy, Massachusetts, an urban

community outside of Boston. The Quincy court coordinates an integrated system of judges, clerks, law enforcement, social services, and local agencies to provide a comprehensive community response. Tsai concluded that the primary effectiveness of Quincy's coordinated system stems from its ability to increase the victim's sense of empowerment through an adequate provision of legal and community resources. Due to its ability to provide victims with the services they need to maintain their safety and successfully escape their abusive situation, Quincy's domestic violence court is often used as a model for other cities.

Tsai (2000) also evaluated the domestic violence court of Dade County, Florida. The Dade County court model is based on *therapeutic jurisprudence*, which has its roots in mental health cases but has also come to the attention of experts as an appropriate response for domestic violence cases. The idea behind therapeutic jurisprudence is to enhance the psychological well-being of those who come into contact with the legal system (Winick, 1997). The Dade County domestic violence court prides itself on expanding its ideas and roles beyond that of the traditional legal system in order to reinforce victim empowerment, increase victim safety, and provide treatment alternatives to traditional penalties for offenders.

Positive findings were reported by a process and outcome evaluation of the Lexington County Domestic Violence Court in South Carolina (Gover, MacDonald, & Alpert, 2003). This study found that offenders who were processed in the specialized court had a 40% lower recidivism rate compared to a historical control group of offenders who were processed in traditional courts. This court also followed the tenets of therapeutic jurisprudence. In addition, Gover, Brank, and MacDonald (2007) reported that victims and offenders whose cases were processed in the domestic violence court found the court to have treated them with respect and thought that the process was fair, and also felt that they had a "voice" in the process in the sense that the judge listened to their side of the story and seemed concerned.

Conclusion

The purpose of this chapter was to review the topic of domestic violence from a criminology and criminal justice perspective. Domestic violence is the attempt by one person to obtain power and control over his or her intimate partner through psychological, physical, or sexual abuse. Victims of domestic violence are familiar with what is called the "cycle of violence," which consists of three stages that victims of domestic violence continually cycle through at the hands of their batterers.

Although there is no specific way to identify a batterer before the abuse starts, the following are some common red flags to be aware of in a relationship: extreme jealousy or possessiveness, the need for control, rigid stereotypical

views on gender roles, isolation from friends and family, economic control, extreme insecurity regarding the self or the relationship, and constantly checking up on or questioning the other's whereabouts. Similarly, there is no way to identify a victim prior to the person's victimization because this form of violence is pervasive in all cultures, faiths, educational levels, income levels, and sexual orientations. The domestic violence movement, with the help of the women's movement, has made many strides toward improving the criminal justice system's response to the crime of domestic violence. For example, although somewhat controversial, the passage of mandatory arrest laws have shown society that law enforcement officers are committed to holding offenders accountable for their actions. The development of domestic violence courts has indicated that the judicial system views domestic violence differently from other crimes and that it therefore needs its own system of offender processing. Despite the many ways in which the criminal justice system has evolved in its response to domestic violence in the past 40 years (Parnas, 1967), there is still much more work to do in the fight against domestic violence.

ENVIRONMENTAL CRIME

RONALD G. BURNS

Texas Christian University

Societal recognition of, and concern for, environmental issues waxes and wanes according to various factors and developments. For instance, recent concerns about global warming and increased costs of oil have contributed to enhanced societal concerns for environmental issues. Similar concern regarding oil shortages in the 1980s generated public concern for environmental issues, including the need for alternatives to fossil fuel–operated vehicles. The term *environmental issues* encompasses many different issues, including protection of the environment, sustainability, and environmental crimes. The last of these is the focus of this chapter.

Scientific and academic focus on environmental issues has contributed to the emergence of environmental studies as a distinct academic discipline. Such programs typically require an interdisciplinary approach to address the varied nature of environmental science. Studying environmental crime demands an interdisciplinary approach that includes fields such as biology, criminology, criminal justice, economics, sociology, chemistry, and psychology. Accordingly, criminologists have much to contribute to the study of environmental issues, primarily due to the significant occurrence of environmental crimes. Unfortunately, the study of environmental crime is in its infancy and much work remains to be completed.

Annually, far more people are killed from environmental crimes than from traditional homicides (Burns & Lynch, 2004), and millions more suffer ill effects from

environmental harms. Yet, the study of environmental crime is largely absent from the criminal justice and criminology research literatures. Medical and environmental scientists, as well as sociologists, have studied various aspects of environmental harms; however, there is scant coverage of the crime- and justice-related elements of environmental harms in the research literature. Criminologists have long studied traditional, or street crimes, often at the expense of environmental crime and other white collar offenses.

Environmental harms have traditionally been recognized by much of society as simply “the costs of doing business.” Fortunately, such acts are increasingly being recognized as the crimes they are. Most attention devoted to environmental crimes highlights the direct, visible, or primary harms associated with offenses against the environment. However, the initial, or direct harms stemming from environmental crimes often signify only a small portion of the associated harms. Many environmental crimes have substantial secondary, or indirect harms that may initially go unnoticed. Accordingly, these harms are sometimes not attributed to the criminal act.

Take, for instance, the harms associated with polluting a lake. The most obvious and direct harms associated with such an act may be the death of the fish in the lake or the discoloration of the water. Consider, however, the secondary effects such as individuals consuming the contaminated fish, swimming in the dirty lake, and drinking the

polluted well water located close by the lake. These secondary harms from polluting the lake, which may very well result in serious illnesses or deaths, may not appear for years. The initial disconnect between the crime and the recognizable harms will likely result in any penalties for the offense being significantly disproportionate to the associated harms.

The term *environmental crime* has been used somewhat loosely thus far in this chapter. The following section discusses what, specifically, constitutes environmental crime. From a legal perspective, a crime cannot occur without a related law. Accordingly, the discussion of what constitutes an environmental crime is followed by an overview of environmental law. Laws serve little purpose if they aren't enforced; thus, the section on environmental law is followed by coverage of enforcement efforts pertaining to environmental crime. The final section of this chapter addresses several issues likely to impact the future of the environment and, specifically, environmental crime.

What Is Environmental Crime?

There are several ways to define environmental crime. From a legal perspective, one could define environmental crime as harms committed against the environment that are in violation of statutorily defined terms. Philosophers may expand this definition to include environmental harms that do not fall under legally proscribed guidelines. The varied interpretations of what specifically constitutes environmental crime generate particular challenges for many groups, including industry leaders, environmentalists, criminologists, and politicians. For the purposes of this chapter, environmental crime is defined as any act, or attempted act, committed against the environment that violates statutorily defined laws.

Environmental crime is often viewed as a form of white collar crime, particularly when considering that the actors involved in committing the illegal act often represent corporate interests. However, it is possible for individuals who don't necessarily fit the mold of a white collar criminal, or are not committing crime on behalf of a business or corporation, to commit environmental crime. For instance, the individual who illegally disposes of his or her used car battery in a secluded area wouldn't necessarily be considered a white collar criminal, yet he or she is certainly committing an environmental crime.

Similar to traditional crimes, environmental crime is committed by various groups and individuals in society. As noted, corporations are responsible for much environmental crime, particularly with regard to pollution and the disposal of hazardous waste. Individuals and small businesses also engage in environmental crime, for instance, when they illegally dump hazardous materials or simply engage in littering. Organized crime syndicates also engage in environmental crime, such as through

illegally disposing of toxic and biohazardous materials for other enterprises.

Much crime and justice research effort and policy making are directed toward traditional crimes such as rape, robbery, burglary, and drug offenses. These and related offenses are certainly important to study and address; however, a strong argument could be made that environmental crimes are equally important. Even so, environmental crime remains understudied. Much of the discrepancy in the attention devoted to the two forms of crime (environmental crime and traditional crime) stems from the differences between the acts and the actors involved in each type. For instance, as mentioned, the harms resulting from environmental crime are often indirect. Environmental crimes also differ in that they are often committed by corporations. Further, environmental crimes differ from traditional crimes in that multiple individuals are often involved in their commission, and identifying who is responsible may be difficult. Identifying the perpetrator(s) of traditional crimes is often more easily done.

There are many other differences between environmental crimes and traditional crimes. For instance, environmental crimes are typically more multidimensional than traditional crimes. To illustrate, investigating an environmental crime requires specific skills and knowledge not often needed during investigations of traditional crimes. Environmental crimes often involve multiple victims, whereas traditional crimes typically involve one offender and one victim. Further, environmental crimes are often committed outside of the public's view. For example, the public may be unaware that a factory is producing an illegal level of pollution. Finally, environmental crimes differ from traditional crimes in the legal responses they generate. For instance, environmental crimes are often considered civil matters that result in financial penalties, while traditional crimes are processed in criminal courts. In sum, environmental crime is different from traditional crimes in many ways, yet the two types of crime are similar in that they both pose notable threats to society and are responsible for substantial harms. Perhaps most critical to any discussion of environmental crime are the legal aspects associated with harming the environment.

Environmental Law

Significant legislation targeted toward environmental crime didn't emerge until the latter half of the 20th century. Increased societal concern for the environment in the 1960s and 1970s generated major pieces of legislation designed to address environmental crime. Former President Richard Nixon, through executive order, created the federal-level Environmental Protection Agency (EPA) in 1970. Prior to that date, there was scant societal attention directed toward environmental crimes and few sanctions available to address them. In other words, formal regulation

of environmental crime existed in piecemeal fashion prior to 1970. The creation of the EPA generally coincided with a series of significant laws targeted at environmental crime.

Environmental laws are often complex given the atypical nature of environmental crime, the toxicity involved in many of the offenses, and the difficulty of translating scientific information into laws. Such laws must identify what constitutes a violation, the exposure level requirements, appropriate testing methods and equipment to be used, and the expected protocols. Further, environmental laws are often complex due to the political process in which multiple interests must be served. Particularly, legislators must consider the interests of industry, the public, and various interest groups. Adding to the complexity of environmental law is overlap among jurisdictions (e.g., state and federal) often associated with environmental crime, and the fact that multiple bodies of law may apply in particular situations (e.g., civil and criminal law). Finally, environmental laws are relatively new and many specifics have yet to be clarified in the courts. The laws are routinely challenged and often reinterpreted and redefined.

Among the more significant pieces of legislation regulating environmental protection are the Clean Water Act; Clean Air Act; the Resource Conservation and Recovery Act; and the Comprehensive Environmental Response, Compensation, and Liability Act. Discussion of the vast body of environmental law is beyond the scope of this chapter. Thus, this discussion is restricted to an overview of four pieces of major federal legislation regulating harms against the environment, with the goal of sharing the range of such laws.

The Clean Air Act was created in 1963 and amended in 1970, 1977, and 1990. Prior to passage of this act, there were no national standards regarding clean air in the United States. The legislation was designed to reduce air pollution levels through creating national, uniform standards for air quality. These standards are primarily assessed through evaluation of pollution emissions.

The Clean Water Act was originally passed as the Federal Water Pollution Control Act in 1972. The Clean Water Act (passed in 1977) was designed to prevent pollution discharges into waterways over which the federal government has constitutional authority. Further, the act was targeted to create fishable and swimmable waterways that protect marine animals and wildlife. To do so, the Clean Water Act utilizes a permit system and the designation of water quality standards.

The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), also known as the Superfund Act, provides the EPA broad powers to protect and restore the environment through requiring offenders to clean up hazardous waste sites. Under CERCLA, the EPA is permitted to take the necessary steps to protect public health and the environment with regard to hazardous waste sites that present an imminent hazard. The EPA may

employ civil remedies to recover remediation costs in cases where a corporation or individual created a hazardous waste site. Provisions in CERCLA also allow the EPA to sue defendants for costs incurred by the federal government when cleanup or other remediation actions are needed.

The Resource Conservation and Recovery Act (RCRA) pertains to management of solid and hazardous wastes. RCRA seeks to establish a tracking system for hazardous solid waste that regulates its transport, handling, storage, and disposal. Through its provisions, the RCRA encourages reductions in solid waste via recycling and improvement in manufacturing technology, alternatives to land disposal, safe land disposal when such disposal is required, and increased state responsibility for managing solid waste disposal.

This discussion highlights only a few aspects of federal legislation pertaining to environmental protection. To be sure, there are many more pieces of federal legislation pertaining to environmental harms, and it is anticipated that there will be more to come. However, the federal government is not alone in legislating environmental protection. States create and enforce their own laws, which vary from state to state, and local governments may create specific statutes that address environmental crime. Federal environmental laws provide the legal minimums for environmental protection by which each state and municipality must abide.

Laws have little impact if they are not considered by potential or actual offenders, nor are laws necessarily effective if they are not enforced by regulating parties. Whether they be restrictions against polluting the environment or statutes regulating the transport or disposal of hazardous waste, laws provide boundaries for acceptable behavior and sometimes prescribe penalties for unacceptable behavior. Accordingly, legislation must be considered with regard to its ability to deter or dissuade criminal behavior, and the extent to which laws are enforced. Legislative bodies are continuously creating laws to protect the environment, although some interested parties would argue that more laws are needed. Of particular concern with regard to legislative actions, especially those pertaining to the environment, are the enforcement practices of regulatory and law enforcement agencies.

Enforcing Environmental Laws

The existence of environmental laws dictates the need for enforcement actions. Accordingly, numerous federal law enforcement and regulatory agencies oversee environmental protection; however, environmental laws are primarily enforced by the EPA (including its regional offices spread throughout the country) and state environmental regulatory agencies. Local law enforcement agencies also have responsibility for enforcing environmental laws;

however, their role has been notably limited in this area given local law enforcement's preoccupation with traditional, or street crime.

Environmental laws are enforced in a different manner from traditional crimes. For instance, the EPA regulates industry by gathering information via industry self-monitoring, industry record keeping and reporting, inspections by government officials (most of which are announced prior to the visit, and occur infrequently), and citizen complaints. When confronting violators, the EPA engages in administrative, criminal, or civil enforcement. The enforcement process typically is initiated by the EPA gathering information and requesting the alleged violator to cease the violating behavior. No further action is taken if the violator complies. Informal negotiations between the EPA and the violator, with the goal of remedying the problem, follow should the violator fail to comply. Civil or criminal actions may be imposed if the violator fails to comply with the request. Criminal enforcement is used as a last resort and requires the cases to be turned over to the U.S. Department of Justice for prosecution. Very few environmental offenses are prosecuted in criminal court.

Enforcing environmental laws places the EPA and other agencies in a volatile, yet important position. For instance, the EPA is criticized by industry groups for impeding industrial progress, while environmentalists believe the EPA doesn't do enough to protect the environment. Accordingly, the EPA must consider the interests of multiple groups in its enforcement practices.

The Federal Level

The EPA performs many duties and has numerous responsibilities. Although the agency's objectives fluctuate over time, the EPA consistently focuses on regulating air and water pollution, hazardous waste, and hazardous chemicals. Organizationally, the EPA's national office is in Washington, D.C., and it maintains 10 regional offices throughout the country. Each regional office is responsible for the execution of EPA programs throughout the region. Most EPA employees are located in regional offices.

Given its vast charges, the EPA is particularly vulnerable to changes in society. For instance, societal changes (e.g., enhanced public concern for pollution) may dictate that varying levels of emphasis be placed on specific issues, and the agency might adjust priorities based on changing EPA administrators and presidents. The EPA has been responsible for many great achievements and has conducted impressive work in protecting the environment. Given its challenging task of representing multiple interests, however, the EPA has been criticized for having unclear agency objectives, succumbing to strong political influences, and corrupt leadership.

The EPA is the primary, but not the sole federal agency responsible for protection of the environment. Other federal agencies maintain partial jurisdiction over the environment,

including the Department of Agriculture, which has authority over the National Forest Service, grasslands, and natural resources; the Department of Justice, which is responsible for prosecuting criminal cases related to the environment; the Department of Defense, which has jurisdiction over military installations, including the handling and disposition of chemical and nuclear weapons; the Department of Energy, including the Office of Environmental Management; and the Nuclear Regulatory Commission, which works closely with the Department of Defense concerning issues pertaining to nuclear fuel and radioactive materials/waste.

Several other federal agencies have some level of environmental authority, including the Department of Health and Human Services, the Department of Labor, the Department of Housing and Urban Development, the Department of Transportation, the National Highway Traffic Safety Administration, the Consumer Product Safety Commission, the Federal Maritime Commission, and the Federal Trade Commission. The EPA also works closely with other groups and agencies that are interested in protecting the environment, including the Council on Environmental Quality and the Department of the Interior (DOI). The EPA also works closely with the Department of Homeland Security (DHS). For instance, in April 2008 the DHS and the EPA jointly hosted a 3-day conference to address high-priority technical challenges for assessing risk of exposure to pathogens.

State-Level Environmental Enforcement

By 1990, each U.S. state had an environmental regulatory agency charged with protecting the environment. Each state regulatory agency must address the unique challenges posed by environmental concerns in its respective state. The EPA works closely with state environmental regulatory agencies, primarily through its regional offices. This decentralized approach to environmental protection is beneficial, as each state can focus on specific environmental issues. Such decentralization, however, limits the EPA's environmental protection efforts, as decision-making authority is dispersed among multiple levels of government.

State environmental regulatory agencies must adopt federal environmental protection standards, although they may impose more stringent regulations than those required at the federal level. As such, there exists much variation among the enforcement practices of the state regulatory bodies. Further contributing to the variation among state environmental regulatory agency practices are differing societal views of particular environmental issues, state fiscal issues, the influence of various interest groups, and the geographic distribution of particular industries and natural resources across the country. State environmental regulatory agencies provide significant protection of the environment.

Law Enforcement and the Environment

Aside from state and federal environmental regulatory agencies, law enforcement agencies at all levels enforce environmental law. Historically, local law enforcement has played a limited role in environmental law enforcement, although their involvement in this area has expanded in recent years as local agencies have become increasingly aware of environmental crime. Through their routine activities such as patrolling, local law enforcement officers are aptly situated to identify and react to environmental harms. The training of local-level law enforcement officers to identify and respond to environmental crimes has been limited, and, historically, officers generally believed that environmental crimes were not worthy of their attention or were the responsibility of other agencies. However, increased concern for homeland security has encouraged local law enforcement officers to become more cognizant of issues beyond street crime, and they are increasingly being trained to detect and respond to environmental crimes.

Issues pertaining to homeland security garnered much public attention following the terrorist attacks against the United States on September 11, 2001. To some extent, the wars in Afghanistan and Iraq, and fear surrounding the possibility of additional terrorist attacks on U.S. soil, shifted public attention away from environmental harms. In response to concerns over homeland security, local-level law enforcement agencies are tasked with the additional and substantial burden of recognizing and reacting to terrorist threats, which could distract them from dealing with environmental crimes. However, efforts toward homeland security certainly involve recognizing terrorist attacks against sites that fall under the jurisdiction of environmental protection agencies, which could lead to enhanced scrutiny of these locations. Further, terrorist threats could increase local law enforcement's recognition of environmental harms as law enforcement agencies increase in size and officers become increasingly responsible for identifying and responding to unusual activity.

Public Involvement in Addressing Environmental Crime

The general public performs a vital role in addressing environmental crime. Public attitudes help shape societal action, and public action typically follows enhanced societal concern for the environment. The actions may include government and industry responses to public pressure, or they can be the result of the public taking a proactive approach to environmental concerns—for instance, as recognized in the contributions of the various environmental movements in recent history.

Recent concern for environmental issues has contributed to the public becoming more responsive to environmental

crimes. This is not a unique situation; for example, public attitudes toward environmental crime shifted during the 1980s when the general public became more likely to view environmental crimes as notably harmful acts and not simply the costs of doing business.

Currently, many Americans are troubled by the “greenhouse effect;” global warming; contamination of soil and water by toxic waste; maintenance of the nation's supply of fresh water for household needs; and pollution of drinking water, rivers, lakes, and reservoirs. Some of this concern undoubtedly stems from Nobel Peace Prize-winner Al Gore's documentary *An Inconvenient Truth*, which highlighted the effects of environmental degradation and won an Academy Award.

Grassroots efforts have contributed much to environmental protection, particularly with regard to the detection of environmental crimes. Such efforts facilitate the prevention and resolution of environmental crime at a local level by addressing particular concerns often overlooked by corporations, politicians, and government entities such as law enforcement and regulatory agencies. Accordingly, there is a demonstrated need to confront environmental harms at the local level as opposed to the historical practice of relying on the seemingly distant federal and state agencies to confront environmental issues. Similar to the recent emphasis on community-oriented policing in which the police have greater interaction with the public and rely on citizens to assist in crime-fighting endeavors, grassroots efforts provide a vital supplement to bureaucratic state and federal regulatory efforts regarding environmental law enforcement.

The many challenges associated with addressing environmental crime undoubtedly hamper efforts to protect the public. For instance, consider that *regulatory* agencies are primarily responsible for enforcing environmental laws, and the penalties associated with committing environmental crime are arguably ineffective as a form of deterrence, rehabilitation, or retribution. The approach taken by regulatory agencies in response to environmental crime largely contrasts with approaches to dealing with traditional crimes (i.e., regulation versus prosecution).

What to Expect and What's Needed With Regard to Environmental Crime

Societal concerns regarding oil prices and global warming have encouraged citizens to become more environmentally conscious. Increasing oil costs have resulted in large SUVs becoming less visible on U.S. roadways and automakers developing alternatives to fossil-fueled vehicles. Recycling efforts are popular, as evidenced for instance in the marketing strategies of numerous large corporations who wish to appeal to environmentally friendly consumers. These and related developments bode well for the future of the environment.

Continuous protection of the environment, particularly through addressing environmental crime, is dependent upon many factors. The following addresses several issues of consideration with regard to effective environmental protection, with an emphasis on addressing environmental crime. While not a comprehensive list, these items will undoubtedly have significant impacts on environmental protection, including the prevention, detection, and enforcement of environmental crimes.

Scholarly Attention

Traditional crimes are highlighted by the media in news reports, on television, and in movies. Media coverage of environmental crime is much less obvious in society. For instance, empirical research on environmental crime doesn't go back much further than the mid-1980s and early 1990s, as there were few empirical studies of environmental crimes prior to this time. Such skewed coverage of crime distorts public perceptions regarding the nature, seriousness, and frequency of both environmental and street crime. Increased research focus on environmental crime, including responses to such offenses, will presumably contribute to more effective regulation of the environment.

From a research perspective, the study of environmental crime is seemingly overshadowed by issues of conventional crime. To address this limitation, additional research on environmental crime could, among other things, assess the applicability of theoretical explanations of crime with regard to environmental offenses; identify challenges environmental crimes pose to the criminal justice system (e.g., evidence collection procedures, jurisdictional issues, etc.); highlight the harms associated with environmental crime; and observe the impact of particular sanctions imposed on environmental crime offenders. To be sure, environmental crime is an understudied, yet important area of focus.

The dearth of environmental crime research can be attributable to a historical lack of data available to researchers. In other words, there is little historical research in this area simply because researchers struggled to obtain data. Accordingly, it is important that useful environmental crime and related data be collected and made available to researchers to analyze and possibly impact policy practices. The EPA and other environmental regulatory agencies have made substantial progress in disseminating data that can be used to study environmental crime. Arguably, researchers can no longer cite the lack of data as a reason for neglecting the study of environmental crime.

Researchers suggest that the EPA and state environmental regulatory agencies should continue their current data collection process and provide more detailed and helpful information. Increasing the extent to which the EPA and other agencies collect data will undoubtedly require additional resources. Nevertheless, the future for the study of environmental crime seems promising, as the EPA and other environmental regulatory agencies have

made considerable progress in providing data for environmental crime researchers and have offered grants and various forms of support for empirical evaluations. The increasing popularity of computer mapping programs, the continued development of academic studies/programs on environmental issues, and the ease with which environmental crime data can be collected online, among other factors, point to increased levels of environmental crime research in the years ahead.

Several obstacles could prevent enhanced levels of environmental crime research. Of particular importance is the government practice of removing "sensitive" information from public access. Concern for homeland security resulted in public agencies throughout the United States removing what were deemed sensitive documents from public access. The attacks on the World Trade Center and the Pentagon on September 11, 2001, prompted fears about additional attacks and the subsequent removal of information that could contribute to the study of environmental crime, although much information remains freely accessible. Time will tell if the heightened concern regarding terrorism continues and additional information is removed from public access.

The perpetuation of interdisciplinary studies is critical to the continued momentum of environmental crime research. The historical lack of cooperative work among researchers in various fields must be addressed if the study of environmental crime is to reach its potential. The various disciplines involved with the study of environmental crime dictate that more collaborative efforts are needed.

Sustainability

In simple terms, sustainability refers to the practice of continuously producing the necessities of human life with little to no harm to the environment. Sustainability, which involves substantial long-term planning, relies on effectively managing society's material and energy needs and wants. Such management requires cooperation among various government agencies, with the goal of maximizing and replenishing natural resources. Accordingly, sustainability requires collaborative and cooperative efforts from various agencies and disciplines, and effective enforcement of environmental laws to protect against continued harms to the environment.

How can sustainability be practiced, and ultimately achieved? The answer to this question is quite complex; however, many efforts are currently underway as society moves closer to sustainable living. For instance, as mentioned earlier, recycling efforts are becoming increasingly popular. Recycling bottles, paper, and other products prevents the continued destruction of environmental resources. The manufacturing and driving of automobiles that don't rely on fossil fuel provide additional examples. Automakers are currently seeking and

increasingly producing alternatives to fossil fuel–powered vehicles in response to public demand. The use of reusable grocery sacks, as opposed to the environmentally harmful plastic bags, is another example of efforts toward sustainability, as is the effective prevention of environmental crime and enforcement of environmental laws.

“Green living,” which involves a demonstrated concern for the protection of environmental resources, is becoming more popular as society moves toward sustainable living. Much work remains for society to ensure that the necessary environmental resources will be available for future generations. Nevertheless, current concerns for sustainability, the enforcement of environmental laws, and every small effort individuals make toward environmental protection contribute to a more promising future.

Enhanced Enforcement Efforts

Consider a society in which there was a notably inappropriate level of social control. For instance, imagine what it would be like if street crimes were regularly dealt with in a piecemeal fashion, and the penalty for serious crimes such as rape and robbery was a warning, or perhaps a fine that provided little deterrent to offenders. What if police patrol efforts were announced, and those caught committing serious crimes were simply granted an opportunity to discontinue their criminal behavior? Such a situation would undoubtedly generate substantial public outcry and the need for enhanced social control efforts. Why, then, has society not effectively voiced concern over environmental crime and responses to it?

Society has not voiced substantial concern about environmental crime primarily because of the differences between environmental crime and street crime. For instance, as noted earlier, environmental crime is often viewed as the “costs of doing business,” and strong political interests often shield the true effects of environmental crime from the general public. Significant enhancements are needed for the effective enforcement of environmental laws.

Such enforcement is complex, however, and involves various groups, the criminal justice system, and enhanced legislation. Citizens could contribute, for example, by voicing their concerns and helping to identify harmful practices. Law enforcement agencies could become more cognizant of, and responsive to, harmful environmental practices. Stricter laws, including the increased use of criminal penalties as opposed to civil sanctions, would contribute to the enforcement of environmental laws, and the courts could increasingly recognize and treat environmental harms as something more than “business costs.” Further, correctional agencies could focus less on incapacitating those convicted of environmental crimes and more on deterrence, rehabilitation, and punishment. Needless to say, addressing environmental crime effectively is going to take commitment on behalf of many individuals, groups, and government and industry leaders.

As noted, recent concern about terrorism and homeland security could contribute to the enhanced enforcement of environmental laws. Federal law enforcement efforts seemingly became better organized with the creation of the Department of Homeland Security, and many state, county, and local law enforcement agencies have redirected their efforts toward identifying terrorist activities. These efforts, in turn, could substantially contribute to dealing more effectively with environmental crime as law enforcement agents become increasingly involved in the day-to-day activities of citizens and businesses alike. For instance, law enforcement efforts that result in the intrusion into industry for the purposes of national security could potentially expose environmental harms, or at the very least deter violators who perceive a greater sense of vulnerability given the government’s enhanced interest in their practices.

Political Change and Support for the Environment

Environmental protection in the United States is heavily dependent upon the actions of the federal government, and is particularly influenced by the president and the party affiliation of those controlling Congress. For instance, the president has substantial impact on environmental protection simply through being able to choose the administrator of the EPA. Historically, Republicans have promoted less regulation than Democrats, primarily due to Republicans maintaining greater support of industry. However, politicians are dependent on the public for votes and support, and in theory they respond to public opinion.

Environmental issues are regularly among the topics of discussion and debate in political elections, particularly those at the national level. Voters are often able to develop a better understanding of political candidates through recognizing how those who wish to be elected consider environmental issues. Those in support of environmental protection applauded former President Bill Clinton when he chose the environmentally friendly Al Gore for vice president. In contrast, those who were concerned about the environment were discouraged to see George W. Bush be elected to the presidency and even more discouraged when he chose Dick Cheney as vice president. Both Bush and Cheney have strong ties to industry, which signaled to environmentalists that they were going to be faced with numerous challenges during Bush’s presidency.

Increased Globalism

Addressing environmental crime will require much greater cooperative and collaborative efforts among countries as international commerce and more general interaction increasingly occurs. Such a change poses particular challenges to current enforcement efforts regarding domestic environmental crimes. International cooperation requires, at minimum, agreement by all involved parties

that work is needed to protect the environment. Getting numerous countries with diverse cultural backgrounds and varied economic interests to agree on environmental crime prevention and resolution efforts is a daunting, albeit necessary task.

The need to consider issues beyond national boundaries is becoming popular in many countries, and global environmentalism is increasingly an area of concern. For instance, the 2002 World Summit on Sustainable Development in Johannesburg, South Africa, demonstrated the overall move toward global considerations of environmental issues. The summit involved a series of workshops, presentations, and exchanges between international organizations, industries, and various interest groups. Further, the fact that the EPA maintains an "Office of International Affairs" suggests that environmental concerns are not simply restricted to the United States, and the federal government recognizes the need for international efforts to protect the environment. Nevertheless, the United States, as a world leader in production and manufactured goods, faces specific challenges and maintains particular responsibilities that must be addressed with consideration given to environmental protection. Much work remains in the area of international environmentalism.

Conclusion

Environmental crimes continue to impact society. The significance of environmental harms, particularly with regard to public health and sustainability, is real. Much progress has been made in the short time that major environmental laws, and the EPA, have been in existence. While it is easy to draw attention to the limitations of environmental protection efforts, one must consider the progress that has taken place since 1970. Fifty years ago, there was no EPA. There were no substantial environmental laws. Environmental protection was a nonissue to many.

Now, consider the shape of the environment 50 years into the future. Is enough being done to ensure that the generations to come will not suffer the ill effects of today's neglectful environmental practices? Continued development with regard to environmental protection will undoubtedly result in a safer, healthier environment for those who follow.

The future of environmental protection is full of hope. Progress toward a better environment demands consideration of the complexities inherent in environmental crime. For example, progress will require law enforcement and regulatory agencies to become increasingly familiar with enforcement practices related to environmental crime. Legislation will need to continuously emerge and develop, society must maintain its interest in environmental protection, and sustainability will hopefully be the status quo and not simply a buzzword. Further, researchers will need to extend beyond their academic boundaries, and countries will need to work collaboratively as expansive efforts are

required for environmental protection. Anything less would be a step backward in the evolution of environmental protection and contribute to the ignorance of environmental crime.

HATE CRIME

HOLLY A. MILLER

Sam Houston State University

BITNA KIM

Indiana University of Pennsylvania

The term *hate crime* became part of the American lexicon in 1985 when it was coined by United States Representatives John Conyers and Mario Biaggi. Although the term hate crime and societal interest in it are relatively recent developments, hate crime has deep historical roots. Throughout U.S. history, a significant proportion of all murders, assaults, and acts of vandalism and desecration have been fueled by hatred. As Native Americans have been described as the first hate crime victims, hate crimes have existed since the United States' inception. Since then, members of all immigrant groups have been subjected to discrimination, harassment, and violence.

Although there are variations in definition, and certainly variations among state hate crime laws, in general a hate crime is considered to be an illegal act against a person, institution, or property that is motivated (in whole or in part) by the offender's prejudice against the victim's group membership status. Although not all jurisdictions, academics, or professionals agree about who should be protected by hate crime laws, the majority of such laws describe the offender's motivation based on prejudice against the victim's, race, color, nationality, religion, gender, ethnicity, sexual orientation, or disability status.

While hate crime behavior has a long history, it has only been in the last couple of decades that research to understand this type of crime has been conducted. The purpose of this chapter is to present the hate crime knowledge that has

accumulated over these last decades. This chapter will present the history of hate crime law, the scope of the problem, the theory and psychology behind hateful/prejudicial behaviors, characteristics of perpetrators and victims, policing hate crime, and responding to and preventing hate crime.

Hate Crime Laws

For and Against Hate Crime Legislation

Proponents of hate crime laws feel strongly about society making a statement that biased (or hate) crimes will not be tolerated and that serious penalties will be applied to those who commit such crimes. In addition, these laws are important in order to deter potential hate crime offenders who intentionally target members of subordinate groups. Hate crime laws are also symbolic and promote social cohesion by officially stating that victimization of people who are "different" is not accepted or tolerated in a modern society.

There have also been arguments against the formation of hate crime laws. Not all believe that hate crimes have been a significant problem in society; rather, some see it as a media-exaggerated issue—a product of a society that is highly sensitive to prejudice and discrimination. Thus, a special set of criminal laws that include hate is not warranted, and the generic criminal laws will suffice. Those

who oppose hate crime laws also argue that attempting to determine motivation for an already criminal act is difficult and may pose moral problems in that the offender is being punished for a criminal act *and* for his or her motivation. It has also been argued that hate crime laws do not deter people from engaging in these crimes. Others argue that the disagreement over which subordinate groups to include in the hate crime laws actually causes added discrimination and marginalization. Critics state that what these laws effectively are saying is that one group is more worthy of protection and care than another. Critics also wonder why anger/hate is more punishable than other motives such as greed. Although there has been (and still is) debate about hate crime laws, the mere fact that they exist in several countries around the world, as well as within the United States, indicates that reasoning in favor of these laws has outweighed that against them.

Federal and State Hate Crime Laws

Hate crime laws in the United States exist at the federal and state levels. Although federal and state laws differ, most protected characteristics include race, national origin, ethnicity, and religion. Some laws also include sexual orientation, gender, gender identity, and disability. The federal hate crime system includes laws, acts, and data collection statutes. The current federal hate crime law permits federal prosecution of crimes committed based upon the victim's race, color, religion, or nation of origin when the victim is engaging in a federally protected activity (e.g., attending a public school; working at a place of employment). The Local Law Enforcement Hate Crime Prevention Act of 2007 (i.e., the Matthew Shepard Act), which is under consideration as of this writing, would extend the existing federal hate crime law to include crimes based upon the victim's gender, sexual orientation, gender identity, and disability, and would drop the existing requirement that the victim be involved in a federally protected activity. The Violent Crime Control and Law Enforcement Act of 1994 requires that the U.S. Sentencing Commission enhance criminal penalties (up to 30%) for offenders who commit a federal crime that was motivated by the victim's race, religion, color, national origin, ethnicity, gender, disability, or sexual orientation.

There are two federal data collection statutes. The first, the Hate Crime Statistics Act of 1990, requires that the U.S. Attorney General collect data on all crimes that are motivated by the victim's race, ethnicity, religion, sexual orientation, or disability. Since 1992, the Department of Justice and the Federal Bureau of Investigation (FBI) have jointly published hate crime statistics on an annual basis. The Campus Hate Crimes Right to Know Act of 1997 requires college and university campus security authorities to collect and report data on crimes committed on the basis of the victim's race, gender, religion, sexual orientation, ethnicity, and disability.

The majority of states have some sort of hate crime legislation, but it differs from state to state. For example, some states treat hate crimes as low-severity offenses, while other states have more general hate crime laws or sentence enhancing for crimes that are motivated by bias. In some states, maximum criminal sentences may be doubled, tripled, or increased even more for a hate crime. The states also differ in the subordinate groups that transform a general crime to a hate crime and as to what degree this bias must be shown (e.g., beliefs, character). All state statutes include at least race, religion, and ethnicity, but differ on inclusion of other subordinate groups. For example, about 70% of the states also include gender and sexual orientation, while fewer include disability, political affiliation, or age.

Hate Crime Statistics

At the national level, data on hate crimes come from two principal resources: the Uniform Crime Reporting (UCR) Program and the National Crime Victimization Survey (NCVS). In addition, several anti-hate groups collect data and report rates of hate crime victimization at both the national and regional levels. It is important to note that each agency collects the data in a different manner and thus, each report varies in terms of rates, types, and focus of hate crime. For example, since the NCVS collects information through anonymous surveys, the rates of hate crime are significantly higher than the official police records reported in the UCR. Also, since state laws differ, what is considered a hate crime in one state may not be considered a hate crime in another state and therefore may not be counted in the UCR. Thus, data reporting sources differ on the number and types of hate crimes reported.

National Hate Crime Statistics Reported Through Summary UCR

Based on the hate crime reports from law enforcement agencies across the United States, the UCR data reflect aggregate frequencies of incidents, victims, suspected offenders, and categories of bias motivation. Since 1991, participation in the program has increased substantially from 29% to 85% of the United States population being represented. Nationally, the number of hate crimes reported has fluctuated between about 6,000 and 10,000 incidents annually since 1991 (U.S. Department of Justice, FBI, 2008).

Historically, racial animosity consistently has been the leading motivation for hate crime, followed by religious intolerance, and sexual orientation bias motives. According to the FBI's most recent report, *Hate Crime Statistics, 2006*, a total of 7,772 criminal incidents involving 9,080 offenses and 9,652 victims were reported in 2006 as a result of bias against a particular race, religion, sexual

orientation, ethnicity/national origin, or physical or mental disability. The majority of hate crime incidents, 51.8%, were motivated by racial bias, and an additional 12.7% were driven by hatred for a particular ethnicity or nationality. Roughly 19% were motivated by religious intolerance, and 15.5% were triggered by bias against a sexual orientation. One percent involved bias against physical or mental disabilities (U.S. Department of Justice, FBI, 2008).

Sixty-six percent of racial bias incidents were anti-black, and 22% were anti-white. Fifty-eight percent of ethnicity bias incidents were anti-Hispanic. Sixty-six percent of religious bias incidents were anti-Jewish, while 11% were anti-Islamic. According to data for the 7,330 known offenders reported in 2006, an estimated 58.6 percent were white, and 20.6% were black. The race of the offender was unknown for 12.9%, and other races accounted for the remaining known offenders. The majority (31.0%) of hate crime incidents in 2006 occurred in or near residences or homes; followed by 18.0% on highways, roads, alleys, or streets; 12.2% at colleges or schools; 6.1% in parking lots or garages; and 3.9% at churches, synagogues, or temples. The remaining 28.8% of hate crime incidents occurred at other specified locations, multiple locations, or other/unknown locations.

National Hate Crime Statistics Through NCVS

On July 1, 2000, the Bureau of Justice Statistics (BJS), a branch of the U.S. Department of Justice, initiated the addition of new items to the National Crime Victimization Survey that are designed to uncover hate crime victimizations that go underreported to the police. The NCVS hate crime questions ask victims about the basis for their belief that the crime they experienced was motivated by prejudice or bigotry, as well as the specific behavior of the offender or evidence that may have led to the victim's perception of bias. Crimes reported to the NCVS—sexual assaults, robbery, assault, burglary, larceny, or vandalism—with evidence of hatred toward any of these specific groups are classified as crimes motivated by hate. However, NCVS does not include crimes covered by the UCR, such as murder, arson, commercial crimes, and crimes against children under the age of 12. In addition, the NCVS does not include reports of crime from institutions, organizations, churches, schools, and businesses, although persons involved in these entities are included. The data for hate crimes from the NCVS include information about victims, offenders, and characteristics of crimes—both crimes reported to police and those not reported (U.S. Department of Justice, BJS, 2008).

According to the Bureau of Justice Statistics special report on victims derived from the NCVS from July 2000 through December 2003, an annual average of 210,000 hate crime victimizations occurred. During that period, an average of 191,000 hate crime incidents involving one or more victims occurred annually in the United States. About 3%

of all violent crimes and 0.2% of all property crimes revealed to the NCVS by victims were perceived to be hate crimes. Victims also indicated that 92,000 of these hate crime victimizations (approximately 44%) were reported to police. That is, NCVS data indicate that the majority of hate crime victims, like victims of many other crimes, do not report the incident to law enforcement. When the victims themselves reported to police, they did so primarily to prevent the offender from committing further offenses (35%) and to obtain help from the police (33%).

Hate Crime Theory

It is important to note that although several explanations may be applicable to prejudice and hate crime occurrence, no existing criminological theory can fully account for the transformation from prejudice into criminal behavior. Experts argue that in order to explain hate crimes, consideration of the interplay of a number of different factors (social, psychological, criminogenic, and contextual) as well as a wide range of aspects that contribute to hate crime (i.e., perpetrators' motives, victims' characteristics, and cultural ideologies about the victims' social groups) is necessary. The criminological theories most often employed to explain hate crime are group conflict theory, social learning theory, and strain theory.

Group Conflict Theory

This theory is based on the fact that humans are more likely to have relationships with other humans holding similar presuppositions for the purpose of comfort, ease, and friendliness, which in turn contributes to the formation of "in-groups" and "out-groups." The formation and development of in-group loyalty serve strong individual desires for relationship and acceptance.

In-group versus out-group conflict strongly facilitates group cohesiveness, affiliation, and identity. In addition, such conflict increases out-group rejection, as revealed by group members' tendencies to stress between-group dissimilarities and ignore between-group similarities. Out-groups are often stereotyped, dehumanized, or perceived as dishonest or malicious, whereas the in-group is idealized as good, powerful, and wholly justified in its views and actions toward others. Previous research has consistently shown that organized in-group preferences and out-group prejudices, and sometimes hostilities, even when the out-group was one with whom in-group members had never met, had never interacted, and about whom they knew very little.

Social Learning Theory

Social learning theories suggest that attitudes, values, and beliefs about individuals who belong to specific groups are learned through interaction with influencing

figures, such as peers and family who reward for adopting their views. Some of the literature on perpetrators of hate crimes stresses the impact of intimate acquaintances and family members, and the influence of localized social norms on the development of a child's prejudice. According to social learning theory, the attitudes of parents profoundly affect a child's prejudice, as a child grows up listening to those views. That is, prejudice toward specific targets is learned and reinforced through children's interactions with their parents, and those relations may even provide both justifications and rewards for committing acts of violence or harassment against out-group members.

Strain Theory

Strain theory holds that crime is a product of the gap between the culturally emphasized goals (e.g., success, wealth, and material possessions) and the legitimate means available to individuals to achieve those goals (e.g., access to high-quality education, participation in social networks). While society by its very nature pressures everyone to achieve those valued goals, not everyone is able to legitimately achieve success because of unemployment, poor education, lack of skills, and so on. Those who are unlikely to legitimately achieve the goals valued by society, according to strain theory, would be placed under a "strain." In essence, then, the frustration, or strain, caused by the desire for "success" and the inability to achieve it legitimately gives rise to criminal behavior. It is achieving society's goals that is important and not the means of achieving them.

Hate Crime Perpetrators

Although hate crime and prejudice theories provide hypotheses for why individuals develop hatred or biases toward others, there is little information on how this prejudice/bias translates into criminal or violent action. Research examining hate crime perpetrators has indicated the most common characteristic profile, situational factors associated with hate crime, an emerging typology, and knowledge of organized hate group members.

Characteristics of Hate Crime Perpetrators

Contrary to common belief, most hate crimes are not committed by people who belong to organized hate groups, but are generally perpetrated by individuals who are considered to be "average" teenagers or young adults. In fact, studies indicate that the most common profile of a hate crime perpetrator is that of a young, white male, who perpetrates with a small group of individuals, has had little previous contact with the criminal justice system, and is not a member of an organized hate group. Although examining overall data on hate crime perpetrators to form a

broad picture of the offender may be important, it is cautioned that not all such perpetrators fit this profile. For example, a percentage of hate crime perpetrators do belong to organized hate groups, are non-white, and range in age from teenage to older adult.

Situational Factors Associated With Hate Crime

There are situational factors that seem to influence and interact with the human factors that affect the occurrence and the brutality of hate crime. These situational factors include that (a) the crime is often conducted in small groups, (b) the victim is most often a stranger, and (c) the crime is expressive (verbal harassment) rather than instrumental (physical aggression).

As previously mentioned, hate crimes are usually not committed by lone offenders, or by members of organized hate groups, but by small groups of young friends. This, coupled with the fact that most hate crime offenders do not have a history of hate crime perpetration, indicates that offender motivation for hate crime may have more to do with group dynamics than individual levels of bias or prejudice. Previous research on group and authority influence has unequivocally indicated its strong persuasive power. This strong influence stems from a few important dynamics. First, engaging in a group assault allows diffusion of responsibility. In other words, acting in a group allows each individual to "blame" the others and not take full responsibility for his or her actions or feel like he or she is anonymous. Second, since hate crime offenders are typically young males, there is a likelihood that each offender may attempt to impress the others as well as encourage another member in an effort to affiliate/identify with those individuals.

Two other factors that affect the brutality of hate crime are stranger victims and the motivation of offenders. Research indicates that it is much easier to dehumanize or hate a person who is not known personally. Thus, since hate crime perpetrators most often offend against strangers, this increases the likelihood that the victim will be dehumanized and hurt significantly more. In addition, since the motivation of the offenders is typically not instrumental (e.g., to gain money), there is no end point to the offending behavior. Offenses that are instrumental have a stopping point—the assault ends when the victim hands over his or her purse or wallet. Since hate crimes are expressive, there is no end point—making higher levels of brutality more likely.

Emerging Typology

In recent years, researchers have begun to examine possible types of hate crime offenders. Thus far, four types of hate crime perpetrators have been identified: thrill seekers, reactive/defensive, mission, and retaliatory (McDevitt, Levin, & Bennett, 2002). The most common type of hate

crime offender is the thrill type. As stated previously, these are usually young males who act in groups. They do not belong to organized hate groups and describe their offense motivation as being bored or looking for some excitement. Although these individuals may have some level of prejudice/bias, their motivation seems to be influenced more by thrill seeking and peer influence. Studies indicate that this type of hate crime offender accounts for approximately two thirds of hate crimes.

The second type is the reactive or defensive type. This offender type commits a hate crime because the person feels that his or her rights or territory has been invaded. For example, the offender may engage in a hate crime because he doesn't feel like a subordinate group member should live in his neighborhood. The third type of hate crime perpetrator is the mission type. This type is the least frequent and usually includes those individuals who are organized hate group members on a "mission" to rid the world of what/who they consider to be immoral or wrong, or to keep a race "pure" and separate. The fourth type, the retaliatory type, commits hate crime in order to "get back at" or "get even with" a group because the perpetrator witnessed or heard of this group committing hate crime against his or her own group.

Organized Hate Group Members

The Southern Poverty Law Center indicates that there are approximately 670 different hate groups in the United States. Most organized hate crime groups focus on one or more of the following: racial bias (e.g., anti-white or anti-black), religious bias (e.g., anti-Jewish or anti-Catholic), ethnic/national origin bias (e.g., anti-Arab or anti-Hispanic), or sexual orientation bias (e.g., anti-gay or anti-transgender). Although there is no single profile of an organized hate crime group member, research has indicated that it is not necessarily the individual's bias/prejudice that gets the person involved, but the need to affiliate. It seems an individual's need to belong may make the person more susceptible to recruitment and then, once a member, to become biased against particular groups. In other words, racism may not cause someone to join a hate group, but joining the hate group may cause racism.

Hate Crime Victims

Problems in Identifying Hate Crime Victims

While trends and patterns can be identified, it is impossible to know exactly what percentage of hate crimes get reported to police. In general, many victims of hate crimes do not report the crime. In addition, once a hate crime is reported, there remain problems in recording, processing, and accurately accounting for all hate crime.

There are a variety of reasons why victims of hate crimes may not report the offense to the police. Nonreporting of

hate crimes is primarily a consequence of lack of trust of the police, fear of discrimination, abuse and mistreatment by law enforcement, or belief that the police are not interested in investigating such crimes. Members of certain groups that are frequently targeted for hate crimes are particularly unlikely to report a hate crime because they have poor relations with the police. This situation is reflected in the huge differences in figures that are consistently found between official police records of hate incidents against blacks or homosexuals and national and local victim surveys.

Even when hate crimes are reported to the police, many potential barriers exist between the reporting of the crime, and the offender's eventual conviction and "counting" of the event as a hate crime. These potential barriers include police officer bias against victims and their avoidance of recording because of the additional paperwork required by the department's hate crime policy. In addition, what is and is not classified as a hate crime varies greatly across different states. The way that hate crime is defined by different jurisdictions greatly affects what, and how much, is recorded in the official figures. Therefore, there are serious difficulties in interpreting the data because important differences exist from officer to officer and agency to agency, as well as among the various states' records.

Hate Crime Victim Types

Little is known about the experiences of hate crime victims. It is clear, however, that race is the most common motivation for hate crime in the United States, followed by religion and sexual orientation. Depending upon the particular state law, disabled individuals and women are also common victims of hate crimes.

Hate Crimes Based on Race and Ethnicity

Racial and ethnic differences are by far the most common motivation for hate crime. Of the different races and ethnicities in the United States, African Americans have been the most common victims of hate crimes. In addition, hate crimes on the basis of ethnicity are far from rare. Americans of Hispanic/Latino, Asian, or Middle Eastern ancestries have been victimized because of their ethnicity, no matter how long their family may have lived in the United States. Hatred against these people has a long history in America. During the same time that blacks were being victimized in the South (following the conclusion of the Civil War and up to and including the 1960s), Asian Americans and Mexican Americans were receiving similar treatment in the West and Southwest. Official discrimination based on ethnic group membership went on throughout the 20th century and continues into the 21st.

Hate Crimes Based on Religion

In reality, the boundaries between race/ethnicity and religion may be especially unclear. Agencies may have trouble

determining the group of the victim because individuals do not always fit neatly into predetermined categories. For example, in early United States history, Irish immigrants were discriminated against because of their adherence to Catholicism. However, it is clear that historically anti-Semitism has been the most universal, deep, and persistent ethnic/religious prejudice, even predating the formation of the United States. Although the situation in the United States was considerably better than in Europe, anti-Semitism was common and served as the core of almost all white supremacist doctrine in the United States as well.

Anti-Semitism is hardly extinct today. A prime factor that contributes to the continuing existence of anti-Semitism is the persistent belief by many non-Jews that Jews killed Christ. For members of the Christian Identity church, for example, hatred of Jews is not only acceptable, but it is actually required. Another factor contributing to modern-day anti-Semitism is Zionism. Many people equate Jews with Israel. When Israel takes action with which non-Jews disagree, such as Israel's treatment of Palestinians, some of the non-Jews blame all Jewish people.

Although anti-Semitism is the most common form of hate crime based on religion, since the attacks on the World Trade Center and the Pentagon of September 11, 2001, there has been a drastic increase in hate crimes against people of the Muslim faith in the United States. For example, during 2001 (after 9/11), about 480 incidents were anti-Islamic in nature (U.S. Department of Justice, BJS, 2008).

Hate Crimes Based on Sexual Orientation and Gender Identity

Similar to biases based on race and ethnicity, heterosexism remains persistent in the United States. Despite recent improvement in attitudes toward gays, antigay violence is still common and widespread. The official data imply that homosexuals are one of the primary victims of hate crimes. What is unique about sexual orientation and gender identity victims is that they can also be members of any of the groups discussed in this chapter, as well as be a minority within their own family.

Antigay ideology remains institutionalized throughout America. Those who are already homophobic can defend their behaviors as socially acceptable. To those who are not especially biased but who are seeking thrills and excitement, as appears to be the case with the majority of hate crime offenders, many believe that gays are suitable targets. Another influence on antigay sentiment is religion; many religious organizations continue to denounce homosexuality, and others have pursued a specifically antigay agenda. In many cases, antigay and antitransgender violence is probably also provoked by offenders' perceptions that gays have violated gender roles, as gay men have voluntarily relinquished the privilege of male domination over women. Heterosexual men's attitudes toward gay men are much more negative than those toward lesbians. Lesbians are seen as less threatening to masculinity and the male

gender role. Thus, homosexual and transgendered men are significantly more likely to be victims of hate crime than lesbians and transgendered women.

As of 2006, a total of 29 of the 48 states that have hate crime laws include sexual orientation and 7 include gender identity. In addition, there are currently no federal hate crime laws that protect victims based upon sexual orientation or gender identity, even though these hate crimes tend to be the most brutal and deadly. In fact, transgendered males are significantly more likely to be murdered than all other groups including African American males (U.S. Department of Justice, BJS, 2008).

Hate Crimes Based on Disability

Each year the FBI records few hate crimes that were perpetrated based on the victim's physical or mental disability. However, there is good reason to think that the true number is much higher. That is, some victims, especially those with mental disabilities, may be unable to report the crimes, police officers may be unlikely to categorize their victimization as a hate crime, and most states do not include disability in the law and therefore do not keep count of these crimes. Compared with all the other latent victims of hate crimes, disabled people are a highly vulnerable population. They are more likely to rely on other people who might take advantage of them for daily necessities, and they may be physically or mentally unable to protect themselves from predation. Some insist that crimes committed on the basis of disability should not be considered hate crimes because these offenders do not truly hate the victims; they are merely choosing them because they are vulnerable.

Hate Crimes Based on Gender

The inclusion of gender within hate crime laws has been controversial and currently is not included in federal law or in the UCR reporting of hate crime statistics. Some argue that there are potential dangers in treating gender-based crimes as hate crimes. One possibility is that, given the large number of rapes and domestic violence incidents, gender-based hate crimes could overwhelm the area of hate crimes, and other forms of bias-motivated crime might not get the attention they deserve. On the other hand, rape and domestic abuse, which surely merit consideration in their own right, could possibly receive less attention under the broader rubric of hate crimes.

Responding to Hate Crime

Crimes motivated by hate and prejudice are nothing new; however, recent hate crime legislation has presented the criminal justice system and society with a unique type of offender. As stated previously, these crimes are distinctive in that they concern both criminal behavior *and* the motivation

behind the behavior. Thus, most agree that the criminal justice system needs to consider both when responding to this type of offender.

Police Response to Hate Crime

Many, if not all, subordinate groups within the United States have had a number of hostile and prejudiced encounters with the police that have increased the likelihood that they will hold negative perceptions of law enforcement. Subordinate group members have reported feeling both under-protected and over-policed by law enforcement. The issue of the over-policing of minority groups can be traced back over the course of the past century when minority communities felt that the police used oppressive tactics and operations disproportionately targeted at minorities. Subordinate groups describe under-policing as law enforcement delaying their response to incidents, not doing enough to apprehend the offender, being disinterested and impolite, and making mistakes or handling matters badly. In other words, minority communities increasingly saw themselves as the targets of policing. Because trust and confidence in the police is lost, the minority groups do not turn to the police for assistance when they are subjected to ongoing violence and harassment. In fact, hate crimes in general are significantly underreported.

There are a number of positive activities that the police can undertake to improve their response to hate crimes. While the police cannot directly lessen hate, they can contribute considerably to the establishment of an environment that lessens the chance that hatred will result in interpersonal violence by providing a fair, effective, and open service to all members of their community. If the police can be fair, effective, and open, then it follows that subordinate group members will be more willing to report crimes as well as assist law enforcement efforts. In addition, if police utilize a deliberately broad and inclusive, but specific, definition of hate crime, it would restrict the discretion of individual officers and possibly encourage better recording of hate crimes. Several jurisdictions have responded to the need by requiring hate crime training while police officers are at the law enforcement academy, using specially trained investigators for hate crime, or forming specialist investigative units with officers dedicated to hate crime investigations.

Courts' Response to Hate Crime

As with other types of crime, the courts main response to hate crime is to mete out punishment. However, since hate crimes include both motivation and illegal behavior, rehabilitation is also necessary. The following methods have been utilized or discussed as ways to work with the hate crime offender: the punishment model, the restorative justice model, counseling or education programs, and civil remedies.

Hate crime offenders can be responded to by simply placing them in prison as punishment. However, few believe that

prison punishment alone will be enough to increase the offender's tolerance of others—and may even increase a hate crime offender's bias, since most prison situations are quite segregated along racial and ethnic lines. In fact, many prisons are rife with hate group recruitment and membership. Most agree that some form of rehabilitation of the hate crime perpetrator in addition to the punishment is warranted.

The *restorative justice model* emphasizes the restoration of the victim and community as much as possible. One component of restorative justice includes victim-offender mediation. During mediation, the offender and victim come together; the victim has the opportunity to explain how the offense impacted him or her and ask any questions of the offender, and the offender has the opportunity to provide apologies and explanations. This offers the venue for the victim to speak of his or her experience and allows the offender to understand his or her impact on the victim and to obtain a more realistic picture of the victim (which is helpful because much prejudice against the victim is based on stereotypes and myths of that particular subordinate group). The goal is for the people involved to reach an agreeable reconciliation.

Another approach to rehabilitating hate crime offenders is to provide them with some sort of educational or *counseling* program. Depending on the offender's unique circumstances, the rehabilitation could involve several aspects such as diversity education, individual or group treatment of prejudice, mentorship of the offender by a member of the victim's subordinate group, and visiting relevant museums (e.g., the Holocaust Museum). Because a portion of hate crime offenders have a history of violence, it may be important to not only focus treatment on bias but also to provide anger management or interpersonal effectiveness treatment as a part of the offender's rehabilitation.

Finally, some states offer *civil remedies* to the victims of hate crime. For example, the state of Illinois offers victims of hate crimes free attorneys that will sue hate crime offenders for physical and emotional damage (in addition to free attorneys for criminal court). Previous victims of hate crimes have been successful at suing both hate crime offenders as well as organized hate groups to which the offender belonged.

Preventing Hate Crime

While responding to hate crime involves working or dealing with offenders or victims once a crime has happened, preventing hate crime focuses on making appropriate changes in society that would prevent future violence related to hate and bias. Since it is known that individuals are not born with prejudice, bias, or hate—that these things are learned—it becomes obvious that these harmful attitudes and feelings can be prevented. Thus, educating individuals to value and embrace diversity would work to reduce prejudice and bias. Several anti-hate organizations

have developed in response to hate crime in order to track these crimes and offer prevention services.

Preventing Hate Crime Through Education

Education and training of individuals to prevent future hate crime and decrease prejudice may take several forms, including school curriculum change, training for educators, specific classroom/school experiences and programs, and public awareness campaigns. Researchers, educators, and individuals who work with specific anti-hate groups have suggested curricula, programs, and exercises that have either been demonstrated to reduce prejudice or seem promising to do so.

Research indicates that typically a certain type of interaction is needed to change bias—specifically, individuals who are different from one another working together to complete a goal. For example, Jigsaw Classrooms have been developed and utilized that reduce stereotypes. In the Jigsaw Classrooms, children are placed in diverse small groups that require each child to “teach” the other children part of the lesson that they are required to learn. In order for the children to do well, they have to rely on the others in the group—as each student holds a piece of the “puzzle.” Examining the effectiveness of this technique has indicated it serves to help the children’s willingness to work together, increase friendship between diverse students, and increase subordinate group children’s grades.

An increasingly popular way to reduce hate and bias has been through public awareness campaigns. These campaigns may consist of mass media publicity (e.g., MTV playing *The Matthew Shepard Story* and listing names of hate crime victims as part of an anti-hate campaign) or specific drives by independent organizations, advocacy groups, or government or law enforcement agencies. These campaigns and drives may provide information and awareness through literature, media programming, advertising, and fund-raising. Research has generally indicated positive outcomes from these types of campaigns.

Anti-Hate Organizations

As there are several hundred organized hate groups, fortunately there are also numerous organized anti-hate groups. These anti-hate organizations range from local and regional to national and international groups. The largest of them will be discussed briefly.

Partners Against Hate (PAH) is an organization funded by the U.S. government that offers education and tools for young people and professionals who work and interact with youth, parents, law enforcement officials, educators, and community leaders. The Partners Against Hate Web site provides numerous links to educational materials, training programs, and tools for individuals interested in reducing bias and hate.

The Anti-Defamation League (ADL) is a Jewish group initially founded in 1913 to reduce Jewish stereotypes and

prejudice. During the 1960s, the ADL broadened its scope to include civil rights issues. Today, the ADL is one of the United States’ largest civil rights/human relations agencies that fight anti-Semitism and all forms of bigotry. The ADL develops materials, programs, and services through over 30 regional and satellite offices throughout the United States and abroad.

The Southern Poverty Law Center (SPLC) was founded in 1971 as a civil rights organization. The SPLC is headquartered in Alabama and monitors organized hate. As the organization was founded by two civil rights attorneys, the SPLC has provided legal counsel in a number of prominent cases against white supremacists and hate group organizations. Since its development, the organization has also become active in educational efforts through publishing resources for educators, parents, and children. The SPLC publishes a semiannual magazine aimed at teachers called *Teaching Tolerance*.

The National Gay and Lesbian Task Force (NGLTF) was founded in 1973 to promote the civil rights of gay, lesbian, bisexual, and transgendered people. This organization tracks antigay and -transgendered violence, advocates for rights, and provides educational activities and information. The NGLTF’s Web site provides information on each state’s legal issues related to the rights of gays and lesbians, information on gay violence and hate crime in general, and links for several informational documents and manuals.

The Simon Wiesenthal Center (SWC) was founded in 1977 by a rabbi who was a Holocaust survivor and is an international Jewish human rights organization. This anti-hate organization focuses its efforts on education by operating the Museum of Tolerance in Los Angeles, California. The SWC also offers training to educators and law enforcement officials on diversity and hate crime.

There are several other anti-hate organizations and agencies throughout the United States that focus both generally on combating hate and specifically on particular hate problems. For example, the American-Arab Anti-Discrimination Committee (ADC) is committed to empowering Arab Americans, defending the rights of Arab Americans, and advocating a balanced Middle East policy. The Mexican American Legal Defense and Educational Fund (MALDEF) works to foster sound public policies, laws, and programs to safeguard the civil rights of Hispanics/Latinos living in the United States and to empower that community to fully participate in U.S. society. All of these organizations, big and small, work to offer knowledge and aid to diverse groups within the United States and to serve communities by providing resources.

Conclusion

Hate crime is defined as an illegal act against a person, institution, or property that is motivated, in whole or in part, by the offender’s bias against the victim’s group membership. Although hate crime is a relatively new category

of crime, the United States has a long history of biased actions against individuals because of their race, ethnicity, religion, sexual orientation, gender identity, disability, and gender. Since the late 1980s and early 1990s, the federal government and states have collected data on hate crime occurrences as well as developed specific laws against such crimes. There are differences between the federal and state laws as well as differences among the states. Most differences include varied group coverage in the law. Because of these differences and the underreporting of incidents, the true rates remain unknown.

Research in the last few decades has indicated that African Americans are the most likely victims of hate crime in the United States, followed by people of the Jewish faith and individuals of differing sexual orientation or gender identity. Initial typology study has indicated the most common type of hate crime offender commits hate crime because of thrill/excitement, followed by defensive, retaliatory, and mission reasons. Research has also specified that the most common hate crime perpetrator is a young, white male, who is not associated with an organized hate group. Research also shows that brutality is more likely for this crime because of the group perpetration, victims are typically strangers, and the crime is expressive rather than instrumental in nature.

Law enforcement, the overall criminal justice system, and anti-hate organizations have developed programs and tools to help respond to and prevent hate crime. For example, several police agencies have developed hate crime teams, several jurisdictions require treatment for hate crime perpetrators, and both national and regional anti-hate organizations have developed Web sites to provide communities with information and aid in the prevention of these horrific crimes. It is encouraging to know that as hate organizations have developed over the United States' history, so too have anti-hate groups that work just as hard in prevention.

HOMICIDE

AMY RECKDENWALD

Florida Atlantic University

KAREN F. PARKER

University of Delaware

Criminal homicide is classified by the Uniform Crime Reporting (UCR) Program as both murder and nonnegligent manslaughter or as manslaughter by negligence. Homicide research generally examines murder and nonnegligent manslaughter, defined as the willful killing of one by another. Justifiable homicide, manslaughter caused by negligence, suicide, or attempts to murder are not included in this definition. For UCR purposes, justifiable homicide is limited to the killing of a felon by an officer in the line of duty or the killing of a felon, during the commission of a felony, by a private citizen. Manslaughter by negligence is the killing of a human being by gross negligence.

When researching homicide, scholars generally utilize two national sources of homicide data—the Uniform Crime Reporting Program of the Federal Bureau of Investigation (FBI) and mortality files from the Vital Statistics Division of the National Center for Health Statistics (NCHS). These two data sources vary greatly in the information collected.

The UCR is an official source of crime statistics based on reported crimes. That is, it is based on the number of arrests voluntarily reported to the FBI by law enforcement agencies. These crimes include murder, rape, robbery, aggravated assault, burglary, larceny-theft, vehicle theft, and arson. In addition to monthly criminal offense information compiled for UCR purposes, law enforcement agencies submit supplemental data to the FBI on homicide.

Supplemental Homicide Reports (SHRs) contain supplemental information on homicide incidents. SHRs include detailed, incident-level data on nearly all murders and nonnegligent manslaughters that have occurred in the United States in a given year. These reports contain information for each homicide incident, including information on trends, demographics of persons arrested, and the characteristics of the homicide (i.e., demographics of victims, victim–offender relationships, weapon used, and circumstances surrounding the homicide).

Though a rich source of homicide data, the UCR Program has weaknesses of which researchers are well aware. Missing information regarding the homicide incident is problematic in the UCR and probably its main weakness. This may be due to the fact that participation by police agencies in the UCR Program is completely voluntary. Therefore, some law enforcement agencies fail to report their homicide incidents to the FBI or fail to fully record all relevant information. Despite this fact, official sources like the Bureau of Justice Statistics (BJS) have found that the SHRs are just over 90% complete. Though the coverage is high, there are still a number of homicides that go unaccounted for. Some researchers have taken steps to correct for underreporting by law enforcement agencies by statistically adjusting for the total number of homicide incidents reported to the UCR (see Fox, 2004). The ability to adjust for missing data based on known homicide cases has increased the popularity of this data source among

researchers. However, one growing problem, particularly with homicide offender information, is the increase in the number of unsolved or uncleared murders by police agencies. Stranger homicides take longer to clear by arrest and therefore often get submitted as “unknown.” Ignoring homicides with missing offender information understates homicide offending. Thus, there is greater dependency on researchers to use weighting strategies that statistically adjust for missing offender data (see Fox, 2004, for a detailed discussion of this specific issue).

The mortality reporting system is far simpler compared to the UCR. In this system, homicide information is gathered by medical examiners in the completion of standardized death certificates. Once verified, death certificates are entered into a national mortality dataset by the NCHS. According to the NCHS, these data represent at least 90% of all homicides that have occurred in the United States. This type of data contains information on the victim of the homicide. Victim information includes demographics, occupation, education, time of death, place of death, and cause of death. Just as seen for the UCR, there are weaknesses in mortality data such as omissions and under-reporting. Unfortunately, for a variety of reasons not all death certificates are received by NCHS, and in some incidents information on death certificates is not entered into mortality figures. In addition, unlike with the UCR, offender information is not available and unable to be collected. Even with these notable limitations, homicide remains the most accurately measured and reported offense relative to other types of criminal offenses.

One of the reasons these data issues are so critical is that researchers and policymakers are interested in documenting and understanding the changes in homicide offending over time. That is, researchers and policy makers alike want to know how much homicide offending is occurring, why homicides occur and if the level of homicide offending is increasing or decreasing in certain areas (i.e., states, cities, or counties) over time.

Homicide Trends Over Time

One of the most remarkable findings in the study of urban violence is that homicide rates fell sharply in U.S. cities in the 1990s. In fact, homicides plunged to their lowest point in 35 years, making this drop critical to any discussion of homicide. That is, any effort to understand homicide requires an examination of homicide trends over time, particularly this rather remarkable, unexpected crime drop of the 1990s. To that end, this chapter will provide statistical information on urban homicide trends since the 1980s, drawing specifically on SHRs. After documenting some important changes, some of the leading explanations for the crime drop will then be outlined, to give the reader an understanding of the level and nature of work being conducted to understand this precipitous decline.

The Crime Drop

Researchers use time series data of total homicide rates to document the crime drop. As stated in the introduction, homicide is the most accurately measured and reported offense, making it the best benchmark when trying to illustrate changes in criminal offending over time. In addition, homicide is the most serious crime, leading it to be the most widely used among academicians. For these reasons and others, homicides provide a useful and accurate account of crime trends.

Time series data show that homicides averaged 19.0 per 100,000 population in 1980, and rates tended to fluctuate between 19 and 22.5 until 1991, when homicides peaked (22.5 per 100,000 population). That is, examination of SHR data reveals that homicides dropped by 20% from 1980 to 1985, but then rose by 47% from 1985 to 1991. Starting in 1991, homicides started a steady decline until 2000, falling to their lowest rate in 2000, or a drop of 46%. Since 2000, the rate of homicide has been largely stable until 2006 or so when an increase was observed. Overall, SHR data have documented a dramatic rise in homicides in the late 1980s, followed by the precipitous decline in the 1990s. This incredible crime drop has gained widespread attention as scholars have searched for answers (FBI, 2008).

Explanations for the Crime Drop

The drop in homicide rates occurred without warning, leading to an explosion of newspaper articles, TV reports, and other media accounts. Scholarly attention soon followed with a list of potential explanations, including greater police presence, prison expansion, reduced handgun availability, tapering drug (specifically crack cocaine) markets, gains in the economy, and age shifts in the population (Blumstein & Wallman, 2001). While the list continues to grow, some of the explanations receiving the greatest attention in the literature are outlined below.

Rise in Imprisonment Rates. An understanding of the changes in crime rates cannot occur without some consideration of the political and legal context of the time period. The enormous growth in “get tough on crime” policies that began in the 1970s is no exception. The expansion of the incarcerated population started in the mid-1970s, and by 2000 more than 2 million persons were incarcerated—4 times the prison population of 1970. Because the rise in incarceration rates corresponds closely with the decline in homicide rates, some researchers linked the two. For example, while homicides were dropping from 1991 to 2001 in large cities, the Bureau of Justice Statistics reports incarceration rates rose by 54.2% during this time period (a rate change of 310 to 478 per 100,000 residents nationally). The rise in incarceration, backed by structured sentencing (i.e., “get tough” on violent and drug-related criminal offenders) and other conservative criminal justice policies, is one of

the longest trends documented in the literature. Given the steady and prolonged trends in both rates of violence and incarcerations, it is not surprising that a number of scholars argue for the association between the two.

Increase in Police Presence. One response to rising crime rates is to hire more police officers. There is evidence that this was indeed a response to crime trends based on annual figures in the UCR. These reports tell of more police on the street, particularly in the 1990s when the FBI reports an extra 50,000–60,000 officers nationally (Levitt, 2004). On average, the police force size was 236.1 per 100,000 city residents in 2000, up from 206.9 per 100,000 persons in 1980 in large U.S. cities (Parker, 2008). These trends provide scholars with reasons to argue that increasing police presence is a likely predictor of the crime decline in the 1990s.

Diminishing Drug Markets. A link between violence and illicit drug markets is another major theme in the crime drop debate. Crack cocaine markets, which grew throughout the mid-1980s and peaked in the early 1990s, were related to homicide trends during this same time period (Blumstein, 1995). In fact, researchers found that drug markets contribute to violence, and studies have pointed to crack cocaine patterns specifically as related to trends in urban violence (Blumstein & Rosenfeld, 1998; Cook & Laub, 1998; Goldstein 1985). While determining how to best capture the impact of drug markets has hindered much of this research, police arrests for drug (specifically cocaine) sales represent one way to tap the level of drug activity in a given area or city. The UCR has shown that drug arrests for sales/manufacturing have exploded, growing by two and a half times from 1982 to 2003 alone (from 137,900 to 330,600). Thus, evidence of the waning crack market in the 1990s, or at least the growing enforcement of drug sales in recent times, has placed drug markets at the forefront of the crime drop debate.

Improving Economy of the 1990s. The link between economic factors and crime cannot be understated, so it comes as no surprise that the economic improvements of the 1990s have gained attention as a plausible explanation for the crime decline. In fact, in accord with labor statistics, the unemployment rate rose during the recessions of the early 1980s and early 1990s, recovering after both periods. On the other hand, the unemployment rate steadily declined throughout the 1990s, where employment gains for males and females correspond to the crime drop of this period. The unemployment rate alone fell from 6.8 in 1991 to 4.8 in 2001 (a drop of 30% in 10 years). Other economic performance indicators suggest better times for many Americans in the 1990s, as well as growth in major industries like information technology and services. Given that the 1990s mark a time of sustained economic growth and prosperity, these economic improvements are likely contributors to the crime drop.

Guns and Gun Control Policies. Finally, while explanations derived from guns and gun control policies drew a lot of attention early in the crime drop debate, mainly because such a large percentage of homicides are gun-related (Cook & Laub, 1998), interest in this explanation has diminished over time. The early interest in the relationship between violent crime and firearms made sense—the rate of violent crimes committed with firearms rose in the 1980s and 1990s and subsequently dropped. But over time, scholars have downplayed the degree to which gun control and concealed weapon laws contributed to the crime drop (Levitt, 2004). For example, some researchers found that the percentage of total killings by young males remained stable during the time of the crime drop, which was troubling since young males are much more likely to use a gun in a homicide than others, and other researchers discovered that the passage of the Brady Act gun control legislation in 1993 had no influence on homicide trends. Adding to the downfall of this explanation, researchers evaluating gun buyback programs and other gun control policies found that these programs also had little to do with reduction in gun violence. Even the highly publicized concealed weapon laws link to lower violent crime came under scrutiny (Lott & Mustard, 1997) when researchers revealed that the decline in crime actually predated the passage of many concealed weapon laws.

Since many of these explanations represent early responses to the crime drop, the chapter will now turn to more recent trends in the study of homicide. Clearly understanding homicide trends, particularly the crime drop of the 1990s, remains a critical focus. Moving beyond time series data of total homicide rates, scholars have acknowledged that since homicide trends differ across groups (Blumstein & Rosenfeld, 1998; Cook & Laub, 2002; Parker, 2008), these characteristics need to be accounted for in the crime drop debate. Current examples include Heimer and Lauritsen's (in press) examination of trends in violence against women; LaFree, O'Brien, and Baumer's (2006) exploration into racial patterns in arrest rates for multiple violent offenses; and Parker's (2008) effort to account for the role of local labor markets in the study of race-specific homicide trends since the 1980s. All of these efforts acknowledge the diversity in the American population, including the differential levels of involvement in violence by the various groups, and argue that accounting for the differences across groups will advance understanding of the crime drop. To illustrate, a closer look at homicide trends is offered, involving two specific characteristics—racial groups and intimate partners.

Race-Specific Homicide Trends

As described, the changes in total homicide rates since the 1980s were dramatic, particularly the now well-documented decline of the 1990s. But the reality is that the trends are

even more striking when separated by racial groups during this time period. When homicide trends are examined for whites and blacks separately, for example, two important differences are revealed. First, the homicide victim rate among blacks is much higher, with more extreme peaks and drops than the white homicide rate or the total homicide rate (see Figure 58.1). In fact, the black homicide rate was 25.8 in 1980, as compared to 19.0 per 100,000 city residents for total homicide. Between 1980 and 1985, the drop in black homicide rates is similar to the rate drop in total homicides (16% versus 20%, respectively). The exception is a large dip in black homicide rates in 1987 (19.43 per 100,000 population). By the 1990s, however, the crime drop in black homicide rates was considerable in magnitude, marking a 45% drop; that is, the rate was nearly cut in half. Subsequent years, on the other hand, show an increase in black homicide rates during the 2000s (approximately ranging from 14.4 to 16.5 per 100,000).

Second, the change in white homicide rates over time is modest, to say the least, suggesting stability rather than variability when compared to black homicide rates and total homicide rates. That is, white homicide rates peaked in 1980, reaching a rate of 5.89 per 100,000 white residents, while in comparison, the total homicide rate peaked in the early 1990s. From 1980 to 1985, white homicide rates dropped 6.8% (from 5.89 to 5.49) and then dropped again in the late 1980s (a 4.5% drop), only to continue to descend throughout the 1990s and into 2000 by another 17%. This drop was far lower in magnitude when compared to total and black homicide rates. Overall, then, white homicides averaged 5 per 100,000 white residents throughout the 1980s and into the 1990s. By 1998, white

homicide rates dropped below 5 per 100,000 white residents for the first time, staying in the mid to low 4s since then (Parker, 2008). Thus, among the notable differences in white homicide rates is the lack of a peak around 1991 and little to no change in offending rates throughout the 1990s. On the other hand, there were considerable shifts and fluctuations in the rates for black homicide rates and total homicide rates over the last three decades. These trends, specifically the differences across racial groups, required researchers to move the discussion away from total homicide rates. Furthermore, it drew attention to whether white and black homicide rates were converging for the first time.

Divergence or Convergence

The racial patterns in homicide trends reveal some interesting findings. First, the trends in black and total homicide rates are similar over time, but white homicide rates follow a different pattern. That is, while both black and total homicide rates experienced a decline in the early 1980s, followed by increases in the late 1980s, only to drop again in the 1990s, the decline in white homicide rates was more modest and steady over the 24-year period. An equally important issue is whether the racial gap in homicide is persisting or narrowing over time. Recent evidence suggests that the racial gap has indeed narrowed, and the racial disparities between groups have declined with the crime drop. That is, by examining the racial difference in homicide offending rates (based on the ratio of black to white homicide rates), it is now known that both black and white homicide rates decreased in the late 1990s and that the racial gap between these groups also narrowed considerably (in fact,

Figure 58.1 Homicide Rate per 100,000 Residents in Total and by Race, 1980–2003 (Adjusted Supplemental Homicide Reports)
 SOURCE: Parker, K. F. (2008). *Unequal Crime Decline*. New York: New York University Press.

by approximately 37%). This is an important reality about homicide that only recently gained attention, largely due to the work by LaFree et al. (2006), and it cannot be understated. In LaFree et al.'s work, they reveal that the black–white gap in violence was exceptionally high during the 1960s, but that gap has decreased over time. They argue that the narrowing of the racial gap is likely linked to the narrowing of crime-generating structural characteristics, such as social and economic indicators. According to LaFree et al., only by examining homicide trends separately by racial groups is it apparent that the racial gap has narrowed. Furthermore, evidence has surfaced that the narrowing of the gap is largely attributed to the rapid decline in black homicide rates during the 1990s, more than to any changes in white homicide rates (see Parker, 2008). This finding alone adds considerable weight to the efforts to diversify the study of homicide.

Intimate Partner Homicide Trends

Intimate partner homicide has also gained attention in recent years, partly because of the efforts by feminist scholars to bring awareness to violence among intimate groups. While intimate partners (i.e., spouses, ex-spouses, boyfriends, and girlfriends) make up approximately 11% of all homicides, females are much more likely to be killed by an intimate partner than males. According to the

Bureau of Justice Statistics, while both the number of male and female victims of intimate partner homicides dropped from 1976 to 2005, the number of males killed by an intimate partner had the most significant drop (75%) since 1976. On the other hand, the decline for females killed by an intimate partner was only witnessed after 1993 (see Figure 58.2).

As research in this area grows, descriptive accounts reveal that intimate partner homicide trends differ not only by the gender of the victim and offender, but also by the type of victim–offender relationship and the race of the victim (Browne & Williams, 1993; Gallup-Black, 2005; Puzone, Saltzman, Kresnow, Thompson, & Mercy, 2000). Essentially, while total intimate partner homicide has decreased over time, much like total homicide rates, once these rates are examined separately by gender, relationship type, or race, significant differences emerge. For instance, males have experienced a greater decline in intimate partner homicide victimization than females, and blacks more so than whites. In addition, intimate partner homicide among married persons has decreased, but homicide involving nonmarried persons has increased over time. In fact, the rise in nonmarried intimate partner victimization is most pronounced among white females. A number of reasons for the specific trends in violence among intimate partners, particularly the differences across gender and relationship type over time, have been offered. Some of these explanations are outlined here.

Figure 58.2 Intimate Partner Homicides by Gender, 1976–2005

SOURCE: Federal Bureau of Investigation. (2008). *Supplemental Homicide Files*. Washington, DC: Bureau of Justice Statistics.

Exposure Reduction

The exposure reduction hypothesis proposes that factors that reduce the exposure or contact between violent intimate partners should decrease the probability of intimate partner homicide, because the opportunity for violence would be removed. A number of factors have been examined to determine the exposure reduction effects on intimate partner homicide. These factors include access to domestic violence resources, declining domesticity, and improved economic status of females.

Access to domestic violence resources, specifically the availability of legal (i.e., presence of statutes pertaining to domestic violence) and extra-legal services (i.e., number of shelters and other programs), is related to the decline in the rates of female-perpetrated intimate partner homicide, but less so for male-perpetrated intimate partner homicide (Browne & Williams, 1989; Dugan, Nagin, & Rosenfeld, 1999, 2003). On the other hand, research has also shown that some domestic violence resources (e.g., prosecutors' willingness to prosecute) have the unintended consequence of putting women more at risk for intimate partner homicide victimization (Dugan et al., 2003). Because the role of domestic violence resources has been largely inconclusive, increasing divorce rates, declining marriage rates, an improved economic status of women, as well as other economic conditions, have received attention, partly because they consistently have been found to predict intimate partner homicide (Dugan et al., 1999, 2003; Reckdenwald, 2008; Rosenfeld, 1997).

Reflecting a decline in domesticity, rising divorce rates and the general trend toward declining marriage in the United States have surfaced as strong predictors of intimate partner homicide largely because these factors reduce the exposure to violence. For instance, divorce rates would result in fewer married couples living together and would therefore reduce the exposure of violent couples. The same idea applies to falling marriage rates, which would reduce the exposure of violent couples because fewer individuals would be getting married and living together. Rosenfeld (1997) examined intimate partner homicide trends in St. Louis, Missouri, and found that 30% of the decline in African American spousal homicides was attributable to falling marriage rates and rising divorce rates.

However, decreasing marriage rates may mean that more individuals are cohabitating without getting married. Cohabitation has been shown to be an important risk factor in intimate partner homicide. Wilson, Johnson, and Daly (1995) found that females that cohabit with their partner are 9 times more likely to be killed by their intimate partner than are married females. Interestingly, other researchers have found that cohabitating men with female partners are 10 times more likely to be victims of intimate partner homicide compared to men in married relationships.

Improvement in the economic status of women has an exposure-reducing effect, reducing the rates of intimate

partner homicide. Improvements such as higher educational attainment, income, and employment increase the opportunities available to women, and thus reduce the likelihood that they will resort to killing their male partners. Dugan et al. (1999) found that females' improved status was associated with a reduction in intimate partner homicide victimization, particularly male intimate partner homicide victimization. That is, the increase in females' relative income is associated with a decline in married female-perpetrated homicide. Furthermore, an increase in females' relative educational attainment is associated with a decline in nonmarried male victimization. They suggest that "more educated women are better able, and perhaps more willing, to exit violent relationships and thus avoid killing their partner" (pp. 204–205).

Backlash or Retaliation

While research has shown the importance of reducing the exposure between intimate partners in violent relationships, it is well-known that the highest risk for homicide is when the victim leaves the relationship, and this is especially true for females who are killed by their male partners (Block, 2000). Thus, retaliation by the abusive partner from domestic violence interventions is another important consideration. Dugan et al. (2003) found a retaliation effect where domestic violence resources actually increased homicide between intimate partners because they failed to effectively reduce exposure between intimate partners. In fact, the prosecutor's willingness to prosecute violators of protection orders, though intended to reduce exposure between violent intimate partners, actually caused a retaliation effect where homicide increased for married and unmarried white females and African American unmarried males. They concluded that "being willing to prosecute without providing adequate protection may be harmful" (p. 192). Reckdenwald (2008) also found that the number of shelters per 100,000 females was significantly related to intimate partner homicide. Despite all the efforts to increase shelter availability to females in violent relationships, it appears that the increase in availability is actually associated with an increase in intimate partner homicide. For instance, in 1990 and 2000, the increase in the shelter rate was related to an increase in male-perpetrated intimate partner homicide. It was concluded that efforts to prevent domestic violence and homicide need to also provide adequate protection during times that are characterized by increased violence.

Economic Deprivation

Aside from exposure reduction and retaliation effects, recent research has explored the link between economic deprivation and intimate partner homicide over time (Reckdenwald, 2008). The main idea is that, even though women have experienced improvements economically

since the 1960s, they still lag behind their male counterparts in regard to occupational prestige and income levels. Furthermore, women are much more likely to be impoverished than males. Economic deprivation arguments allows researchers to tap the influence of poverty, unemployment, and the dependency on public assistance on the trends in male- and female-perpetrated intimate partner homicides over time, particularly since patterns of intimate partner homicide involving males and females diverge over time. Reckdenwald (2008) found that cities that had the greatest levels of change in female poverty, unemployment, and public assistance from 1990 to 2000 were also areas that experienced significant changes in female-perpetrated intimate partner homicides, suggesting that trends in such homicide were largely influenced by persisting economic deprivation among females.

As noted, overall attempts to explain the different trends in male and female intimate partner homicide have examined a number of different factors, including domestic violence resources, declining domesticity, improving economic status of females, and economic deprivation. Though a conclusive explanation has not surfaced, separating homicide trends by gender and the victim-offender relationship gives a better understanding of the nature of the crime drop in the 1990s.

Conclusion

The study of homicide invokes a scientific investigation of the frequency, nature, and causes of one human being killing another. As researchers explore criminal homicide, they tend to examine murder and nonnegligent manslaughter as defined by official sources (such as the UCR), which excludes justifiable homicide, manslaughter caused by negligence, suicide, or attempted murders. There are generally two national sources of homicide data—the Uniform Crime Reporting Program of the FBI and mortality files from the Vital Statistics Division of the National Center for Health Statistics. Even though these data sources are not without limitations, particularly as they relate to missing data on key characteristics of victims or offenders involved in these incidents, homicide remains the most accurately recorded and documented offense relative to other types of criminal behavior.

One of the most critical questions facing scholars and policymakers today is this: Why did homicide rates decline so considerably during the 1990s? As described here, UCR Supplemental Homicide Reports show that homicide rates fell sharply in U.S. cities in the 1990s. In fact, homicides were almost cut in half, declining approximately 46% during this 10-year period and plunging to their lowest point in 35 years. Scholars have offered a number of potential explanations, including greater police presence, prison expansion, reduced handgun availability, tapering drug (specifically crack cocaine) markets, gains in the economy, and age shifts in the population. Unfortunately, a lack of

data and other measurement issues restrict definitive tests of these ideas and explanations.

Because the reasons for the crime drop remain largely unanswered, scholars have moved toward both documenting the potential differences in homicide trends across specific groups and exploring the nature of homicide trends in more detail. Two examples of recent efforts are provided: (1) the study of racial patterns in homicide trends and evidence of a convergence in black and white homicide rates over time and (2) research on how homicide among intimate partners differ by gender of the victim, type of relationship, and race, and recent attempts to explain the different trends in intimate partner homicides over time. As these examples clearly show, total homicide rates mask the nature of the crime drop, ignoring the diversity in trends and differences in life circumstances across groups based on race, gender, and other characteristics. The reality of the crime drop and an understanding of homicide trends over time require moving beyond a general investigation of total homicide rates to explore homicides among distinct groups more closely.

ROBBERY

JOHN D. McCLUSKEY

University of Texas at San Antonio

The crime of *robbery* is defined by the Federal Bureau of Investigation (FBI, 2002) as “the taking or attempting to take anything of value from the care, custody, or control of a person or persons by force or threat of force or violence and/or by putting the victim in fear.” Concern over this crime and its consequences is so ubiquitous that Daniel Defoe, of *Robinson Crusoe* fame, opined about it hundreds of years ago. In the more modern era, some robbers were given heroic status, including Billy the Kid and, to some extent, John Dillinger and other outlaws who robbed banks in the 1930s.

The crime bridges the gap of violence and property crime as it, by definition, features a face-to-face confrontation between the perpetrator and the victim. The amount of violence and coercion that occurs in the context of robbery, however, varies quite widely across events that are labeled as robberies.

In this chapter, the measurement of robbery, robbery-homicides, victimization and its consequences, as well as types of robbery and robbers, are explored. As will become clear, the underlying phenomenon labeled as robbery is quite varied. Robbing banks, for example, requires a somewhat different approach from robbing a drug dealer. The outcomes of this crime, from reporting to authorities to clearing the crime by an arrest, are highly dependent upon the nature of the targeted victim. Similarly, a street robbery that features a gun will likely provoke different responses from a victim compared to one that features a perpetrator with no convincing means of making a lethal threat. Such

robbers may instead have to rely on assaults to convince victims that they “mean business.” These important dimensions of robbery are explored in detail below.

Measuring Robbery in the United States

The National Crime Victimization Survey (NCVS) and the FBI’s Uniform Crime Reports (UCR) seek to measure the annual number of robberies in the United States. These methods of data collection have different strengths and weaknesses for describing robbery patterns. Nevertheless, each contributes valuable information to the understanding of robbery.

The NCVS is a survey composed of a nationally representative sample of respondents who are asked directly about types of victimizations they may have suffered. This method, by virtue of directly soliciting information from citizens, therefore uncovers a substantial number of crimes that might otherwise go unreported to authorities. In particular, robberies by acquaintances and attempted robberies are much more prevalent in NCVS data when compared with official data sources. Clearly, some victims would seek to protect acquaintances from legal entanglements. Others may seek to avoid potential retribution from the perpetrator for informing police. Similarly, unsuccessful robberies, where no property is lost, may not be worth the victim’s time in terms of reporting. In addition, the robberies recorded in the NCVS involve far fewer guns than

those recorded by the police in the UCR. The official police data compiled in the UCR clearly suffer from non-reporting, which appears to be somewhat of a problem as only about 60% of victims report robbery victimizations to police (Hart & Rennison, 2003). Thus, the picture of robbery in the UCR tends to involve more gun robberies, many more completed robberies, and more robberies by strangers than the NCVS data depict.

To illustrate the data source differences, in 2006 the NCVS estimated that there were 645,950 personal, non-commercial robbery victimizations, and the UCR estimated about 261,000 such events for the same year. Thus, the nonreporting by victims and nonrecording or “unfounding” of robberies by police, where the investigation of the incident leads them to the belief that the event brought to their attention should not be classified as a robbery, both contribute to the differences in observed robbery levels in the United States across the two series.

Another important distinction between the NCVS and the UCR data is that commercial robberies are not captured as robbery victimizations in the NCVS and are only captured in the UCR. Thus, the UCR offers a more expansive picture of victimization in the sense that approximately one quarter of robberies recorded in 2006 involved commercial interests as the direct victim. Since commercial robbery is likely to have a higher level of reporting, this does not translate into a large knowledge gap regarding the extent of this particular type of robbery.

Despite the differences in the two data collection efforts, the contemporary trends from 1990 to 2006 indicate that robbery has declined. The NCVS indicates that during that period, robbery fell from levels of approximately 600 per 100,000 to approximately 250 per 100,000 residents over the age of 12 in the United States. The UCR tracked a decline from 250 recorded robberies per 100,000 U.S. residents down to levels of approximately 150 per 100,000. Thus, both measures agree that the crime of robbery was much rarer in the middle of the 2000s than it had been during the early 1990s.

Overall, individuals should be cautioned that neither the UCR nor the NCVS offers a complete picture of robbery prevalence in the United States. The concept of convergence of the two—that is, UCR and NCVS measuring the same underlying phenomenon—is unlikely to occur precisely because many crimes go unreported and because of coverage and reporting issues that emanate from the UCR data collection effort. Taken together, however, the two data series’ complementary treatment of the crime of robbery offer a good sense of the nature, trends, and extent of robbery.

Robbery Consequences: Death, Injury, and Losses

A potential consequence of a robbery is the killing of the victim or, in rare cases, the killing of the offender in a thwarted robbery. More commonly, injuries occur in the

context of robberies as offenders are frustrated by the victim’s response and use force to, as Wright and Decker (1997b) observed, establish “the illusion of impending death.” Consideration of the number and rate of homicides that result from robberies is possible by examining data from the Supplemental Homicide Reports (SHR). These reports provide data on the number of homicides that take place in the context of robberies. SHRs are submitted to the FBI from local law enforcement, and they establish data about age, sex, race of offenders and victims, as well as weapons used and the circumstances under which the homicide occurred. One circumstance code denotes homicides that emanate from robberies, and thus the SHR data are used to determine the numbers and rates of homicides that occur in the context of robberies. The SHR data collection dates to 1976, and an examination of long-term trends in robbery-homicides indicates they are relatively less frequent than in the past. During the late 1970s and the early 1990s, there were more than 2,000 robbery-homicides recorded yearly in the SHR. More recently, the number of robbery-homicides had dropped to below 1,000 per year by the mid-2000s.

It is probably most useful to consider the robbery-homicide relative to the number of robberies recorded in any particular year. Such an examination would help in understanding if robbery is becoming more lethally violent over time. In examining the proportion of robberies that become homicides, clearly such a situation is relatively rare. In the late 1970s, when at the peak of the rate, there were about 4.5 robbery-homicides for every 1,000 robberies recorded in the UCR data. In contrast, by the beginning of the millennium, the number had declined to approximately 2.6 robbery-homicides for every 1,000 robberies. Thus, the long-term trend is for decreasing lethal violence both in raw numbers as well as in the rate of robbery-homicides.

Zimring and Zuehl (1986) studied a sample of robberies from Chicago, Illinois, and coded data from police reports in that city. Their research indicated that evidence at the scene of homicides is not always clear regarding the temporal order of events. More precisely, it is likely that some apparent robberies are, in fact, thefts that occur after the homicide event. Similarly, Loftin (1986) studied a sample of homicides in Baltimore, Maryland, and used several trained coders to check on the coding of homicide circumstances in official records. That analysis, with explicit attention to robbery, indicated that there is a substantial amount of error in how codes are assigned in the SHR. Nevertheless, the SHR data still must be considered unique in their ability to speak to the robbery-homicide phenomenon on a national level.

Much more common than robbery-homicide is the likelihood of a physical injury that can result from a robbery event. The prevalence and nature of injuries have been captured in interviews with robbery victims in the NCVS since 1973. The most recent data on robbery victims and their injuries, obtained from the NCVS in 2006, indicate

slightly more than 1 in 3 of the victims of a robbery suffered an injury. Closer examination of that data indicates about 7% of the victims had their injuries cared for at a hospital. Black victims, female victims, and victims acquainted with the robber were more likely to suffer an injury during the victimization and to seek care at a hospital for injuries.

Potential for psychological consequences of victimization from the robbery confrontation is understandably great. Victims of robbery can often have a great sense of violation and helplessness. Newspapers have documented evidence of victims being unable to return to work after robberies in the workplace due to overwhelming fear. The systematic study of the consequences of victimization, however, has received limited attention. As a personal crime that involves monetary loss, threats of harm, and actual physical harm, the consequences are likely to have a wide variation based on how the robbery was completed as well as individual victims' predispositions and psychological responses to such stress. More simply, the variation in consequences of crimes of robbery is likely to be extremely wide ranging.

The amount or value of goods lost in a robbery is heavily dependent on the type of robbery that is being considered. According to FBI statistics compiled in 2007, bank robberies were clearly the most lucrative for the offender, as the typical robbery results in \$4,000 in losses. The least lucrative robbery target was convenience stores, where the average amount of reported losses totaled approximately \$800 per event. Considering that individuals are the target of street or highway robberies, the totals associated with loss from that crime were surprisingly high at slightly more than \$1,300. It should be noted that some criminologists argue that as the U.S. economy moves toward more credit and debit card usage, robbery will become more concentrated among the poorest citizens, who typically are more likely to deal in cash transactions. Similarly, the cash associated with drug markets and prostitution also makes illicit targets attractive to those seeking to commit robberies.

Robbery and Weapon Choices

Surveys of inmates indicate that more lethal weaponry, such as guns compared with knives or no weapon at all, are preferred tools for completing robberies. The preference for guns, paradoxically, is linked to the notion that they make it easier to control victims and thereby reduce the need for overt physical violence. Robberies involving perpetrators with less lethal weapons or no weapon at all are more likely to result in some kind of injury to the victim, because the threat posed by robbers who are not armed with a gun is less persuasive. Therefore, physical force is likely more necessary to control victims in such situations. If one looks at the number of gun robberies that are committed, according to data sources, the use of a gun as

compared with a knife or other weapon is more strongly associated with both successfully completing the robbery and the possibility of lethal outcomes.

The NCVS indicates that about 1 of every 4 or 5 robberies involves a gun, yet the proportion of robbery fatalities that involve a gun is more than 50%, if one traces robbery circumstances and weapons types from 1976 to the present using the SHR data. It is apparent from discussions with robbers, both active and incarcerated, that committing robbery while equipped with a gun helps to establish the "illusion of impending death," as noted by Wright and Decker (1997b). The notion that robbers choose weapons to establish credible threats has been corroborated over time in interviews with robbers in the United States and abroad. For example, interviews with incarcerated English commercial robbers generally echoed the concept of having a gun so that less physical force would be necessary to complete the crime. Interviews with active street robbers in the city of St. Louis, Missouri, also affirmed that sentiment.

An examination of weapon patterns in the NCVS robbery data indicates that, in 2006, of nearly 650,000 robberies that were estimated to have occurred, 41% involved no weapon. Victims reported that robbers wielded a firearm in 23% of robberies and knives in 8%. It should be noted that victims reported that they did not know if the perpetrator had a weapon in 15% of the crimes. Similarly, the UCR data on robbery weapons indicate that in 2006, an estimated 42% of robberies involved a firearm and about 40% were "strong arm" or unarmed robberies. Clearly, while robbery with a gun is the image most frequently evoked by the term, non-gun robbers make up the majority of these events in any given year according to both victimization surveys and official police data.

Victim Resistance and Robbery

In the 1970s and 1980s, the idea of resisting robbers was generally discouraged. It was argued, by some criminologists and many commentators, that resistance was strongly related to injury and increased the likelihood of suffering retaliation at the hands of the robber. Thus, passive behavior in the face of robbery was considered the wisest course of action. Clearly, robbery is not a homogeneous event and therefore suggestion of a single best practice with regard to dealing with a robbery from the perspective of the victim may not be appropriate. For example, robbers may outnumber the victim, may be well armed, and may have a victim cornered. Certainly, in that situation, a lone victim would wisely surrender his or her items and offer no resistance. However, it is clear from the data obtained from police records and self-reported victimizations that many robberies involve unarmed perpetrators. In these cases, resistance might reduce the likelihood of robbery completion or loss of goods, especially if the victim identifies an escape route.

Criminologists that have analyzed data from victimization surveys tend to find that resistance is beneficial in that many robberies are not completed when victims resist physically or verbally. This contrasts with data collected by police because official reports greatly underrepresent attempted robberies, and studies indicate that police reports may be more likely to be taken if a victim is injured. Thus, although there appears to be a positive relationship between injury and resistance in police data, it may be due to the nature of how police decide whether to record or not record the crime. Victimization surveys overcome these obstacles and thus more completely enumerate robbery circumstances while also providing researchers with the ability to tell if victims' resistance is a consequence of being injured or if it causes injury. The systematic biases in the recording and reporting practices that influence the types of events that appear in official data are not an issue for victimization surveys.

The most recent analyses of victimization survey data from the NCVS make it clear that resistance against robbers is not random but instead reflects choices and consideration of situational cues and risks on the part of the victim. Victims are, for example, more likely to resist against offenders who are unarmed. Outcomes of events indicate that victims use resistance relatively wisely, as illustrated by the fact that resistant victims are less likely to suffer completed crimes. In sum, the wisdom of robbery resistance has swung from sureness that resistance is likely to increase negative consequences for the victim, to a sense that, in many situations, resistance is a wise course of action.

Robbery Types

Scholarly work has generated a sense that robberies are not a unitary event but encompass a great variety of subtypes. Robbery types include stranger and acquaintance robberies, carjackings, home invasions, commercial robberies, bank robberies, and street robberies or muggings. Each of these types of robberies presents a different set of difficulties for those victimized as well as differing obstacles for the perpetrator. Perhaps the most useful distinction to make when considering variations in robbery is the difference between commercial and personal robberies. For example, the scholarly research indicates that robberies of convenience stores and other commercial establishments may be different in the sense that the robber is asking the victim to surrender someone else's money. This might be easier to accomplish with less forceful action than when convincing someone to give up his or her personal money and property. The carjacking is of relatively recent consideration, but similarly presents difficulties of securing control of an automobile through force and threats.

Commercial robberies commonly include, among other targets, convenience stores and banks. Research from the 1960s and 1970s indicated that commercial robbery was often conducted by professional robbers. That is, commercial

robberies were planned to maximize success in the form of monetary value and likelihood of escape. Interviews of contemporary robbers show that there is typically only minor planning of commercial robberies. Although these crimes do involve offenders whose behaviors are consistent with the concept of professional planning, most contemporary commercial robberies appear to be the work of robbers who try to capitalize on opportunities. There may be variation across convenience stores and bank robbers; however, expectations that the latter are drawn from a pool of highly professional robbers do not appear to be supported.

Convenience Stores

One setting of particular interest for robbery and its consequences is the convenience store. Convenience stores are, by design, created for quick transactions and generally have little more security than a clear view from the cash register and security cameras. According to UCR data compiled on robberies in 2007, the typical convenience store robbery netted only \$800, which is less than all other forms of robbery recorded in the UCR.

Wellford, MacDonald, and Weiss (1997) interviewed 148 incarcerated convenience store robbers across five states, and approximately one third indicated that they planned the convenience store robbery more than 6 hours in advance, while 16% of the sample also reported abandoning a plan to rob another store. Petrosino and Brensilber (2003) interviewed 28 incarcerated convenience store robbers in Massachusetts, and they indicated a much lower level of planning with 13 robbers reporting no planning, 12 reporting 5 minutes to 4 hours of planning, and only 3 reporting a week or more of planning. An inference can be drawn that *some* effort goes into commercial target selection in the context of American convenience store robberies and other commercial robberies. Conklin (1972), Einstader (1969), and Feeney (1986) refer to the robbers that target businesses as "professional," but such a distinction may not hold in samples of contemporary robbers.

The proliferation of convenience store robberies and homicides involving employees and customers in the 1980s led to a research effort focused on crime prevention through environmental design (CPTED) for these locations. Improving the way cash is handled, including limiting amounts available; making counters visible; illuminating parking lots for surveillance purposes; and staffing stores with at least two clerks were included among some of the recommendations for making convenience stores a less attractive robbery target. Some evidence has accumulated that such target-hardening strategies, which make locations less attractive for criminals, do lower risk of robbery.

Bank Robbery

Bank robberies, which have notoriety as being a federal offense, are often considered to be crimes committed by professional robbers. This extends from their characterization

as high-value targets. Banks, however, tend to be prepared to convince robbers otherwise with a variety of measures including security cameras, alarm systems, personnel training programs, security mechanisms for tracking bills, time locks, and occasionally armed security. According to 2007 UCR data, there were 7,175 bank robberies reported in the past year in the United States, with an average net of slightly more than \$4,000 (FBI, 2007). Though these robberies appeared to be lucrative, data analyzed by the FBI indicate that bank robberies were cleared (i.e., arrests were made) 58% of the time compared with a typical clearance rate of 25% for other robbery types (FBI, 2002). Data from the FBI's Bank Crime Statistics (BCS) database, from 1996–2000, indicated that just one-third of bank robberies involved a firearm, but data from the National Incident-Based Reporting System (NIBRS) program combined with other data sources indicated slightly less than half of the recorded bank robberies in that data involved a firearm.

The two data sources show that injury in the context of bank robbery is also relatively rare. The NIBRS data indicate victim injury in about 6% of the cases analyzed, and the BCS indicates victim injury in only 2% of bank robberies. The difference in numbers most likely stems from the minimal coverage of the United States by NIBRS data, which are based on crime data reported by a fraction of police agencies, as compared with the more exhaustive data collection on incidents in the BCS data source.

The consideration that bank robbers might be more professional was examined by the FBI and is consistent with the expectation generated by earlier research, which suggested that professional robbers, who more thoroughly plan their crimes, may be more likely to opt for such valuable targets. This research was accomplished by examining each arrested bank robber's prior convictions for bank robbery. Of those caught, only 1 in 5 had a prior conviction for bank robbery, leading the FBI (2002) to conclude that bank robberies are largely conducted by amateur criminals. The high clearance rate also indicates that bank robbers are generally unsuccessful and thus must not be as attentive to managing the risks of apprehension as one might expect from professional criminals. Certainly, some professional robbers may operate among all bank robbers, but generally, those robbing banks are not particularly adept at successfully completing their work.

Personal or Street Robberies

Personal robberies could include street robberies, home invasions, carjackings, and robbery of drug dealers. These types of events have some differences in terms of the contours of the personal victimizations. The confrontation involved in a street robbery is often opportunistic predation, where a motivated offender finds a suitable target with property or money available. Wright and Decker's (1997a) interviews with active robbers in St. Louis, for example, indicated that much of street robbery is opportunistic in fashion. Street robberies accounted for approximately 45% of the robberies

recorded in the UCR during 2006. NCVS data indicate that robberies that occur on the street or in parking lots are more likely to involve strangers, whereas robberies by non-strangers are likely to occur inside one's home.

Such associations between stranger and nonstranger and locations make sense in the context of opportunities. Few strangers who are motivated to rob are likely to know of a particular dwelling to target, whereas robbers targeting specific persons for their property and cash are likely to find their home a convenient location in which to engage in a robbery. Zimring and Zuehl's (1986) analysis of robbery reports in Chicago found that home invasion robberies were much more likely to result in injuries when compared to street robberies. This could stem from the fact that the robber and victim are not strangers and therefore the definition of the situation as a robbery requires demonstrable force against the occupant. Conversely, a stranger, encountered on the street, might more easily convince a victim, with less overt force, that the event is a robbery.

Carjackings have only recently received academic attention, as the motive and opportunity to conduct such a dangerous crime seem to be somewhat of a departure from the conception of the goals of a robbery. The NCVS data indicate that there were approximately 34,000 carjackings per year from 1993–2002 (Klaus, 2004). Victims in carjackings resisted the offender in two thirds of the incidents. Victim injuries in carjackings were quite high, with 32% of those in completed carjackings and 17% in attempted carjackings suffering an injury (Klaus, 2004). Imagine the car as the location for this particular type of robbery. The nature of removing someone from the vehicle, and the ability of someone to resist by speeding away, make such a transaction very risky and may help to explain why injury appears to be so prevalent in carjackings.

Finally, robberies of drug dealers and other criminals involved in illicit activity represent a subset of personal robberies that is worthy of consideration for a number of reasons. First, the victimization of criminals is unlikely to yield many official crime reports. Second, such individuals are not likely to be accurately represented in the NCVS panel sample. Thus, the extent of robbery of drug dealers is not known from typical data sources. Furthermore, such victimizations are unlikely to come to the attention of authorities unless a severe consequence such as a shooting requiring medical attention or a homicide results. By interviewing robbers, Jacobs (2000) has found that drug dealers, because of their use of large sums of cash and need to avoid law enforcement, are considered good targets for robbery. In areas where drug markets are in operation, it is likely that such victimizations and retaliatory violence are intimately linked.

Robbing drug dealers is a lucrative, if dangerous approach to robbery. Victims tend to have large amounts of valuable commodities such as drugs or cash. This makes them prime targets in terms of benefits. At the same time, the drug dealer may represent a very unwilling victim who defends his or her possessions to the death. Some ethnographers who interviewed active robbers face-to-face found

that those who rob drug dealer indeed reap large rewards, but one must be cautious regarding the amount of information that exists about this relatively hidden crime. A successful drug robbery yields prized possessions, drugs, and cash while simultaneously ensuring minimal exposure to criminal justice sanctions. Some researchers surmise that much of the violence that occurs in such illicit markets, in the vacuum where police presence is unwelcome, is immune to conventional police intervention. Others argue that the nature of police efforts to disrupt drug and prostitution markets will indirectly reduce robbery, as the valuable targets are no longer concentrated in well-defined geographic areas.

It is important to think about the types of robberies as shaping, in many ways, how the event will unfold. Thus, the type of robbery is a variable that helps to understand other outcomes such as completion and injury to the victim. Personal robberies, for example, require a threat that is convincing enough to make one give up a possession. Conversely, a commercial robbery may merely require a note passed over a counter in a bank to convince a teller to give up his or her employer's money. Considering the many different types of events helps one understand the extensive variation that fall within the scope of the definition of robbery.

Robbery and Correlates

Consideration of age, sex, and race patterns in robbery offending and robbery victimization is an important part of understanding the phenomenon of robbery. Official police data and victimization surveys are the two data sources that provide the clearest pictures of robbery. Both indicate that, for the most part, offenders tend to be males under the age of 30, and there is an overrepresentation of African Americans. UCR arrest data from 2006 indicate that 56% of arrestees were black, but the NCVS data, which rely on victim self-reports of their perception of the offender's race, indicated that, of offenders who could be identified, only 37% were reported as black. This discrepancy is likely due to several factors including differential police coverage and arrest patterns across racial groups and neighborhoods. Nevertheless, both data sources indicate an overrepresentation of African Americans involved in robbery. This is likely due to the fact that robbers frequently come from economically disadvantaged urban neighborhoods, which in many U.S. cities tend to have high proportions of black and other minority residents.

With respect to sex and age of offenders, the two data sources tend toward close agreement. Males comprised 85% of perceived perpetrators in the 2006 NCVS victimization survey data and about 89% of the offenders arrested for robbery as recorded by the UCR during 2006 (FBI, 2006). Victims interviewed for the NCVS in 2006 reported that approximately 2 out of 3 offenders were under the age of 30. The UCR confirms this pattern with arrest data, which indicated in 2006 that 3 out of

every 4 arrestees were under the age of 30. Clearly, those committing robbery tend to be more youthful and overwhelmingly male.

With respect to victim characteristics, youthful victims between the ages of 16 and 24 suffer the greatest robbery rate, according to victimization survey data. Blacks suffered a robbery rate of 3.8 per 1,000 as compared to the white rate of 2.8 robberies per 1,000. Males also have the highest rate of robbery victimization at 3.9 per 1,000 compared with the female rate of 2.0 per 1,000 in the 2006 NCVS data. As was noted previously in this entry, the robbery rates have fallen dramatically in the decade and a half since 1990. In particular, black male robbery victimization has declined extensively. For example, black male robbery rates in 1996 were 16.7 per 1,000 and dropped to 4.8 per 1,000 by 2006, which is a more than 70% decline in victimization rates.

Some speculation exists regarding the frequent choice of female victims in robbery. Perhaps females are quicker to acquiesce at the hands of a robber when compared with males, who may be more likely to bend to societal pressure and respond to the coercive threat with a macho resistant response.

Female participation as a perpetrator in robbery appears to be relatively rare. What research has been conducted in this area indicates that female robbers have a greater preference for working in teams, with lone female robbers being exceptions. The teams of robbers tend to be mixed in gender, and some have argued that robbery's hyper-masculine requirement of the domination of others are not easily carried off convincingly by a lone female perpetrator. Miller's (1998) seminal work on female robbers also indicated that a significant proportion of robberies by females involve prostitute–john relations, where the victim is particularly vulnerable and unlikely to report the victimization that is suffered, since the underlying activity of seeking a prostitute was illegal.

The data clearly indicate that robbery is not randomly distributed among the population in terms of offenders and victims. Rather, it appears that robbery is disproportionately concentrated among the youthful and male as both victims and offenders. Blacks are similarly overrepresented with regard to victimization in robbery and as perpetrators, although there has been a dramatic decrease in terms of victimization and somewhat of a decrease in terms of offending since the 1990s. Finally, in terms of the geographic location of robberies, they are events that tend to be concentrated in poorer urban neighborhoods.

Perspectives on Robbers' Attitudes and Lifestyles

Involvement in robbery is limited by the risk-to-reward ratio of confronting individuals face-to-face. Such encounters are fraught with difficulties. It is most likely that while a large number of individuals participate in the crime of

robbery, only a select few persist and become chronic robbers. The attitude of robbers has been conceived as being one of comfort with chaos and trying to project the image of a “hardman” or tough guy. Traits of the persistent robber are likely to include a desire for establishing control over others and comfort with the possibility of using physical force to achieve one’s ends. The study of persistent robbers and their outlooks is difficult as they are, fortunately, a very small number of individuals.

With respect to the lifestyle of active robbers, it is surmised that, contrary to the rational calculator who seeks out targets to exploit, robbers are often put in a desperate situation with respect to needs requiring resources. This activates their search for an appropriate victim with minimal attention to planning the crime. Their lifestyle often includes spending money on drugs and sexual companions, in the context of a fast lifestyle, which quickly leads to the need for more money to fuel it. Such a pattern lends little opportunity for the individual to engage in systematic planning and targeting. Thus, opportunistic victimizations are thought to be most common among even persistent robbers.

The Myth of the Noble Robber

The FBI’s early history under J. Edgar Hoover involved a strong focus on bank robbers such as John Dillinger, Bonnie and Clyde, and Ma and Pa Barker (Burrough, 2004). Successfully apprehending these individuals was a test of fire, and of public relations management, for the bureau. Those robbers, by some accounts, represented disenchantment with the Depression-era banking system and were viewed, in some cases, sympathetically by citizens suffering in the throes of Depression-era America. The notion of the noble robber is probably best illustrated by Robin Hood of ancient English folklore. More modern-day celebration of the robber as “noble” is obvious in tales of Billy the Kid, the legendary American frontier outlaw. Thus, the crime of robbery, in some instances, is seen as a way to redress grievances with the powerful, such as the Sheriff of Nottingham in the Robin Hood tales or the railroad barons and their control of developing lands on the Western frontier during the late 19th century.

In addition to robbers gaining wide acclaim and infamy for their exploits, particular robberies similarly enjoy consideration and some admiration for the daring nature of the crime. There are many examples of robberies that have garnered public attention for their daring and the high value of the goods involved. In 1963, the Great Train Robbery netted 2.6 million pounds as a train carrying used currency was hijacked on its way to London, England. The movie *Dog Day Afternoon* highlighted a bank robbery that went horribly wrong in Brooklyn, New York, during the summer of 1972. Similarly, the Great Brinks Robbery of 1950, in Boston, was eventually made into a film. At that time, the robbery netted more than \$1 million in cash as well as other financial instruments of even greater value. Robbers

and robberies clearly make for interesting stories since by definition these crimes involve great risk and the potential for great rewards. Perhaps the bold nature of the crime lends itself to this treatment in popular literature, film, and culture.

Explaining Robbery

Understanding robbery patterns and the motivations of robbers through a single theory is unlikely to be fruitful, as the phenomenon operates on many levels and involves many questions. It may be most useful to consider different elements of the robbery and apply theories about crime, offender actions, and choices to different analytical questions. For example, one might consider how robbery is distributed in terms of rates of robberies across neighborhoods. Cloward and Ohlin’s (1960) *opportunity theory* is beneficial in that it helps to understand how robberies come to be distributed in the poorest neighborhoods. That theory posits that crime will be distributed in relation to the availability of legitimate means to attain success in society. More simply, in neighborhoods where jobs are scarce and economic mobility out of poverty seems to be a remote possibility, one would expect to find higher rates of robbery. This results from such places having the lowest level of legitimate opportunities, and therefore robbery becomes a plausible illicit opportunity for success.

Social disorganization theory offers a similar perspective. This theory argues that neighborhoods with high poverty and population heterogeneity tend to lack strong, informal social control. Social disorganization theory may be useful for understanding how robbery distributions across geographic space are associated with larger structural dynamics in society. In sum, one may expect to find higher robbery rates in neighborhoods with fewer legitimate opportunities and with lower levels of social control. Overall, such theories help explain why robbery is more concentrated in some places when compared with others.

In terms of explaining how individuals come to be involved in robbery, those theories that address individual traits such as low self-control, or differential association theory, are probably most useful for understanding how one initiates and maintains a robbery career. With regard to traits such as low self-control, it is argued that a trait established in childhood, that could be considered similar to impulsiveness, is linked to offending when combined with opportunities. Thus, robbers, described in ethnographies as those who seek a “fast living” and who tend to not dwell on the long-term consequences in favor of short-term gratification, would likely fit the bill as having low self-control. Similarly, *differential association* is essentially a learning theory that argues that humans learn their behaviors, even criminal ones. Thus, one might expect that robbery tactics and behaviors could be transferred across individuals. Both of these theories might help to account for individuals who choose to become involved in robberies—one by

arguing that individual traits such as low self-control or impulsiveness make robbery an activity that is acceptable to the individual, and the other by arguing that one must learn how to conduct a robbery from peers or mentors.

A very different question that one may pose is this: What targets do robbers choose, and why do they choose them? With respect to target choices, routine activities theory and ideas from situational crime prevention are very useful for understanding robbers' behaviors, especially those of commercial robbers. *Routine activities theory* relies on three elements: absence of capable guardians, suitable targets for committing a crime, and motivated offenders. Routine activities theory, as applied to convenience stores, suggests that one can increase capable guardianship (through surveillance) and reduce the suitability of the target (less cash in the till advertised), and thereby reduce the likelihood of being chosen as a robbery target. Evidence from security researchers and criminologists points to the fact that, indeed, increasing surveillance around a business reduces the opportunity for surprise, and decreasing the money in the till decreases the reward and thus reduces the risk of robbery. Manipulation of risks by changing the environmental features, such as lowering shelf height to increase visibility and staffing stores with multiple clerks, is an additional example of tactics that reduce the likelihood that a robber will choose a particular target for a robbery.

A final area where one might consider theory useful for understanding robbery is the victim-offender encounter itself. This is probably best understood as a contest of coercive power in which injury, resistance, and completion of the event could all be outcomes of interest in the context of the robbery transaction. *Social interactionist theory*, for example, would be useful for understanding why robbers choose guns but tend to not use physical force. In the context of this theory, the gun represents overwhelming coercive power and reduces the need to do more than verbalize the threatening potential to gain compliance from the victim. Conversely, unarmed robbers are less likely to be perceived as having overwhelming coercive power, and therefore they may be less apt to complete a robbery and more likely to use physical force since they need to convince the victim that they can coerce them into compliance.

Conclusion

Overall, the variation in robberies and the levels on which robbery can be understood leave much room for scientific inquiry regarding the distribution of robberies across places, how individuals come to choose to commit robbery, how robbers develop targets, and how offenders and victims

behave in individual encounters. These are a sampling of possible questions that could arise in the context of studying robbery and a set of theoretical frameworks from which the questions can be understood.

SEX OFFENSES

KAREN J. TERRY

John Jay College of Criminal Justice

Sex offenders constitute a heterogeneous group of individuals. The term *sex offender* describes one who has committed any of a variety of offenses, including rape, child sexual abuse, possession of child pornography, exhibitionism (flashing), and even consensual sex among teenagers. Sexual offenders can be adults or juveniles, male or female, and the perpetrators may be strangers, acquaintances, or related to their victims. These offenders have different characteristics and motivations for committing their offenses, and as such, differing responses are appropriate in order to accurately treat, manage, and supervise them. This chapter will review types of offenses and offenders; the prevalence of sexual abuse and recidivism; and responses to sexual offending, including treatment, supervision, and management practices for this population.

Types of Sexual Offenses and Offenders

There are few objective standards of what is acceptable sexual behavior, and “normal” sexual behavior is a socially constructed reality that is constantly adapting (Jenkins, 1998). Definitions of deviant sexual behavior are largely culture-bound and vary across religions, nations, and even states. These definitions adapt to the prevailing social norms of the time, and punishments for sexual offenders depend largely upon the political and social ideologies of

the day. Several highly publicized cases of sexual abuse and murder in the 1980s and 1990s have brought forth increased public, political, and academic attention to sex offenders, resulting in substantially enhanced punishment, management, and supervision of sex offenders today. Though these policies primarily intend to target sexual abusers of children, they have been applied to all sex offenders.

Various sexual behaviors are criminalized today. These acts may include sexual contact (touching the intimate parts of the body either without the consent of the victim or when one person is incapable of consenting under the law); no contact (behaviors committed for the purposes of sexual gratification such as exposure of the offender’s genitals or “peeping”); and acts related to the possession or distribution of child pornography (any filming or photographing of a child that is for the purpose of sexually gratifying an adult) (Terry, 2006). The names of these offenses, definitions of the crimes, the class of the crimes (as felonies or misdemeanors), and the punishments for these offenses vary by state. Some sexual behaviors, even when consensual, are considered offenses, such as incest and statutory rape (sexual behavior between an adult and a minor under the age of consent). For most sexual behaviors to be considered criminal, however, there must be a lack of consent on the part of the victim and some level of intent on the part of the offender. The laws in most states stipulate

that consent is lacking from a sexual act when any of the following holds true (Terry, 2006):

- The act is the result of force, threat, or duress.
- A reasonable person would understand that the victim did not consent due to a clear or implied statement that he or she would not want to engage in the sexual act.
- The victim is incapable of consenting because he or she is below the age of consent (this ranges from 16 to 18 in various states); is mentally disabled; is mentally incapacitated; is physically helpless; is under the custody of correctional services; or is placed within the care of Children and Family Services (or any other organization in charge of monitoring and caring for those in the charge of the state).

Rapists

Rapists are a heterogeneous group of offenders. They commit sexual offenses for a variety of reasons and have largely varying rates of recidivism. Rapists do tend to share certain characteristics, however. Many men who rape women have negative views of women, endorse rape myths, condone violence, and display a hyperidentification with the masculine role. Other common characteristics include low self-esteem, alcohol or substance abuse problems, and an inability to manage aggression; it is not uncommon for rapists to have come from broken homes where punishment was frequent and the parents had alcohol or substance abuse problems (see Marshall, Laws, & Barbaree, 1990; Scully, 1990).

Some researchers, beginning with Groth (1979), attempted to classify rapists into typologies based upon the primary motivation of their offenses. Groth distinguished rapists based upon the degree of aggression used, the underlying motivation of the offender, and the existence of other antisocial behaviors. Knight and Prentky (1990) expanded upon Groth's framework when they developed the MTC:R3 classification system with typologies of opportunistic, pervasively angry, vindictive, and sexual rapists. Within this system, they created nine subtypes of rapists, including opportunistic, low social competence; opportunistic, high social competence; pervasively angry; sexual sadistic, nonfantasy; sexual sadistic, fantasy; sexual, nonsadistic, social competence; sexual, nonsadistic, high social competence; vindictive, low social competence; and vindictive, high social competence.

Until the late 1960s, rape was seen almost entirely as a crime motivated by sexual needs or deviant sexual interests. However, rape is now typically viewed as a crime motivated by the need for power and control. By the 1970s, feminist researchers such as Brownmiller (1975) began to analyze rape from a cultural, political, and historical context. They theorized that sexual assault was systemic to a patriarchal society, and rape was simply an exaggeration of prevailing norms rather than a departure from them. Feminist researchers viewed rape as a tool to dominate and

control women and as a consequence of deep-rooted social traditions of male dominance and female exploitation. Empirical studies such as those by Scully (1990) support the assertions that rape is often motivated by power and control, and that the men who commit such acts make justifications and excuses for their behavior. Though women can also commit the offense of rape, most empirical research today considers only rape committed by men.

Child Sexual Abusers

Like rapists, child sexual abusers constitute a heterogeneous population of individuals who abuse for a variety of reasons. Many have common characteristics, such as poor social skills, low self-esteem, feelings of inadequacy, a sense of worthlessness and vulnerability, difficulty forming normal adult relationships, or previously frustrating experiences with adult relationships. Many child molesters seek out mutually comforting relationships with children and find comfort with those children who are passive, dependent, psychologically less threatening than adults, and easy to manipulate. Stranger abduction and abuse is rare; the majority of child molesters abuse someone they know, and often a child to whom they are related or with whom they have a nurturing/mentoring relationship. They "groom" their victims, or use various techniques to manipulate potential victims into complying with the sexual abuse. Some of these techniques include games, emotional manipulation, verbal coercion, threats, seduction, and enticements (see Pryor, 1996; Terry, 2006).

Researchers created classification systems for child molesters beginning in the early 1980s. These systems were based upon the offenders' motivation for committing the sexually deviant behavior. Groth, Hobson, and Gary (1982) proposed the fixated/regressed typology system, which is one of the most fundamental classification schemes and is rooted around two basic issues: the degree to which the deviant sexual behavior is entrenched in the abuser and the basis for psychological needs. Fixated abusers are those who are primarily attracted to children, are often exclusively attracted to children, and are usually attracted to children from adolescence. Regressed abusers, on the other hand, tend to commit sexual offenses against children that are situational and precipitated by external stressors such as unemployment; marital problems; substance abuse; or negative affective states such as loneliness, stress, isolation, or anxiety. Regressed offenders are primarily attracted to adults, but regress to the abuse of children to whom they have easy access.

Many researchers have further developed the typologies based upon this fixated/regressed system. Most notably, Knight and Prentky (1990), in their MTC:CM3 classification system, developed multidimensional typologies of offenders on two axes. Axis I addresses the degree to which an offender is fixated with children and also considers the offender's level of social competence. Axis II evaluates the amount of contact an offender has with children, and

the offender is analyzed according to the meaning (interpersonal or sexual) of that contact. This axis further evaluates the amount and type of physical injury involved in the contact. Through this system, each offender is assigned a separate Axis I and Axis II typology (see Finkelhor, 1984, for more information about child sexual abuse).

Female Sex Offenders

Compared to the vast literature available on male sex offenders, few empirical studies have been conducted regarding female sex offenders. One reason for this is the small number of known female sex offenders—approximately 2% of adult sex offenders and 10% of adolescent offenders. Many of the studies that have been conducted focus on typologies of female offenders, though they often lack sufficient numbers to be statistically tested. Most of the studies that evaluate female sex offender characteristics show that, compared to male sex offenders, female offenders are less likely to use force, are more likely to initiate their behavior at an early age, often commit their offense with a partner, are less likely to be diagnosed with any paraphilia, are more likely to admit their behavior, and are less likely to have offended prior to adulthood.

Typologies of female sex offenders differ substantially from male sex offender typologies. One of the most commonly cited typology systems is that created by Matthews, Matthews, and Speltz (1991), consisting of teacher/lover, male coerced/male accompanied, and predisposed types. However, because of the small number of known sex offenders who are women, it is unlikely that any of the typologies can be empirically tested anytime soon.

Juvenile Sex Offenders

Juveniles are responsible for committing many sex crimes—approximately 15% of forcible rapes and 17% of other sex crimes reported in the UCR (see Weinrott, 1996, for more information about juvenile sex offenders). These juveniles vary in age, development, maturity, and understanding of sexual issues. Many have academic difficulties, learning disorders, and mental disorders, and many suffer from impulse control. The majority of juvenile sex offenders are male—90%—and the average age of offenders is 14 years. While recent literature shows that few juvenile sex offender continue to commit sexual crimes into adulthood (Zimring, Piquero, & Jennings, 2007), many adult serious sexual offenders began their offending behavior as juveniles. As such, it is important to understand why juveniles commit such offenses and address the underlying problems of the deviancy early.

One difficulty in assessing juvenile sex offenders is understanding whether their actions constitute experimentation or offending behavior. To do this, it is necessary to know how much sexual knowledge the juvenile has. Sexual behavior is learned, and children may learn about sex through peers, television, their parents, or self-exploration.

It is normal for children to explore their own bodies, and it is normal for children to be curious about children of the opposite sex. The question is, at what point does this experimentation become an offense?

To better understand why juveniles commit sexual offenses, many researchers have attempted to create typologies of the offenders. At the most basic level, juveniles can be separated into two categories: those who abuse young children (preadolescents) and those who abuse peers. Those who abuse younger children often target those they know or are related to, while the offenders who abuse peers are likely to target strangers, use weapons, and cause injuries to their victims. Several researchers have created typologies of juvenile offenders (see O'Brien & Bera, 1986; Prentky, Harris, Frizzell, & Righthand, 2000), though more research needs to be done to fully understand who is likely to continue offending into adulthood.

Cyber Offenders

In the last 10 years, a new type of offender has emerged: the *cyber offender*. This term generally refers to someone who makes available or sends pornographic images of children to others via the Internet, sends children pornographic images, or solicits children online. Though several laws have been passed to protect children from these offenses, it is still difficult to identify and control cyber offending largely due to the anonymity of the Internet.

According to U.S. Code Title 18, Part I, Chapter 110, Section 2256, child pornography is “any visual depiction of a person under the age of 18 engaged in” any of the following: actual or simulated vaginal intercourse, oral or anal intercourse, bestiality, masturbation, sexually sadistic or masochistic behavior, or exhibition of the genitals. States have also included offenses such as penetration of the vagina or rectum digitally or with foreign objects, and excretory functions performed in a lewd manner. Images are also considered pornographic if the child is the focal point of a sexually suggestive setting, the child is in an unnatural pose or inappropriate attire, the depiction suggests coyness or willingness to engage in sexual activity, or the depiction is intended to elicit a sexual response in the viewer.

According to Wortley and Smallbone (2006), those who view child pornography may have differing levels of interest in this material, ranging from recreational to at-risk to sexually compulsive. Citing Krone (2004), they identified nine typologies of child pornographers:

Browsers—They may accidentally find child pornography but purposely save the images; they do not network with other offenders or employ strategies to avoid detection.

Private fantasizers—They create their own images of children to satisfy their desires; they do not network with other offenders or employ security strategies to avoid detection.

Trawlers—They seek child pornography through open browsers; they engage in minimal networking and employ few strategies to avoid detection.

Nonsecure collectors—They seek out child pornography in nonsecure chat rooms; they have engaged in high levels of networking and do not employ strategies to avoid detection.

Secure collectors—They are members of closed groups or other organizations like pedophile rings; they engage in high levels of networking and employ sophisticated measures to protect their activities from detection.

Groomers—They develop online relationships with children and send pornography to children as part of the grooming process; they may or may not network with other offenders, but they are at risk of detection because of their contact with children.

Physical abusers—They sexually abuse children; child pornography is one part of the sexual gratification process for them; they may or may not network with other abusers.

Producers—They record the sexual abuse of children to disseminate it to others; they likely network with other offenders, but the extent of this networking depends on whether they are also distributors.

Distributors—They disseminate images of sexual abuse; the interest in child pornography may be financial and/or sexual; they likely have a large network. (pp. 15–17)

Paraphilias

Some sexual offenders are diagnosed with *paraphilias*—diagnosable sexual disorders—and the *Diagnostic and Statistical Manual of Mental Disorders (DSM)* lists eight main ones. The features of these paraphilias are recurrent, intense, sexually arousing fantasies or urges involving nonhuman objects, or suffering or humiliation of oneself or one's partner, children, or other nonconsenting persons (American Psychiatric Association, 1994). Paraphilias may be mild (the individual may be markedly distressed by his feelings but not act upon them), moderate (the individual occasionally acts upon his urges), or severe (the individual repeatedly acts upon his urges). The fantasies and stimuli may be episodic or necessary to achieve erotic arousal, but to be diagnosable the behavior, urges, or fantasies must last at least 6 months and lead to distress or impairment in social, occupational, or other areas of functioning. The eight primary paraphilias listed in the *DSM-IV* are the following:

Exhibitionism—exposure of genitals to a stranger; may include exposure only or masturbation during the exposure

Voyeurism—watching a stranger who is naked, disrobing, or engaging in a sexual act; no sexual activity sought with the victim

Frotteurism—touching or rubbing up against a nonconsenting person in a crowded area; may rub genitals against or fondle the victim

Sadism—the act of humiliating, binding, beating, or making another person suffer in some way; sexual excitement the result of control over the victim

Masochism—the act of being humiliated, bound, beaten, or made to suffer in some way; may occur with a partner or during masturbation

Fetishism—sexual attraction to nonliving objects, such as a shoe or undergarment; individual often masturbates while holding the object or has a partner wear the object during sexual encounters

Transvestic fetishism—cross-dressing; heterosexual man sexually aroused by himself wearing female clothing

Pedophilia—sexual activity with a prepubescent child; may involve own children or children nonrelated, males or females

Other paraphilias are also mentioned in the *DSM*, such as necrophilia (sexual urges about dead people), zoophilia (sexual urges about animals), and telephone scatologia (sexual urges about making obscene phone calls). In addition to these, the *DSM* notes that other behaviors may be labeled paraphilias that are “otherwise not specified.”

Prevalence and Scope of Sexual Offending

It is impossible to accurately assess the extent of sexual offending because it is highly underreported. For example, from 1992–2000, it is estimated that only 31% of rapes and sexual assaults were reported to the police (Hart & Rennison, 2003). Cases of child sexual abuse are underreported, and when they are reported, it is often after a substantial delay.

There are a number of reasons for this underreporting, including the following (see Arata, 1998; R. F. Hanson, Saunders, Saunders, Kilpatrick, & Best, 1999; Lamb & Edgar-Smith, 1994):

Gender—Several researchers have found that females are more likely, both as children and as adults, to report sexual abuse than males.

Victim–perpetrator relationship—Victims are less likely to report or delay the report of child sexual abuse if the perpetrator is well-known to the child. This relationship is most significant if the perpetrator is a relative or stepparent.

Anticipated outcome of the disclosure—Children are more likely to report abuse if they believe they will be supported by family. Those who do not feel they will be supported often wait until adulthood to report abuse, when they can choose to disclose to someone who will support them. Older children who are able to understand and anticipate social consequences of sexual abuse, and who may feel more shame and guilt about the abuse, are less likely to report than young children.

Severity of abuse—Some researchers have found that children are less likely to report sexual abuse if the abuse is severe or they fear that their disclosure will result in further harm. Others, however, have found that the more severe the sexual abuse, the more likely the victims were to report the abuse sooner.

Based on data in the National Crime Victimization Survey, Hart and Rennison (2003) showed that victims of sexual abuse are more likely to report it if the perpetrator

was male, if the offender was black, if the perpetrator was young (12–14 years of age), if there were multiple perpetrators, if the offense was committed by a stranger, or if weapons were used. They also noted that victims said the most common reason for reporting sexual offenses was to prevent future violence, while the most common reason *not* to report was because of privacy issues. It is worth noting that the cases most likely to be reported are the most unusual or extreme cases.

The most common cases, such as sexual assault by someone known to the victim, are the least likely to be reported to the police. As such, it is important to remember that knowledge of sexual offenders is skewed.

Despite these limitations, it is possible to estimate the extent of sexual abuse based upon information from a combination of official data, victimization surveys, and research statistics. The Uniform Crime Report (UCR), which is compiled annually by the FBI and contains information from approximately 17,000 local police departments, shows that the rate of forcible rape in the United States has remained relatively stable over the last 20 years. In 1987, the rape rate was 37.6 per 100,000 residents, and decreased to 30.9 per 100,000 residents by 2006 after brief fluctuations in the 1990s.

Child sexual abuse is more difficult to measure through official statistics because of differences in state statutes, reporting agencies, and methods of compiling the data. The best source of official statistics on the prevalence of child sexual abuse is the annual Child Maltreatment Reports, which contain incident-level reports from state child protective services collected by the National Child Abuse and Neglect Data System (NCANDS). These reports show a decrease in cases of sexual abuse throughout the 1990s, and Jones and Finkelhor (2004) found that Child Protective Services substantiated significantly fewer cases each year in this time period.

Statistics derived from academic studies on the incidence and prevalence of sexual abuse vary greatly, but all show that sexual victimization is common. One meta-analysis showed that the overall prevalence of sexual abuse of male children is 13% and for female children is between 30 and 40% (Bolen & Scannapieco, 1999). In other words, approximately 1 in 6 boys and 1 in 3 girls is abused in his or her lifetime.

Also important is the assessment of recidivism rates of sex offenders. It is often presumed that sex offenders recidivate at very high rates, and many policies have been enacted to control sex offenders based upon this premise. However, research shows that recidivism rates are actually much lower for sex offenders than for almost all other types of offenders. R. K. Hanson and Morton-Bourgon (2004) conducted a meta-analysis of 95 studies of sex offenders and found that nearly 14% recidivated with a new sexual offense and approximately 36% recidivated with any offense within a 5-year follow-up period. Caution should be given, however, because these studies only measure offenses that are officially processed through the criminal justice system. Even so, the research clearly shows that “sex offenders” are actually more likely to commit nonsexual

offenses than sexual ones. Like other types of offenders, sex offenders are more likely to be “generalists” than they are to specialize in a particular type of deviant behavior throughout their careers (see R. K. Hanson & Morton-Bourgon, 2004; Lussier, Beauregard, Proulx, & Nicole, 2005; Miethe, Olson, & Mitchell, 2006; Simon, 2000; and Smallbone & Wortley, 2004, for a discussion about versatility and specialization in offending).

Despite the low levels of recidivism based upon conviction rates, it is clear that sexual victimization is a widespread problem, and it is important to understand why people commit sexual offenses and how they can be prevented from doing so in the future.

Victims of Sexual Abuse

Much of the research on sexual victimization indicates that it is a severe and intrusive violation against a person and that it can lead to negative physical, psychological, and emotional effects. Child sexual abuse can be particularly traumatic, with psychological effects lasting into adulthood. In addition to the potential physical effects of sexual victimization (e.g., injury, pregnancy, or sexually transmitted diseases), sexual victimization may lead to psychological effects, the most prevalent of which seem to be fear and anxiety. The fear often leads to nervousness, specific anxiety about future sexual abuse, and ultimately a generalized anxiety. Many adults who were sexually abused as children develop anxiety-related disorders, such as phobias, panic disorders, obsessive-compulsive disorder, eating disorders or other weight regulation practices, and sleep disturbances (see Calhoun & Atkeson, 1991; Lundberg-Love, 1999).

Some researchers have found that victims of sexual abuse may develop symptoms similar to posttraumatic stress disorder (PTSD), and delayed disclosure of abuse may enhance those symptoms. Others, however, have noted that PTSD is more likely to result from a discrete event (e.g., a rape), whereas the negative effects of childhood sexual abuse tend to develop as a result of the process of the abusive relationship. The type and severity of abuse, however, does not seem to have an effect on the development of trauma symptoms (see Bal, De Bourdeaudhuij, & Crombez, 2005; Browning & Laumann, 1997; Finkelhor, 1988; Ullman, 2007).

Another psychological consequence of sexual abuse is depression, which is more likely to develop if the abuse was ongoing and the perpetrator was someone close to the victim. Many of those abused experience low self-esteem and self-blame, and they are likely to withdraw from social interaction. This withdrawal can further perpetuate the cycle of depression, because when victims most need social support they are instead avoiding those close to them. Though the effects of such psychological problems fade over time for some victims, others do experience long-term depression or other significant effects such as dissociative disorders that emerge to help them cope with the trauma (see Browning & Laumann, 1997; Calhoun & Atkeson, 1991; Lundberg-Love, 1999).

Sexual abuse also seems to affect the victims' "sexual trajectories." Some victims, both male and female, may experience sexual dysfunction as a result of sexual victimization, particularly if they are experiencing long-term anxiety about the assault. Even if there is no physical dysfunction, victimization may result in altered sexual practices. While some researchers have shown that sexual abuse victims may have an increased likelihood of avoidance or loss of sexual satisfaction, other more extensive studies show that victimization is more likely to result in increased sexual activity (Browning & Laumann, 1997).

For men in particular, sexual abuse can be stigmatizing, lead to confusion and anxiety about sexual identity, and cause concern about their gender identity. Watkins and Bentovim (1992) showed that boys who were sexually abused were 4 times more likely to engage in homosexual activity than boys who were not abused, and boys who were abused and identify as homosexual often link their sexual identity to the abuse. Males who were abused may attempt to reassert their masculinity by acting out and by stigmatizing others.

Some studies have shown a link between childhood victimization and future delinquency, sexual offending, or deviant sexual interests. Alcohol abuse and substance abuse tend to be common coping strategies for those victimized as children (Terry, 2006). Widom, Schuck, and White (2006) found a direct path from early victimization to later violence for males, though not for females. Smallbone and McCabe (2003) found that offenders with a history of sexual abuse reported having begun masturbating at an earlier age than nonabused offenders, hypothesizing that these images of sexual abuse may be associated with this early masturbation and tied to the development of deviant interests through classical conditioning. The Bureau of Justice Statistics (1997) reported that offenders who had perpetrated sexual assaults were substantially more likely than other groups of offenders to report having been physically abused or sexually victimized during childhood, though two thirds of sex offenders did not report having been physically abused or sexually assaulted as a child. Weeks and Widom (1998) found that, among a sample of convicted felons, perpetrators of sexual offenses reported higher rates (26.3%) of childhood sexual victimization than other offenders (12.5%). R. K. Hanson and Slater (1988) found that adult sex offenders who had perpetrated offenses against a male child were more likely to have a history of childhood sexual abuse (39%) than those who had perpetrated offenses against female children (18%). Similarly, Worling (1995) found that adolescents with a history of having assaulted a male child were more likely to have disclosed sexual abuse (75%) than adolescents who had assaulted females, peers, or adults (25%). As Coxe and Holmes (2001) note, factors such as victim age at time of abuse; the relationship between the victim and the perpetrator; response to the report of sexual abuse; as well as the extent, frequency, and duration of abuse may be important with regard to the development of deviant beliefs or offense behaviors.

Responses to Sexual Offending

Sex Offender Policy

Many laws have been enacted since the early 1990s that increase the punishment, supervision, and management of sex offenders. The catalyst for most of these was the kidnapping, sexual assault, and/or murder of a child. The aim of these laws is to protect the community from sex offenders who are considered to be at risk to repeat their offenses, and the policies fall into three main categories: registration of sex offenders and notification to the community about where they are living, the restriction of where sex offenders live in the community, and the incapacitation of sex offenders with a "mental abnormality or defect" who are dangerous. The courts have upheld these laws as constitutional because their aim is to protect the public. It is not clear how effective these laws are at preventing recidivism because few methodologically sound studies have been conducted to analyze their efficacy.

Registration and Community Notification Laws (RCNL)

In 1994, 7-year-old Megan Kanka was raped and killed by recidivist sex offender Jesse Timmendequas, who was living across the street from her. Timmendequas had two prior convictions for violent sexual offenses, but his neighbors in this New Jersey suburb were unaware of his background. As a result of Megan's death, her mother went on a crusade to get laws passed that would allow the community to be notified about sex offenders living in the area. As a result of Mrs. Kanka's advocacy, New Jersey passed "Megan's Law," and the federal government and all states soon followed.

RCNL statutes vary in every state, but there are some commonalities. Sex offenders are required to register with law enforcement or another state agency, and that agency is charged with maintaining the central registry of sex offenders. Sex offenders must provide their names and aliases; addresses where they live and work; and additional information such as the type of car they drive, tattoos, and so forth. The requirement to register is triggered by the conviction of offenses specified by statute. These include any sexually based offenses, completed or attempted, and, in most states, offenses against children such as kidnapping. Each state has a way to assess the risk level of sex offenders, and in most states they are designated into one of three tiers of risk: low, moderate, or high. Low- and moderate-risk offenders must verify their addresses annually, and high-risk offenders must verify their information every 90 days. The offenders must stay on the registry for a set amount of time, ranging from 10 years to life. Failure to register or knowingly providing false information is an offense, ranging from a violation to a felony. Every state now maintains an online registry of sex offenders that can be publicly accessed, and some states also have some type of "active" notification, like sending out flyers or going door-to-door to warn neighbors about offenders living in the community.

RCNL was controversial at its inception and has been challenged often in state and federal courts. Sex offenders challenged nearly all the provisions in RCNL statutes, claiming violations of *ex post facto*, due process, cruel and unusual punishment, equal protection, and search and seizure, among other issues. Other challenges have been brought on grounds that the state failed to notify the offender of his duty to register (another type of due process challenge), that the offense for which the offender was convicted should not have triggered registration under the statute (e.g., a juvenile offense), that the offender did not knowingly violate the registration law, that failure to register was not a continuing offense (a type of *ex post facto* challenge), that the tier risk level assigned was improper, that the court lacked jurisdiction, and that Internet notification is too broad. These challenges have resulted in varying degrees of success, but the courts have unanimously declared that RCNL is constitutional (for a full review of RCNL, see Terry & Furlong, 2008).

Residency Restrictions

Residency restrictions limit the places where sex offenders can live and, sometimes, where they can work. They are based upon the premise that geographical proximity to offense opportunities increases the likelihood that offenders will recidivate. The goal of residency restriction statutes is to increase public safety by limiting sex offenders' access to the places "where children congregate." The places of congregation and the length of the restriction vary by jurisdiction. Residency restrictions typically bar offenders from living within a 1,000- to 2,500-foot distance from schools, day care centers, parks, or other places densely populated by children (see Nieto & Jung, 2006). Though many states—22 as of 2006—have implemented general residency restrictions, these are more commonly implemented on a local (city or county) level.

Sex offenders have challenged residency restrictions in court but, like RCNL, they have been upheld. The Supreme Court has ruled that residency restrictions are not, on their face, unconstitutional, even though they may deprive sex offenders of housing options; may force offenders to move from supportive environments and employment opportunities; and, subsequently, could increase rather than decrease recidivism risk.

Few empirical studies have thus far addressed the outcome of this legislation, and the empirical studies that do exist have produced conflicting results. Studies in Minnesota, Ohio, Colorado, and San Diego, California, have indicated that residency restrictions lead to a shortage of available housing alternatives for sex offenders. This could force sex offenders into isolated areas that lack services, employment opportunities, or adequate social support, which could actually destabilize offenders (see Levenson & Cotter, 2005).

Sexually Violent Predator Legislation

Several states have passed legislation allowing for the civil commitment of "sexually violent predators" (SVP) to a

mental institution if they are assessed as having a mental abnormality or personality disorder and are dangerous to themselves or others. Washington was the first state to enact SVP legislation as part of the Community Protection Act of 1990, and 20 states currently have some version of SVP laws. The goal of this legislation is to incapacitate sex offenders at high risk of reoffending until they are rehabilitated. SVP laws are similar to legislation from the 1930s–1950s, which allowed "sexual psychopaths" to be incapacitated in mental health facilities instead of prison with the understanding that "sexual psychopathy" was a disorder that could be "cured."

To be designated an SVP, a person must generally (a) be convicted of a sexually violent offense and (b) suffer from a mental abnormality or personality disorder that is likely to put the person at high risk of committing a future act of sexual violence. To be committed, an offender is referred to the court before release from prison. There is then a hearing to determine if there is probable cause to believe the sex offender fits the criteria of an SVP and, if so, the offender undergoes a risk assessment evaluation. Sex offenders assessed as dangerous then have a trial to assess whether they should be incapacitated. States differ on their burden of proof necessary at trial to determine if the offender is an SVP; some states require proof beyond a reasonable doubt, but others merely require clear and convincing evidence. Offenders have due process rights throughout the hearing process.

SVP facilities differ across the states. Some use "secure facilities" run by the state (e.g., South Carolina, Illinois, and Iowa), while others have secure facilities run by private corporations (e.g., Florida), state hospitals (e.g., Arizona, California, North Dakota, and Wisconsin), correctional mental health facilities (e.g., Kansas, New Jersey, and Washington), mental health hospitals (e.g., Minnesota, Missouri, and Wisconsin), or even outpatient commitment facilities (e.g., Texas). States have varying regulations about the length of time the SVP can be confined, the most common being indefinite/indeterminate commitment with reviews every set number of years (e.g., every 2 years).

SVP legislation is controversial for several reasons. First, it allows for the confinement of offenders after they have completed their criminal sentences. Second, the risk assessment process is fallible. Assessment processes vary in each state, and no process can accurately predict all those who may or may not be dangerous, resulting in both false negatives and false positives. Third, few offenders are ever released because, once incapacitated, offenders have difficulty showing that they are "rehabilitated." Most releases have been due to technical issues rather than an assessment that the offenders were rehabilitated. Finally, civil commitment is very expensive—approximately 2 to 3 times the cost of incapacitation in maximum security prisons.

Almost immediately after its inception, offenders challenged SVP legislation in the courts on grounds of *ex post facto* application, double jeopardy, due process, equal application, vagueness of the statute, and definition of an SVP. The U.S. Supreme Court stated that the law is constitutional, however, because it is a civil rather than a criminal statute. As such, it does not violate double jeopardy

clauses by adding additional punishment because the purpose of civil commitment is neither retribution nor deterrence (see *Kansas v. Hendricks* 521 U.S. 346 [1997]).

Treatment for Sex Offenders

Treatment is often required for sex offenders serving some or all of their sentences in the community (e.g., on probation or parole). The most common type of treatment for sex offenders today is cognitive-behavioral therapy (CBT). CBT was developed from earlier behavioral models and focuses on reducing sexually deviant behavior through a number of processes. First, the treatment must address deviant sexual fantasies. Several behavioral approaches are used to accomplish this while at the same time increasing sexual arousal to appropriate stimuli. These include covert sensitization (the pairing of a negative consequence with the sexual arousal stimulus), aversion therapy (the sexual arousal stimulus is paired with an aversive event), and masturbatory satiation (masturbating to ejaculation while verbalizing an appropriate sexual fantasy).

The second step of CBT is to enhance the offenders' social and relationship skills, and help them to understand appropriate social interaction and empathy. CBT targets issues such as social problem solving, conversational skills, social anxiety, assertiveness, conflict resolution, intimacy, anger management, and self-confidence. A third aspect of CBT addresses cognitive restructuring. The goal is to reduce cognitive distortions, or the internal rationalizations, excuses, and justifications that sex offenders make for their behavior (see Marshall & Barbaree, 1990). A final part of CBT is to teach offenders how to manage their own behavior. This phase follows the idea that offenders should understand their high-risk situations and be able to manage them by making appropriate decisions.

Though CBT is the most common form of treatment today, it is sometimes used in combination with other treatment approaches such as "chemical castration." Chemical castration treatments usually consist of taking regular doses of anti-androgens such as medroxyprogesterone acetate (MPA) that reduce the level of serum testosterone in males. Other pharmacological treatments may include selective serotonin reuptake inhibitors (SSRIs) such as sertraline (Zoloft), fluoxetine (Prozac), fluvoxamine, desipramine, and clomipramine.

Studies have varied in their assessment of treatment efficacy (see R. K. Hanson & Bussiere, 1996; Looman, Dickie, & Abracen, 2005; Marques, Day, Nelson, & West, 1994). Overall, it seems that sex offenders who participate in a CBT do have lower levels of recidivism, though this is difficult to measure through methodologically sound studies.

JUVENILE DELINQUENCY

MATT DELISI

Iowa State University

Juvenile delinquency refers to antisocial and criminal behavior committed by persons under the age of 18. Juvenile delinquency is also simply called *delinquency*, and the two terms are used interchangeably in popular discourse. Once persons reach adulthood, antisocial and criminal behavior is known as crime. In this way, juvenile delinquency is the child and adolescent version of crime. Juvenile delinquency encompasses two general types of behaviors, status and delinquent offenses. Status offenses are behaviors that are considered inappropriate or unhealthy for children and adolescents, and the behaviors are proscribed because of the age of the offender. Such behaviors, if committed by adults, are not illegal. Examples of status offenses include smoking or using tobacco, drinking or possessing alcohol, running away from home, truancy or nonattendance at school, and violating curfew. There are also other status offenses that are essentially labels that parents and the juvenile justice system place on young people. These offenses include waywardness, incorrigibility, idleness, and being ungovernable. Depending on the jurisdiction, the juvenile justice system has devised formal labels for adolescents that are in need. These include CHINS (child in need of supervision), PINS (person in need of supervision), MINS (minor in need of supervision), FINS (family in need of supervision), and YINS (youth in need of supervision).

Delinquent offenses are violations of legal statutes that also apply to adults in the criminal justice system.

Delinquent offenses include acts of violence against persons, such as murder, rape, armed robbery, aggravated and simple assault, harassment, stalking, menacing, child abuse, and similar offenses. Delinquent offenses also include acts that are considered property crimes, such as burglary, theft or larceny, motor vehicle theft, arson, damage to property, criminal mischief, vandalism, and others. A variety of miscellaneous crimes sometimes known as public order offenses are also delinquent offenses. These include driving while intoxicated, cruelty to animals, possession and use of a controlled substance, forgery, fraud, disorderly conduct, weapons violations, prostitution and commercialized vice, vagrancy and loitering, traffic violations, and others.

Juvenile delinquency is important in society for several reasons but for three in particular. First, children and adolescents commit a significant amount of delinquent offenses that result in violent, property, or other forms of victimization. Each year, more than one million children and adolescents are arrested by police for their delinquent acts. Second, juvenile delinquency is itself seen as an indicator of the general health and prosperity of a society. In neighborhoods with high levels of delinquency, the antisocial behavior is seen as part of a larger set of social problems. In this sense, juvenile delinquency is troubling because of the victimizations that are inflicted and the perceptual image of society as unable to adequately control and supervise young people. Third, as this chapter will

explore, juvenile delinquency has different meanings depending on its severity and other factors. For many young people, juvenile delinquency is a fairly normal facet of growing up. For a small group of youths, however, juvenile delinquency is simply the beginning stage of what will become a lifetime of antisocial behavior. This chapter offers a comprehensive look at juvenile delinquency including its historical background, major theories of juvenile delinquency, and types or typologies of juvenile delinquents.

Historical Background

The ways that juvenile delinquency has been defined, perceived, and responded to have changed over time and generally reflect the social conditions of the particular era. During the colonial era of the United States, for example, the conceptualization of juvenile delinquency was heavily influenced by religion. At this time, juvenile delinquency was viewed as not only a legal violation, but also a moral violation. Delinquent acts were viewed as affronts to God and God's law, and as such, wrongdoers were treated in very punitive and vengeful ways.

American colonial society was similarly harsh toward children and the control of children's behavior. Throughout society, there was a general notion that children were particularly susceptible to vice and moral violations. For instance, in 1641, the General Court of Massachusetts Bay Colony passed the Stubborn Child Law, which stated that children who disobeyed their parents would be put to death. The language and the spirit of the law were drawn from the biblical Book of Deuteronomy. The Stubborn Child Law descended from the Puritans' belief that unacknowledged social evils would bring the wrath of God down upon the entire colony. The Puritans believed they had no choice but to react to juvenile misbehavior in a severe and calculated manner. However, not all colonies adopted the Stubborn Child Law. Outside Massachusetts, children found guilty of a serious crime frequently were punished via corporal punishment, which is the infliction of physical pain such as whipping, mutilating, caning, and other methods.

What would today be considered normal and routine adolescent behavior, such as "hanging out with friends," was in early eras considered serious delinquent behavior, such as sloth and idleness. Today, the use of a death penalty or beatings for minor types of delinquency seems shocking; however, there are similarities between colonial juvenile justice and contemporary juvenile justice. In both eras, adult society held ambivalent views about children. On one hand, children and adolescents were seen as innocents that were not fully developed and required compassion, patience, and understanding. From this perspective, the response to juvenile delinquents should be tempered, tolerant, and used to teach or discipline. On the other hand,

children and adolescents were viewed as disrespectful, annoying, and simply different from adults. It was believed that children were born in sin and should submit to adult authority.

Over time, the puritanical approach to defining, correcting, and punishing juvenile delinquency came under attack. Not only had these severe forms of juvenile justice failed to control juvenile delinquency, but also they were portrayed as primitive and brutal. In 1825, a progressive social movement known as the Child Savers changed the course of the response to juvenile delinquency and made corrections a primary part of it. Rather than framing juvenile delinquency as an issue of sin and morality, the Child Savers attributed it to environmental factors, such as poverty, immigration, poor parenting, and urban environments. Based on the doctrine of *parens patriae*, which means the state is the ultimate guardian of children, the Child Savers sought to remove children from the adverse environments that they felt contributed to children's delinquency.

The Child Savers actively pursued the passage of legislation that would permit placing children in reformatories, especially juvenile paupers. The goal of removing children from extreme poverty was admirable, but resulted in transforming children into persons without legal rights. Children were placed into factories, poorhouses, and orphanages where they were generally treated poorly and where almost no attention was given to their individual needs. The first and most infamous of these facilities was the New York House of Refuge, which opened in 1825 and served to incarcerate thousands of children and adolescents viewed as threats to public safety and social order.

Another curious response to juvenile delinquency during this era was the use of transport. For example, between the 1850s and the Great Depression, approximately 250,000 abandoned children from New York were placed on orphan trains and relocated to locations in the West where they were adopted by Christian farm families. The process of finding new homes for the children was haphazard. At town meetings across the country, farming families took their pick of the orphan train riders. Children who were not selected got back on board the train and continued to the next town. The children who were selected and those who adopted them had one year to decide whether they would stay together. If either decided against it, the child would be returned, boarded on the next train out of town, and offered to another family.

Progressive reformers continued looking for new solutions to the growing problem of juvenile delinquency. Their most significant remedy was the creation of the juvenile court in Cook County, Illinois, in July 1899 via the passage of the Chicago Juvenile Court Act. The juvenile court attempted to closely supervise problem children, but unlike the houses of refuge, this new form of supervision was to more often occur within the child's own home and community, not in institutions. In the juvenile court, procedures

were civil as opposed to criminal, perhaps because social workers spearheaded the court movement. They thought that children had to be treated, not punished, and the judge was to be a sort of wise and kind parent. The new court segregated juvenile from adult offenders at all procedural stages.

The juvenile court reaffirmed and extended the doctrine of *parens patriae*. This paternalistic philosophy meant that reformers gave more attention to the “needs” of children than to their rights. In their campaign to meet the needs of children, the Child Savers enlarged the role of the state to include the handling of children in the judicial system. Because of its innovative approach, the juvenile court movement spread quickly, and by 1945, all states had specialized juvenile courts to respond to juvenile delinquency.

As juvenile courts across the United States continued in operation, two concerns emerged that would later motivate additional reforms. First, the informality of juvenile proceedings was seen as good in that justice could be tailored to the needs of individual youth. However, the informality also invited disparate treatment of offenders. The second and related point was that the juvenile court needed to become more formalized to ensure due process rights of delinquents that were comparable to the due process rights of adults in the criminal courts. These rights were established in a series of landmark cases during the 1960s and early 1970s.

An important milestone in the history of juvenile delinquency occurred in 1974 with the passage of the Juvenile Justice and Delinquency Prevention Act. This act was the most sweeping change in juvenile justice since the founding of the juvenile court. There were five major points of the Juvenile Justice and Delinquency Prevention Act. First, it mandated the decriminalization of status offenders so that they were not considered delinquent. Second, it mandated the deinstitutionalization of juvenile corrections so that only the most severe juvenile delinquents would be eligible for confinement. In addition, the act mandated that status offenders should not be institutionalized and that juveniles in adult jails and prisons should be separated by sight and sound from adults. Third, it broadened use of diversion as an alternative to formal processing in juvenile court. Fourth, it continued application of due process constitutional rights to juveniles. Fifth, it created the federal Office of Juvenile Justice and Delinquency Prevention (OJJDP), which funded research to evaluate juvenile justice programs and disseminated research findings on the juvenile justice system.

The Juvenile Justice and Delinquency Prevention Act was modified in 1977, 1980, 1984, 1988, and as recently as 2002. For instance, in 1980 the act specified the jail and lockup removal requirement, which meant that juveniles could not be detained or confined in adult jails or lockups. Adult facilities had a 6-hour grace period to ascertain the age of the offender or transport the youth to a juvenile facility. (Rural jails had up to 48 hours.) In 1988, the act specified the disproportionate minority confinement

requirement, which required juvenile corrections to gather data on the racial composition of their population compared to the racial composition of the state. In 2002, this was changed to disproportionate minority *contact*, whereby racial data were mandated for all aspects of the juvenile justice system. Correctional systems must comply with OJJDP guidelines to remain eligible for federal allocations from the Formula Grants Program.

Beginning in the 1960s and continuing until the early to mid-1990s, the United States experienced dramatic increases in the most serious forms of juvenile delinquency, such as murder, and an increasingly visible juvenile gang problem in major American cities. As a result, states enacted more legislation that targeted youths involved in the most serious types of juvenile delinquency. During the 1990s, 45 states made it easier to transfer juvenile offenders to adult criminal courts. Thirty-one states expanded the sentencing options to include blended sentencing, which allows juvenile courts to combine juvenile and adult punishment that is tailored to the needs of the individual offender. For instance, juvenile courts can combine a juvenile disposition with a criminal sentence that is suspended. If the delinquent complies with the juvenile disposition, the criminal sentence is never imposed. If not, the youth is eligible to receive the adult sentence.

In 34 states, there are “once an adult, always an adult” provisions that specify that once a youth has been tried as an adult, any subsequent offenses must also be waived to criminal court. Laws have been modified to reduce or remove traditional juvenile court confidentiality provisions and make juvenile records more open in 47 states. In 22 states, laws have increased the role of victims of juvenile crimes by allowing them more voice in the juvenile justice process.

Nationwide, adolescents account for about 1% of new court commitments to adult state prisons. This means that more than 4,000 adolescents are in adult prisons because they have been convicted of the most serious forms of delinquency, which includes offenses such as armed robbery, assault, burglary, murder, and sexual assault. More punitive measures such as waivers are justified based on the serious violence and chronic delinquencies of the most serious offenders; however, some of these provisions carry unintended consequences. For example, research suggests that youths who are waived to criminal court and receive adult punishments ultimately have higher recidivism levels than youths that receive juvenile court dispositions.

Over the past 20 years, American society has also struggled to understand the place of capital punishment as a way to punish the most violent juvenile delinquents. In 1988, in *Thompson v. Oklahoma*, the Supreme Court held that imposing the death penalty on a person who was 15 years at the time of his or her crime violated the Eighth Amendment’s prohibition against cruel and unusual punishment. One year later, in *Stanford v. Kentucky*, the Supreme Court held that no consensus exists that forbids

the sentencing to death of a person that commits capital murder at age 16 or 17. That changed in 2005 with the landmark case *Roper v. Simmons*, which rendered capital punishment unconstitutional as applied to persons under age 18. The *Roper* decision invalidated the death penalty for juveniles, which is a far different approach from earlier eras. According to the Supreme Court, several factors contributed to a changing consensus about applying the death penalty to juveniles, including the fact that several states had abolished the juvenile death penalty in the intervening years since *Stanford*; most states that retained the juvenile death penalty basically never used it; the juvenile death penalty was not used in most parts of the Western world; and there was greater appreciation for the developmental differences between adolescent and adults in terms of decision making, emotional and behavioral control, and other neurocognitive factors that influence criminal decision making.

It is conventional wisdom within criminology to lament the increasing toughness or punitive stance that society takes toward juvenile delinquents, primarily through the process of transfer to criminal court. But it should be noted that the last 40 years of juvenile justice reflect a profound commitment to due process and the legal rights of adolescents, the abolishment of the juvenile death penalty, and a general hands-off policy stance toward status and low-level delinquents. Indeed, the juvenile justice system and particularly juvenile corrections have noted the diversity of the juvenile delinquent population and have focused resources disproportionately toward the most serious youths.

Major Theories of Juvenile Delinquency

Any idea about the causes, extent, and correlates of juvenile delinquency is essentially a theory, such as equating juvenile delinquency with sin and violating God's law. For more than two centuries, academic criminologists have developed a host of theories to explain juvenile delinquency. The major difference among them relates to the academic discipline in which the theorist was trained. The various disciplines, such as economics, psychology, and sociology, have differing assumptions about humans and human behavior, and these result in different conceptualizations about what causes juvenile delinquency. This section broadly examines theories of juvenile delinquency from economics, psychology, and—the most common theoretical approach—sociology.

Some of the earliest theories of juvenile delinquency were economic in their perspective. Economic theories are known as classical theories. They generally state that juveniles are rational, intelligent people who have free will, which is the ability to make choices. Young people calculate the costs and benefits of their behavior *before* they act. Delinquency is the result of juveniles imagining greater gains coming from breaking the law than from obeying it. In the same way, children and adolescents that skip school

first weigh the likelihood of getting caught against the potential fun they will have. Similarly, juveniles who commit serious crime weigh the pleasure they imagine they will receive against potentially being arrested, prosecuted, convicted, and sent to prison. Since behavior is a conscious decision that youths make, they may be held responsible for their choices and their consequences.

One of the major figures in classical theory is Cesare Beccaria (1764/1963), who formulated his ideas about crime control during the 18th century when the criminal justice systems throughout Europe were cruel and ruthless and exercised a callous indifference toward human rights. People were punished for crimes against religion, such as atheism and witchcraft, and for crimes against the state, such as criticizing political leaders. Worse yet, “offenders” were rarely told why they were punished. No one was exempt. Any person could be hauled off to jail at any time, for any reason. Wealthy persons were generally spared the most torturous and degrading punishments, which were reserved for ordinary citizens who sometimes were burned alive, whipped, mutilated, or branded.

These conditions inspired Beccaria to write an essay titled “On Crimes and Punishments,” where he laid the framework for a new system of justice that emphasized humanity, consistency, and rationality. According to Beccaria, the system would follow these principles:

1. Social action should be based on the utilitarian principle of the greatest happiness for the greatest number.
2. Crime is an injury to society, and the only rational measure of crime is the extent of the injury.
3. Crime prevention is more important than punishment. Laws must be published so that the citizenry can understand and support them.
4. In criminal procedure, secret accusations and torture must be abolished. There should be speedy trials, and accused persons should have every right to present evidence in their defense.
5. The purpose of punishment is to prevent crime. Punishment must be swift, certain, and severe. Penalties must be based on the social damage caused by the crime. There should be no capital punishment. Life imprisonment is a better deterrent. Capital punishment is irreparable and makes no provision for mistakes.
6. Imprisonment should be widely used, but prison conditions should be improved through better physical quarters and by separating and classifying inmates as to age, sex, and criminal histories.

Another important classical theorist was the English economist Jeremy Bentham who, observing that people naturally seek pleasure and avoid pain, believed that the “best” punishment was one that would produce more pain than whatever pleasure the offender would receive from committing the crime. In other words, punishment must “fit the crime,” and no single punishment was always best. Instead, a variety of punishments should be used.

Today, classical theory is generally known as rational choice theory, which again asserts that people are rational and make calculated choices regarding what they are going to do before they act. Juvenile delinquents collect, process, and evaluate information about the crime and make a decision whether to commit it after they have weighed the costs and benefits of doing so. Juvenile delinquency represents a well-thought-out decision whereby delinquents decide where to commit the crime, who or what to target, and how to execute it.

Psychological theories explain juvenile delinquency with individual-level constructs that exist inside of all people and interact with the social world. For instance, behavioral theory proposes that behavior reflects people's interactions with others throughout their lifetime. A leading behaviorist was the psychologist B. F. Skinner (1953), who theorized that children learn conformity and deviance from the punishments and reinforcements that they receive in response to their behavior. He believed the environment shapes behavior and that children identify those aspects of their environment they find pleasing and which ones are painful; their behavior is the result of the consequences it produces. He concluded that children and adolescents repeat rewarded behavior and terminate punished behavior.

Similarly, Albert Bandura (1977) argues that learning and experiences couple with values and expectations to determine behavior. In his social learning theory, Bandura suggests that children learn by modeling and imitating others. For example, children learn to be aggressive from their life experiences and learn aggression in different ways—for instance, by seeing parents argue, watching their friends fight, viewing violence on television and in movies, and listening to violent music. What children learn is that aggression is sometimes acceptable and can produce the desired outcome. The ideas of Skinner and Bandura would later be adopted by sociologists.

According to psychodynamic theory, unconscious mental processes that developed in early childhood control the personality, and these mental processes influence behavior, including juvenile delinquency. The main author of this theory is Sigmund Freud (1925), who theorized that the personality consists of three parts: the id, ego, and superego. The id, which is present at birth, consists of blind, unreasoning, instinctual desires and motives. The id represents basic biological and psychological drives and does not differentiate between fantasy and reality. The id also is antisocial and knows no rules, boundaries, or limitations. If the id is left unchecked, it will destroy the person. The ego grows from the id and represents the problem-solving dimension of the personality. It deals with reality, differentiates it from fantasy, and teaches children to delay gratification because acting on impulse will get them into trouble. The superego develops from the ego and is the moral code, norms, and values the child has acquired. The superego is responsible for feelings of guilt and shame and is more closely aligned with the conscience. In mentally

healthy children, the three parts of the personality work together. When the parts are in conflict, children may become maladjusted and ready for delinquency. Freud did not write specifically about delinquency. However, he did influence criminologists, who took his ideas and applied them to the study of crime. The lasting importance of Freud and psychodynamic theory is evidenced in the way that early childhood experiences and mental processes have figured prominently in studies of human behavior.

The psychological theory that most explicitly matches the thinking patterns and personality of the individual with his or her subsequent involvement in juvenile delinquency is psychopathy. *Psychopathy* is a clinical construct that is usually referred to as a personality disorder defined by a set of interpersonal, affective, lifestyle, and behavioral characteristics that manifest in wide-ranging antisocial behaviors. The characteristics of psychopathy read like a blueprint for juvenile delinquency. Psychopathic persons are impulsive, grandiose, emotionally cold, manipulative, callous, arrogant, dominant, irresponsible, short-tempered individuals who tend to violate social norms and victimize others without guilt or anxiety.

Psychopathy is a controversial theory, and much disagreement centers on whether the theory should be applied toward children and adolescent delinquents. At the heart of psychopathy is the complete lack of feeling for other people evidenced by callous-unemotional traits, remorselessness, and the absence of empathy. Psychopathic persons do not experience the feelings that naturally inhibit the acting out of violent impulses, and their emotional deficiency is closely related to general under-arousal and the need for sensation seeking. Because of this inability to morally connect to other people, psychopathic persons are distinct from other offender groups. Research has also shown that the callous and unemotional traits that are indicators of psychopathy are present early in life during childhood, and these traits are mostly genetic in origin. In this way, psychopathy does not just implicate the personality and character of a person but also his or her genes.

Sociological theories of juvenile delinquency point to societal factors and social processes that in turn affect human behavior. Unlike other explanations, sociology explains people's behavior using characteristics beyond the individual. Mostly, sociological theories assert that certain negative aspects of neighborhoods and society in general serve as structural inducements for young people to resort to juvenile delinquency. In this way, sociological theories tend to ignore or deny individual-level psychological differences that might partially explain who engages in delinquency.

One of the most prominent sociological theories is the social disorganization theory developed by Clifford Shaw and Henry McKay (1942), who suggested that juvenile delinquency was caused by the neighborhood in which a person lived. Instead of focusing on individual traits, Shaw and McKay studied the impact of the kinds of places, such

as neighborhoods, that created conditions favorable to delinquency. They discovered that delinquency rates declined the farther one moved from the center of the city. They reached this conclusion after dividing Chicago into five concentric circles or zones. At the center was the Loop, the downtown business district where property values were highest (Zone I). Beyond the Loop was the zone of transition (Zone II) containing an inner ring of factories and an outer ring that included places of vice, such as gambling, prostitution, and the like. Zones III and IV were suburban residential areas, and Zone V extended beyond the suburbs. Delinquency rates were highest in the first two zones and declined steadily as one moved farther away from the city center.

Neighboring railroads, stockyards, and industries made Zone II the least desirable residential area, but also the cheapest one. Because of this, people naturally gravitated to this area if they were poor, as many new immigrants to the United States were. What did these findings say about juvenile delinquency? Shaw and McKay interpreted the findings in cultural and environmental terms. The rates of juvenile delinquency remained stable in certain Chicago neighborhoods, regardless of the race or ethnicity of the people who lived there. Areas that were high in juvenile delinquency at the turn of the 20th century were also high in juvenile delinquency several decades later, even though many of the original residents had moved away or died. Shaw and McKay explained juvenile delinquency via the following four points.

First, run-down areas create social disorganization. Cities such as Chicago were expanding industrially, their populations were increasing, and segregation was forcing new immigrants into the slums. These immigrants were not familiar with the city's geography or culture; they arrived with different languages and work experiences; and they immediately faced new and overwhelming problems, including poverty, disease, and confusion.

Second, social disorganization fosters cultural conflicts. In low-delinquency areas of the city, there typically was agreement among parents on which values and attitudes were the "right" ones, with general consensus on the importance of education, constructive leisure, and other child-rearing issues. Local institutions, such as the PTA, churches, and neighborhood centers, reinforced these conventional values. No such consistency prevailed in high-delinquency areas. The norms of a variety of cultures existed side by side, creating a state of normative ambiguity, or anomie (cultural conflict). This condition was aggravated by the presence of individuals who promoted an unconventional lifestyle and defined behaviors such as theft as an acceptable way to acquire wealth. This value system could count on the support of criminal gangs, rackets, and semi-legitimate businesses.

Third, cultural conflict allows delinquency to flourish. Children raised in low-socioeconomic, high-delinquency areas were exposed to both conventional and criminal

value systems. They saw criminal activities and organizations in operation daily. Successful criminals passed on their knowledge to younger residents, who then taught it to even younger children. Delinquency became a tradition in certain neighborhoods through the process of cultural transmission, where criminal values are passed from one generation to the next. Fourth, allowed to flourish, delinquency becomes a full-time career. Children in these Chicago neighborhoods dabbled in initially trivial forms of juvenile delinquency, but their acts became increasingly serious and prone to gang delinquency.

Edwin Sutherland (1947) developed differential association theory, which is one of the most popular and enduring theories of juvenile delinquency. The theory consists of nine principles. First, Sutherland asserted that delinquent behavior is learned and not inherited. Biological and hereditary factors are rejected as explanations for the cause of delinquency. Only sociological factors explain why youth commit delinquency. Second, delinquent behavior is learned through interaction with others by way of communication. The communication can be either verbal or non-verbal. Third, learning occurs in intimate groups. It is in small, face-to-face gatherings that children learn to commit delinquency. Fourth, in small, intimate groups, children learn techniques for committing crime, as well as the appropriate motives, attitudes, and rationalizations. The learning process involves exposure not only to the techniques of committing offenses, but also to the attitudes or rationalizations that justify those acts. Fifth, the specific direction of motives and drives is learned from definitions of the legal code as being favorable or unfavorable. The term *definitions* refers to attitudes.

Sixth, a juvenile becomes delinquent due to an excess of definitions favorable to the violation of law over definitions unfavorable to the violation of law. This sixth principle is the core of the theory. A parent who even hints through words or actions that it is acceptable to fight, treat women as potential conquests, cheat on income tax returns, or lie may promote juvenile delinquency in children unless these statements are outnumbered by definitions or attitudes that favor obeying the law—for example, driving the speed limit. Definitions favorable to the violation of law can be learned from both criminal and non-criminal people.

Seventh, the tendency toward delinquency will be affected by the frequency, duration, priority, and intensity of learning experiences. The longer, earlier, more intensely, and more frequently youths are exposed to attitudes about delinquency, both pro and con, the more likely they will be influenced. Sutherland used the term *intensity* to refer to the degree of respect a person gives to a role model or associate. Thus, correctional officers are not likely to become criminals despite the positive things inmates say about living a life of crime. The reason is that officers do not respect the inmates and therefore do not adopt their beliefs, values, and attitudes.

Eight, learning delinquent behavior involves the same mechanisms involved in any other learning. While the content of what is learned is different, the process for learning any behavior is the same. Ninth, criminal behavior and noncriminal behavior are expressions of the same needs and values. In other words, the goals of delinquents and nondelinquents are similar. What is different are the means they use to pursue their goals.

Decades of research supported the general claims of differential association and what is more broadly known as social learning theory. One of the strongest indicators of juvenile delinquency, for example, is the number of delinquent peers that an individual has. Youths that do not have delinquent peer associations tend not to be involved in juvenile delinquency. On the other hand, youths with many delinquent friends, such as adolescents that are involved in delinquent gangs, are significantly likely to commit status and delinquent offenses.

The other major sociological theory of juvenile delinquency is social control theory. This theory can be traced to 17th-century philosopher Thomas Hobbes, who believed that human beings are naturally aggressive, argumentative, shy creatures in search of glory that would naturally use violence to master other men, their wives, and their children. This profile described all men, not simply criminals. In Hobbes's view, human beings were basically bad and at the very least, self-interested at the expense of others. Because of their fundamentally "bad" nature, a strong state or government was needed to strike fear into their hearts and punish them severely when they broke the law. Twentieth-century criminologists expanded upon Hobbes's ideas and created social control theory. These theorists assumed that without controls, children would break the law. From this perspective, juvenile delinquency was expected behavior. Rather than look for factors that push children into delinquency, the purpose of social control theory is to identify the factors that stop, insulate, or prevent children from participating in delinquency in the first place. In social control theory, what must be explained is why most children conform to society's rules most of the time. It is taken for granted that children break rules. The real question is, why do children *not* commit crime?

Arguably the most important social control theory is Travis Hirschi's (1969) version, which is called social bond theory. A social bond describes a person's connection to society and consists of four elements: attachment, commitment, involvement, and belief. Each component of the social bond forms its own continuum, ranging from low to high. When the continua are merged, they provide a gauge of how strongly a person is tied or bonded to society. The stronger the bond, the less likely the youth will commit juvenile delinquency. Hirschi asserted that the best predictor of delinquent behavior was a youth's attachments to parents, schools, and peers, which are the primary agents of socialization. Decades of criminological research have consistently reported that children who are strongly tied to

parents are less likely to become delinquent. In addition, their positive feelings promote acceptance of the parents' values and beliefs. These children avoid juvenile delinquency because such behavior would jeopardize their parents' affection. Belief in the moral validity of law also has been found to reduce the likelihood that a juvenile will commit crime. Hirschi maintains that in the United States, there is one belief system that centers on conventional values. From this perspective, there are no subcultures that regard theft and assault as proper and permissible, which is contrary to the claims of cultural deviance theories. Belief in the moral validity of law does seem to reduce the likelihood of committing crime.

The commitment component of the social bond is about success, achievement, and ambition. Social bond theory proposes that ambition or motivation to achieve keeps juveniles on the "straight and narrow" path because they know that getting into trouble will hurt their chances of success. In other words, children have a stake in conformity. The more time and energy they have invested in building an education, a career, or a reputation, the less likely they will risk their accomplishments by committing juvenile delinquency. Research examining the importance of commitment has reported that children who are more heavily invested in conventional activities are less likely to be delinquent.

Involvement in conventional activities has been seen as a way of preventing juvenile delinquency as illustrated by the popular phrase "Idle hands are the devil's workshop." The notion that people need to be involved in society and otherwise kept busy has inspired politicians and city planners to call for more and better playgrounds and after-school sports programs to keep children off the streets. If these facilities are available, young people will have less time to engage in delinquent behavior. Unfortunately, involvement does not have as much impact on preventing delinquency as other components of the bond to society. This is because delinquency is not a full-time job. It requires so little time that anyone, no matter how involved in conventional activities, can find time for juvenile delinquency if he or she wants to.

There are many other theories of juvenile delinquency stemming from an array of academic disciplines. But the fields of economics, psychology, and sociology have been the most visible disciplinary starting points for understanding why young people commit criminal acts.

Types of Juvenile Delinquents

Juvenile delinquents are a diverse group of young people that varies in terms of the severity of delinquent acts they commit, the frequency with which they commit delinquent acts, how early they begin their delinquent career, and how long they commit delinquency. For many youths, juvenile delinquency is a short-lived flirtation that goes away as

quickly as it emerges. It is common and even normal for adolescents to engage in trivial forms of misbehavior and delinquency as they mature through adolescence and enter adulthood. However, for some youths, juvenile delinquency has a more troubling meaning. Several decades of research have shown that a small subset of youths—comprising approximately 5% to 10% of the population—constitute serious, violent, and chronic offenders. Although this group is statistically small, they account for more than half of the juvenile delinquency occurring in a population and even greater levels of the most violent offenses, such as murder, rape, and armed robbery. Researchers have provided evidence of this group using samples from across North America, South America, Europe, Asia, and Australia. Because of the empirical consistency with which the small group of serious delinquents appears in crime data, criminologists have developed theories and helped to influence public policies that are tailored to the various needs and risk profiles of different types of juvenile delinquents.

For example, in 1993, the Office of Juvenile Justice and Delinquency Prevention (OJJDP) published the Comprehensive Strategy for Serious, Violent, and Chronic Juvenile Offenders, which is a research-based framework of strategic responses to help local and state juvenile justice systems respond to delinquency. Two years later, the OJJDP conducted a national training and assistance initiative to put the Comprehensive Strategy into place. The Comprehensive Strategy has two main components, prevention and graduated sanctions. Prevention targets youths that are at risk for juvenile delinquency and attempts to enhance their prosocial development by focusing on healthy and nurturing families, safe communities, school attachment, prosocial peer relations, personal development and life skills, and healthy lifestyle choices. In other words, prevention provides education and guidance on the very factors that will insulate youths from selecting a delinquent career. Graduated sanctions, which is the second component of the Comprehensive Strategy, target the same prosocial developmental points but for a different target population of youths—those that have already begun their delinquent career.

The Comprehensive Strategy is multidisciplinary and uses the range or continuum of sanctions that exists in the juvenile justice system to address the needs of the range of youthful offenders, from those first experimenting with problem behaviors to those with sustained and violent records. It is guided by six principles: (1) strengthening the family in its primary responsibilities to instill moral values and provide support and guidance to children; (2) supporting core social institutions, such as schools, churches, and community organizations, to help develop capable, mature, and responsible youth; (3) promoting delinquency prevention as the most cost-effective approach to reducing juvenile delinquency; (4) intervening immediately and effectively when delinquent behavior first emerges to prevent it from becoming worse; (5) establishing a system of

graduated sanctions that holds each juvenile offender accountable, protects public safety, and provides programs and services that meet treatment needs; and (6) identifying and controlling the small percentage of serious, violent, and chronic juvenile offenders who commit the majority of felony offenses.

What happens if nothing is done to prevent or intervene in delinquent careers once they are under way? A study by Kimberly Kempf-Leonard and her colleagues (Kempf-Leonard, Tracy, & Howell, 2001) is telling. Kempf-Leonard et al. studied more than 27,000 delinquent careers from the 1958 Philadelphia Birth Cohort Study and followed the youths until age 27. Among youth that had been serious delinquents, 48% were arrested as adults. For violent delinquents, 53% were arrested as adults. For chronic delinquents, 59% were arrested during adulthood. For those that were serious and chronic juvenile offenders, 63% were arrested during adulthood. For violent and chronic delinquents, over 63% were arrested as adults. In short, the deeper a youth becomes entrenched in his or her delinquency, the more likely antisocial behavior will be a lifelong problem.

Conclusion

Juvenile delinquency is a tremendous burden on society, and the most antisocial youths impose staggering costs in terms of victimization and correctional fees. A recent study by Brandon Welsh and his colleagues (2008) is illustrative. Welsh and his collaborators estimated the victimization costs created by the self-reported delinquency of 503 boys from the Pittsburgh Youth Study and produced several important findings. The cohort reported 12,514 crimes or about 25 crimes each. These crimes resulted in victimizations that ranged from \$89 million to \$110 million stemming from victims' pain, suffering, and lost quality of life. The 34 chronic offenders averaged 142 crimes, which was nearly 10 times the criminal activity of other delinquents, and this group imposed 5 to 8 times the victimization costs of nonchronic offenders. Other research has shown that chronic criminal offenders, nearly all of whom began their career as serious juvenile delinquents, cost society more than \$1 million per offender. In this way, juvenile delinquency will continue to be an area of intense criminological study because of the various costs that it imposes, the ways that it is viewed as a social indicator, and its relationship to more serious and violent forms of antisocial behavior.

TERRORISM

MATHIEU DEFLEM

University of South Carolina

From the viewpoint of criminology, terrorism is a fascinating subject that presents a challenging opportunity for scholarly reflection on a range of theoretical, empirical, and practical issues. The field of terrorism studies broadly encompasses both terrorism as a particular activity involving the infliction of harm for specified purposes, and counter-terrorism, involving practices and institutions concerned with defining and responding to terrorism. It is the unique province of criminology to focus on terrorism as a form of criminal or deviant behavior and on counter-terrorism as social control. Criminological analyses also focus on the dynamic interplay between terrorism and counter-terrorism to offer a unique perspective in the wider field of studies examining terrorism and terrorism-related phenomena. The study of these phenomena is itself part of the historical unfolding of terrorism and counter-terrorism in the context of societal development.

This chapter reviews the central criminological aspects of terrorism and counter-terrorism. It first offers a description of the major types, strategies, and characteristics of terrorism and provides a brief review of terrorist activity throughout history. Next, attention goes to the mechanisms and agencies involved with counter-terrorism to define and respond to terrorism. Subsequently, the major part of this chapter discusses the manner in which criminologists theoretically and empirically approach terrorism and counter-terrorism as elements of their subject matter. Criminology analyzes terrorism as crime or deviance and investigates

counter-terrorism as social control. The unique contributions of criminology make it a valuable addition to the wider field of terrorism studies.

Definition, Types, and Strategies of Terrorism

Terrorism is undeservingly notorious for its presumed difficulty to be clearly defined. In actuality, the search for an adequate definition of terrorism is difficult because various institutions compete for the most appropriate approach. Thus, terrorism is defined from the variable viewpoints of law, politics, culture and public opinion, and the sciences. In any one discipline of the sciences, moreover, a plurality of definitions is developed from a multitude of theoretical perspectives. Underlying these approaches, however, are certain recurring elements that can be put forward to develop a minimal definition of terrorism.

Terrorism involves the use of illegitimate means, typically involving the exercise of violence oriented at civilians, for political-ideological purposes. Terrorism thus has both an instrumental component, referring to its means, and a goal-oriented component, referring to its objectives. Differences in the extant definitions of terrorism revolve around the differential emphasis that is placed on either the means or the objectives of terrorism. From the viewpoint of a nation-state, for example, an official definition

of terrorism as it is articulated in a formal legal system typically emphasizes the means of terrorism as involving some unlawful methods, such as the (violent) tactics that are used by a certain type of actors (unlawful combatants). Other definitions, by contrast, focus on the aims of terrorism in seeking to destabilize the social order and endangering the security of a state or population. From a strict analytical viewpoint, it is useful to incorporate more, rather than fewer, dimensions of the acts of violence conceived as terrorism, so that both means and aims should be considered.

Because terrorism typically involves violent tactics employed on a relatively massive scale, it shares certain characteristics with warfare. Yet, terrorism is different from warfare in that it exists outside, and purposely operates against, the principles of war as they are regulated by the international community of nations. Unlike warfare, terrorist acts are often oriented toward civilian populations or are indiscriminate in their infliction of violence. Whereas war operates on the basis of standards of international law, involving legally recognized methods and actors (soldiers), terrorist activities are conducted by individuals and groups who do not enjoy any legally recognized status. Strategically, the means of terrorism involve methods oriented at the power of governments, including the kidnapping or killing of government officials, economic strategies such as sabotage and property damage, and other criminal activities such as drug trafficking and robberies to finance terrorist activities.

Acts of terrorism are politically oriented and ideologically motivated, ranging from specific goals formulated in terms of the might of political nation-states to more general aims related to the plight of certain peoples and groups. Thus, terrorism can result from demands made by ethnic groups to receive representation in an existing political community or have its own state be formed, while terrorism can also be part of ideological fights for the acknowledgment of underrepresented and oppressed expressions of ideas and ways of life. Because of the intrinsically political-ideological objectives of terrorism, the underlying ideas of terrorism are important to consider as the motivating forces that fuel terrorist groups and individuals. Strategically, moreover, the instilling of fear is an important immediate objective of terrorism.

Specific forms of terrorism can be distinguished on the basis of a variety of typologies differentiating more precisely among various means and aims of terrorist activity. From a historical viewpoint, for example, the distinction among revolutionary, nationalist, and religious terrorism can usefully bring out important shifts in terrorist activity over the ages. Revolutionary terrorism is associated with attempts to violently seize political power in the context of nation-states. Nationalist terrorism involves the violent quest by certain groups, who define themselves mostly on the basis of ethnicity as a nation, to gain autonomy and establish a new state. Religious terrorism is ideologically rooted in strands of various religious traditions that typically oppose secularization

processes in society. Historically, terrorism was mostly associated with revolutionary movements involved with seeking to overthrow political regimes. As the establishment of nation-states took on a more permanent hold, nationalist terrorism increased to secure the rights of specific ethnically defined minority groups, such as the Irish in the United Kingdom, the Basques in Spain, and Zionists in the former British Mandate of Palestine. In recent times, religious terrorism has proportionally increased the most, especially on an international level. The most conspicuous examples are al-Qaeda, which is held responsible for the attacks on the World Trade Center and the Pentagon on September 11, 2001, and other extremist groups with connections to Islam.

Historically, the term *terrorism* originated during the aftermath of the French Revolution, when the French National Assembly in 1793 decreed a mass mobilization of all able-bodied men in order to secure the republic and thwart off both internal and external enemies of the revolution. During the resulting “Reign of Terror,” tens of thousands of people, most of them ordinary workers and peasants, were massacred as purported enemies of the people. Other important historical precursors of terrorism can be traced back to the strengthening of conservative political regimes. In the late 19th century, for instance, anarchist terrorism involving various violent means, such as bombings and assassinations, spread across various nation-states. On May 4, 1886, the so-called Haymarket Riot erupted in Chicago, Illinois, when a bomb was thrown at police who were overseeing a rally protesting the police killing of two striking workers the day before. The May 4 bombing resulted in the deaths of several police and civilians. Eight anarchists were tried for murder and four received the death sentence. Although the Haymarket incident was relatively isolated, anarchist violence took on a more systematic character in Europe. In the late 19th century, numerous violent attacks took place that were motivated by anarchist ideas aimed at overthrowing established conservative regimes.

The invention of dynamite, the favorite tool of the 19th-century bomb-throwing anarchist, has been said to signal the beginning of terrorism from a technological point of view. Today, the means employed by terrorist organizations and individuals are more varied than ever, involving both legitimate as well as illegitimate activities and political as well as nonpolitical crimes. In addition to engaging in bombings of civilian populations in hostile lands, modern terrorist groups can branch out into the legitimate world of human affairs by organizing social welfare provisions in friendly territories. Terrorist activity today, furthermore, can involve routine criminal enterprises, such as drug trafficking and money laundering, in order to facilitate other, more violent activities that are politically motivated. An additional characteristic of contemporary terrorism is the increasingly high degree of technological sophistication that marks terrorist organizations and their methods of operation. Aided by newly developed means of transportation and communication, a

relatively high degree of internationalism and cross-border cooperation characterizes many contemporary terrorist groups. The methods of personnel recruitment, training, and intelligence gathering have likewise modernized to high levels of expertise. Modern-day terrorism is also feared to involve the use, or at least the deliberate pursuit, of lethal means of unprecedented proportion (e.g., so-called weapons of mass destruction) and has occasionally taken on a more organized character, involving globally organized terrorist networks. The contemporary world of terrorism is also more complex, involving both multiple domestic and international forms as well as a growing number of causes, as varied as the environment, white supremacy, and abortion, and includes state-sponsored or state terrorism in addition to terrorism committed by a host of nonstate actors.

Dimensions of Counter-Terrorism

Because terrorism is a highly complex phenomenon, a wide range of counter-terrorism strategies have been developed to deal with the causes and consequences of terrorist activity at the national and international level. Politically, counter-terrorism involves various measures taken by the governments of nation-states as well as by international governing bodies in which nation-states are represented. Such (inter)governmental responses to terrorism are historically most developed, dating back to at least the middle and latter half of the 19th century when governments in Europe sought to disrupt activities of political dissent that were aimed at overthrowing established regimes. In particular, surveillance systems were then set up to oversee and suppress politically suspect ideas, and international legal agreements were reached by intergovernmental accords. In 1898, for example, in the wake of the assassination of the Austrian Empress Elisabeth by an Italian anarchist, the governments of 21 countries agreed upon an international protocol to suppress the spread of anarchist violence. Although the protocol failed to be ratified by the participating states, similar initiatives would from time to time be taken. A first intergovernmental treaty specifically dealing with terrorism was drafted in 1937 in the form of an international Convention for the Prevention and Punishment of Terrorism that was arranged by the League of Nations, the precursor of the United Nations. However, although the convention had been signed by 24 nations, it was ratified only by India.

During the 20th century, intergovernmental counter-terrorism measures would develop in a piecemeal fashion to focus, not on terrorism as such, but on selected issues commonly associated with terrorist activity, such as hijackings and bombings. For example, the United Nations drafted various conventions to fight elements of terrorism, such as the International Convention Against the Taking of Hostages (1979), the International Convention for the Suppression of Terrorist Bombings (1997), and the International Convention for the Suppression of the

Financing of Terrorism (1999). Other international governing bodies, such as the Organization of American States and the Council of Europe, have likewise drafted international protocols to prevent and punish terrorist activity.

International agreements against terrorism have been complemented by similar legislative efforts at the level of individual nation-states. Especially in nations where terrorism has been a long-standing concern, such policies have been developed for a long time. Various nations in Europe, for instance, drafted counter-terrorist legislation throughout the 1970s, when extremist political organizations threatened to destabilize the political order. In the United States, the Act to Combat International Terrorism and the Omnibus Antiterrorism Act were passed in the late 1970s. Subsequently, the attacks that hit the United States in the 1990s, specifically the World Trade Center bombing in 1993 and the bombing of the Alfred P. Murrah Federal Building in Oklahoma City in 1995, led to passage of the Antiterrorism and Effective Death Penalty Act during the Bill Clinton Presidency.

In the United States as well as in many other nations of the world, no historical event has had as much of an impact in steering the course of counter-terrorism policies as the attacks of September 11, 2001, when members of al-Qaeda deliberately crashed hijacked airplanes into the World Trade Center towers in New York and the Pentagon building in Washington, D.C., with a fourth plane crashing into a field in the state of Pennsylvania. In the United States, a comprehensive USA PATRIOT Act (the Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism Act) was passed to intensify surveillance against terrorist activity, create the Department of Homeland Security, and institute exceptional measures to detain and try terrorist suspects in military tribunals that lack many of the due process protections afforded in criminal courts. Political policies against terrorism also extended to military operations when the governments of the United States and other NATO countries decided to undertake armed operations against the Taliban government in Afghanistan. The international impact of the events of 9/11 took hold on the legal front as well. Since 2001, many nations across the world have considerably strengthened and expanded their measures against terrorism by means of formal legislative efforts. The focus on terrorism as a matter affecting the national security of states is additionally prevalent at the international level by means of various intergovernmental treaties oriented at fostering more effective methods of cooperation. International agreements against terrorism are often difficult to enforce, however, because of the differences that exist among the legal systems of the world's nations and the different conceptions that exist regarding terrorism and counter-terrorism.

Although political and legal measures against terrorism have increased, they do not stand alone in the complex reality of counter-terrorism. On the contrary, counter-terrorist measures involve a wide range of practices and institutions, including governmental bodies, military and

intelligence forces, legal institutions, public security agencies, economic organizations, and cultural groups. Besides policy and law, counter-terrorism thus involves such varied actions as the efforts taken by businesses to thwart terrorist threats against private enterprise, the promotion of democratic ideas and peaceful means of protest, the actions taken by civil liberty groups to ensure an adequate balance between maintaining security and protecting rights, and the law enforcement efforts by national and international police organizations. The policing of terrorism is an element of counter-terrorism that, as a matter of social control, belongs very distinctly to the province of criminology, closely related to the criminological analysis of terrorism in terms of crime and deviance.

Criminology, Terrorism, and Counter-Terrorism

In the social sciences, terrorism and counter-terrorism have not always enjoyed an undisputed reputation as topics of scholarly reflection. The primary impediment against taking terrorism seriously in the social sciences has been the difficulty presumed to be involved in studying social realities that are often highly divisive in political and ideological terms. Yet, some social science disciplines have traditionally been more readily engaged in the study of terrorism and terrorism-related phenomena. Scholars of political science, international studies, and law, in particular, have examined important dimensions of terrorism, including, respectively, the political and ideological dimensions of (counter-)terrorism, the causes and effects of terrorism in the international community of nation-states, and the legal aspects posed by terrorism and counter-terrorism policies from the viewpoint of criminal and international law. Other fields of social science have been more hesitant to study terrorism and counter-terrorism except in a sporadic fashion in connection with other, more long-standing areas of investigation, such as religion, war, law, and social movements.

As important as the intellectual considerations that pre-occupy the various social sciences, the study of terrorism and counter-terrorism has also waxed and waned relative to the changing societal context, specifically the extent to which societies have experienced terrorist attacks. The field of terrorism studies has generally developed better in Europe than in the United States because of the relatively longer history of terrorism on the European continent. In Europe, terrorist incidents were already receiving much attention throughout the 1970s, when a variety of extremist political groups (for instance, the Red Brigades in Italy, the *Action directe* in France, and the Red Army Faction in Germany) resorted to violent tactics. In even more specific contexts, such as the state of Israel, the occurrence of and responses to terrorism can be of an even more enduring nature, consequently also fostering the development of terrorism studies.

On a global scale, the study of terrorism began to proliferate during the 1990s, when several high-profile incidents took place that moved terrorism to the world stage. Among these incidents were especially those involving the United States, as the sole surviving world power after the cold war, such as the World Trade Center bombing in New York in 1993, the bombings of the U.S. embassies in Kenya and Tanzania in 1998, and the suicide bombing attack against the *USS Cole* naval ship in 2000. No single event in history, however, has influenced the study of terrorism and counter-terrorism in a more drastic and enduring manner than the September 11 attacks on the United States. The events of that day have also contributed greatly to the development of criminological analyses of terrorism and counter-terrorism.

Criminology incorporates the social-scientific study of crime and deviance as well as the practices and institutions of social control, broadly defined as the definition of and response to crime or deviance. The distinction between crime and deviance corresponds to the theoretical demarcation between perspectives that contemplate the causes of criminal behavior and crime rates and those that differentiate between deviance as behavior and crime as the labeling of such behavior. Social control, in turn, is theoretically conceived as a consequence of crime, oriented at restoring social integration and harmony, or as a process of criminalization whereby deviance is treated as crime, most clearly through the development and application of criminal law and measures of enforcement. Social control can be informal, such as in the case of gossip and peer pressure, or formal, as in the case of law enforcement. In criminological discourse, the term *criminal justice* is often used to refer to the formal means of social control, including the institutions of police, courts, and corrections. At the most general level of criminological analysis, then, terrorism and counter-terrorism can be conceived as crime and social control, respectively. It is from within this general framework that more specific criminological perspectives unfold that can meaningfully contribute to the broader area of terrorism studies.

Terrorism as Crime or Deviance

Criminologists have not always been favorable toward incorporating terrorism into their field of study because of the political dimensions of terrorism, which have been claimed to prevent scientific analysis. This argument can be contested, however, because all acts of crime are subject to definitions and responses by a variety of institutions, such as law and police, in addition to their analytical treatment in the sciences. More recently, indeed, criminological models have been forwarded that conceive of terrorism in terms of crime and deviance. From the viewpoint of crime causation perspectives concerned with the etiology of criminal behavior, terrorism can be conceived as a form of violence, the causes of which can be analyzed at the micro- and macrolevel. From the microviewpoint that focuses on

the individual characteristics of terrorist perpetrators, criminological research concentrates on the people who are more likely to become terrorists or to join, or be recruited by, a terrorist organization. From this viewpoint, for instance, social learning theory can unravel the learning processes whereby somebody is initiated into the techniques and values associated with terrorist activities as a specific form of violence. At the macrolevel, criminological analysis of terrorism as crime concentrate on the fluctuations of terrorism as a function of other societal developments, such as periods of political strife, economic conditions, and cultural-ideological conflicts. For example, strain theorists can examine the sociostructural determinants under which terrorism, as a form of rebellion, will be more or less likely as a mode of adaptation, under conditions of blocked opportunities to legitimate means for voicing grievances.

Criminologists examining the causes of crime as a specific form of violent behavior do not take on the task of criminalistics or forensic science to investigate criminal evidence (in order to “solve” a crime), but instead describe and explain the structures and processes of terrorist crimes on the basis of various theoretical models (in order to analyze crime). Like other acts of crime, terrorist violence involves a perpetrator intent on achieving certain aims with particular means. In applying various crime causation theories to terrorism, criminologists view the political and ideological objectives of terrorism as one goal among many others, much like the way nonterrorist acts of violence will also be guided toward achieving a variety of aims, such as retribution or control. As to the consequences of terrorism, criminologists pay attention to the victimization that is brought about. Much as is the case with other forms of criminal conduct, the victims of terrorism involve the direct casualties and fatalities of a terrorist attack but also relate to the wider impact on the population and their sense of security. It is the latter form of victimization from which the expression terrorism is derived as referring to its primary purpose—to terrorize or instill fear.

Among the best-developed explanatory theories that focus on terrorism as a function of macrotheoretical conditions is the perspective of pure sociology. From this viewpoint, terrorism is conceived as behavior that is oriented at unilaterally handling a grievance (crime as a form of social control) whereby organized civilians covertly inflict mass violence on other civilians. Terrorist behavior is deliberately oriented at injuring and killing numerous individuals that are associated with a particular collectivity, such as a race or ethnic group, a nationality, or a religious group, that is defined as hostile. Like warfare, terrorism is very violent. Yet, unlike warfare, terrorism is not bilateral, involving two opposing factions openly engaged in military actions, but is unilateral and covertly planned and executed. In terrorist conduct, there is a high degree of relational and cultural distance between the perpetrators and the victims, often crossing the boundaries of

entire nations. Terrorism is also often upward in direction, oriented at superiors who cannot be reached through nonviolent means such as law or political debate. Especially because of technological developments, terrorism is a largely modern phenomenon that is more typical of advanced societies.

The pure sociological perspective can be broadened to contemplate both the moralistic and nonmoralistic elements of terrorist violence. To the extent that terrorist activity is oriented at addressing grievances, it is moralistic. Yet, inasmuch as terrorism is not provoked by the victim, not even from the offender’s viewpoint, it is predatory. As such, terrorist behavior is both warlike and criminal. Its societal conditions relate primarily to the balance among the institutional powers in society. In the case of contemporary terrorism, the institutional balance has tipped in favor of free-market capitalism, democratic polities, and cultural traditions of secularism and other Western values. Therefore, terrorism is more likely to come from groups who feel economically, politically, and culturally deprived. Institutional imbalances in the contemporary world help explain the rise of religious and ethnic terrorism in both domestic and international contexts. By means of example, some Palestinian groups have resorted to terrorist tactics, such as suicide bombings and indiscriminate rocket attacks, because of the deprivation of political rights they experience by the state of Israel. Likewise, al-Qaeda militants can be explained to be engaged in terrorism because of the repression from Western powers that is felt among certain Muslim communities, even in their own homelands.

From the viewpoint of crime construction theories that examine terrorism as a form of deviance, criminologists focus on at least two interrelated questions. On the one hand, research attention goes to the processes and motives that can be interpreted as meaningfully contributing to the occurrence of terrorist activity as a form of deviance. Based on hermeneutic strategies of analysis that are interested in uncovering the meanings an act or event has for the people who are involved, deviance theorists will be particularly interested in the motives of terrorist conduct. On the other hand, crime construction theorists will also interpret the societal context in which such acts of deviance are formally labeled as (the crime of) terrorism. This criminalization process minimally involves the definition of certain acts as terrorism, for instance by means of a legal description of certain acts as terrorism, and the subsequent application of such a description to concrete instances of terrorist conduct through the enforcement of laws.

Importantly, crime constructionists do not conceive of terrorism in essentialist terms as a kind of behavior (for which the term *deviance* is reserved), but as the result of a labeling process applied to certain kinds of conduct. What this theoretical focus can bring out are the differential conditions under which certain acts are, or are not, defined as terrorism and when and how certain people and groups are similarly seen and treated as terrorists or not. Typically, the

focus of this approach is such that the criminalization of certain kinds of deviance, and not others, as terrorism will be conceived as problematic inasmuch as the criminalization of terrorism will be seen as a function of authoritative people and institutions who have the power to label some acts as terrorism. From this viewpoint, therefore, an analytically useful criminological expression can be given to the otherwise tired slogan that a terrorist in one person's eyes can be a freedom fighter in the eyes of another. Further, a crime construction perspective can also lead to broadening the scope of terrorism studies by focusing on violent acts of a terrorist nature that are perpetrated by state actors in the course of their official duties. Thus, the notion of state terrorism can be introduced.

Crime construction theories are often conducted at an interactional level, involving the dynamic interplay between rule-violator and rule-enforcer, yet they can also be broadened to an institutional level that is situated in the wider sociohistorical context of society. Among the central mechanisms of crime construction in the case of terrorism, criminological research has devoted special attention to the process of a moral panic that surrounds suspected offenders of actual and potential terrorist activities, for instance since the events of 9/11. As those attacks originated from certain extremist elements in the Islamic religious community, an immediate response to the events involved anti-Muslim and, more broadly, anti-foreign sentiments. Soon after the attacks, there were many reports, across the United States, of acts of violence inflicted on people of Muslim or Middle Eastern origin who were held responsible by association. The very labeling of the acts of 9/11 as "Islamic" terrorism brought about a general distrust toward the Islamic religion, despite the best of efforts to divorce the religion from the terrorist violence. Further contributing to the equation of Islam and terrorism was the notion that terrorist cells loosely connected with the al-Qaeda network were globally organized and thus thought to represent a threat to all of civilization, including many predominantly Muslim nations. Moreover, the increasing globalization of the contemporary world, which has brought physically distant parts closer together than ever before, also meant that immigration could be redefined as a security concern rather than a mere administrative issue. As such, the contemporary age of terrorism has brought about a criminalization of immigration.

Among the primary mechanisms of the moral panic of terrorism are political propaganda and media reports. Propaganda derives its impact from the authority of the messenger, be they powerful government officials or civic leaders. The role of the media cannot be divorced from propaganda articulating the official, state-sponsored perspective of terrorism. Via the media, the rhetoric of politics, as much as of entertainment and sensationalist "reality" reporting, can connect with and mold the concerns of the public at large to form a widespread vision of terrorism as a growing menace, irrespective of objective conditions. At the same time, such descriptions of the

problem of terrorism will also help to pave the way to inform policies against terrorism and have them accepted as the necessary and valid responses.

Counter-Terrorism as Social Control

Although criminology has traditionally focused the most attention on crime and criminality, contemporary criminological perspectives have been broadened to also study the definition of and responses to crime or deviance under the heading of social control. It is from this perspective that counter-terrorism can be criminologically analyzed to focus on the mechanisms and institutions that are involved in treating terrorism as a function of crime and deviance. Counter-terrorism has generally received less scholarly attention than has terrorism, which is no doubt a result of a differential analytical concern that is closely related to the power and authority of the subject matter. Criminologists know much more about criminals and crime than they do about policing and police. Most terrorism studies that have focused on counter-terrorism have examined formal government policies and accompanying pieces of legislation on terrorism that have been enacted at the national and international levels of multiple governing bodies. This orientation toward policy and law harmonizes with the interests of political science and legal scholarship. Yet, a dimension that has been of growing concern, especially among criminologists, is the role played by criminal justice agencies and police institutions in counter-terrorism practices. Because security and police organizations are inevitably targeted at the criminal components of terrorist incidents, their activities in terrorism-related activities are ideally suited for criminological analysis.

Whether social control is conceived in response to terrorism as a crime or as a component in the criminalization of terrorism as deviance, the role of police in counter-terrorism has undeniably been of growing importance. What criminological research has found, especially in the aftermath of highly visible terrorist incidents, is that policing powers are generally strengthened and coordinated among various (local and federal) levels. For example, after the events of 9/11, the Federal Bureau of Investigation (FBI) stepped up its efforts and personnel involved with terrorism investigations. Local U.S. law enforcement agencies likewise began to devote more attention to terrorism-related operations, even when such concerns appeared rather peripheral to local conditions. Other federal agencies that are mainly concerned with administrative issues have likewise reoriented their tasks in terms of the new security situation. The U.S. Immigration and Naturalization Service, for instance, has been abolished in favor of the creation of two new agencies, U.S. Citizenship and Immigration Services and U.S. Customs and Border Protection, of which the latter is concerned with immigration as a security issue. Similar developments to those in the United States have also taken place in many other countries, where police powers have likewise expanded

after the events of 9/11 and terrorism has become a security priority, even when there were no indications of a concrete terrorist threat.

The various security efforts and other components involved with counter-terrorism have been subject to an intensified coordination at the policy level of government as well as at the organizational level of law enforcement. At the level of policy, the policing and security dimensions of counter-terrorism have been subject to increased efforts at supervision and coordination by the governments of nation-states. Police and security measures against terrorism are thereby attempted to be aligned with other counter-terrorism measures in the intelligence community and at the military, political, and legal level. In the United States, most famously, a new Department of Homeland Security was established to protect the nation from future terrorist attacks by coordinating various counter-terrorism functions. The idea for such a department was not newly developed after 9/11, but originated from a number of proposals that were drafted in 1999, 2000, and early 2001 by committees that had been commissioned by U.S. Congress and the Department of Defense. Each proposal called for a coordinated and unified national counter-terrorism program, and two proposals suggested the creation of a new federal agency to oversee such a program. None of the plans were implemented until the events of September 11, when an Office of Homeland Security was established within the executive branch of the U.S. government in October 2001. The office turned into the new Department of Homeland Security by the passage of the Homeland Security Act of November 25, 2002. The department oversees a large number of agencies, offices, and councils involved with various terrorism-related tasks, including health affairs, intelligence and analysis, security, customs and border protection, and immigration.

Internationally, there are also political efforts directed at coordinating the response to terrorism. The United Nations, most notably, has developed a Global Counter-Terrorism Strategy that calls on the nations of the world to unify and unite in their respective efforts against terrorism. The strategy calls for the condemnation of all acts of terrorism, irrespective of purpose, as constituting serious threats to international peace and security, and it urges nations to adopt all necessary measures to prevent and combat terrorism. As part of its counter-terrorism programs, the United Nations also promotes peaceful methods of conflict resolution, economic development programs across the world, and measures of international cooperation and assistance. Similar international initiatives as the ones developed by the United Nations have also been developed by various international organizations at regional levels, such as the Organization of American States, the Commonwealth of Independent States, the League of Arab States, and the European Union.

On the organizational level of law enforcement, it is important to note that police and security agencies have also developed their own, independently created coordination

mechanisms aimed at harmonizing counter-terrorism efforts by law enforcement at both the national and international level. In the United States, the FBI works with other federal agencies as well as state and local law enforcement in cooperation efforts through so-called Joint Terrorism Task Forces. At the international level, counter-terrorist police cooperation is secured through various bilateral and multilateral partnerships. Bilateral police cooperation in counter-terrorism can be conducted on a temporary, case-by-case basis, for instance to facilitate the transformation of information in view of the arrest of a fugitive from justice, or it can be of a more permanent nature through the establishment of joint investigative task forces. Multilateral counter-terrorism cooperation is ensured through international police organizations such as the International Criminal Police Organization (Interpol) and the European Police Office (Europol). Importantly, these multilateral police organizations are of a collaborative character in that they establish direct systems of information exchange among the police of various nations, for the transmission of criminal data as well as the transfer of police technologies, without the creation of a supranational force.

Among the mechanisms of counter-terrorist policing, research has uncovered that while there are undeniable political efforts to bring police institutions in line with the “war on terror,” police institutions are able to resist such political pressures to remain relatively independent in determining the means and specifying the objectives of counter-terrorism enforcement tasks. Organizationally, police agencies can often secure an independent position, remote from governmental control. In the United States, for instance, it is striking that the FBI, the primary enforcement agency for counter-terrorism, is not part of the Department of Homeland Security. As terrorism is in many nations also a law enforcement concern, rather than exclusively an intelligence or military matter, counter-terrorism efforts at the level of policing are an element of criminal justice rather than national security or foreign affairs. With respect to the means of counter-terrorist policing, technological advances are observed to form a primary driving force in determining the police strategies that are used in terrorism investigations. Exemplary of the technological focus are advanced methods of information exchange among police, for instance encrypted Internet-based communications systems, and the focus on the technical dimensions of terrorism operations, such as the weaponry involved and the methods of communication used by terrorist networks. With respect to the objectives of counter-terrorism policing, terrorism is among law enforcement agencies conceived in terms of distinctly criminal components, irrespective of any political dimension or ideological motivation. Police institutions of different nations can on the basis of a shared understanding of terrorism as a crime even accomplish cooperation when they originate from nations that are ideologically and politically diverse. As such, the counter-terrorism efforts of police are central in the criminalization of terrorism, both domestically as well as internationally.

Conclusion

Terrorism and counter-terrorism have historically evolved in various forms. Terrorism has increasingly diversified in terms of the objectives that are pursued, and counter-terrorism efforts have likewise proliferated across a range of institutions. Criminologists have contributed to the study of terrorism and terrorism-related phenomena by focusing on terrorism as crime or deviance and counter-terrorism as social control. The incorporation of terrorism and counter-terrorism as distinctly criminological topics of research serves to bring important dimensions to terrorism studies that other disciplines do not focus on. The criminological study of terrorism and counter-terrorism also has the added benefit of broadening the scope of existing criminological theories beyond their traditional areas of application.

Terrorism and counter-terrorism present important intellectual challenges for criminological theory and research and are likely to remain important for many years to come. Studying the causes and motives of terrorism, criminologists can unravel many of the complexities in the development and proliferation of terrorist activities across the world. The most critical contribution of criminology in this area is the study not merely of crimes or acts of deviance associated with terrorism, but of terrorism itself as crime or as deviance. Developing theory and undertaking research in this area, criminologists can expand social-scientific knowledge and contribute to building a counter-terrorism policy that is effective and just in tackling terrorist violence.

Studying counter-terrorism as a form of social control and, more specifically, a component of criminal justice, criminological research can bring out the security dimensions of social control that are not of a military or political character. Much of the contemporary public discourse on terrorism, especially in the popular media, typically focuses on counter-terrorism in the world of politics and in relation to war, but criminologists can reveal the manner in which institutions of social control, particularly law enforcement agencies, conceive of and respond to terrorism as a criminal matter. The targets of counter-terrorism are thereby treated as suspects, who are given certain rights of due process on the basis of publicly presented evidence in courts, and who, upon a determination of guilt, can receive punishment. Military counter-terrorism operations, by contrast, are oriented at enemies, not suspects, who can be apprehended or killed in combat. Captured enemies are detained, to be released when a cessation of hostilities has been declared. The respective logics of criminal justice policy and military counter-terrorism actions, then, are very different, although they factually coexist in the wider constellation of counter-terrorism today. Bringing out the essentially multidimensional nature of counter-terrorism is among criminology's most exciting challenges.

THEFT AND SHOPLIFTING

TAMMY L. ANDERSON AND PHILIP R. KAVANAUGH

University of Delaware

In the United States and elsewhere, *theft* commonly refers to the illegal taking and possessing of another's property, anything of value, with the intent to permanently deprive that person of the item or the value of the item taken. Shoplifting is a certain kind of theft (i.e., larceny-theft) that occurs at retail stores and commercial businesses. Theft and shoplifting are two types of property crime. Other property crimes are burglary, motor vehicle theft, and arson. While there are many kinds of theft, those discussed here are larceny-theft, burglary, and motor vehicle theft. None of these crimes features the use of force against people. Common examples of larceny-theft include stealing a bike or someone's wallet (pickpocketing), or taking things from a retail store, e.g., CDs or clothes.

Theft and shoplifting are important to address because they account for the largest portion of all criminal offending in the United States. Laws against them date back to ancient Roman law (e.g., Hammurabi Codes) and English common law. In those times, the crime of theft was rampant, and proscriptions about what to do with thieves dominated extant law. These codes and laws have played an important role in shaping modern criminal law in the United States. Today, the forces that motivate theft are powerful and ever present, and the consequences of theft are felt by individuals, businesses, communities, and government agencies.

The chapter begins with a discussion of the major types of theft and shoplifting, followed by the prevalence of each

in U.S. society today. Here, some demographic and regional variations in theft rates are examined, as well as the offenders who are involved. From there, the discussion moves to the major schools of thought regarding why theft and shoplifting take place and what society can do to address the problem. The chapter concludes with some observations for future research, theory, and practice.

Defining Common Types of Theft

In most societies today, including the United States, there are many different legal classifications of theft across jurisdictions. In the United States, there are state and local laws against a variety of theft categories and another level of codes at the federal level. Most states divide theft into "major" or felony theft and "petty" or misdemeanor theft. Classifications usually depend on the value of the item taken. Below, three different kinds of theft are reviewed: larceny-theft (which includes shoplifting), motor vehicle theft, and burglary.

Larceny-Theft

The Federal Bureau of Investigation's (FBI) Uniform Crime Reports (UCR) is the official and leading data source on crimes reported to the police and arrests made by them in the United States. As such, the definitions articulated in

the UCR formally define what is known about crime in society today. According to the UCR, larceny-theft is the “unlawful taking, carrying, leading, or riding away of property from the possession or constructive possession of another” (FBI, 2008). Common examples of larceny-theft include stealing bicycles, shoplifting goods from retail stores or businesses, pickpocketing, or swiping someone’s laptop at an Internet café or other location. Larceny-theft covers any stealing of property that is not taken by force, violence, or fraud. Included in the FBI’s definition are attempted larcenies.

Motor Vehicle Theft

The FBI has a separate category of theft for stolen automobiles and other motor vehicles. Motor vehicles are those that are self-propelled on land surfaces, not on water or railways. Examples include cars, motorcycles, trucks, buses, sport utility vehicles, snowmobiles, and so forth. This category of theft does not, however, include farm equipment, airplanes, or any type of boat or Jet Ski. Joyriding, or the temporary taking of a vehicle, is not included in the category of motor vehicle theft.

Burglary

Burglary is a type of theft very different from larceny-theft and motor vehicle theft because it requires unlawful entry—trespassing into a facility so as to steal a given item. This unlawful entry into a private or secured dwelling for purposes of theft makes burglary a more serious offense than simple larceny or shoplifting. The UCR defines burglary as “the unlawful entry of a structure to commit a felony or theft” (FBI, 2008). One does not have to exert force to enter a facility in order to be guilty of burglary. In fact, there are three subclassifications of burglary specified in the UCR. They include forcible entry, unlawful entry where no force was used, and attempted forcible entry. Common examples of structures that are burglarized include homes, apartments, offices, and retail stores.

Prevalence of Theft and Shoplifting in Society Today

According to official data (FBI, 2008), there were about 10 million property crimes reported to the police in 2006. This translates to an estimated property crime rate of 3,334.5 for every 100,000 U.S. residents. Nearly two thirds of all property crimes are larceny-thefts (Bureau of Justice Statistics [BJS], 2006). According to the BJS, theft from motor vehicles (a type of larceny-theft and not theft of the actual vehicle, i.e., motor vehicle theft) comprises the largest portion of larceny-thefts annually. This pattern has remained consistent over time. Theft from buildings and shoplifting follow in second and third place, respectively. As indicated above, property crimes like theft yield

significant costs to society. According to the BJS, losses from property crimes in 2006 totaled about \$17.6 billion. Like other crimes, rates of property crime have declined significantly from the early 1990s, when the United States began to see a national crime drop (Blumstein & Wallman, 2005). Rates of property crime offending and victimization are highest in cities and much lower in the suburbs and rural areas (BJS, 2005b, 2006).

Contrary to logic, perhaps, the highest rates of property crime victimization are reported in the poorest of American households (BJS, 2005b). For example, burglary, motor vehicle theft, and major and minor larceny victimizations are higher in households with incomes below \$7,500 per year than in households earning more than that. The exception to this pattern is that larceny-theft victimizations are about as high in households earning \$75,000 or more per year as they are in households earning less than \$7,500.

Below is a comparison of the crime literature on the market value of goods and their risk of theft with claims by routine activities theorists. The market value approach suggests that theft should be highest where goods are most plentiful and most valuable. This would seem to suggest higher rates of theft victimization in higher-income households, a contradiction to the data reported above by the BJS (2005b). However, the routine activities claim that motivated offenders (e.g., lower-income people residing in poorer households) confronted with easy targets (e.g., unattended households not guarded by locks or alarms) leads to high rates of property crime victimization, may help explain greater theft victimization in poorer households.

Demographic Variations in Theft

Offenses and arrests for theft are not evenly distributed across demographic groups. In general, adult males who live in urban areas are responsible for the highest levels of theft and other property crimes. The exception to this pattern is for motor vehicle theft, which has been historically dominated by adolescent males. While research shows most females offenders are arrested for drug offenses, property crimes, and prostitution (Anderson, 2008), males still outpace females with respect to arrests for theft and shoplifting. However, women have gained ground on men in recent times.

With respect to theft victimizations, data show that African Americans are more likely to have their homes burglarized and their vehicles stolen than are whites (BJS, 2005a). Whites, on the other hand, are more often victims of larceny-theft than are blacks.

Data (BJS, 2005a) show that a large portion of property arrestees at the local and state level committed their offense to get money for drugs. In fact, property arrestees were more likely than violent crime or drug arrestees to commit their crimes for money for drugs. The relationships among theft, shoplifting, and drugs are elaborated below.

Understanding the Causes of Theft: Criminological Research and Theory

The field of criminology has approached the study of theft with respect to two theoretical issues that have occupied scholarly attention for several decades. The first is the relationship between macrolevel economic forces and theft, typically conceptualized in terms of classic strain theory (Merton, 1938) or social disorganization theory (Shaw & McKay, 1942). The second centers on the extent to which rates of theft reflect the opportunities for crime provided by certain locations and the processes by which potential victims and offenders converge in space and time. This conceptual focus was strongly influenced both by the development of routine activities theory (Cohen & Felson, 1979) and a growing emphasis on the role of the physical and social environment in shaping opportunities for theft (Repetto, 1974). In the following sections, a summary of research in these two main conceptual areas is provided. Following that, research is reviewed that has examined the relationship between drug use and addiction and theft.

Economic Conditions and Theft

Income Inequality and Theft

The relationship between income inequality and theft is one of the most enduring in all of criminology and is generally conceptualized in terms of classic strain theory (Merton, 1938). Strain theory posits that theft is the result of the gap between the culturally induced aspirations for economic success and the structurally distributed possibilities for achieving it. Merton predicted that some individuals would respond to the strain between aspiration and the lack of opportunity by engaging in criminal behavior such as theft. The theory assumes similar success aspirations across social classes and posits that crime is disproportionately concentrated in the lower class because they have the fewest legitimate opportunities for achievement and so are the most vulnerable to this pressure or strain. Simply put, overemphasis on material success and lack of opportunity for this kind of success lead to crime.

Recent research indicates that income inequality is the most consistent structural correlate of rates for theft and other forms of property crime (Bursik & Grasmick, 1993; Walsh & Taylor, 2007). All forms of theft tend to occur disproportionately in poor, isolated, socially disadvantaged neighborhoods (Bernasco & Nieuwebeerta, 2005; Reiss & Cancino, 2004). In the United States in particular, social isolation and poverty are highly racialized. Research also finds that residential segregation, which is often a proxy measure for black–white income inequality, is strongly associated with burglary, larceny, and motor vehicle theft (Akins, 2003). Racialized income inequality leading to residential segregation can be traced to fundamental changes in the labor market, which resulted in the elimination of industrial jobs in major cities (Wilson, 1987). This

fundamental economic shift is consistent with both sociological and criminological anomie theories, which predict an inability or failure of certain segments of the population to effectively adapt to major structural or economic changes (Merton, 1938), or that they will react to such changes by engaging in crime.

Similarly, research has also found links between welfare and theft suggested by classic strain, familial support, and variations of social disorganization theory. Both monetary assistance levels and welfare participation rates are negatively associated with all forms of theft (R. C. Allen & Stone, 1999). Basically, if state and local governments take measures to alleviate economic inequality by providing job training, welfare benefits, as well as ground-level efforts to improve communities by providing access to after-school programs and such, rates of theft decline substantially. In general, it is evident that state and local governments with strong welfare and monetary assistance programs will experience lower rates of theft. This research is also consistent with more recent formulations of social disorganization theory (Hunter, 1985; Sampson, Raudenbush, & Earls, 1997). That is, the inability or unwillingness of families and neighbors to come together for the betterment of their community tends to result in higher rates of all forms of crime. These factors are particularly well established as correlates of major forms of theft such as residential burglary, motor vehicle theft, and robbery (Reiss & Cancino, 2004; Rice & Smith, 2002). Accordingly, establishing higher levels of social control and cooperation among families, friends, neighbors, and public organizations such as the police will lead to lower rates of theft.

Unemployment and Theft

The unemployment rate is one of the most commonly used measures in research on the relationship of economic conditions and theft. Research and theory addressing the connection between unemployment and theft consistently predict that higher rates of unemployment lead to higher rates of theft (Bursik & Grasmick, 1993; Merton, 1938; Wilson, 1987). Given the theoretical consensus, one would assume that the empirical relationship would be fairly strong regardless of its interpretation. Findings, however, are quite inconsistent. Some research has found a positive relationship between unemployment and theft (Carmichael & Ward, 2001; Reilly & Witt, 1996), some research has found a negative relationship (Cantor & Land, 1985; Land, Cantor, & Russell, 1995), and other work has failed to find any appreciable effect (Weatherburn, Lind, & Ku, 2001). The continuation of mixed findings has led some criminologists to question whether the unemployment rate is a useful indicator in conceptualizing the relationship between economic conditions and theft, or at least, to conclude that it must be understood as one of a number of measures of economic hardship (Cantor & Land, 1985).

A growing body of research suggests that the effect of unemployment on theft is not straightforward, but rather,

is contingent on various demographic or contextual factors. One consistent predictor is length of unemployment. Research suggests that individuals are more likely to commit crime the longer they are unemployed (Witt, Clarke, & Fielding, 1996). This indicates that individuals are generally able to endure short-lived instances of economic hardship, but will resort to theft if no legitimate opportunities surface in a reasonable period of time. Other demographic predictors are less reliable. The relationship appears to vary by age, but research is mixed as to the precise nature of the relationship. For example, some research has identified a link between adult male unemployment and theft (Carmichael & Ward, 2001), while other studies have found that unemployment is only related to rates of theft among juveniles (Britt, 1997). The kind of theft that occurs as a result of unemployment also appears to be impacted by considerations related to national or regional culture. For example, one recent study (Herzog, 2005) examined the relationship between unemployment and crime by focusing on the unique framework provided by the large, integrated labor force of Palestinian workers employed in Israel over the past few decades. Overall, a relationship between unemployment among Palestinians and theft in Israel was not found, except in one case: motor vehicle theft. As such, it appears that the relationship between economic hardship and crime may not be a general one, but rather, is specific to certain forms of activity (Herzog, 2005).

The main point to emphasize is that the relationship between unemployment and theft is far more nuanced than previously believed. The complexity of this relationship is further illustrated by Cantor and Land's (1985) seminal work on the differential effects of motivation and opportunity. They argue that although rises in the unemployment rate may increase criminal motivation to commit theft, they may also decrease the opportunity to successfully complete theft. Simply put, if people aren't working, they're likely at home, which increases guardianship (Cantor & Land, 1985; Land et al., 1995). Despite this reasoning, recent research has found that overall, opportunity levels are unrelated to theft rates and do not appear to mediate the unemployment-crime relationship for most forms of theft (Kleck & Chiricos, 2002). Presently, then, it appears that the motivation to commit theft due to unemployment is stronger than the decreased opportunities that are theorized to decrease theft during periods of unemployment.

Market Forces and Theft

Theft is also directly impacted by the nature of the capitalist economy and the market for certain items, as well as other, more subjective economic indicators such as consumer confidence. A recent study (Rosenfeld & Fernango, 2007) found that consumer confidence and optimism had significant effects on theft rates that were largely independent of objective indicators such as unemployment and economic growth. Consumer sentiment also accounted for

a significant portion of the overall crime decline that began during the early 1990s. This suggests that broad economic conditions, beyond the unemployment rate, are useful in modeling rates of theft in recent decades.

Research also suggests that theft rates are directly impacted by the cycle of the free market. Patterns of theft seem to be initially related to goods production. The relationship is straightforward: with more new items to consume, there is more to steal (Von Hofer & Tham, 2000). Then, when products reach the "saturation" stage, where people who want an item (such as a VCR or CD player) already have it, prices decline and such items are less likely to be stolen (Felson, 1996). This line of research supports a theft market life cycle of innovation, growth, mass market, and saturation. The optimum time to steal goods is during the "growth" phase, where demand for newer items is highest. The most inopportune time to steal goods is during the "saturation" period, where most everyone who wants an item already has it. These factors are also related to both prices and ownership levels of an item (Felson, 1996; Von Hofer & Tham, 2000). This research suggests that instances of theft can likely be reduced by an awareness and manipulation of certain licit markets as well as the pricing of merchandise (Wellsmith & Burrell, 2005).

Environment, Opportunity, and Theft

Routine Activities and Theft

There is a large amount of literature devoted to conceptualizing the relationship between criminal opportunity and theft. The dominant theoretical framework shaping this line of inquiry is routine activities theory (Cohen & Felson, 1979), which assumes that crime represents a convergence in time and space of motivated offenders, suitable targets, and a lack of effective guardianship (surveillance and protection) of persons and property. These key variables were later refined to incorporate dimensions of exposure (physical visibility), proximity (physical distance), and target attractiveness, and the guardianship variable was extended to account for security guards, bouncers, police presence, and so forth.

Research in this area implies that individual-level efforts to increase the security, surveillance, or guardianship provided should decrease theft victimization risk. Several measures of individual-level guardianship have been linked to burglary victimization, specifically. For example, type of residence (Coupe & Blake, 2006), household composition (Tseloni, Wittebrood, Farrell, & Pease, 2004), and certain leisure activities (Miethe & Meier, 1994; Mustaine & Tewksbury, 1998) are all highly correlated with theft outcomes. Research consistently demonstrates that younger, single persons who are renting, living in transitional neighborhoods, or engaging in nighttime leisure activities experience a substantially higher risk of theft victimization. Specifically, lifestyles that include dining out often and regularly frequenting bars, clubs, and taverns are all highly

correlated with minor theft victimization (Anderson, Kavanaugh, Bachman, & Harrison, 2007; Mustaine & Tewksbury, 1998; Smith, Bowers, & Johnson, 2006). These lifestyle factors are also strong predictors of repeat theft victimization and repeated violent victimizations (Anderson et al., 2007; Wittebrood & Nieuwebeerta, 2000). Other research finds that older people are an increasingly attractive target population for various forms of theft, including residential burglary (Mawby & Jones, 2006) and petty theft (Harris & Benson, 1999).

Conversely, engaging in routine activities that provide protection of homes and vehicles (target hardening), including locking doors, installing alarms, and light timer devices, are negatively correlated with theft victimization (Miethe & Meier, 1994). Accordingly, successful theft reduction initiatives include hardening techniques that overlap with individual-level guardianship. These include improved street lighting (Painter & Farrington, 1998), the establishment of Neighborhood Watch groups (Forrester, Chatterton, & Pease, 1988), alarm systems (Hakim, Gaffney, Rengert, & Shachmurove, 1995), improved locks and doors (Tilley & Webb, 1994), ensuring possessions are out of view (Bromley & Cochran, 2002), and the gating of residential property (Bowers, Johnson, & Hirschfield, 2004).

Environmental Factors and Theft

Brantingham and Brantingham (1999) suggested that the selection of theft targets is largely dependent on an assessment of the immediate environment of the target. Essentially, this work makes a strong case for incorporating elements of social context in understanding theft. As such, more recent research has incorporated elements of neighborhood control, derived from social disorganization theory (Miethe & Meier, 1994; Wilcox, Madensen, & Tillyer, 2007), in an attempt to offer a more holistic model of theft that accounts for social context and the role of the physical environment. This work has found that environmental cues in neighborhoods extending beyond the specific target are, in fact, important considerations. Findings consistently indicate that all forms of theft tend to occur at higher rates in poor, socially isolated neighborhoods (Akens, 2003; Rice & Smith, 2002; Walsh & Taylor, 2007).

It is important to note that the role of “environment” in theft extends beyond a consideration of the neighborhood. More recent research has begun to conceptualize the role of the environment in broader terms. Other environmental factors such as the time of day, time of week, and season of the year (Bromley & Cochran, 2002; Coupe & Blake, 2006) all function to shape theft outcomes. Local or regional culture can play a role as well (Herzog, 2005; Painter & Farrington, 1998). For example, Burns (2000) found that the southern and western regions of the United States experience higher percentages of stolen trucks than the midwestern and northeastern regions. Burns (2000) suggests that this is because in these regions, trucks are

recognized as ingrained artifacts of their respective cultures. Their attractiveness as targets has increased due to the fact that these vehicles are an integral part of their local culture. Proximity to major roads is another important environmental consideration shaping perceived opportunity for residential burglary (Rengert & Wasilchick, 2000) and especially for auto theft (Lu, 2006). With respect to commercial theft, research has found that it is typically clustered in areas with a large number of liquor licenses—namely, convenience stores, restaurants, and bars—indicating that land use is another important variable in structuring theft outcomes (Smith et al., 2006).

Predicting when and where theft crimes are most likely to occur is crucial for prioritizing police resources (Kane, 2006), and research indicates that theft is highly likely to be deterred by aggressive policing practices that target “hot spots” and certain neighborhoods. The potential deterrent effect, however, is further shaped by environmental factors. With respect to residential burglary, for example, research has found that (1) repeat victimization in general tends to occur in poorer areas; (2) houses located next to a previously victimized house are at a substantially higher risk relative to those located farther away, particularly within one week of an initial burglary; and (3) properties located on the same side of the street as a previously victimized house are at significantly greater risk compared with those opposite (Bowers et al., 2004).

The selection of theft targets is also conditioned by two additional factors related to accessibility: (1) proximity to the homes of the offenders and (2) proximity to the central business and entertainment districts (Bernasco & Nieuwebeerta, 2005; Bromley & Cochran, 2002). This is the case with both residential and auto burglaries (breaking into cars to steal stereos or possessions), as well as auto thefts. Installation of new security measures often fails to deter repeat victimization, suggesting target familiarity is an overriding priority for offenders and can sometimes negate the beneficial effects of target hardening and even police presence (Palmer, Holmes, & Hollon, 2002).

Theft and Drug Use

Illicit drug use, particularly heroin use, became associated with property crime in the 1970s based on the reasoning that users will turn to burglary, fraud, shoplifting, as well as other forms of crime such as robbery and prostitution, to obtain money to maintain their addictions. Such reports emerged during the Nixon administration, and remain popular in anti-drug campaigns today. In criminology, this reasoning was formalized in Goldstein’s (1985) economic-compulsive model of drug use and crime. Heroin and cocaine, because they are expensive drugs typified by compulsive patterns of use, are the most relevant substances in this category.

While some scholars have framed these claims as exaggerated attempts to drum up public support for “get tough on crime” policies, an empirical link between drug use and

theft does exist. Two things, however, should be noted. First, the onset of participation in crimes such as theft and shoplifting tends to precede induction into drug use (C. Allen, 2005), so the relationship is not directly causal. Second, the relationship between theft and drug use is observable only with serious and prolonged narcotics use. There is a much weaker, almost negligible relationship between regular use of marijuana or other hallucinogens and theft. In studies that have observed a positive relationship, theft and drug use tend to be correlated simply because they are common measures of general delinquency. However, research consistently demonstrates that regular use of harder drugs such as heroin and crack cocaine will eventually lead to participation in theft and is therefore strongly related to, if not a direct cause of, theft (C. Allen, 2005; Best, Sidwell, Gossop, Harris, & Strang, 2001).

Patterns of theft involvement tend to vary with respect to the recent levels of drug activity, with users reporting the highest levels of drug expenditure and accordingly, the highest rates of crime (Best et al., 2001; Manzoni, Brochu, Fischer, & Rehm, 2006). Petty forms of crime by drug users such as shoplifting and bicycle theft tend to be the most common, whereas burglaries and motor vehicle thefts are exceedingly rare (Van der Zanden, Dijkgraaf, Blanken, Van Ree, & Van den Brink, 2006). Violent forms of theft such as street robbery and purse snatchings tend to be one-off occurrences rather than criminal lifestyles (C. Allen, 2005). Frequent crack cocaine and other hard drug users are equally likely to be heavily involved in drug selling or prostitution, as well as the performance of marginal, part-time work in the legal economy (Cross, Johnson, Davis, & Liberty, 2001). The point is that neither serious nor petty theft functions as a primary source of income to support individual drug habits. Drug offenders are far more likely to recidivate with a drug offense than either theft or violent crime.

Conclusion

Theft has very immediate and costly consequences. It is one of the most prevalent forms of criminal behavior in the United States, consistently accounting for around 80% of all crimes reported to the police in a given year. However, the social processes reflected in theft are extremely complex. More so than almost any other crime, theft is heavily dependent on opportunity. Even the most motivated offenders may ignore attractive targets if they are well guarded. This fundamental consideration has led many criminologists to approach the study of theft in terms of routine activities theory, the most enduring explanatory framework that accounts for variables such as time, place, space, and situations.

Routine activities theory is linked to both opportunity and lifestyle, and living arrangements. This, in turn, has

led to an increasing focus on the role of environmental context in shaping theft outcomes, and more recent research has made an effort to conceptualize routine activities variables in broader terms, incorporating variables related to neighborhood social organization. This inevitably opens the door to readdressing issues of income inequality, unemployment, and community poverty and exploring how these interrelated variables coalesce to constitute risk environments, shaping both opportunity and motivation in new and unique ways.

Such conclusions have important crime-prevention implications. Prior research has focused on either situational theft and theft prevention or aggregate-level rates of theft in countries or states, highlighting socioeconomic inequality. Recent research suggests that incorporating these two broad explanatory frameworks is useful in effectively understanding the whens and whys of theft. Such possibilities suggest the use of more context-driven crime-prevention policies that incorporate new and inventive understandings of social environments as well as economic factors.

WHITE-COLLAR CRIME

MICHAEL L. BENSON
University of Cincinnati

White-collar crime is a generic term that refers to a broad range of illegal acts committed by seemingly respectable people in business settings as part of their occupational roles. There are many different types of white-collar crime, ranging from antitrust offenses to environmental violations to health care frauds and beyond. These types of crime are important because they impose enormous financial, physical, and social harms on individuals, communities, and society in general. Because of their special characteristics and the techniques by which they are committed, they pose significant problems for law enforcement and regulatory agencies interested in controlling them. Evidence suggests that white-collar crime is pervasive, widespread, and growing.

This chapter begins with a brief discussion of the history of the concept of white-collar crime in the discipline of criminology. The nature and extent of the harms imposed by white-collar crime are then detailed. Next, the characteristics and techniques of white-collar offending are described, and the problems that these features create for societal efforts to reduce white-collar crime are outlined. This section is followed by a summary of some of the major forms of white-collar crime. Finally, the chapter concludes by identifying recent social and economic developments that are likely to ensure that white-collar crime will maintain its status as a major social problem well into the future.

Definition and Costs of White-Collar Crime

The phrase “white-collar crime” was coined by the eminent American sociologist Edwin H. Sutherland, in the late 1930s. At the time that Sutherland was writing, most criminologists thought that crime was concentrated among the urban poor and caused by the disadvantages and pathologies associated with poverty. Sutherland disagreed and argued strenuously that respectable people from the upper social classes committed a great deal of harmful criminal acts in the course of their occupations and in the furtherance of their economic and business interests. According to Sutherland (1949), upper-class criminality was ignored by the government and the general public because the perpetrators did not fit the common stereotype of the criminal. His work was aimed at reforming criminological theory by bringing this neglected form of criminality into the realm of scientific and public discourse.

There are two main approaches to defining white-collar crime: offender-based versus offense-based. Sutherland (1940) defined white-collar crime as a crime committed by a person of respectability and high social status in the course of his occupation. This definition is the most well-known and influential example of what has been called the offender-based approach to defining white-collar crime. Offender-based definitions emphasize

as an essential characteristic of white-collar crime the high social status, power, and respectability of the actor. Another approach to defining white-collar crime focuses more on the characteristics of the offense rather than the actor. The most well-known offense-based definition was proposed by Herbert Edelhertz in 1970. Edelhertz defined white-collar crime as an illegal act or series of illegal acts committed by nonphysical means and by concealment or guile to obtain money or property, to avoid the payment or loss of money or property, or to obtain business or personal advantage. For offense-based definitions, what distinguishes white-collar crimes from other types of crime is the manner in which they are committed rather than the characteristics of the person who commits them.

Regardless of how it is defined, white-collar crime is widely acknowledged to cause tremendous financial, physical, and social harms. The amount of money lost to white-collar crime annually is impossible to establish with any precision, but it clearly exceeds the losses due to ordinary street crime. For example, according to the Federal Bureau of Investigation (FBI, 2007), in 2006 traditional property crimes such as larceny, burglary, auto theft, and robbery accounted for an estimated \$17.6 billion in losses. By comparison, the FBI estimates annual losses due to white-collar crime at \$300 billion.

Although typically thought of as a financial crime, certain types of white-collar crime can have physical effects as well. These include violations of workplace safety laws, the manufacture and distribution of unsafe consumer products, and violation of environmental laws and regulations. Between 1982 and 2002, over 2,000 American workers died as a result of willful violations of safety laws by employers. It is estimated that hundreds of thousands more are injured by such violations. The victims of occupationally related diseases also run into the hundreds of thousands annually. In addition, consumers suffer physically as a result of dangerous products, including most notably toys, food, pharmaceuticals, and medical equipment. The exact number of deaths and injuries caused by dangerous or defective products that can be attributed to lawbreaking by corporations is impossible to determine with any precision. Nevertheless, criminal cases involving some of the largest and most well-known corporations in the world occur regularly. In addition, the physical effects of white-collar crime extend beyond workers and consumers to society in general in the form of violations of environmental protection laws.

Like ordinary street crime, white-collar crime also has social or moral costs that extend beyond its affects on individual victims. Many scholars believe that white-collar crime damages the moral climate in society by undermining people's faith in the legitimacy and fairness of business and government. White-collar crime is thought to create distrust and to undermine public confidence in the morality of big business. By disregarding the rules of free and open competition, business organizations that engage in

white-collar crime gain unfair advantage over their law-abiding competitors. The ability of the market to reduce the costs of goods and services and to improve efficiency through competition is thereby threatened. Thus, white-collar criminal behavior harms the American economy and free enterprise system. The moral and social costs of white-collar crime may extend to political institutions. White-collar crime scholars from Sutherland on have speculated that publicity about white-collar crimes committed by big businesses can delegitimize the government, especially when it appears that corporations and their executives receive special treatment in the justice system. Finally, publicity about white-collar crime also may serve as a justification for other sorts of crime and deviance.

Characteristics and Techniques of White-Collar Crime

White-collar crime can be found in all types of businesses, industries, occupations, and professions. Hence, it comes in a large variety of forms and styles. All white-collar crimes, however, share certain characteristics and are committed using particular techniques. These characteristics and techniques distinguish white-collar crimes from most forms of traditional street crime. Three characteristics of white-collar crime are particularly important: (1) The offender has *legitimate access* to the target or victim of the crime on the basis of an occupational position; (2) the offender is *spatially separated* from the victim; and (3) the offender's actions have a superficial *appearance of legality*.

Legitimate access means that white-collar offenders do not have to solve a problem that most predatory offenders confront—the problem of getting close to the target. For example, before a burglar can steal something from a home, he or she must first gain access to the home by somehow entering it. This is usually done by using force to break in a door or window. Breaking in creates additional risk of exposure for the offender. White-collar offenders, on the other hand, are not exposed to this additional risk because their occupational roles give them legitimate access to the targets of their crimes. For example, because of their occupational positions, bank employees have legitimate access to other people's money and can embezzle it without breaking into their homes or physically confronting them on the street. Similarly, in many other forms of white-collar crime such as securities violations, antitrust violations, and health care frauds, the perpetrators take advantage of their occupational roles to get access to the targets of their crime.

In many white-collar crimes, the offenders never directly confront or come in contact with their victims. Rather, they are spatially separated from victims. Consider, for example, the antitrust violation of price fixing. Illegal price fixing occurs when competitors in an industry get

together and collude to set prices for their products or services, as opposed to having prices determined by free and open competition in the marketplace. The victims of price fixing often are members of the general public, who have to pay more for goods and services than they would if prices were set by competition. The victims are never contacted directly by the perpetrators.

Perhaps the most troublesome aspect of white-collar crime is the superficial appearance of legitimacy. When a burglar breaks into a home, or an auto thief steals a vehicle, or any of the other traditional street crimes occurs, the fact that a crime has occurred is obvious. The offender's actions leave visible traces of the crime (e.g., the broken door and missing television), and the offender's actions can clearly be recognized as illegal by observers. In the case of the vast majority of white-collar crimes, however, the offender's actions are not obviously illegal. Indeed, at first glance they look entirely legitimate, and the fact that a crime may have occurred is not obvious. For example, a common form of health care fraud engaged in by physicians is billing insurance providers for services that were not rendered to patients. To commit the crime, the physician simply submits a form to the insurance provider, often either the federal Medicare or Medicaid program, in which he or she claims to have administered some service to a patient that in reality was never provided. If the fraudulent claim is not detected and the physician is paid by the insurance provider, then the crime of health care fraud has occurred. Since literally millions of such forms are submitted legally every day, on the surface nothing is obviously out of the ordinary or untoward about the physician's actions. Indeed, the physician's behavior looks perfectly normal and legitimate.

The Problem of Controlling White-Collar Crime

Taken together, the characteristics of white-collar crime—legitimate access, spatial separation, and appearance of legitimacy—raise special problems for its control by the criminal justice system. The most notable problem is that of detection. Most ordinary street crimes are detected by their victims, who can then report the incident to the police. However, in the case of white-collar crime, victims may be wholly unaware that they have been victimized. Hence, no crime may ever be reported to the police. Because discovery is problematic, it is difficult to estimate the magnitude of the white-collar crime problem and hence to make decisions regarding how to allocate resources toward its control.

A second control problem raised by white-collar crime involves assigning responsibility for the offense. Many white-collar crimes occur in organizational or corporate settings and are the result of collective actions taken by groups of people. In these cases, it is often difficult to

identify the individual or individuals who should be held accountable for the illegal activity. Because it may not be clear who is responsible for a particular offense, prosecutors often are reluctant to bring such cases to trial.

Related to the problems of detection and accountability is the difficulty of securing convictions in court. Because white-collar crimes are often complex and embedded in legitimate business routines, it can be difficult for prosecutors to prove beyond a reasonable doubt that an individual is guilty of an offense. The major obstacle is proving that the offender knowingly intended to violate the law. For example, in the health care fraud example discussed above, the physician submits a fraudulent claim for reimbursement for services rendered. Even if it can be shown that the claim is not accurate, the physician may still be able to argue successfully in court that he or she did not intend to submit a false claim. Rather, the fraudulent claim was simply a mistake or accident and not an intentional act. The denial of criminal intent is a very common feature of white-collar trials.

Convictions are also difficult to secure in white-collar cases, because the defendants typically have access to strong defense counsel. Unlike ordinary street offenders, white-collar offenders often can afford to hire the very best defense lawyers. White-collar defense attorneys work hard to control the prosecutor's access to information and evidence related to the alleged crime. For example, to demonstrate that a crime has occurred in a business setting, prosecutors often need access to company records and files. Defense attorneys can file motions and objections to attempts by prosecutors to secure search warrants. Although these motions are not always successful, they can make the prosecutor's job more difficult and time consuming. The strategy of information control can make it difficult for prosecutors to build successful cases in court.

For the reasons discussed above, investigating and prosecuting white-collar crime cases is often very expensive and time consuming. These constraints limit the effectiveness of the criminal justice system as a means of controlling white-collar crime. Local law enforcement agencies have multiple and competing demands on their time and resources. They are under constant pressure to respond to gang-related, drug, and violent crimes. Not surprisingly, in this context, white-collar crimes are considered less important, and accordingly given lower priority when decisions are made regarding which cases to pursue. Although state and federal law enforcement agencies do not suffer from the same resource constraints as local agencies, they too are limited in their ability to respond to white-collar crime.

Criminal justice agencies operate under legal constraints that can make it difficult to use the criminal law successfully against white-collar offenders. Legal constraints refer to features of the law that make it more or less difficult for law enforcers to use. For example, the standard of proof in criminal court is very high, as the defendant's guilt must be proved beyond a reasonable doubt. Because

of their complexity, proving guilt beyond a reasonable doubt in white-collar cases is often difficult. Other legal constraints such as the right to be free from unreasonable searches and seizures and the privilege against self-incrimination also complicate the efforts of law enforcers to bring the guilty to justice.

For all of the reasons outlined above, most scholars agree that while the criminal justice system is an important component of white-collar crime control, it should not be the first line of defense. Rather, regulatory controls are considered to be more effective and efficient. The regulatory system holds three distinct advantages over the criminal justice system as a means of controlling white-collar and corporate crime: (1) specialized expertise, (2) greater investigative powers, and (3) more flexibility and discretion.

When they are established, regulatory agencies are given a mandate to look at problems in specific areas. For example, the Food and Drug Administration (FDA) is supposed to regulate the safety and quality of foods and drugs. The Environmental Protection Agency (EPA) looks after the environment, while the Securities and Exchange Commission (SEC) keeps track of activities in the securities industry. Because regulatory agencies are focused on specific problems and subject areas, agency personnel can develop specialized expertise. This expertise can help them see problems and envision solutions more easily than law enforcement agencies can.

As noted above, the police and other law enforcement investigative agencies operate under strict legal constraints. They typically cannot act until there is evidence that a crime has been committed and that a particular person or organization is involved. Regulatory agencies operate under fewer legal constraints, and in many cases they are given explicit authority to enter premises and to ask for information from business organizations. Hence, in theory, they can learn about potential problems before they happen rather than after the fact, and they can act proactively rather than reactively.

Finally, regulatory agencies also have more flexibility and discretion in the fashioning of their responses to corporate wrongdoing. The criminal justice system is, for the most part, restricted to applying the criminal law as it is enacted by legislative bodies. Regulatory agencies can work with businesses to create innovative solutions to problems.

However, there are disadvantages to overreliance on regulation. A significant problem is *agency capture*. By design and necessity, regulatory agencies must work closely with regulated industries. Agencies routinely ask for industry input on the development and implementation of rules. Regulatory inspectors also meet regularly with the people they regulate as they go about enforcing the rules. Hence, there is always the possibility that regulatory agencies will be “captured” by the regulated industry and begin to act more in the interests of the industry rather than the interests of the general public.

Another problem with regulation as a means of controlling corporate misbehavior is that the sanctions imposed by regulatory agencies are not nearly as powerful or threatening as those imposed by the criminal justice system. Regulatory agencies can impose large fines on violators. Yet, no matter how big the fine is, it does not carry the social stigma of criminal penalties. Hence, critics of the regulatory system argue that regulation doesn’t really deter wrongdoing. They argue that regulated businesses look at fines and other regulatory penalties as simply a cost of doing business.

Finally, there is the problem of *regulatory unreasonableness*. In theory, regulatory agencies are supposed to work to protect the public interest and to prevent harmful situations from developing in the first place. For example, it makes sense to establish rules to protect workers and to lower the risk that they will be made ill, injured, or killed on the job. But some agencies become more focused on enforcing the rules and less on preventing problems. If carried to an extreme, this tendency can lead to regulatory unreasonableness, in which the rules are enforced in a narrow-minded and legalistic fashion simply because they are the rules. The broader goal of preventing harm sometimes gets lost in the zeal to enforce the rules.

Types of White-Collar Crime

White-collar crime comes in a variety of forms and can be found in every industry, profession, and occupation. In this section, five major forms of white-collar crime are defined and described: antitrust violations, securities violations, consumer fraud, health care fraud, and environmental offenses.

Antitrust Violations

Antitrust violation can be divided into two broad groups: restrictive trade agreements, and monopolies or monopolistic practices. Restrictive trade agreements involve an illegal agreement or understanding between competitors in an industry to restrict how the industry works. Two examples of restrictive trade agreements are price fixing and market sharing or division. *Price fixing* refers to agreements between competitors to set prices at a certain level. For example, if milk producers get together and agree among themselves to charge schools a set price for the milk used in school lunch programs, that is price fixing. *Market sharing* occurs when competitors get together and divide up an area, so that only one of them operates in any one area at a time. For example, two paving contractors might divide up a town so that one takes the east side and the other the west side of town. These sorts of agreements are illegal because they restrain trade. In these examples, the prices for these goods and services (milk

and paving) are not being set by open competition in the marketplace, as they should be in a free market economy. Rather, prices are being set by collusion between or among competitors.

Monopolies and monopolistic practices involve unfair attempts to corner a market or to drive out competitors from a marketplace. A monopoly is said to exist if one company controls an entire market, but a company can have monopolistic control even though it has competitors if it controls a large enough share of a market. Microsoft's Windows operating system, for example, was declared a monopoly even though there are other operating systems available. The other systems have such a small market share and Windows has such a large share that it effectively controls the market.

There are two main techniques of monopolistic practices. The first is to use predatory pricing, which occurs when a company sets a price for its products or services that is economically unfeasible in order to drive competitors out of business. A second technique is for a company to pressure or control other companies that supply or deal with competitors so as to put them at a competitive disadvantage. Microsoft was accused of doing this with computer manufacturers. It forced computer manufacturers who wanted to preload their machines with the Windows operating system to agree not to install software from some rival companies when selling computers to the public. In effect, this destroyed the market for rival software companies.

Securities Violations

A *security* is evidence of ownership, creditorship, or debt. It is a piece of paper, or an account number, or something that indicates that someone has a financial interest or stake in an economic undertaking. For example, stocks, bonds, shares in a mutual fund, promissory notes, and U.S. government savings bonds are all securities. Publicly traded securities are bought and sold on exchanges, such as the New York Stock Exchange.

There are five major types of security offenses. *Misrepresentation* involves lying about the value or condition of a security. *Stock manipulation* occurs when an individual or a group of individuals attempts to artificially manipulate the price of a security. *Misappropriation* is an offense committed by brokers or other financial advisors who take money that their clients have given them to invest and misappropriate it for their own use. *Insider trading* is perhaps the most publicized security offense. It arises when people trade on the basis of inside, nonpublic information. It is illegal for insiders to buy or sell stock on the basis of information that is not available to the public. Finally, in an *investment scheme*, the perpetrator tricks people into investing money in an undertaking or security by falsely promising investors that they will receive a high rate of return on their investment. In reality, the undertaking has

little or no chance of paying off, and the perpetrator simply makes off with the investors' money.

Consumer Fraud

Consumer fraud is one of the most common forms of white-collar crime. It involves the use of deceit or deception in the marketing and selling of goods or services. This offense usually involves the deliberate use of false, deceptive, or misleading statements about the cost, quality, or effectiveness of a product or service. Consumer fraud offenders are drawn from all types of businesses and represent a continuum of size and complexity. Fraud against consumers has been perpetrated by offenders ranging from fly-by-night con artists to major multinational corporations, such as Sears and K-Mart. Fraud also occurs in businesses that fall between these two extremes, including local "legitimate" businesses that may on occasion resort to fraud in order to make extra profit or to avoid going out of business.

The following are seven of the more common forms of consumer fraud:

1. *Mislabeled products and misleading advertising.* Many consumer products come with labels that purport to tell about the ingredients in a product or about its performance or efficiency—for example, prepared foods, computers, water heaters, furnaces, and a host of other products. One way to sell cheap or shoddy products is to put inaccurate or misleading information on the label to make them seem better or more attractive than they really are. Misleading advertising is another way to influence buying decisions. For example, food manufacturers may make questionable claims about the nutritional or health value of their products.

2. *Real estate fraud.* Real estate fraud involves lying or being deceptive about the condition of real property, things such as land, houses, and buildings.

3. *Free prize scams.* In these types of scams, people are told that they have won a valuable free prize, but in order to collect it they must send in money or make a phone call. The money that is sent in will greatly exceed the value of the prize, or the victim will be charged for the phone call at a rate that greatly exceeds the value of the prize.

4. *Bait-and-switch advertising.* Popular with "legitimate" retail businesses, this fraud involves advertising some well-known product, such as a TV or major appliance, at a ridiculously low price. However, when consumers come to the store, they are told that the item is sold out or temporarily out of stock and then are steered toward other more expensive products that are available.

5. *Repair frauds.* Repair frauds typically involve big-ticket items such as homes, automobiles, or major appliances (dishwashers, washing machines, furnaces, and the

like). The fraud involves either doing unnecessary repairs or doing substandard work and then charging the victim full price.

6. *Charity and advocacy frauds.* Charity frauds appeal to the emotions. The victims think they are donating money or goods to help a worthy cause, when in reality the money is kept by those who collected it. Advocacy frauds are slightly different in that the offender promises to advocate for the victim with some other governmental body, such as the U.S. Congress or a state legislature. The offender promises to see that the victim's interests are protected on Capitol Hill or at the state capitol. However, in reality, like charity frauds, little or none of the money is actually used to promote these ends. Rather, it finances the lifestyles of the so-called advocates.

7. *Advance-fee swindles.* Anytime someone is asked to pay in advance for a service or product, he or she is vulnerable to an advance-fee swindle. Typically, in these swindles someone promises to do something for the victim, but the offender asks the victim to pay first and then the offender never delivers on the promise. Often, the promised service is one where it may be difficult to confirm one way or the other whether the service was provided. For example, advance-fee swindles may involve such services as finding housing, or educational loans, or employment. In these cases, the swindler promises to help the victim find an apartment, or a college loan, or a new job in return for a fee. The victim pays the fee, but does not get what he or she wanted in return. The swindler claims to be working for the victims but really is just taking their money.

Health Care Fraud

Health care fraud involves fraud against health care insurers and government programs such as Medicare and Medicaid. These two programs are particularly ripe for fraud because of their size and complexity. They process literally billions of dollars worth of claims annually. Although the exact cost of health care fraud is unknown, it is estimated to be in the hundreds of billions of dollars per year. Health care fraud can be committed by any person or organization in the health care industry who is involved with the provision of health care services to patients, including physicians, mental health professionals, hospitals, nursing homes, equipment suppliers, and pharmaceutical companies, as well as many others. Because physicians deal most directly with patients, their involvement in fraud is particularly serious. The following are three common forms of health care fraud involving physicians:

1. *Unnecessary procedures.* Because most people know very little about their bodies and the various problems they can have, they rely on the expertise of physicians. Physicians are supposed to provide treatment based on their best assessment of the patient's medical needs.

Some physicians, however, make decisions based not on the medical needs of patients but rather on their financial goals. Physicians may recommend that patients undergo unnecessary procedures, ranging from relatively simple but unnecessary tests to life-threatening surgery. So-called "Medicaid mills" make a business out of providing unnecessary procedures. These operations often are run in low-income neighborhoods. A group of unscrupulous doctors sets up a shop and recruits low-income patients—drug addicts, alcoholics, homeless people, and so forth. The patients are paid a small fee, are run through a battery of unnecessary tests, and then the federal government is billed for the cost of the tests.

2. *Fee splitting.* Most general practitioners cannot handle serious illnesses or medical conditions. When confronted with these types of cases, they often refer patients to specialists. To the extent that referrals are made on the basis of the physician's medical judgment, that is appropriate. But sometimes, physicians make referrals because they have a financial arrangement with a particular specialist. In return for referring patients to the specialist, the general practitioner gets a kickback in the form of a cut of the specialist's fee.

3. *Fraudulent billing.* Probably the most common type of fraud is fraudulent billing. This can be accomplished in a variety of different ways, but basically it involves submitting claims for reimbursement for services that were never really provided. For example, a physician may submit a claim saying that he or she performed some medical service for a patient when the service really was not provided, or when the service that was provided was somehow less than the physician is claiming.

Environmental Crime

There is no clear, widely accepted definition of the term *environmental crime*. Implicitly, it is defined as any violations of local, state, or federal "environmental laws." Environmental laws seek to protect the quality of the air, water, and soil by regulating both harmful additions to the environment (water, air, and soil pollution) and harmful subtractions from the environment (destruction of habitats).

Environmental crime comes in a variety of forms and sizes. Offenders may be homeowners who dump leftover paint into a city sewer system in violation of local ordinances, or they may be multinational corporations that manufacture, ship, and dispose of hazardous materials under conditions that are criminally negligent and morally outrageous.

Because different types of environmental crimes are associated with different industries and businesses, the nature of environmental crime in a community tends to reflect local economic activity. Certain types of environmental crime problems, however, are widespread. A study

of local law enforcement responses to environmental crime concluded that illegal waste tire disposal, improper disposal of furniture stripping and electroplating waste, used motor oil disposal, and hazardous wastes dumped into streams and rivers, are found in nearly all communities (Rosoff, Pontell, & Tillman, 2006). Along with these generic forms of environmental crime, some communities suffer unique problems as a result of their particular mix of local industries and businesses. For example, in some rural communities, most of the local environmental problems may be caused by one particular business, such as a tannery or textile manufacturer. The states of Maine and New Jersey both have problems with illegal disposal of hazardous waste, but the type of waste is specific to each state. In Maine, waste cases tend to involve the textile, wood, and fishing industries. In New Jersey, on the other hand, they involve the chemical and petrochemical industries.

In a strictly legal sense, what counts as environmental crime varies a great deal across jurisdictions. Statutory inconsistencies and the lack of uniform codification in state environmental laws pose difficulties for prosecutors and investigators. At the same time, they create opportunities for environmental offenders, who can evade prosecution merely by moving their operations to jurisdictions that are legally more “user-friendly” from the offender’s point of view.

One of the most important types of environmental crime is the illegal disposal of hazardous waste materials. In recent years, research suggests that environmental criminals have become more sophisticated. Rather than simply dumping hazardous waste in some isolated area late at night (often called “midnight dumping”), today’s more sophisticated environmental criminal may forge a waste transportation manifest or bribe public officials to look the other way. Other techniques involve mixing hazardous waste with nonhazardous waste, known as “cocktailing”; mislabeling drums, or disposing of the waste on the generator’s own property. Cocktailing is particularly common in the oil industry when dumping used oil. (For more information on environmental crime, see Chapter 56, this volume.)

Conclusion

Although offenses similar to what is referred to as white-collar crime have been around for centuries, it is likely that white-collar crime will become even more prevalent in the future than it is now or was in the past. Social and technological changes have made white-collar crime opportunities more available to a broader range of people than ever before. The important changes include (a) a rise in white-collar-type jobs, (b) the growth in state largesse, (c) an increase in trust relationships, (d) economic globalization, (e) the revolution in financial services, and (f) the rise of the Internet as a means of communication and business.

In modern postindustrial economies, more people have access to the tools of white-collar crime because they work in offices with forms and files and computers. These paper and electronic documents can be manipulated and altered so as to create a false impression of reality and permit employees to have illegal access to financial and other resources. In addition, more and more white-collar employees find themselves in jobs that are somehow connected to banking or financial services. The potential to engage in fraud is therefore great.

Opportunities to engage in fraud have also been expanded by the growth in programs associated with the welfare state, including Social Security, Medicare, and Medicaid, as well as a host of other less well-known programs such as the Federal Crop Insurance Program. All of these programs distribute enormous amounts of money to literally millions of applicants annually. They all depend on written materials and all are open to the possibility of fraudulent applications.

There is another change in the social organization of work and the economy that has increased opportunities for white-collar crime—the rise in trust relationships involving agents and principals. A *trust relationship* is one in which someone (called the *principal*) depends on someone else (called the *agent*) to manage assets or provide specialized services. For example, contributors to a pension fund are in a trust relationship with the pension fund managers, in that the contributors have to trust that the managers will manage the fund’s assets in a financially prudent manner. Similarly, someone who goes to a doctor is in a trust relationship with the doctor in that the person has to trust that the doctor will treat him or her according to what is in the person’s best medical interests. In the modern world, people increasingly find themselves in trust relationships in which they have to depend on others to do things for them that they cannot do for themselves. Trust relationships raise two main problems for the people who must rely on them. First, it is often difficult for principals to monitor and evaluate agents because of the complexity or hidden nature of the services that agents provide. In effect, principals often do not know whether agents really are doing the right thing for them. Second, agents have their own financial interests that may conflict with those of the principals whom they are supposed to be serving. Taken together, these two features of trust relationships mean that agents often have the motivation and means to take advantage of others.

The increasing number and complexity of political-economic ties that cross national borders have been a boon to white-collar criminals. This globalization of the economy has made it easier for potential offenders to contact victims, orchestrate complex criminal fraud schemes, and avoid detection and punishment by governments. Companies can be set up in one place to victimize individuals, businesses, and governments in other places. For example, some foreign companies have attempted to take advantage of changes in trade regulations in the United

States that benefited North American manufacturers. These new regulations followed the passage of the North American Free Trade Agreement (NAFTA). To take advantage of the new regulations, foreign companies would mislabel their products as being manufactured in North America. Opportunities to engage in these sorts of frauds are plentiful today, because most global business transactions are not conducted via face-to-face meetings. Rather, they are conducted by means of telephone, fax, email, and other forms of electronic exchange. All of these impersonal modes of communication create abundant opportunities for fraud and deception.

Since the 1980s, the financial services sector of many national economies, including that of the United States, has exploded in size and democratized in scope. Insurance, consumer credit, mutual funds, and other securities, once available only to the wealthy, are now offered to middle- and lower-income individuals. Vast amounts of money flow between individuals and institutions in electronic funds transfers. The temptation and opportunity to engage in fraud are ever present.

Many, if not all, of the social and economic developments outlined above have been made possible as a result of technological changes. The effects of the emergence of the personal computer, network servers, and the Internet as the standard means of information storage, manipulation, and communication can hardly be overstated. Money and information flow faster now than ever before. More and more transactions take place anonymously rather than through face-to-face contact. In this environment, opportunities to engage in fraud and deception abound, and white-collar crime flourishes.

WILDLIFE CRIME

KRISTIE R. BLEVINS

University of North Carolina at Charlotte

TERRY D. EDWARDS

University of Louisville

The United States is one of the largest markets for wildlife and wildlife products from all over the world. Hundreds of millions of dollars are earned annually from wildlife crimes committed in the United States alone, and about \$6 billion are earned every year from wildlife crimes worldwide (see Musgrave, Parker, & Wolok, 1993; Tobias, 1998; U.S. Fish and Wildlife Service, 2007; Warchol, 2004). This chapter offers a general overview of wildlife crime at both the state and federal levels, identifies a variety of types of wildlife offenders, provides an overview of the techniques involved in the policing and punishment of wildlife criminals, and makes suggestions to address and prevent wildlife crime in the future.

Definition and Characteristics of Wildlife Crimes

Wildlife crime is a unique category of crime. It does not fit “cleanly” into the various traditional categories, or classifications, often used to describe criminal activity—categories such as crimes against persons or property crimes. Like gambling, prostitution, and drug use, wildlife crimes are sometimes considered to be “victimless crimes” because a readily identifiable injured party or victim, at least in the form of a human being, is not present or filing a complaint. However, it has been argued that in the case

of wildlife crime, like other victimless crime, society-at-large is the true victim because these criminal acts lead to significant harm to, if not the complete eradication of, entire species of animals and plants, thereby affecting hunters, anglers, nature photographers, and anyone else who enjoys wildlife in some way. Indeed, some would say that wildlife crimes, taken to the extreme, have the cumulative effect of seriously damaging entire ecosystems (Clifford, 1998; see also Muth, 1998).

Wildlife crimes are generally considered to be a subset of environmental crime. A common, albeit very general, definition of wildlife crime states that it is any violation of a criminal law expressly designed to protect wildlife. One of the most common wildlife crimes is *poaching*, which is generally defined as taking a wild resource out of season or through an illegal means. The laws usually cover animals (including mammals, reptiles, birds, amphibians, fish, and even insects), as well as certain plants (Gregorich, 1992; Muth & Bowe, 1998). Although poaching often results in the death of an animal, it also encompasses illegal live trapping of animals that are later sold or traded for profit. Consequently, poaching is not simply hunting out of season or with the wrong type of weapon; it can also be the killing or trapping of endangered, rare, or protected species. Wildlife crimes also include activities that affect wildlife more indirectly, such as pollution of waterways that results in damage to fish or other wildlife, or the destruction of protected wildlife habitats.

Animals are illegally harvested within the United States, or illegally imported into the country, for a variety of motives. They may be used or sold as food, displayed as trophies, or sold simply for economic gain. Frequently, illegally obtained animals are sold for use as exotic pets or for entertainment in circuses, road shows, and so forth. Further, sometimes it is the animal parts, rather than the entire animal, that are more valued. For example, rhinoceros horns and elephant ivory are often used to make ornamental household items. Other animal parts, such as tiger genitals, bear paws and gallbladders, and some fish fins have medicinal uses in Asia and Africa (Warchol, Zupan, & Clack, 2003). In addition, illegally obtained animal skins and furs are sold or traded for use in apparel, wall hangings, and rugs. Within the United States, species such as the paddlefish have had to be protected because poachers will illegally harvest the fish for their eggs and market the eggs as “fake” caviar (Graham, 1997). These are just some examples showing how wildlife offenders can bring in significant revenue by supplying animals or animal parts to meet the demand for these types of items.

History of Wildlife Crimes

The first laws regulating hunting and fishing were implemented in England in the 1600s in an effort to protect the wildlife and property of landowner and the aristocracy. Such laws allowed the aristocrats to preserve game animals and fish on their property by prohibiting others from hunting and fishing there without permission (see Palmer & Bryant, 1985). While game wardens were appointed in some American colonies in the 1700s, fishing and game hunting were not well regulated in the United States until the late 1800s, when state legislatures began to create fish and wildlife protection and conservation agencies (Sherblom, Keranen, & Withers, 2002).

Prior to the late 19th century, lawmakers in the United States did not deem it a priority to place controls over hunting and fishing because wildlife resources were plentiful across sparsely populated land. However, as the human population increased and more land was developed or farmed, wildlife resources began to decline. In addition, conflict developed as individuals would often hunt or fish on property that was owned by other persons.

Movements to preserve wildlife in the United States arose in the early 1900s. During this time, federal and state parks, along with other wildlife preserves, were created to manage fish and game populations, some of which were in danger of becoming extinct (see National Park Service, 1940). Similarly, state regulations and restrictions were created to regulate hunting and fishing. While the regulations varied somewhat from state to state, one commonality is that states began to require individuals to purchase a license to hunt or fish. States also set mandates concerning the types, size, and number of fish and game animals that may be taken. In addition, they began to designate hunting

seasons, or particular times of year when each type of animal could be legally hunted (see Blair, 1985). Other common state wildlife laws concern property regulations (e.g., hunting is not allowed on any property without permission from the owner), specific hours per day during which hunting is allowed (e.g., daylight hours only), and type of weapon that may be used during certain hunting seasons.

Typical State Wildlife Crimes

As with virtually all criminal laws, each state has adopted its own statutes or ordinances related to wildlife crime. Part of the reason for the differences among state laws stems from the difference in wildlife resources. For example, some states have bear or elk hunting seasons, while others do not provide such seasons simply because the animal is not present (or is present in low numbers) in the state. While individual laws may vary somewhat from state to state, they are similar in many regards. In spite of the sometimes vast differences in the amounts and species of particular forms of wildlife across states, wildlife laws and hunting regulations are created to protect plant and animal populations and wildlife resources in each respective state.

Each state is responsible for identifying the game species that may be legally hunted and for adopting the restrictions that are imposed relating to when and how such game may be taken. Specifically, state gaming departments select specific dates when hunting may occur, determine what weapon(s) may be used, and place restrictions on the size and number of animals that may be taken by each hunter. In addition, limitations are imposed with regard to the times hunting may occur, the gender of the animals harvested, and the locations for hunting activity. Hunters are expected to follow the state's guidelines, which includes the purchase of a hunting license. For most large game animals such as deer, elk, and moose, hunters are also required to tag each animal harvested, report the kill either in person or by phone to the appropriate regulatory agency, and complete and display all required forms or paperwork (see Johnston, Holland, Maharaj, & Campson, 2007).

Across all states, one of the most commonly reported and detected wildlife crimes is hunting or fishing without a valid license. This crime defrauds the state of valuable revenue that would be used to protect and improve wildlife resources. Another common state wildlife crime is hunting out of season or hunting animals for which there is no legal hunting season. These violations can have significant detrimental impact on a wide variety of wildlife populations. A third common state hunting crime is failure to tag hunting kills, which results in inaccurate counts for the state. The primary reason hunters do not tag or report their activity is so they may engage in harvesting more animals than are permitted. Unfortunately, taking more than the limit of game kills is another crime familiar to state fish and wildlife officials. Other common crimes include

shooting from the road, hunting with an illegal weapon or firearm caliber, spotlighting to hunt, and trespassing to hunt or fish. Since only a small percentage of state wildlife crimes are treated as felonies, many individuals claim that they are not a serious problem, especially when compared to other types of crime. What they fail to realize is that even misdemeanor wildlife crimes may ultimately threaten fish and wildlife populations (Eliason, 2003, 2004).

Typical Federal Wildlife Crimes

At the federal level, Congress is empowered by the U.S. Constitution to enact appropriate legislation, and create government units to enforce such legislation, for any and all wildlife crimes for which there is a national, or federal, interest. Accordingly, Congress has enacted a wide variety of federal criminal statutes relating to wildlife crimes and vested enforcement of these statutes in a number of federal agencies including the Federal Bureau of Investigation, U.S. Immigration and Customs Enforcement, the National Park Service, the Environmental Protection Agency, the U.S. Forest Service, the U.S. Bureau of Land Management, and the U.S. Fish and Wildlife Service (USFWS). At the federal level, it is the USFWS that primarily focuses on protecting wildlife resources throughout the country. The USFWS contains an office of law enforcement that investigates federal wildlife crime and regulates interstate and international wildlife trade. They focus on identifying and apprehending international and domestic smuggling rings that deal in endangered or protected species, protecting wildlife and habitats from environmental hazards, enforcing federal migratory bird and game hunting laws, and monitoring legal domestic and international wildlife trade to ensure that regulations are followed (USFWS, 2007).

Intelligence and general investigative resources are typically superior at the federal level compared to most state levels. For instance, the USFWS compiles information concerning species, port of entry, mode of transportation, and time of year to monitor the illegal wildlife trade. This information has been used to develop a risk assessment system that aids in targeting illegal animal trading.

The USFWS sometimes works with states to protect game animals and enforce state wildlife laws. (Just over 2% of the USFWS's 2006 investigative caseload was spent on state law violations.) However, most of the USFWS's investigative efforts are spent working on cases involving endangered species and enforcing laws regulating importation and exportation of wildlife. For example, a great deal of federal resources are committed to enforcing the Lacey Act, which prohibits the exportation, importation, sale, transportation, or purchase of fish and wildlife taken or possessed in violation of any federal, tribal, state, or foreign laws. Recognizing the investigative limitations imposed by the reduced number of federal agents in the field, the USFWS works very closely with state agencies and many state wildlife enforcement personnel cross-designated as

federal USFWS agents in an effort to increase the number of wildlife offenders who may be prosecuted in federal court (USFWS, 2007).

Types of Wildlife Offenders

Individuals are motivated to perpetrate wildlife crimes for a wide range of reasons. Several different typologies have been established to profile and describe the motivations that influence people to commit wildlife crimes. Overall, there are four broad categories that can be used to portray the various types of individuals who commit these crimes.

The “Back Door” Wildlife Criminal

The term *back door offender* refers to individuals who illegally hunt on their own property. They do not purchase a hunting license, and they often take animals out of season and with techniques that are not normally permitted. Even if they are aware that their behavior is illegal, they rationalize the act by claiming that it is acceptable for them to kill animals on their own property because they “own” the animals. Back door offenders may use their kills for consumption for themselves or their families, sell the meat to others for profit, or simply mount the animal on the wall as a trophy. This type of offender can be extremely difficult to detect since the person does not hunt beyond his or her own property. In fact, back door hunters are rarely discovered unless they are reported by a neighbor who witnessed the event or by another individual with whom the suspect discussed the illegal activities—or more likely to whom they have bragged about their efforts (Eliason, 2008).

The Opportunist Wildlife Criminal

The opportunist offender does not commit wildlife crimes on a regular basis, but will do so if the opportunity is available. For example, an opportunist may be legally hunting deer in a particular area when an elk approaches. The hunter may kill the elk simply because the opportunity presented itself. Unless the hunter had a permit to kill elk during that particular season, he or she has committed the crimes of hunting out of season and hunting without a license. Another common crime committed by opportunist offenders is taking more than the legal limit of game. Like the back door offender, opportunist offenders may commit wildlife crimes for a variety of reasons. They too are difficult to detect because their actions are so irregular—they typically do not have the motivation or intent to commit a wildlife crime until the opportunity is present.

The Habitual or Chronic Wildlife Offender

This category includes those individuals who engage in wildlife crime on a regular basis. They may participate in a broad array of wildlife crimes, or they might focus on

one particular type (e.g., hunting endangered species or other animals for which there is no designated hunting season). While some animals taken by chronic wildlife offenders are used for personal consumption, these offenders are more likely than back door or opportunist criminals to be motivated by profit. Their bounties are often sold to others, domestically or internationally, for consumption or for use in making goods containing animal pelts. Offenders who illegally smuggle wildlife or animal parts into the United States are often habitual offenders (Eliason, 2008).

Experienced wildlife offenders usually become very skillful at their craft, as they simply get better through experience. Those who have not been apprehended get better over time through practice, and those who have been previously arrested tend to improve their abilities after learning from the mistakes that led to their apprehension. Many chronic offenders go as far as purchasing police scanners or other listening devices in order to monitor law enforcement activities and movement in the immediate area. Though habitual wildlife offenders are apprehended more often than back door or opportunistic offenders, their apprehensions typically come after they discuss their activities with someone who later reports the crimes. Those who do not discuss their actions with others are rarely detected (Eliason, 2008).

Trophy Poachers

Trophy poachers differ from the other three types of wildlife offenders in that their only motivation is to obtain animals to be used as trophies. Pictures of the “biggest and best” hunting and fishing trophies are often published in magazines, shown on Internet Web sites, and shared among sportspersons. These pictures often lead to competitions among hunters to establish who can obtain the best trophy of a particular animal. Since trophy animals are often extremely difficult to take legally during hunting seasons, trophy poachers frequently hunt them through illegal means (e.g., hunting out of season, spotlighting while hunting at night, trespassing, and using illegal weapons). Interviews with trophy poachers have revealed that most will keep the illegally obtained trophies for themselves, while a few will sell them to other hunters who will claim them as their own kills. Like habitual wildlife offenders, trophy poachers often commit a wide variety of wildlife crimes while hunting their trophy animal (Eliason, 2008).

Conservation Officers: Policing Wildlife Crime

Each state and the federal system has its own force of specialized law enforcement agents to investigate wildlife crimes and apprehend offenders. Such conservation officers, often called game wardens, are charged with enforcing

laws that regulate hunting, fishing, and other environmental concerns including protected plant species. Some jurisdictions also commission conservation officers to enforce boating regulations and police waterways.

The predecessor of American conservation officers were the gamekeepers in Europe. Gamekeepers were appointed by the kings to enforce hunting and trespassing regulations on their property and the property of the nobility. The main role of the gamekeepers was to keep peasants from hunting on land owned by the aristocrats.

The first record of a position resembling a modern-day conservation officer in the United States was a forest ranger in Yosemite National Park. He was appointed in 1866 with the main goal of enforcing quotas on game hunting. Around the same time, the government commissioned 150 U.S. Army cavalry troops to patrol the park. These troops served to help the ranger enforce the quotas and other hunting regulations in the park (see National Park Service, 1940). Today, the USFWS assigns special agents and wildlife inspectors throughout the United States, including wildlife inspectors at all border crossings, major international airports, and other ports of entry. Federal wildlife agents often build partnerships with state conservation officers to conduct joint investigations and training programs.

At the state level, the rank of conservation officer was first created in Michigan in 1887. Missouri later established game wardens in 1905. Other states implemented their own fish and wildlife departments and installed conservation officers throughout the early 20th century. Today’s conservation officers are similar to traditional law enforcement officers in that they are responsible for investigating crimes and arresting offenders. However, game wardens also differ from conventional police officers in several ways. First, there are far fewer conservation officers than other types of law enforcement agents in the United States. There are currently fewer than 10,000 state and federal conservation officers, which is equivalent to about 1 game warden for every 10,000 sportspersons. The ratio of traditional law enforcement officials to the general population is about 24 to 10,000 (see Bureau of Labor Statistics, 2008).

Since conservation officers focus first and foremost on violations of wildlife and environmental laws, their work inherently involves concentrating most of their investigative efforts in remote rural areas that are often unoccupied. Because of the limited number of game wardens, many of them are expected to cover large amounts of remote territory alone. The closest backup conservation officer may be more than 100 miles away. Further, the vast majority of individuals that conservation officers come into contact with will have a firearm or some other type of weapon. Therefore, it is important for game wardens to develop relationships with other local agencies so that they can get assistance quickly if necessary.

Though conservation officers specialize in violations of fish and wildlife laws, they might also encounter other

types of crimes and criminals during their daily activities. For example, while in the woods on daily patrol, conservation officers might inadvertently discover active methamphetamine laboratories or even a homicide victim. Consequently, today's game wardens are well trained concerning what to do if they come across a nonwildlife crime. Most states instruct conservation officers to preserve such a crime scene until other local authorities arrive, but also give them full law enforcement powers in the event an active crime is discovered and an immediate arrest should be made. As a result, conservation officers are sometimes forced to serve the role of both game warden and traditional police officer (Eliason, 2007; Falcone, 2004).

Conservation officers face many unique challenges and obstacles not encountered by traditional law enforcement personnel in their quest to eradicate wildlife crime. Conservation units often find themselves limited in their enforcement efforts by the small number of officers available and the large ratio of hunters to officers. Officers are handicapped by the vast areas they are expected to cover—large hunting areas can make it easy for poachers to evade capture, especially since they are almost always wearing camouflage and often are far more familiar with the terrain than the officers trying to catch them. Further, conservation officers often find themselves using unique equipment (ATVs, aircraft, boats, GPS systems) and investigative techniques (ground and aerial surveillance, “trick” decoy animals) rarely employed by other enforcement agencies. Nonetheless, conservation officers as a whole do an excellent job performing their duties given their limited resources and frequent need to engage in covert investigative methods (see Grosz, 1999).

As mentioned previously, many wildlife offenders do not get caught unless they discuss their crimes with others who later report them. Only a small portion of wildlife crimes are actually detected (Green, 2002; Green, Phillips, & Black, 1988). For that reason, it is important for conservation officers to develop positive relationships with members of the communities in which they patrol. These relationships can often lead to tips that result in the apprehension of wildlife offenders.

Punishing Wildlife Offenders

It is important to consider what type of punishment(s) convicted wildlife offenders should receive. There are four different traditional philosophies of punishment that may be used in the American criminal justice system: (1) retribution, (2) deterrence, (3) incapacitation, and (4) rehabilitation. The first philosophy, retribution, simply serves to punish offenders for their crimes. That is, they are subject to some penalty that should be equal to the crime that was committed. Because offenders should be punished for their crimes, retribution generally sets the overall structure for sentencing. One or more of the other

three goals of punishment may then be used within the framework of retribution.

The latter three philosophies of punishment are all aimed at preventing offenders from committing future crimes, though the means for achieving the goal may be very different. Deterrence is based on the premise that an individual will not commit future crimes if the punishment is certain, swift, and severe enough. That is, offenders will be deterred from additional crimes if they believe they will certainly be detected and apprehended and then swiftly and severely punished for the crime.

Incapacitation for traditional crimes typically involves incarceration in prison or jail. While incapacitation may be used as part of a deterrent or retributive goal, the use of incapacitation alone serves to prevent crime because the offender is locked up and therefore incapable of committing new crimes on the outside. Since wildlife crimes are typically not viewed as a serious threat to humans, long terms of incarceration are rare for wildlife offenders. However, sentences involving “quasi-incapacitation” in the form of forfeiture of hunting privileges or the loss of weapons or vehicles are frequently imposed.

Rehabilitation involves identifying and addressing the factors that contributed to an offender committing a crime. If those causes can be addressed through correctional programming, the offender should not commit additional crimes. Rehabilitative treatment for any type of offender, including wildlife offenders, may be as simple as participation in educational and vocational programs, or as extensive as cognitive-behavioral therapy or psychiatric treatment. While rehabilitation can be effective at preventing crime, it can also be expensive and time consuming. Accordingly, it is not used frequently as part of a sentence for many types of crimes, especially wildlife and environmental crimes.

In order to determine which philosophy of punishment should be used for a particular offender, the motivation of the offender should be considered. For example, if an offender committed a wildlife crime simply because he or she did not understand the wildlife regulations in the area (such regulations may be complicated—see Hall, 1992), that offender can probably be rehabilitated by completing an educational program concerning hunting and fishing regulations along with the standard retributive punishment. Conversely, a chronic wildlife offender that is motivated by profit or thrill may need extensive rehabilitation and therefore may be more efficiently punished through deterrent measures such as steep fines and a short jail sentence.

Ultimately, most wildlife crimes are misdemeanors and do not typically involve the imposition of a jail sentence. Misdemeanor wildlife crimes are most often punished with loss of hunting and fishing privileges for a period of time, the forfeiture of any illegally obtained fish or game animals, heavy fines, or a period of probation or other community corrections sentence. Felony wildlife offenders may receive any or all of those penalties but may also be subject to terms of incarceration in jail or prison or the loss of hunting or fishing equipment (including weapons and

vehicles) that was used in the commission of the crime(s) (see Musgrave et al., 1993).

As with traditional crimes, wildlife crimes prosecuted at the federal level tend to carry heavier sentences than those prosecuted by the state. For example, an Arizona man was apprehended in 2006 by federal fish and wildlife agents for killing and selling eagles for profit. He was convicted and sentenced to 3 years of probation and required to pay \$10,000 in fines. Likewise, a man in Washington State was convicted of smuggling in more than \$30,000 worth of reptiles from Thailand and was sentenced to 2 years in federal prison (USFWS, 2007). Still, ramifications (such as fines) for wildlife crimes are important at the state level. Not only may the consequences play a role in deterring future crime and protecting natural resources, but a few state-level wildlife enforcement agencies (e.g., in Kentucky) also fund their entire agency budget from the fees collected from licenses and fines imposed on violators—they operate on no tax dollars whatsoever.

Conclusion

While it is not known exactly how many fish and wildlife resources are lost each year because of wildlife offenders, estimates indicate that more than \$200 million are earned annually from wildlife crimes in the United States alone. Authorities never find out about the vast majority of wildlife crime. Estimates of the ratio of wildlife crimes discovered to actual crimes committed range from 1 in 30 to 1 in 80, with deer poaching detection rates being as low as 1.1% (Eliason, 2003).

The fact is that environmental laws, including hunting and fishing regulations, are enacted to protect plant and animal species and breeding cycles. Without these wildlife laws and regulations, wildlife resources in the United States would be put at risk. Illegal hunting and fishing activities can quickly reduce, or even eliminate, animal populations.

Consider the fact that the elephant population in Africa was reduced by over 50% from 1979 to 1989, primarily because of the illegal hunting of elephants to harvest their ivory. Similarly, although Kenya made the trade of rhinoceros horns illegal in 1975, the rhinoceros population declined from about 20,000 in 1975 to only 500 in 1990. This dramatic decline was largely caused by poachers motivated by profit from the sell and trade of the horns. These examples show how quickly the number of animals in an entire species can be reduced through poaching and trafficking (see Warchol, 2004; Warchol et al., 2003).

Wildlife trafficking is actually the second-largest form of black market commerce (between drug smuggling and illegal weapons) (Warchol, 2004). The illegal commercial wildlife trade poses a significant threat to plant and animal species around the world. Still, it is expected that noncommercial wildlife offenders pose about the same threat to

wildlife resources because they significantly outnumber commercial poachers.

To preserve the environment and prevent the reduction of plant and animal species, it is important to educate people about the negative consequences of wildlife crimes. This type of education should be offered not only to sportspersons, but to the general population as well. After all, jeopardizing wildlife resources affects hunters and anglers as well as others who enjoy the natural world. Specifically, nature watchers, photographers, and other ecotourists are affected by depleting resources. Educating individuals about the consequences of wildlife crime can help to protect natural resources by (a) making potential wildlife offenders truly aware of the impending results of their actions and therefore deterring them from committing the crime and (b) informing the general public of the costs of wildlife crime, thereby making them more likely to report wildlife violations to local conservation authorities. The social context of the early 21st century provides a perfect milieu for bringing attention to wildlife crime because there is increased awareness of environmental conservation and a focus on preserving the environment.

It is also important to continue to seek knowledge through research regarding the types of people who commit wildlife crimes and their motivations for offending. Fortunately, after many years of scarce literature, scholars are beginning to empirically examine the world of wildlife offenders and conservation officers (Eliason, 2004; McMullen & Perrier, 2002; Muth & Bowe, 1998). Future research should include surveys of or interviews with known wildlife offenders in order to gather insight into the types of activities in which they engage and why they engage in them. Understanding the motivations for wildlife crime can lead to policies and practices that will aid in detecting, arresting, and properly punishing wildlife offenders and ultimately preventing at least some wildlife crime. Positive steps toward preserving wildlife resources will help to conserve plant and animal species and the recreational opportunities they provide.

IDENTITY THEFT

HEITH COPES

University of Alabama at Birmingham

LYNNE VIERAITIS

University of Texas at Dallas

In 1998, the U.S. Congress passed the Identity Theft Assumption and Deterrence Act (ITADA), which criminalized the act of identity theft and directed the Federal Trade Commission (FTC) to collect complaints from consumers. In the decade following passage of ITADA, reports of identity theft victimizations to the FTC surged. In 2001, consumers filed 86,212 complaints. Three years later, the number reported increased nearly 250% to 214,905 complaints (FTC, 2004). Data from other government agencies and private organizations also support the claim that identity theft has risen exponentially since 1998. The Social Security Administration's (SSA) Fraud Hotline received approximately 65,000 reports of social security number misuse in 2001, more than a fivefold increase from about 11,000 in 1998 (U.S. General Accounting Office [GAO], 2002). The Privacy and American Business (P&AB) survey reports that the incidence of identity theft almost doubled from 2001 to 2002 (P&AB, 2003). Although recent FTC data suggest that reports of identity theft were relatively stable from 2003 to 2006, it is still the most prevalent form of fraud committed in the United States (36% of the 674,354 complaints filed with the FTC in 2006). In fact, identity theft has headed the FTC's list of top consumer complaints for the past 7 years (FTC, 2007).

In response to federal identity theft legislation and rising concern by the public, state lawmakers have increasingly turned their attention to the issue by enacting bills

criminalizing the act and expanding the rights of consumers victimized by this crime. In 1998, at the time the ITADA was passed, only a few states had specific laws criminalizing identity theft (GAO, 2002). Although all 50 states and the District of Columbia currently have identity theft laws, there is significant variation in what behaviors are classified as identity theft, penalties for offenders, and assistance to victims of identity theft (Perl, 2003). Lawmakers have continued to draft identity theft legislation. At the end of 2007, more than 200 bills focusing on the issue were pending at the state level.

Identity theft has also garnered the attention of the media, whose coverage of cases has risen dramatically over the past 10 years. The media regularly report on the latest scams used by identity thieves to steal personal information, the dangers of conducting routine transactions involving personal data, and the newest products and services designed to protect consumers from becoming victims of identity theft. Although much of this attention is directed toward educating consumers and marketing products, the media regularly present identity theft as an ever-increasing, ever-threatening problem. As Morris and Longmire (2008) note, the media typically present identity theft cases alongside several overlapping themes including "scorn, shock, marvel from the use of technology, and identity theft as an unstoppable problem" (p. 2). Indeed, many have referred to identity theft as the "fastest growing crime in America" (Cole & Pontell, 2006).

This chapter provides an overview of what is known about identity theft. The chapter begins with a discussion of the ambiguity and difficulties scholars have in defining the crime. This is followed by a description of the patterns and incidences of identity theft, which includes a review of the primary sources of data on the extent and costs of this crime. The next two sections discuss what is known about those victimized by the crime and those who choose to engage in it. This is followed by a description of the most common techniques identity thieves rely on to steal sensitive information and then convert it into cash or goods. The final section elaborates on legislation directed toward identity theft prevention.

Defining Identity Theft

According to ITADA, it is unlawful if a person

knowingly transfers or uses, without lawful authority, a means of identification of another person with the intent to commit, or to aid or abet, any unlawful activity that constitutes a violation of Federal law, or that constitutes a felony under any applicable State or local law.

Although the federal statute, passed in 1998, supplied the first legal definition of identity theft, “There is no one universally accepted definition of identity theft as the term describes a variety of illegal acts involving theft or misuse of personal information” (Bureau of Justice Statistics [BJS], 2006).

Although the term *identity theft* is often applied to a wide range of crimes, including checking account fraud, counterfeiting, forgery, auto theft using false documentation, trafficking in human beings, and terrorism, most policymakers and researchers agree that identity theft includes the misuse of another individual’s personal information to commit fraud. The issue that has impeded development of a universally accepted definition centers on the concept of “personal information.” For example, if an offender steals a credit card, makes a purchase, and then discards the card, has the victim’s identity been stolen? Does the use of a *financial account identifier* or *personally identifying data* constitute identity theft? An offender can use a credit card number (financial account identifier) to make unauthorized purchases or use a social security number (personally identifying data) to open a new credit card account and make purchases.

The government’s first attempt to systematically collect a large, nationally representative sample of data on identity theft, the National Crime Victimization Survey (NCVS), includes three behaviors in its definition of identity theft: (1) unauthorized use or attempted use of existing credit cards, (2) unauthorized use or attempted use of other existing accounts such as checking accounts, and (3) misuse of personal information to obtain new accounts or loans or to commit other crimes (BJS, 2006). By including the

unauthorized use or attempted use of existing credit cards, the NCVS considers financial account identifiers as personal identification. Other researchers, however, have employed the definition of identity theft specified by the federal statute but only include offenders who had used personally identifying data to commit their crimes. Offenses where financial account identifiers were used (e.g., credit card fraud and check fraud) were treated separately. In sum, there is no consistent definition or use of the term identity theft across agencies or organizations that collect data, which makes gauging the extent and patterning of identity theft difficult.

Patterns of Identity Theft

Numerous agencies and organizations collect data on identity theft, including government agencies, nonprofit organizations/advocacy groups, popular trade and media sources, and credit reporting agencies. However, the use of varying definitions of identity theft and methodologies used by these data collectors produce varying estimates of the extent of identity theft and its costs to businesses and citizens.

Pursuant to the ITADA, the FTC began compiling consumer complaints related to identity theft in 1999. The data are collected from victims who report their victimization via phone or the FTC Web site. Included in the database is information about the victim, contact information for the local police department that took the victim’s report, type of offense, and the companies involved. The database is made available to all law enforcement agencies in an effort to assist in their investigations of identity theft cases. Officers have access to information about identity theft offenders and victims, including details of their experiences.

A second source of data on identity theft is the Internet Crime Complaint Center (IC3), an alliance between the National White Collar Crime Center (NW3) and the Federal Bureau of Investigation (FBI). The IC3 receives complaints related to all Internet crime, including identity theft. Data are collected online and include information on the victim and offender by state, demographic characteristics, monetary losses, and law enforcement contact. Complaints are submitted from either the person who believes he or she was defrauded or from a third party to the complainant.

Several nonprofit and for-profit research groups such as the California Public Interest Research Group (CALPIRG), Javelin Strategy & Research, Gartner Inc., Harris Interactive, and the Identity Theft Resource Center (ITRC) have also collected data on identity theft through Internet, mail, and telephone surveys and face-to-face interviews. The data collected by these groups are based on information from victims of identity theft. Although not as long running and extensive as the FTC’s data collection program, the ITRC has conducted annual victimization surveys since 2003, but these surveys are limited to “confirmed” victims of identity theft who have worked with the ITRC. In addition,

CALPIRG has conducted a study of police officers and their experiences with identity theft cases.

Extent of Identity Theft

In 2007, the FTC released a report on estimates of the incidence and costs of identity theft. According to the report, approximately 8 million people experienced identity theft in 2005 and total losses were nearly \$16 billion (Synovate, 2007). Estimates from the NCVS vary from the FTC report. According to the NCVS, in 2005, an estimated 6.4 million households, representing 5.5% of the households in the United States, discovered that at least one member of the household had been the victim of identity theft during the previous 6 months. The estimated financial loss reported by victimized households was about \$3.2 billion (BJS, 2006).

It is difficult to ascertain the financial costs of identity theft since estimates vary across the available data. However, all indicate that this is an extremely costly crime. According to estimates from the FTC's Identity Theft Clearinghouse, the total financial cost of identity theft is over \$50 billion a year, with the average loss to businesses being \$4,800 per incident and an average of \$500 of out-of-pocket expenses to the victim whose identity was misused (Synovate, 2003). In the 2006 survey, estimates were considerably lower with the average amount obtained by the offender equal to \$1,882 and the average victim loss totaling \$371 (Synovate, 2007). The FTC cautions, however, that these changes may be attributed to differences in methodology between the 2003 and 2006 surveys. According to the most recent data from the NCVS (BJS, 2007), the estimated loss for all types of identity theft reported by victimized households averaged \$1,620 per household. Households that experienced misuse of personal information reported an average loss of \$4,850, while theft of existing credit card accounts resulted in the lowest average losses (\$980). These figures represent losses that may or may not have been covered by a financial institution, such as a credit card company.

It is also difficult to get a clear assessment of the actual costs incurred by victims of identity theft. In most cases, the victim whose information was misused is not legally responsible for the costs of the fraudulent transaction by identity thieves; rather, it is typically the credit card company or merchants who lose money. Victims may incur expenses from time spent resolving problems created by the theft. These problems may include the need to close existing accounts and open new ones, disputing charges with merchants, and monitoring their credit reports. A survey with CALPIRG found that the average amount of time spent by victims to regain financial health was 175 hours, which takes an average of 2 years to complete. According to the Identity Theft Resource Center's 2003 survey, the average time spent by victims clearing their financial records is close to 600 hours. In addition to time spent resolving problems created by the identity theft, victims may experience a great deal of emotional distress, including feelings of anger, helplessness and

mistrust, disturbed sleep patterns, and a feeling of lack of security (Davis & Stevenson, 2004).

Regional Variation

It appears that residents in certain regions of the United States are at a heightened risk of being victimized. According to the FTC (2007) data, Arizona (147.8), District of Columbia (131.5), Nevada (120.0), California (113.5), and Texas (110.6) had the highest identity theft victimization rates per 100,000 residents, while the lowest victimization rates were reported in West Virginia (39.3), Iowa (34.9), South Dakota (30.2), North Dakota (29.7), and Vermont (28.5). The NCVS data demonstrated that households in the West were approximately 1.5 times more likely than those in the Northeast, Midwest, or South to experience identity theft, and urban (6%) and suburban (6%) households were more likely to have a member experience identity theft than rural households (4%) (BJS, 2007). Many have blamed the methamphetamine epidemic in the Western United States for this finding. However, this link has not been substantiated with sound research and data.

Clearance Rates

Clearance rates (percentage of crimes for which an arrest is made) for identity theft are low. Available evidence suggests that offenders are seldom detected and rarely apprehended. Allison, Schuck, and Lersch (2005) reported an average clearance rate of 11% over a 3-year period. Similarly, law enforcement officials interviewed by Owens (2004) and Gayer (2003) estimated that only 10 and 11%, respectively, of identity theft cases received by their departments were solved. There are several obstacles that make the investigation of identity theft cases and the likelihood of arrests difficult (U.S. GAO, 2002). For example, identity theft cases can be highly complex, or the offender may have committed the theft in a different jurisdiction from where the victim resides, making it difficult to secure an arrest warrant. In addition, departmental resources may be directed toward the investigation of violent and drug-related offenses rather than identity thefts.

Victims

According to Anderson's (2006) analysis of the FTC's 2003 data, consumers ages 25–54, those with higher levels of income (particularly those with incomes greater than \$75,000), households headed by women with three or more children, and consumers residing in the Pacific states are at the greatest risk for identity theft. Older persons, particularly those aged 75 and older, and persons in the Mountain states are at the least risk for victimization. Educational attainment and marital status had no effect on risk of victimization (Anderson, 2006). Similarly, Kresse, Watland, and Lucki's (2007) study of identity

thefts reported to the Chicago Police Department from 2000–2006 found that over 65% of victims were between the ages of 20 and 44 and that young people (under age 20) and older persons (over 65) were underrepresented among identity theft victims. The NCVS reported that households headed by persons ages 18–24 were most likely to experience identity theft, while households headed by persons ages 65 and older were least likely to experience it. Households in the highest income bracket, those earning \$75,000 or more, were also most likely to be victimized (BJS, 2007).

Special Victims

Anyone can become a victim of identity theft, including newborns and the deceased. These groups are unique in that the people whose information is used illegally are not likely to incur any out-of-pocket expenses. Instead, their information is used by thieves to defraud others, usually businesses, or to hide from law enforcement. Historically, deceased victims have been thought to be the targets of choice for identity thieves, who obtain information about deceased individuals in various ways, including watching obituaries, stealing death certificates, and even getting information from Web sites that offer Social Security Death Index files, though this practice has decreased substantially in the past several years. In addition, some thieves may take advantage of family members. Often the family is unaware of the victimization, and if they do know about it, it may have little effect on their lives.

Child identity theft occurs when an offender uses a child's identifying information for personal gain. Using data from the Consumer Sentinel Network, Newman and McNally (2005) report that in 2004, there were 9,370 identity theft victims who were under the age of 18 (4% of all cases reported). The Identity Theft Resource Center estimates that they receive reports on 104–156 child victims a year. Similarly, Kresse et al. (2007) report that only 3.5% of victims were under the age of 20.

The perpetrator of child identity theft is typically a family member who has easy access to personal information. According to Pontell, Brown, and Tosouni (2008), over three quarters of those who stole the identities of victims under the age of 18 were the parents. Similarly, the ITRC 2006 survey data indicated that in child identity theft cases, 69% of the offenders were one or both parents or a stepparent. In 54% of these cases, the crime began when the victim was under 5 years of age (ITRC, 2007). However, strangers also target children because of the usually lengthy amount of time between the theft of the information and the discovery of the offense. Evidence suggests that child identity theft is relatively rare, but when it does occur, it takes a considerable amount of time to discover. Typically, the cost to the child whose identity was obtained illegally does not take place until the child applies for a driver's license, enrolls in college, or applies for a loan or credit.

Offenders

The paucity of research on identity theft coupled with the low clearance rate makes it difficult to have a clear idea of what those who engage in this offense are like. From what is known about offenders, there is considerable diversity in regards to the race, age, gender, and criminal background of identity thieves. To gain an understanding of the type of individual who commits identity theft, Gordon, Rebovich, Choo, and Gordon (2007) examined U.S. Secret Service closed cases with an identity theft component from 2000–2006. They found that most offenders (42.5%) were between the ages of 25 and 34 when the case was opened. Another one-third fell within the 35–49 age group. Using data from a large metropolitan police department in Florida, Allison et al. (2005) found that offenders ranged in age from 28 to 49 with a mean age of 32.

Both studies found similar patterns regarding race. Gordon et al. (2007) found that the majority of the offenders were black (54%), with white offenders accounting for 38% of offenders and fewer than 5% of offenders being Hispanic. Allison et al. (2005) found that the distribution of offenders was 69% black, 27% white, and less than 1% Hispanic or Asian. The two studies differed in terms of the gender of offenders. Gordon et al. found that nearly two thirds of the offenders were male. Whereas, Allison et al. found that 63% of offenders were female. Gordon et al. also examined the place of birth of the offenders. They found that nearly a quarter of offenders were foreign born. The countries most represented by foreign-born offenders, in rank order, were Mexico, Nigeria, the United Kingdom, Cuba, and Israel.

In their qualitative study of identity thieves, Copes and Vieraitis (2007, 2008) sought to gain an understanding of federally convicted identity thieves' experiences by asking offenders to describe their past and current family situations. They found that most offenders were currently married or had been married in their lifetimes: 25% of the offenders were married, 31% were separated/divorced, 32% had never been married, and 5% were widowed. Approximately 75% of the offenders had children. With respect to educational achievement, the majority of offenders had at least some college education.

Prior arrest patterns indicated that a large portion of the offenders had engaged in various types of offenses, including drug, property, and violent crimes. Yet the majority of them claimed that they only committed identity thefts or comparable frauds (e.g., check fraud). In total, 63% of the offenders reported prior arrests and most were arrested for financial fraud or identity theft (44%), but drug use/sales (19%) and property crimes (22%) were also relatively common (Copes & Vieraitis, 2008). This finding is consistent with that of Gordon et al. (2007), who found that while the majority of defendants had no prior arrests, those who did have criminal histories tended to commit fraud and theft-related offenses.

Copes and Vieraitis (2007) also questioned identity thieves about their prior drug use. Approximately 58% had tried drugs in their lifetime—mostly marijuana, cocaine in

various forms, and methamphetamine. Only 37% reported having been addicted to their drug of choice. Of those offenders who said that they were using drugs while committing identity theft, 24% reported that the drug use contributed to their offense. Gordon et al. (2007) did not ask specifically about drug use, but they did discover that nearly 10% of the defendants they studied had previous arrests for drug-related offenses.

Techniques

To be successful at identity theft requires that the would-be offenders not only secure identifying information but also convert it into goods or cash. Identity thieves have developed a number of techniques and strategies to do just this. Researchers and law enforcement agencies have collected information, primarily from victimization surveys and interviews with offenders, on the techniques identity thieves commonly employ.

Acquiring Identifying Information

The first step in the successful commission of identity theft is to obtain personal information on the victim. This task is relatively easy for offenders to do. Offenders obtain this information from wallets, purses, homes, cars, offices, and businesses or institutions that maintain customer, employee, patient, or student records. Social security numbers, which provide instant access to a person's personal information, are widely used for identification and account numbers by insurance companies, universities, cable television companies, the military, and banks. The thief might steal a wallet or purse; or work at a job that affords him or her access to credit records; or purchase the information from someone who does (e.g., employees who have access to credit reporting databases commonly available in auto dealerships, realtors' offices, banks, and other businesses that approve loans); or may find victims by stealing mail, sorting through the trash, or searching the Internet.

The most common way that offenders commit identity theft is by obtaining a person's credit card information. They then use this information to forge credit cards in the victims' names and use them to make purchases. According to the Privacy & American Business (2003) survey of victims, 34% of victims reported that their information was obtained this way. In addition, 12% reported that someone stole or obtained a paper or computer record with their personal information on it, 11% said someone stole their wallet or purse, 10% said someone opened charge accounts in stores in their name, 7% said someone opened a bank account in their name or forged checks, 7% said someone got to their mail or mailbox, 5% said they lost their wallet or purse, 4% said someone went to a public record, and 3% said someone created false identification to get government benefits or payments.

The FTC data has also shed light on strategies of offending from the victim perspective. This data show that of those who knew how their information was obtained (43%), 16% said their information was stolen by someone they personally knew, 7% during a purchase or financial transaction, 5% reported their information was obtained from a stolen wallet or purse, 5% cited theft from a company that maintained their information, and 2% said the information was obtained from the mail (Synovate, 2007). Other techniques have been identified, such as organized rings in which a person is planted as an employee in a mortgage lender's office, doctor's office, or human resources department to more easily access information. Similarly, these groups will simply bribe insiders such as employees of banks, car dealerships, government, and hospitals to get the identifying information. Others have obtained credit card numbers by soliciting information using bogus emails or simply by *shoulder-surfing*, which involves peering over someone's shoulder while the person types in a credit card number.

Researchers have also sought the offenders' perspective in determining how they obtain information (Copes & Vieraitis, 2007, 2008). These interviews indicate that offenders use a variety of methods to procure information and then convert it into cash or goods. According to Copes and Vieraitis (2007), most identity thieves used a variety of strategies and seldom specialized in one method. The most common method used to obtain victims' information was to buy it, although some offenders acquired identities from their place of employment. It was common for offenders to buy identities from employees of various businesses and state agencies that had access to personal information such as name, address, date of birth, and social security number. Offenders also purchased information from persons they knew socially or with whom they were acquainted "on the streets." In some cases, the identity thieves bought information from other offenders who had obtained it from burglaries, thefts from motor vehicles, prostitution, or pickpocketing.

Converting Information

After obtaining a victim's information, offenders often use it to acquire or produce additional identity-related documents, such as driver's licenses or state identification cards, in an attempt to gain cash or other goods. Often offenders apply for credit cards in the victims' names (including major credit cards and department store credit cards), open new bank accounts and deposit counterfeit checks, withdraw money from existing bank accounts, apply for loans, open utility or phone accounts, or apply for public assistance programs.

In 2006, the most common type of identity theft was credit card fraud (25%) followed by "other" identity theft (24%), phone or utilities fraud (16%), bank fraud (16%), employment-related fraud (14%), government documents

or benefits fraud (10%), and loan fraud (5%). Although not directly comparable due to differences in methodology, units of analysis, and definition of identity theft, data from the NCVS indicate that of the 6.4 million households reporting that at least one member of the household had been the victim of identity theft, the most common type was unauthorized use of existing credit cards (BJS, 2007).

The most common strategy for converting stolen identities into cash is to apply for credit cards. Most offenders use the information to order new credit cards, but they also use the information to get the credit card agency to issue a duplicate card on an existing account. They use credit cards to buy merchandise for their own personal use, to resell the merchandise to friends or acquaintances, or to return the merchandise for cash. Offenders also use the checks that are routinely sent to credit card holders to deposit in the victim's account and then withdraw cash or to open new accounts. Offenders have been known to apply for store credit cards such as those of department stores and home improvement stores. Other common strategies for converting information into cash or goods include producing counterfeit checks, which offenders cash at grocery stores, use to purchase merchandise and pay bills, open new bank accounts to deposit checks or to withdraw money from an existing account, and apply for and receive loans.

Victim–Offender Relationship

The limitations of currently available data make the relationship between the victim and offender difficult to assess. Research on the topic has produced mixed results regarding whether the offenders knew victims before stealing their information. To date, the available data suggest that the majority of victims do not know their offenders. The FTC reported that 84% of victims were either unaware of the identity of the thief or did not personally know the thief; 6% of victims said a family member or relative was the person responsible for misusing their personal information; 8% reported the thief was a friend, neighbor, or in-home employee; and 2% reported the thief was a coworker (Synovate, 2007). Although the figures are lower than those reported by the FTC study, two additional studies also reported that the majority of victim–offender relationships involved individuals who did not know each other. Both Allison et al. (2005) and Gordon et al. (2007) reported that the majority (59%) of victims did not know the offender. The most recent data from the ITRC (2007) also indicate that 60% of victims did not know the offender. In contrast, in Kresse et al.'s (2007) study of identity thefts reported to the Chicago police department, in over 60% of the cases where the means or method of theft was known (282 of 1,322), the victim's identity was stolen by a friend, relative, or person otherwise known to the victim. According to a victim survey administered by Javelin Strategy and Research (2005), for those cases where the perpetrator was known, 32% were committed by a family

member or relative; 18% were committed by a friend, neighbor, or in-home employee; and 24% were committed by strangers outside of the workplace.

Identity Theft Legislation

A wide range of federal laws relate to identity theft, including those pertaining to social security fraud, welfare fraud, computer fraud, wire fraud, and financial institution fraud. This review focuses on specific laws designed and enacted to criminalize the act of identity theft. The first federal law to combat identity theft occurred in 1998 with the passage of the Identity Theft Assumption and Deterrence Act (18 USC § 1028). This act has made it easier for law enforcement to investigate the crime and for victims to recover any losses from it. This law made identity theft a separate crime against the person whose identity was stolen, broadened the scope of the offense to include the misuse of information and documents, and provided punishment of up to 15 years of imprisonment and a maximum fine of \$250,000. Under U.S. Sentencing Commission guidelines, a sentence of 10 to 16 months of incarceration can be imposed even if there is no monetary loss and the perpetrator has no prior criminal convictions (U.S. GAO, 2002). Violations of this crime are subject to investigations by federal law enforcement agencies, including the U.S. Secret Service, the FBI, the U.S. Postal Inspection Service, and the Social Security Administration's Office of the Inspector General.

In an effort to protect consumers against identity theft and assist those who have been victimized, Congress passed the Fair and Accurate Credit Transactions Act (FACTA) in 2003. The act grants consumers the right to one credit report free of charge every year; requires merchants to leave all but the last five digits of a credit card number off store receipts; requires a national system of fraud detection to increase the likelihood that thieves will be caught; requires a nationwide system of fraud alerts to be placed on credit files; requires regulators to create a list of red flag indicators of identity theft, drawn from patterns and practices of identity thieves; and requires lenders and credit agencies to take action before a victim knows a crime has occurred. In addition, FACTA created a National Fraud Alert system.

In an effort to stop credit grantors from opening new accounts, FACTA also allows consumers to place three types of fraud alerts on their credit files. Individuals who suspect they are, or are about to become, victims of identity theft, can place an "initial alert" in their file. If individuals have been victims of identity theft, and have filed reports with law enforcement agencies, they can then request an "extended alert." After an extended alert is activated, it will stay in place for 7 years, and the victims may order two free credit reports within 12 months. For the next 5 years, credit agencies must exclude the consumer's name from lists used to make prescreened credit or insurance offers. Finally, military officials are able to place an "active duty alert" in their

files when they are on active duty or assigned to service away from their usual duty station.

In 2004, the Identity Theft Penalty Enhancement Act (ITPEA) established a new federal crime, aggravated identity theft. This act prohibits the knowing and unlawful transfer, possession, or use of a means of identification of another person during and in relation to any of more than 100 felony offenses, including mail, bank, and wire fraud; immigration and passport fraud; and any unlawful use of a social security number. The law mandates a minimum 2 years in prison consecutive to the sentence for the underlying felony. In addition, if the offense is committed during and in relation to one of the more than 40 federal terrorism-related felonies, the penalty is a minimum mandatory 5 years in prison consecutive to the sentence for the underlying felony.

States have also passed laws in efforts to protect consumers and victims of identity theft. In 2006, states continued to strengthen laws to protect consumers by increasing penalties and expanding law enforcement's role in investigating cases. Laws were also enacted to assist victims of identity theft, including prohibiting discrimination against an identity theft victim, allowing victims to expunge records related to the theft, and creating programs to help victims in clearing their names and financial records. To date, 39 states and the District of Columbia have enacted laws that allow consumers to freeze their credit files. As of November 1, 2007, the three major credit bureaus, Equifax, Experian, and TransUnion, offer the security freeze to consumers living in the 11 states that have not adopted security freeze laws and to all consumers in the 4 states that limit the option to victims of identity theft.

The effectiveness of legislation pertaining to identity theft has not yet been determined. These laws have provided law enforcement with the tools to fight identity thieves, but whether identity thieves have desisted because of these laws is still unclear. If identity thieves are like other fraudsters, and indicators suggest that they are, then they will adapt to law enforcement strategies aimed at stopping them. Thus, ITADA, FACTA and ITPEA will likely be amended to adjust to changing technology and adaptations of thieves.

Conclusion

Identity theft is a widespread problem affecting approximately 8 million people each year. A common scenario involves an offender who obtains or buys a victim's personally identifying information from an acquaintance or employee of an agency with access to such information. The offender then uses the information to acquire or produce additional identity-related documents such as driver's licenses and state identification cards, make checks, order new credit cards, and cash checks. The victim is likely to be between the ages of 18 and 55 with an income greater than \$75,000 and does not know the offender.

Like most offenders, identity thieves are motivated by a need for money. For some identity thieves, the need for money is fueled by a desire to maintain a partying lifestyle characterized by drug use and fast living. Others use the proceeds of their crimes to support a conventional life, including paying rent, mortgages, or utilities, or buying the latest technological gadgets. Although the desire for money is a common motivation among street-level and white-collar offenders, the selection of identity theft as their crime of choice may be attributed to the ease with which they can justify their actions. Many identity thieves are able to justify their crimes by denying that they caused any "real harm" to "actual individuals."

Most official attempts to control identity theft have been in the form of legislation. Federal and state lawmakers have approached the problem by passing legislation defining identity theft as a crime, delineating penalties for offenders, and increasing protection to consumers and victims of identity theft. In addition to legislative action, numerous non-profit agencies, organizations, and private companies have launched campaigns to educate consumers on how to protect their personally identifying information. Although limited, the currently available data suggest that certain situational crime prevention techniques may be useful in decreasing the incidence of identity theft. Specifically, increasing the effort and risks of acquiring information and converting information to cash or goods, eliminating ways in which information is acquired and converting information to cash or goods, and advertising the potential legal consequences of identity theft may help reduce identity theft.

To understand the crime of identity theft and thus increase the likelihood that policymakers and law enforcement are effective in reducing this crime, more research needs to be done. First, a number of laws have been passed to provide help to consumers and victims of identity theft and to assist law enforcement; however, the effectiveness of these laws has not yet been assessed. Although much of this legislation is relatively new, future research should evaluate the degree to which legislation is an effective strategy in reducing identity theft. Second, there is very little research on identity thieves themselves. Researchers should consider further developing this line of inquiry by expanding the work of Copes and Vieraitis (2007) to include active offenders and offenders convicted at federal, state, and local levels.

PROSTITUTION

RAYMUND ESPINOSA NARAG AND SHEILA ROYO MAXWELL

Michigan State University

This chapter discusses the many issues and nuances related to prostitution and is divided into five sections. In the first section, a definition of prostitution is provided, and acts that are commonly construed as prostitution are listed. At the outset, it must be noted that there is no one accepted definition of prostitution, and the term is fraught with ideological debates. Prostitution has also had different meanings across different time periods and locations, and the understanding of prostitution continually evolves.

The second section provides a brief background of prostitution. The prevalence of this activity is discussed, as well as a brief historical backdrop of it being “the oldest profession.” The section distinguishes among the different types of prostitution in terms of *modus operandi* (that is, street versus in-house and other forms). This is followed by a brief discussion of more recent trends linking prostitution in the era of globalization with the dynamics of global sex trade, tourism, and the trafficking of humans for sex purposes.

In the third and fourth sections, the causes and effects of prostitution are discussed, respectively. This comprises the bulk of the chapter. Again, it should be noted at the outset that depending upon ideological perspectives (i.e., whether one views prostitution as deviant, as a legitimate form of work, or as a form of violence that ranks among human rights issues), there are competing versions of the prevalence of prostitution and the nature of its effects. It

will be noted that differences in how scholars view prostitution will possibly explain the differences and perspectives seen in research findings.

The fifth section discusses competing views on policies and perspectives to address prostitution that have evolved through the years. For most countries and for most of the modern age, prostitution has been seen as a form of deviance, and many countries have had criminal and civil laws against prostitution. However, this dominant view has been challenged, and in a few developed countries, there have been attempts to decriminalize or legalize prostitution. This will be elaborated more thoroughly in this section. The paper concludes by evaluating the efficacy of some current policies used to alleviate or moderate the potential harmful effects of prostitution, such as the spread of diseases.

What Is Prostitution?

Prostitution is a highly debated term. Its common definition is the exchange of sexual services for compensation, usually in the form of money or other valuables (Ditmore, 2006; Edlund & Korn, 2002; Esselstyn, 1968). Yet, there are many activities that can fall into this category, and it can be argued that getting married for the purpose of having a home and livelihood qualifies as prostitution (Edlund & Korn, 2002). Some add that to differentiate prostitution

from other forms of nonmarital sexual activities, it must be devoid of emotional attachment between partners (McGinn, 1998). Others, such as Edlund and Korn, argue that an element of promiscuity must also be involved. However, the notions “devoid of emotional attachment” and “promiscuity” are also vague. A young woman maintaining a long-term sexual relationship with a “sugar daddy” may not fall in this category, while others may argue that this is indeed a form of prostitution. There is also difficulty in determining the number of partners one should have to be considered promiscuous. For example, the following was noted:

A woman who had sex with more than 23,000 men should be classified as a prostitute, although 40 to 60 would also do. However, promiscuity itself does not turn a woman into a prostitute. Although a vast majority of prostitutes are promiscuous, most people would agree that sleeping around does not amount to prostitution. (Edlund & Korn, 2002, p. 183)

John Ince, a lawyer and leader of the Sex Party, a Canadian political party, wrote an interesting letter to ProCon.org (an Internet-based organization that provides pro and con discussions on social issues). He argued that the key elements of prostitution are sexual contact and exchange for money. Yet, sexual contact can be defined in myriad ways. For example, if it is defined as genital contact, then he contends that a massage therapist is not a prostitute and neither is a professional dominatrix who spans and humiliates, but does not touch the genitals. If it is defined as genital contact for pleasure, then a urologist is not a prostitute but an erotic masseur qualifies as one. However, if it is defined as genital contact for pleasure that includes penetration, then erotic masseurs are not prostitutes. Finally, if it is defined as genital contact for pleasure that includes penetration in circumstances where the provider feels shame, fear, pain, or exposes him- or herself or others to disease, then escorts who are highly selective about their clients and enjoy their work are not prostitutes (ProCon.org, n.d.).

These differing definitions are an offshoot of the ideological variations in how individuals and organizations view prostitution. One commonly held view is that prostitution is a form of social and moral deviance that individuals fall into. Individuals involved in prostitution are largely seen as lacking self-worth (Ditmore, 2006). This has been the dominant view that, as will be described later, became the basis of the criminalization of the act. Many believe that this view resulted in the stigmatization of people involved in prostitution and made them vulnerable to different kinds of risks.

Beginning in the 1960s, this dominant view came to be challenged by feminists and other social activists across two ideological variants (Davidson, 2002). On the one hand, liberal feminists maintain that prostitution can be best understood as a form of legitimate work or profession.

This view holds that individuals who are involved in prostitution do so freely and it is within their civil rights to do so (Jenness, 1990). Those who concur with this view prefer to call individuals involved in prostitution “sex workers” (Kurtz, Surratt, Inciardi, & Kiley, 2004) in order to convey a sense of professionalism and to remove the stigmatizing taint of the words *whore* and *prostitute* (Ditmore, 2006). Taken to its extreme, this view suggests that sex work is within the parameters of self-expression for individuals and an acceptable way of conveying sexual liberation. This viewpoint holds that prostitution needs to be differentiated according to whether it is forced or voluntary. Advocates of this view, as will later be seen, propose that sex work (conceived as voluntary prostitution) should be legalized and decriminalized. Organizations like COYOTE (Call Off Your Old Tired Ethics) are in the forefront of this campaign to sever prostitution from its historical association with sin, crime, and illicit sex (Jenness, 1990).

On the other hand, a group of radical feminists put forth that prostitution is an act of violence, particularly against women, and is a form of human rights violation (Farley, Baral, Kiremire, & Sezgin, 1998; Farley & Kelly, 2000; Raymond, 1998). This view holds that prostitution, whether forced or voluntary, is an act that is intrinsically traumatizing to the person being prostituted, and decries attempts to distinguish between forced and voluntary prostitution (Farley & Kelly, 2000; Raymond, 1998). This view also suggests that by artificially delineating between forced and voluntary prostitution, prostitution becomes normalized and provides a mechanism for those who exploit children and women to hide under the cloak of having a business that is “voluntary.” An extreme version of this view maintains that prostitution, especially child prostitution, should be viewed as an economic crime (Bakirci, 2007).

These differing positions on prostitution are a recurring theme and are further examined in the subsequent discussions. The ideological views about prostitution inevitably dictate how its causes and effects are analyzed, as well as the policies recommended to address the issue.

Prevalence of Prostitution

Despite a wealth of literature, it is hard to estimate the prevalence of prostitution. This is because the definitional differences regarding what comprises prostitution make estimations highly variable. It was estimated that the number of sex workers in the United States in 1987, for example, stood close to a million, or 1% of the total population (Alexander, 1987). By limiting its definition to full-time equivalent prostitutes (FTEP), Potterat, Woodhouse, Muth, and Muth (1990) found that the prevalence of prostitution is about 23 per 100,000 population. They concluded that by extending this statistic to the nation, an average of about 84,000 women, or about 59,000 FTEPs,

worked as prostitutes in the United States annually during the 1980s. They also concluded that women prostitutes typically remain in prostitution for a relatively short time (about 4 or 5 years for long-term prostitutes).

In a systematic attempt to estimate the prevalence of female sex work (FSW) in different countries (measured as female sex workers in an area over the number of adult women in that area), Vandepitte and colleagues (2006) found huge variations within world regions. This was especially true for countries within Latin America (between 0.2% and 7.4%) and sub-Saharan Africa (between 0.4% and 4.3%). There was comparably less variation within countries in the other regions of the world. For example, the national FSW estimates prevalence in Asia to range only between 0.2% and 2.6%, in the Russian Federation between 0.1% and 1.5%, in Eastern Europe between 0.4% and 1.4%, and in Western Europe between 0.1% and 1.4% (Vandepitte et al., 2006).

There also appears to be historical variation on the prevalence of prostitution. In documenting the social history of prostitution, Bullough, Bullough, and Bullough (1987) found that in Western societies, prostitution flourished when large numbers of men were concentrated away from wives and families for long periods, when there was a double standard that restricted the movement of women while giving men freedom, and when there were many socioeconomic obstacles to marriage. They contended from this finding that the prevalence of prostitution will be reduced as women are permitted greater sexual freedom and as the socioeconomic conditions that provide fertile grounds for the recruitment of prostitutes are reduced.

Brief History of Prostitution

The history of prostitution is intimately linked with the patterns of tolerance and prohibition leveled against prostitution as a society adapts appropriate policies to address the activity. The notion that prostitution is the oldest profession has some credence, as ancient societies viewed prostitution as an accepted component of religious, social, and cultural life. For example, as early as 2400 BC, documents of prostitution are found in temple services in Mesopotamia (Lerner, 1986). There are also early documents that showed that prostitution was viewed as a legitimate economic activity. In 600 BC, Chinese emperors recognized commercial brothels as a means of increasing state income (Bullough et al., 1987), and a couple of centuries later, Greek and Roman heads of state also established specific mechanisms that detail the economic and social roles of prostitutes (Bullough et al., 1987; Vivante, 1999).

Not until the Middle Ages were there considerable records of prohibition against the practice of prostitution. In 534 AD, Justinian the Great banished brothel keepers from his capital and granted freedom to slaves sold into prostitution (Ringdal, 2004). The Visigoths of Spain also

strictly prohibited prostitution in the early Middle Ages, viewing the practice as morally reprehensible and punishable by flogging and banishment (Roberts & Mizuta, 1994). Throughout the centuries, prohibition of prostitution continued at varying intensities, although also interspersed with periods of tolerance and minimal regulation. Prohibition appeared particularly pronounced during times of widespread diseases, such as in the spread of syphilis in the late 1400s (Bullough et al., 1987), especially when it was recognized that the disease was sexually related. In the period from the 15th to the 20th century, the moralistic approach to prostitution resulted in conflicting social policies. In Europe, while religious institutions were vigorously opposed to prostitution, the elite male-dominated social classes discreetly supported its existence. As a consequence, women involved in prostitution were stigmatized and criminalized, yet their customers were not.

The moralistic view held sway throughout most of the 20th century as well. However, with the birth of the feminist movement in the 1960s and 1970s, this view was challenged and the alternative view that prostitution is a legitimate form of work was proposed. As mentioned earlier, groups like COYOTE, Friends and Lovers of Prostitutes (FLOPS), Hooking Is Real Employment (HIRE), and Prostitutes Union of Massachusetts (PUMA) campaigned to dissociate prostitution from sin, crime, and illicit sex (Jeness, 1990). These groups also fought for the protection of the rights of the sex workers, and the World Whore Congress that was held in 1985 in Amsterdam articulated many of the groups' positions (Ringdal, 2004). Largely through these campaigns, some governments decriminalized prostitution, offered services to sex workers, and ensured a safer working atmosphere for those involved.

However, with the advent of globalization, prostitution is caught in the nexus of sex tourism and human trafficking. There is a growing recognition that as an industry, prostitution had been economically and systematically exploited (Leheny, 1995). Young girls and boys from poor rural areas of developing countries are also systematically deceived with offers of jobs and other opportunities, only to end up as prostitutes for local and international customers in the big cities (Flowers, 2001; Lazaridis, 2001). As mentioned earlier, more radical feminists have thus articulated that prostitution is a modern form of sex slavery and it should be viewed as violence against women and a violation of human rights (Farley et al., 1998; Farley & Kelly, 2000; Raymond, 1998).

Types of Prostitution

Prostitution can be classified according to modus operandi and gender and age of providers. In their comprehensive review of studies on prostitution, Harcourt and Donovan (2005) identified 25 different modi operandi of commercial sex work in more than 15 countries. In their typology,

they identified the name of the activity, how clients are solicited and where they are serviced, and in what world regions certain activities are prevalent. Among the more prominent *modi operandi* for sex work are street, brothel, and escort prostitution. Street prostitution is the mode where clients are solicited on the street, in parks, or in other public places and are serviced in side streets, vehicles, or short-stay premises. Street prostitution is widespread, particularly in societies where alternative work sites are unavailable (e.g., in the United States, Europe, United Kingdom, Australasia) or there is socioeconomic breakdown (e.g., Eastern Europe, parts of Africa, South and Southeast Asia, and Latin America).

Brothel prostitution is the mode where certain premises are explicitly dedicated to providing sex. Usually, brothel prostitution has better security provisions accorded to sex workers than street prostitution. Brothels are often licensed by authorities. Brothel prostitution is the preferred mode when sex work is decriminalized or brothels are “tolerated.” This type is prevalent in Australia, New Zealand, Southeast Asia, India, Europe, and Latin America.

Escort prostitution is the mode where clients contact sex workers by phone or via the hotel staff. This is the most covert form of sex work. It is relatively expensive because of low client turnover (i.e., a higher price is charged for services because the client pool is smaller and more exclusive). The service can be provided at a client’s home or hotel room. This mode of prostitution is ubiquitous. In the United States, escorts and private workers contacted by phone and working from a “call book” are known as “call girls” or “call men.” Other less prominent *modi operandi* include: lap dancing, massage parlors, and traveling entertainers (Harcourt & Donovan, 2005).

Other modes documented by Harcourt and Donovan (2005) are culturally bound and unique to certain countries. For example, in Cambodia and Uganda, a mode called “beer girl” prostitution was documented where young women hired by major companies to promote and sell products in bars and clubs also sell sexual services to supplement their income. Also, in some Japanese cities, a popular mode is the geisha. These are women engaged primarily to provide social company, but sex may ensue. Harcourt and Donovan also found that policing of sex work can change the *modus operandi* and location of prostitution, but rarely its prevalence. They argued that it is necessary to develop complete understanding of the *modus operandi* of sex work in a particular area in order to come up with comprehensive sexual health promotion programs. Harcourt and Donovan concluded that there is no one best intervention for prostitution and that interventions must be suitable to the form (*modus operandi*) of prostitution in a local area to have some impact.

The following typology generally applies to male and transgender sex workers. In one of the few studies on male prostitutes, Luckenbill (1986) identified three modes of operation—street hustling, bar hustling, and escort prostitution—ranked according to level of income

and safety from arrest. The author also found that while some male prostitutes developed relatively stable careers within a given rank, others developed ascending careers. Most of the respondents moved from street hustling to bar hustling, and a few ascended to escort prostitution (Luckenbill, 1986). Lately, with the prominence of the Internet, male prostitutes can find customers through their online advertisements (Pruitt, 2005). This has opened a new mechanism for male-to-male prostitution and entailed a more elaborate form of escort prostitution (Bimbi & Parsons, 2005; Pruitt, 2005). Compared to female prostitutes, male prostitutes are more likely to be either in bars or working as escorts. Male-to-female transgender prostitutes generally follow the typology of street and off-street prostitution (Belza et al., 2000; Leichtentritt & Davidson-Arad, 2004). Transgender prostitutes, however, are predominantly based on the streets and compete with female prostitutes for their customers. A recurrent theme for transgender prostitutes is the higher risk of HIV and other sexually transmitted disease (Risser et al., 2005), which limits their customer base. As such, to be competitive, transgender prostitutes offer more explicit sexual services and engage in unprotected sexual contact more often (Parsons, Koken, & Bimbi, 2004).

Finally, prostitution can also be classified according to the age of providers, namely adult and child prostitutes. Studies indicate that the dynamics of child prostitution are different from those of adult prostitution. Child prostitutes are involved without their consent, and they are usually systematically deceived (Ayalew & Berhane, 2000; Sachs, 1994). Child prostitution is generally condemned by most individuals, organizations, and governments. Nevertheless, some child prostitutes eventually become adult prostitutes, and many adult prostitutes had prior childhood histories of sexual abuse and prostitution (Widom & Kuhns, 1996). In some jurisdictions, the age limit of those who could legally become prostitutes is very low, as young as 16 years old in Singapore (ProCon.org, n.d.).

Causes of Prostitution

Based on one’s ideological stance, there are differing sets of explanations as to why people engage in prostitution. This section describes some causes as delineated by differing ideological perspectives on prostitution. It should be noted that ideological views also influence interpretations of the effects of prostitution and the policies recommended to address the issue.

Prostitution as a Fall From Grace

One of the earliest and possibly most enduring explanations of prostitution is the social and moral deviance perspective. This perspective assumes that prostitution is a crime against the laws of the state and a sin against the laws of God. Studies that assume this position generally

find that prostitutes have low self-esteem and low self-control (Greenwald, 1958). If prostitutes maintain that economic circumstances pressured them into involvement in prostitution, this perspective views them as weak, as they should have explored other decent forms of generating income.

Studies that applied this assumption also maintained that prostitution was associated with feeble-mindedness and that prostitution could be passed on from one generation to the next. Some studies also asserted that as a deviant act, prostitution could be learned. Individuals who grew up in families or neighborhoods where prostitution was common may likely end up prostituting. This view maintains that individuals who are too weak to control their sexual desires and are too promiscuous have an elevated risk of becoming prostitutes.

With the onset of drug epidemics, studies also often find strong correlations between drug use and prostitution (Graaf, Vanwesenbeeck, Zessen, Straver, & Visser, 1995; Inciardi, Pottieger, Forney, Chitwood, & McBride, 1991; Potterat, Rothenberg, Muth, Darrow, & Phillips-Plummer, 1998). Many studies maintain that prostitutes take drugs to deaden their senses while engaged in prostitution, and many drug-addicted individuals engage in prostitution to maintain their drug habits (Erickson & Butters, 2000). This fortifies the position of the social and moral deviance perspective by arguing that low self-control and lack of attachments to the traditional values of society fuel both the phenomena of drug addiction and prostitution.

Prostitution as Voluntary

Studies that assume that prostitution is a voluntary act usually find that most prostitutes are involved in the activity for the purpose of quick economic and commercial gains (Davidson, 1995). These studies also show that involvement in prostitution is fleeting, and a prostitute may leave as soon as the reasons for working as one are no longer present. Individuals who voluntarily participate in prostitution have also been called sex workers and are part of what many call a "sex industry" (Rickard, 2001)

The assumption that prostitution is voluntary asserts that female sex workers are simply using their free choice regarding what to do with their bodies (Jenness, 1990). Since they view prostitution as a legitimate form of employment, female sex workers are in fact actualizing a civil right inherent in their work. This assumption maintains that prostitution is a legitimate way to explore sexual pleasures, and those who engaged in it are not deviants but rather are normal human beings. Some liberal feminists view prostitution as one of the mechanisms women can use to liberate themselves from male sexual domination (Scambler & Scambler, 1997).

A corollary view maintains that prostitution is inevitable in every society as long as sexual needs are not met or there are repressions of sexual desires (Scambler &

Scambler, 1997). Prostitution meets the sexual needs of those currently not served in traditionally accepted institutions. For example, husbands who could not have sex with their wives during periods of pregnancy or long-term separation may solicit the services of a professional sex worker. As such, prostitution is seen to have a legitimate functional role: to support the institution of marriage. Proponents of this view are critical of the deviance perspective because of its inherent double standard: harsh treatment of prostitutes yet lenience toward the customer.

Prostitution as Involuntary and Coerced

Recently, a scathing critique of both the deviance and free choice perspectives has arisen. Both the deviance and free choice perspectives assume that prostitutes have a say in their involvement; in the former, the prostitute is an antagonist and stigmatized, while in the latter, the prostitute is a protagonist and hailed. The third perspective dismisses both modes of reasoning and argues that prostitution, in whatever form, can never be voluntary. Prostitutes are victims of their personal and environmental circumstances and they should be helped (Farley & Kelly, 2000). The mere fact that most prostitutes want to get out of prostitution but cannot and that those who engage in prostitution have few options during the onset of their involvement means that prostitution is never voluntary (Davidson, 2002; Farley, Baral, Kiremire, & Sezgin, 1998).

Scholars who follow this reasoning find a strong correlation between childhood sexual abuse and involvement in prostitution (Farley et al., 1998; Vanwesenbeeck, 2001). Many argue that traumatizing experiences during childhood compromise an individual's sense of being and may drive these sexually abused children to view prostitution as a normal activity. As such, their involvement in prostitution is not based on a rational choice, contrary to the claims of the free choice perspective (Farley et al., 1998), but a consequence of their victimization.

Scholars who subscribe to this view also find that most prostitutes are deceived into joining prostitution. Many prostitutes are in dire economic conditions: they are usually jobless and in a state of poverty. This condition is especially true for many individuals in the developing countries (Bamgbose, 2002). Offers for a job and other remunerations usually lure these individuals to accept invitations for work, which later turn out to be prostitution. As such, the push of poverty and the deception involved usually translate into coerced prostitution (Farley et al., 1998).

Scholars who embrace this perspective identify macroconditions that systematically produce prostitution. This includes the system of patriarchy that treats women as second-class citizens (Davis, 1993), brazen capitalism that commercializes the female body (Kuntay, 2002), and religious-cultural beliefs that offer women as sex offerings (Mensendiek, 1997; Orchard, 2007). For example, the tremendous growth of global sex tourism, where rest and

recreational activities are packaged for male business executives in the developed countries to sexually exploit young women in the developing countries, is an example of how patriarchy, brazen capitalism, and perverted sexual beliefs sustain prostitution (Mensendiek, 1997).

Effects of Prostitution

Prostitution as a Fall From Grace

The view that prostitution is a socially and morally deviant act implies that prostitutes are criminals and sinners. One common effect of this perspective is the stigmatization of those involved in prostitution. This affects more than just the prostitute; rather, the stigmatization spreads to individuals associated with the prostitutes like their children and other family members. This negative labeling may also be the cause of long-term involvement in prostitution, as prostitutes who want out may have limited options. For example, employers may not want former prostitutes working for them.

The stigmatization associated with prostitution also makes prostitutes vulnerable to physical attacks. Words like “whore” and “hooker” provoke extreme reaction on the part of some individuals who may take a vigilante attitude of ridding the streets of prostitutes (Lowman, 2000). Likewise, considering that prostitution is illegal in most places, prostitution exchanges may be done in the streets, usually in the dark, where the security of the prostitutes against aggressive clients is compromised (Kurtz et al., 2004). In addition to this, some prostitutes are also dependent on illicit substances, thereby increasing their vulnerability. Thus, cases of homicide, mutilation, harassment, and rape are elevated among those involved in prostitution (Erickson & Butters, 2000; Lowman, 2000).

The deviance perspective also normalizes police misconduct against prostitutes. Since the prostitutes are seen as criminals and “sinners,” the reasoning goes that it is best for the police to handle them with discretionary decisions. Police officers can abuse this discretionary power and may turn it to their personal advantage. There is then little option for the prostitutes, given their marginalized states.

Prostitution as Voluntary or Free Choice

Those who view prostitution as voluntary do not deny that prostitutes are stigmatized. In fact, they decry systematic efforts to stigmatize sex workers because they believe that involvement in prostitution has substantial positive effects. Among these positive effects is the support provided by the sex workers to their families and other dependents. In developing countries, for example, sex workers in the urban areas send their earnings to sustain the needs of family and relatives in the rural areas. Related to this, prostitution as an industry provides income

for the state. When properly regulated, sex workers, pimps, and brothel owners can be taxed on their incomes. It also reduces the number of unemployed people and thus stimulates economic activity.

Those who freely engage in prostitution are also found to have relatively high self-esteem (Vanwesenbeeck, 2001). This is especially true for those involved in high-end prostitution, like the escort service providers who have control in choosing their clients (Vanwesenbeeck, 2001). Generally, studies that assume that individuals willingly chose this trade find that sex work enhanced the workers’ self-worth.

Others argue that due to its functional role (Goodall, 1995), prostitution sustains traditional institutions like marriages. Many adolescent males who explore their sexuality employ the services of professional sex workers. Without these readily available services, adolescent sexual pressures may translate into sexual aggressions like rape and other sex crimes.

Prostitution as Involuntary and Coerced

Studies that subscribe to the perspective that prostitution is involuntary emphasize the mental, psychological, and physical harms inflicted on prostitutes. For example, they indicate that prostituted women experience posttraumatic stress disorder (PTSD), anxiety, depressive symptoms, and other forms of trauma (Farley, 2000; Farley et al., 1998; Surratt, Kurtz, Weaver, & Inciardi, 2005). Anecdotal accounts of young prostitutes show that they have sleepless nights and that their experiences of assault hound them in their sleep. Women saved from prostitution were also found to have difficulty assuming normal lives. Scholars who use this perspective also found that prostitutes often have low self-esteem and exhibit suicidal tendencies (Kidd & Kral, 2002; Risser et al., 2005).

Another negative effect of prostitution is the elevated risk of acquiring HIV-AIDS and other sexually transmitted diseases. Surveys from different locales estimate that positive testing of HIV run from 20 to 80% of all identified prostitutes (Farley & Kelly, 2000). The prevalence of HIV and other sexually transmitted diseases is higher for those who use drugs (Graaf et al., 1995) and for transgender prostitutes. Studies also show that despite efforts to educate prostitutes to use condoms for protection, most prostitutes report that they do not often use condoms (Farley & Kelly, 2000). One of the common reasons mentioned is that customers are unwilling to use them.

Other studies have documented the physical violence inflicted on prostituted women who run away from sex dens. These women are usually victims of organized syndicates and are imprisoned in their place of work. Usually coming from rural areas of developing countries and exported to urban areas in a different country (Bamgbose, 2002; Mukhopadhyay, 1995), the prostituted women rarely get any social support. Worse, they may run into

police systems of the host country, which may be part of organized crime groups.

Views on How to Deal With Prostitution

Given the differing views on the causes and effects of prostitution, there are also competing views on how to deal with prostitution (Phoenix, 2007). This is one arena of major contention among scholars, social activists, and policymakers. Each group has compelling arguments.

Outright Criminalization

Outright criminalization is often the policy position of those who view prostitution from the social and moral deviance perspective. By adopting a strict policy against prostitution, the government is sending a strong deterrent message to would-be prostitutes, organizers of prostitution, and their customers. This policy position holds that by keeping the streets clear of open solicitations of prostitution and other forms of street social deviance like drug peddling and panhandling, other forms of criminality can be eradicated as well.

Proponents of outright criminalization argue that decriminalizing or legalizing prostitution will encourage it. This will simply promote idleness, promiscuity, and risk of infections of sexually transmitted diseases. They also echo the arguments (of those within the prostitution-as-violence camp) that there is a fine line between forced and voluntary prostitution and that those who orchestrate involuntary prostitution (pimps and businesses) hide under the cloak of voluntary prostitution. Thus, this position calls for harsh penalties for prostitutes, clients, and third parties.

Outright Legalization and Decriminalization

Outright decriminalization and legalization is the policy position of those who view prostitution as a legitimate form of work and believe that sex between consenting adults is perfectly acceptable. This policy position argues that treating prostitutes as criminals is a failed and hypocritical social policy. It assumes that, instead of solving the problems associated with prostitution, criminalization has simply corrupted the political and police systems. Proponents note that even the most repressive governments could not eradicate prostitution. This policy position also holds that criminalization simply stigmatizes sex work, thus creating tremendous physical, medical, and health risks for its workers. As such, it is simply pragmatic to openly recognize the existence of prostitution.

Proponent's is of decriminalization and legalization dichotomize between voluntary and involuntary prostitution and concede that their position does not apply to child prostitutes and victims of human sex trafficking. They generally concur that those facilitating involuntary

prostitution must be punished (Bullough et al., 1987). However, they argue that, recognizing that some individuals pursue sex work out of their own free will, the best way to deal with them is through regulation (Goodall, 1995). By placing sex workers in safe environments like inspected brothels, by keeping track of the registered workers, and by mandating regular physical checkups for HIV and other STDs, sex workers and their clients in particular, as well as society in general, will be protected. As mentioned in the Effects of Prostitution section, one of the benefits of a regulated sex industry is the stimulation of the economy. Eleven counties in Nevada, and some cities in Europe, for example, have economies benefitting from regulated sex work.

A Combination Approach

A combination of punishment and decriminalization, *depenalization*, is advocated by those who view prostitution as a form of violence and a human rights violation. This policy position assumes that all kinds of prostitutes, whether voluntary or forced, adult or child, are victims and are in need of help. Thus, they advocate for depenalization of the victims of prostitution (the prostitutes themselves) (Farley et al., 1998; Farley & Kelly, 2000; Robinson, 2006). They also advocate for the provision of psychological, emotional, and financial support to the survivors of prostitution.

However, this policy position takes a very strong stance against customers and facilitators of the prostitution industry. They are against any effort to legalize the so-called voluntary prostitution, as this will only normalize the sex trade. They argue that clients sustain the markets of the sex industry and that police efforts should be centered around them and not the victims. These policy arguments are often presented to international regulatory bodies, as they see the mechanics of prostitution to be cutting across national borders. They press for strong penalties from countries that supply clients and advocate for assistance from countries where prostituted women and children are coming from. They also argue strongly that child prostitution should be considered an economic crime so that children used for sex work can be protected by the international treaties agreed to by different countries.

Conclusion

From the preceding accounts, it appears that prostitution as a social issue is here to stay. With the advent of globalization, particularly, new forms of prostitution appear to be cropping up and are posing new challenges to moral entrepreneurs, scholars, and policymakers.

While the debate about what policies to adopt toward prostitution rages, its harmful effects loom large. Moralists, liberals, and radicals are all agreed, though in varying degrees, that prostitution facilitates the spread of diseases.

As such, short-term stopgap measures have been introduced. In many places, sex workers have been provided free condoms in the hopes that they will not be transmitters of infectious diseases. Some sex workers have also been trained to acquire social skills in order to successfully persuade their clients to engage in protected sex. In some areas that regulate prostitution, prostitutes are required to have weekly medical checkups for STDs.

While these initiatives at the individual and local levels are helpful, they will not be enough to significantly impact the spread of infectious diseases. In most countries in Africa and Asia, for example, the spread of HIV had been intimately linked to the dynamics of prostitution. Success of efforts to distribute condoms and to educate prostitutes on how to use them pale in comparison to the new cases of HIV-AIDS that are reported monthly. It takes more than an individual and localized effort to solve a problem that has economic and social roots.

The ideological differences in how to view prostitution must be transcended, given the need to more proactively effect safe prostitution practices. Not to trivialize the positions of those who view prostitution as work, but their agenda should also include policies to curb the spread of diseases through prostitution. Likewise, the policy positions of either criminalization or decriminalization should also reflect a recognition of this socio-medical reality and not so much the unbending dictates of an ideology.

ELDER ABUSE

BRIAN K. PAYNE

Georgia State University

Since the 1970s, elder abuse has been increasingly recognized as a problem across the world. Attention from researchers first surfaced when Baker (1975) discussed the concept of “granny battering” in British medical journals in the mid-1970s. In the United States, interest paralleled a series of political actions, media exposures, and research reports. In 1979, the House Select Committee on Aging held a hearing called “The Hidden Problem.” Around the same time, an episode of *Quincy*, a late-1970s TV drama series, depicted a case of elder abuse. Katz (1990) argues that the *Quincy* episode built support for the elder abuse agenda and contributed to public demands for changes in state and federal statutes. Also, *The Battered Elder Syndrome* was published by Block and Sinnott (1979) around this time, giving increased attention to problems of abuse encountered by older adults.

Since that time, many have accepted that elder abuse is a problem that needs to be addressed by different disciplines and practitioners. Most agree that the best response to elder abuse involves what is called a “multidisciplinary” or “integrated” response. This means that several different agencies are involved in the prevention of and response to elder abuse. To promote a full understanding of the integrated response to elder abuse, this chapter addresses the following areas: defining elder abuse, identifying elder abuse, and explaining elder abuse.

Defining Elder Abuse

Elder abuse is an underdeveloped area of study. Part of the problem inhibiting the development of research in this area hinges on the lack of uniform definitions of elder abuse. Generally speaking, elder abuse can be defined in several ways:

- Elder abuse as a violation of the criminal law
- Elder abuse as a violation of regulatory law
- Elder abuse as a social construction
- Elder abuse as social harm

Elder Abuse as a Violation of the Criminal Law

In considering elder abuse as a violation of the criminal law, one can evaluate how elder abuse is criminally defined across the United States. The criminalization of elder abuse is a relatively recent phenomenon. This criminalization involves a surge of criminal justice activity in an effort to apply criminal laws in the area of elder abuse. Criminal laws related to elder abuse can be characterized in three ways. These include (1) laws penalizing offenders for crimes against older individuals, (2) laws specific to the treatment of older persons, and (3) general criminal statutes. First, laws that penalize offenders for crimes against older persons

are criminal statutes that call for increased penalties for crimes against persons over a certain age. Known as *penalty enhancement laws*, they provide for stiffer penalties for individuals who victimize older persons. For example, if an offender robs a 30-year-old victim, the recommended penalty might be 5 years in prison. However, if that offender robs an 80-year-old victim, the penalty might be 8 years.

Second, criminal laws regarding the treatment of older persons include laws that specifically apply to this population. Failure to provide care to an older person is one example. Another example involves states that have specific laws covering crimes occurring in nursing homes or other long-term care settings. For instance, stealing from a vulnerable adult might be classified as “adult abuse” or some other phrase in some states’ statutes.

Third, general criminal statutes apply to elder abuse when states do not have specific laws related to elder abuse. If a grandchild abuses his grandparent, this would be called criminal assault in states where elder abuse laws are not provided. Consider as another example a case where a prosecutor prosecuted a contractor under the burglary criminal statutes when he defrauded an older woman. The prosecutor successfully argued that the contractor entered the woman’s home with the intent to steal from her. Entering a residence with the intention to steal is the basic definition of burglary, and thus the general criminal statute was applied.

There is tremendous variation in the way that states criminally define laws related to elder abuse. According to Lori Stiegel (1995), an elder abuse expert who works for the American Bar Association, the complexity and breadth of the criminal law with regard to elder abuse are evidenced by the fact that the state laws vary in at least six important ways: (1) their definitions of elderly, (2) their definitions of abuse, (3) whether the abuse is classified as criminal or civil, (4) their standards for reporting the abuse, (5) how the abuse should be investigated, and (6) their recommended sanctions for the abuse.

Elder Abuse as a Violation of Regulatory Law

Elder abuse can also be conceptualized as a violation of regulatory law. Indeed, there may be instances when an institution or agency harms an older person. In these cases, it is rare that criminal statutes are used to govern or respond to the harmful behavior; instead, regulations developed by state and federal governments are used to guide the response to the abusive activities. As an illustration, consider that an inordinate number of regulations have been developed to govern the way nursing homes serve their residents. Routinely, licensing investigators visit nursing homes to determine whether the institutions are adhering to regulations. Among the common violations cited against nursing homes are that they fail to adhere to the following regulations:

- Make an adequate comprehensive assessment of resident’s needs.
- Store, prepare, distribute, and serve food under sanitary conditions.

- Develop a comprehensive care plan, with measurable goals and timetables, to meet resident’s medical, nursing, and mental and psychosocial needs.
- Ensure that the resident environment remains as free of accident hazards as possible.
- Promote care for residents in a manner and in an environment that maintains or enhances each resident’s dignity and respect in full recognition of his or her individuality.

Note that when nursing homes commit these actions, they are not criminally prosecuted; instead, because the actions are regulatory violations, the institutions are issued a warning or fined if the actions are not reconciled.

Elder Abuse as a Social Construction

Some have also argued that elder abuse is a socially constructed crime. What this means is that the actions are illegal because society says they are illegal. Consider elder sexual abuse. It is illegal for a caregiver (who is unrelated to the elder) to have sexual relations with the care recipient. However, if the individuals were of the age of consent and under the age determined to be elderly, such relations would not be considered as illegal.

There are other ways to view elder abuse as a social construction. For example, certainly the behaviors that are now labeled elder abuse have occurred throughout time. In fact, some of Shakespeare’s writings have included behaviors that are now cited as elder abuse. During Shakespeare’s time, the phrase “elder abuse” had not yet been socially constructed. Today, the phrase is used to describe a range of behaviors that were defined in different ways in the past.

Some have criticized those who have been instrumental in promoting the study of elder abuse as a separate field. Social scientist Stephen Crystal (1987) argued that the area of study broadly defined the phenomenon of elder abuse so as to increase the number of “elder abuse” victims. This was done, he argued, in order for practitioners to justify their careers and agencies and receive funding and resources for their activities.

Elder Abuse as Social Harm

Another way to define elder abuse is as social harm. What this means is that whether the crime is defined in statutes as illegal is insignificant; rather, if an older person is harmed, then elder abuse has occurred. Justifying this approach to understanding elder abuse, in his book *Crime and Elder Abuse*, criminologist Brian Payne (2006) argues the following:

Because many abuses against older adults are not universally defined as illegal, a social harm conceptualization of crime offers a broader base from which we can begin to understand abuses against older adults. This is important because states vary in their definitions of abuse, and it would be virtually impossible to get all to agree on a consistent legal definition of what many refer to as elder abuse. (p. 1)

From this perspective, behaviors that harm older persons can be classified as elder abuse. Such a broad conceptualization includes harmful behaviors at the societal, institutional, and individual levels.

Societal abuses include harmful actions, laws, and policies implemented at the societal level that harm older persons. Institutional abuses include the regulatory violations described above. Individual abuses include a range of behaviors. The most commonly cited forms of individual abuse include the following behaviors:

- Physical abuse
- Financial abuse
- Sexual abuse
- Neglect
- Self-neglect
- Emotional abuse

The way that each of these behaviors can be defined as elder abuse within a social harm framework is addressed below.

Physical Abuse

Physical abuse involves a host of acts that have been committed against elderly persons that range from pinching, slapping, or hitting an older person to committing murder. Five related types of physical abuse have been discussed in the literature: parent abuse, spouse abuse, patient abuse, other violent crimes, and homicides. Parent abuse occurs when an offspring abuses his or her parent. This is among the more commonly reported cases of elder abuse. In these cases, health care professionals or neighbors are the likely reporters, and it is common that the abuser is unemployed and suffering from a drug problem.

Spouse abuse occurs when violence takes place between older persons who are in an intimate relationship. Several patterns have been used to describe elder spouse abuse. Some have noted that it is the result of abuse occurring over the life span. Because abusers do not stop when they become elderly, elder spouse abuse may simply be an indication of a lifetime of violence. Another pattern is that women may become the abusers (after having been victimized by their husbands) once their husbands are physically dependent on them. Also, some experts have noted that elder spouse abuse may occur in second marriages. Difficulty dealing with adult stepchildren, concerns about joint finances, and unfair comparisons to former spouses have been cited as factors contributing to abuse in second marriages. A final pattern is that elder spousal abuse has been attributed to the consequences of dementia.

Patient abuse occurs when a paid care provider physically abuses someone in his or her care. The extent of patient abuse is unknown. Abuse is more commonly attributed to nurse's aides. Originally, it was believed that such abuse was caused by poor training, difficulties dealing with a stressful work situation, and self-defense against abusive residents. More recently, research by Brian Payne

and Randy Gainey (2005) found that a significant proportion of patient abusers were basically predators who had committed prior criminal acts. The need for criminal background checks is being explored by a number of state and federal governments.

Elder physical abuse also includes the range of violent crimes (e.g., robbery, assault, etc.) that can occur at any point during the life course. Robbery is using force or threat of force to steal or attempt to steal another's property. Assault includes attacks with or without weapons that may or may not result in injury. It seems important to note that the majority of offenders reported in these cases involving older victims were strangers to the victims. The Bureau of Justice Statistics (1994) reports that older violent crime victims "are more likely than younger victims to face assailants who are strangers" and that older robbery victims "are more likely than younger victims to be particularly vulnerable to offenders whom they do not know" (p. 2). Further, findings from the National Crime Victimization Survey (BJS, 1994) show the following results:

- People aged 65 to 74 have a higher victimization rate than those 75 or older.
- Older blacks are more likely to be victimized than older whites.
- Elderly persons with the lowest incomes experience higher rates of violence than elderly with high incomes.
- Separated and divorced elderly persons are more likely to be victims of violent offenses than married elderly persons are.
- Elderly victims of violence are almost twice as likely to be victimized at or near their homes.

Homicides are also committed against the elderly, and it is believed that a high number of elder homicides are misdiagnosed as natural deaths each year. Former homicide investigator Joseph Soos has identified the following five types of homicide committed against elderly persons: (1) murder-for-profit killings, (2) revenge killings, (3) eldercide, (4) gerontophilia, and (5) relief-of-burden killings (cited in Payne, 2006). Murder-for-profit killings occur when individuals kill older persons for their life insurance, inheritance, or other profit. Revenge killings occur when individuals kill older persons out of anger toward the older victim. Eldercide occurs when individuals, typically serial killers, have a fascination with killing older persons. Gerontophilia occurs when individuals kill older persons in order to cover up some other crime. Relief-of-burden killings occur when individuals feel overly stressed about the caregiving experience.

A National Institute of Justice study by Erik Lindbloom and his colleagues (2005) found that four factors in elder deaths often result in referrals to the attorney general's office for further investigation. These factors included the following:

Physical condition/quality of care. Specific markers include documented but untreated injuries; undocumented

injuries and fractures; multiple, untreated, and/or undocumented pressure sores; medical orders not followed; poor oral care; poor hygiene, and lack of cleanliness of residents; malnourished residents who have no documentation for low weight; bruising on nonambulatory residents; bruising in unusual locations; statements from family concerning adequacy of care; and observations about the level of care for residents with nonattentive family members.

Facility characteristics. Specific markers include unchanged linens, strong odors (urine, feces), trash cans that have not been emptied, food issues (unclean cafeteria), and documented problems in the past.

Inconsistencies. Specific markers include inconsistencies between medical records, statements made by staff members, or observations of investigators; inconsistencies in statements among groups interviewed; and inconsistencies between the reported time of death and the condition of the body.

Staff behaviors. Specific markers include staff members who follow an investigator too closely, lack of knowledge or concern about a resident, unintended or purposeful verbal or nonverbal evasiveness, and a facility's unwillingness to release medical records (cited in McNamee & Murphy, 2006).

Financial Abuse

According to criminologist Brian Payne (2006), four general varieties of elder financial abuse include exploitation by primary contacts, nursing home theft by caregivers, fraud by secondary contacts, and other property crimes by strangers. Exploitation by primary contacts refers to those thefts by individuals who supposedly have a close relationship with the victim (e.g., children, caregivers, other relatives, etc.). Exploitation is defined in various ways, depending on one's orientation. The exploiter is often a relative of the victim and is in many cases financially dependent on the victim.

One scenario that arises in financial abuse cases is that a time may come when an elderly person must rely on someone else to help with his or her financial matters. The assistance may be limited to providing help paying bills or shopping, or it may be that the older adult will grant power of attorney to a trusted primary contact, thus giving the person the authority to make virtually all financial decisions. As already established, many cases of financial exploitation are those where the victim has placed a great deal of trust in a relative, friend, or caregiver.

Nursing home theft by caregivers occurs when nursing home employees steal from residents. Dianne Harris and Michael Benson (1998) have conducted several studies considering various dynamics related to thefts in nursing homes. Based on their estimates from reported victimizations, they claim that up to 2 million thefts possibly occur in nursing homes each year. Items stolen include jewelry, clothing, and cash. New employees and disgruntled employees tend to be implicated as offenders more often

than other types of employees. Nursing home administrators use a variety of strategies in an effort to curtail thefts. Harris and Benson argue that the premeditated nature of nursing home thefts potentially makes these thefts "worse" than physical abuse. In effect, thieves plan thefts, whereas some cases of physical abuse may be unplanned and reactive in nature.

Fraud by secondary contacts includes offenses committed by individuals with whom the older victim did not have a long-lasting, trusting relationship. These offenses include home repair fraud, insurance fraud, medical fraud, confidence games, telemarketing fraud, and phony contests. Home repair fraud occurs when offenders steal from the elderly by either overcharging or failing to appropriately provide services for which they were contracted. Insurance fraud occurs when offenders convince older persons to buy useless or unnecessary insurance policies. Medical fraud occurs when health professionals charge older persons for unnecessary services. Confidence games occur when offenders con older persons out of their money, usually through some get-rich-quick scheme. Telemarketing fraud occurs when offenders contact older persons over the phone and steal from them through the offer of some particular service or product. Finally, phony contests fraud entails situations where offenders convince older persons to engage in some contest that they have absolutely no chance of winning. To be sure, each of these offenses could also target younger persons; however, older persons are overrepresented as victims. They are believed to have more money and to be more trusting, so offenders intentionally seek out older persons at church, Bingo halls, or other places that older persons are known to frequent.

Other property crimes by strangers include the range of property offenses that can target all individuals, such as larceny, burglary, arson, and so on. Like the "other violent offenses," interesting patterns surround these crimes. Of particular interest are the following estimates from the Bureau of Justice Statistics (1994):

- In 1992, the personal theft and household crime rates among the elderly were the lowest since the NCVS started collecting data in 1972.
- Like the rest of the population, older adults are the least susceptible to violent crimes, but most susceptible to household crimes.
- Those 65 and over are about as likely as younger individuals to be victims of purse snatching and pocket picking.
- Older women are more likely than older men to be victims of personal larceny.
- Elderly black women are the least likely to be victims of personal theft.
- Younger victims of personal theft are less likely to tell the police about the act than elderly victims are.
- Separated or divorced elderly persons are more likely to be victims of personal theft than married elderly persons are.
- Elderly renters are less likely than elderly homeowners to be victims of household crimes.

Other patterns also appear from analysis of NCVS data. For example, among elderly persons, white females are most likely to be victimized by personal theft, followed by white males, black males, and black females. These figures are particularly interesting when compared to rates of violence reported in the official crime statistics. In contrast, among elderly persons, elderly black males have the highest rate of violence, followed by black females, white males, and white females. Thus, elderly whites are more likely to be victims of personal theft, and elderly blacks are more likely to be victims of violent crime.

Sexual Abuse

According to the National Center on Elder Abuse (2005), elder sexual abuse is “non-consensual sexual contact of any kind with an elderly person” (National Center on Elder Abuse, 2006, p. 1). Official statistics suggest that older adults are rarely sexually abused (as compared to younger victims). Even so, interviews conducted by elder abuse expert Holly Ramsey-Klawnsnik (1991) with Adult Protective Services employees show that most, if not all, individuals working in Adult Protective Services have encountered instances of elder sexual abuse. Ramsey-Klawnsnik argues that elderly persons are prime targets of sexual abuse because many are vulnerable and either unwilling or unable to report the abuse. The central premise of her approach to understanding elder sexual abuse is that sexual offenses are more often about power and control, and abusive caregivers find themselves in a position of power. They use sex to maintain the power and subsequently exert even more control over the victim. She further suggests that official statistics underestimate the extent of elder sexual abuse.

Based on this framework, Ramsey-Klawnsnik (1999) cites three types of behaviors that are examples of elder sexual abuse. First, hands-off behaviors include activities where the offender does not touch the victim but does things that are sexual in nature that potentially harm the victim. Ramsey-Klawnsnik cites “exhibitionism, voyeuristic activity, and forcing an individual to watch pornographic materials” as examples of hands-off behaviors (p. 2). Second, hands-on behaviors involve behaviors where the offender makes contact with the victim. Third, harmful genital practices include “unwarranted, intrusive, and/or painful procedures in caring for the genitals or rectal area” (p. 2).

Neglect

Neglect is a form of elder abuse that occurs when individuals fail to provide care to a person for whom they are expected to provide care. Some have argued that neglect is the most common form of elder abuse. Experts cite two types of neglect: active and passive. The simplest distinction between the two forms of neglect has to do with intent. In active neglect cases, the offender intends to neglect the care recipient; in passive neglect cases, the caregiver does not intend to commit neglect—the

offender often just does not know how to provide care to an older person.

Self-Neglect

Self-neglect has been described as the most controversial form of elder abuse. It basically refers to instances where individuals fail to provide care to themselves. Technically, it is not criminal in nature. Older persons would never be sent to jail or prison, or placed on probation for that matter, for failing to take their medication, not eating, hoarding goods, or any other self-neglectful behavior. Still, protective services may be called to intervene in situations where self-neglect is believed to be occurring. It is controversial because self-neglect has been regarded, by some, as ageist. That is, if a younger person engages in self-neglectful behaviors, no formal interventions will occur. If an older person engages in these behaviors, however, the individual may be approached by Adult Protective Services for some form of intervention, which in some cases—albeit rarely—may include institutional placement. While it is not criminal behavior, in *Family Violence and Criminal Justice: A Life Course Approach*, Payne and Gainey (2005) argue that self-neglect is a form of family violence. They suggest that such behavior may be occurring with other forms of abuse. Even if other forms of abuse are not occurring, self-neglect may harm family members who have to witness their loved one not taking care of him- or herself.

Emotional Abuse

The National Center on Elder Abuse defines emotional (or psychological) abuse as the “infliction of anguish, pain, or distress through verbal or nonverbal acts” (<http://www.ncea.aoa.gov>). Although this is the least commonly reported form of elder abuse, the harm from such abuse can be devastating. The range of behaviors include using derogatory language, calling people names they don’t want to be called, isolating them, not allowing them to choose how to spend their time, and so on. In some instances, emotional abuse may be subtle. Consider a case in which a caregiver never lets a care recipient choose what to watch on television. In other instances, the behavior may be more blatant. Consider a case in which a caregiver arranges furniture so that the care recipient cannot move around as easily, or the caregiver moves pictures of the care recipient’s loved ones so they are out of the view of the care recipient. Such behavior certainly falls within the framework of a social harm approach to defining elder abuse.

Identifying Elder Abuse

Estimates from the National Center on Elder Abuse show that a number of different groups are involved in identifying elder abuse. The following estimates show how often different representatives reported suspected elder abuse cases to state reporting systems:

- Health care providers reported 22.5% of elder abuse cases to protective services.
- Family members reported 16% of elder abuse cases to authorities.
- Service providers (including paid and volunteer workers) reported 15% of the cases.
- Friends and family members reported 8% of elder abuse cases to protective services.
- Adult protective services workers reported 6% of cases to authorities.
- Law enforcement officials reported 4.7% of cases to protective services.
- An unrelated caregiver reported elder abuse in 3.3% of cases.
- The victim reported the elder abuse in 3.8% of cases.

Given that just 1 in 25 reports is made by the victim him- or herself, it is imperative that those who are in situations where elder abuse might be present are able to identify the cases. Warning signs are related to types of abuse. One set of warning signs demonstrates the possibility of physical abuse, while other sets of warning signs exist for sexual abuse, neglect, financial abuse, and so on.

The California Department of Justice (2002) classifies warning signs into categories of physical, isolation, and behavioral. Physical warning signs of elder abuse include the following:

- Uncombed or matted hair
- Poor skin condition or hygiene
- Unkempt or dirty appearance
- Patches of hair missing or bleeding scalp
- Any untreated medical condition
- Malnourished or dehydrated
- Foul smelling
- Torn or bloody clothing or undergarments
- Scratches, blisters, lacerations, or marks
- Unexplained bruises or welts
- Burns caused by scalding water, cigarettes, or ropes
- Injuries that are incompatible with explanations
- Any injuries that reflect an outline of an object—for example, a belt, cord, or hand (p. 3)

Isolation warning signs refer to instances when older persons are physically separated from others. Experts suggest that abusers use isolation as a strategy to hide the abuse and promote the victim's dependence on the abuser. Signs of isolation include the following:

- Family members or caregivers have isolated the elder, restricting the elder's contact with others, including family, visitors, doctors, clergy, or friends.
- Elder is not given the opportunity to speak freely or have contact with others without the caregiver being present. (California Department of Justice, 2002, p. 4)

Behavioral warning signs refer to behaviors of the elder or caregiver that indicate abuse. Consequences of virtually any form of abuse may result in victims acting or behaving

differently. Behavioral warning signs for elder physical abuse include instances when the older victim appears to exhibit the following behaviors:

- Withdrawal
- Confusion
- Depression
- Helplessness
- Secretiveness
- Fear to communicate
- Fear in general (California Department of Justice, 2002, p. 5)

A different set of warning signs might arise for other forms of elder abuse. For example, discussing ways that health care professionals can identify financial abuse in *Crime in the Home Health Care Field*, Brian Payne (2003) suggests that the warning signs of financial abuse include the following:

- Sudden changes in banking practice
- Abrupt changes in a will or other documents
- Abrupt and unexplainable disappearance of money or other assets
- Additional names on elder's bank signature card
- Poor care provided although adequate resources available
- Previously uninvolved relatives become involved and make claims to assets
- Unpaid bills although funds are available
- Sudden withdrawal from accounts
- Extraordinary interest by others in elderly person's assets

To be sure, when searching for signs of abuse, individuals should focus on all forms and recognize that it is not their job to determine that elder abuse occurred; instead, it is their job to determine if it *might* have occurred. Investigators are given the task of substantiating the abuse. As an illustration, the American Medical Association suggests that health care practitioners ask the following questions of vulnerable patients who exhibit risk factors for abuse:

- Does anyone hit you?
- Are you afraid of anyone at home?
- Does anyone take things that don't belong to you without asking?
- Has anyone ever touched you without your consent?
- Are you alone a lot?
- Does anyone yell at you or threaten you?

If a patient answers yes to any of these questions, it does not necessarily mean that abuse occurred. However, it does mean that abuse *might* have occurred, and health care professionals or other individuals should report their suspicions to social services.

While signs of elder abuse exist and practitioners are given a set of questions to ask to identify the possibility of abuse, the reality is that elder abuse is drastically underreported. Estimates from the National Center on Elder Abuse

suggest that anywhere from 1 in 5 to 1 in 14 cases of elder abuse are reported. To address underreporting and other issues related to elder abuse, Attorney General Janet Reno asked a group of 27 experts to participate in a round table in October 2000. The round table was titled *Elder Justice: Medical Forensic Issues Relating to Elder Abuse and Neglect*. The panel suggested that elder abuse was unreported and undiagnosed for the following reasons:

No established signs of elder abuse and neglect. There is a paucity of research identifying what types of bruising, fractures, pressure sores, malnutrition, and dehydration are evidence of potential abuse or neglect. This impedes detection and complicates training. Some forensic indicators, however, are known. For example, certain types of fractures or pressure sores almost always require further investigation, whereas others may not require investigation if adequate care was provided and documented.

No validated screening tool. There is no standardized, validated screening or diagnostic tool for elder abuse and neglect. Such a tool could greatly assist in the detection and diagnosis of elder abuse and neglect and would serve to educate and, where appropriate, to trigger suspicion, additional inquiry, or reporting to Adult Protective Services (APS) or law enforcement. Research is needed to create and validate such a focus.

Difficulty in distinguishing between abuse and neglect versus other conditions. Older people often suffer from multiple chronic illnesses. Distinguishing conditions caused by abuse or neglect from conditions caused by other factors can be complex. Often the signs of abuse and neglect resemble—or are masked by—those of chronic illnesses. Elder abuse and neglect are very heterogeneous; medical indicators should be viewed in the context of home, family, care providers, decision-making capacity, and institutional environments.

Ageism and reluctance to report. Ageism results in the devaluation of the worth and capacity of older people. This insidious factor may result in a less vigorous inquiry into the death or suspicious illness of an older person as compared with someone younger. Such ageism may impede and result in inadequate detection and diagnosis, particularly where combined with physicians' disinclination to report or become involved in the legal process.

Few experts in forensic geriatrics. In the case of child abuse, doctors who suspect abuse or neglect have the alternative of calling a pediatric forensic expert who will see the child; do the forensic evaluation; do the documentation; and, if necessary, do the reporting and go to court. This eliminates the responsibility of primary care physicians to follow up and relieves them of the burden of becoming involved in the legal process. It increases reporting because the frontline providers feel like they have medical experts backing them up. Training geriatric forensic specialists to serve an analogous role

should similarly promote detection, diagnosis, and reporting and increase the expertise in the field.

Patterns of problems. In the institutional setting, data indicating a pattern of problems may facilitate detection. For example, the minimum data set (MDS) of information for a single facility or for a nursing home chain may include an unacceptably high rate of malnourishment that—absent an explicit formal diagnosis—should trigger additional inquiry. Similarly, a survey may cite a facility for putting its residents in “immediate jeopardy” as a result of providing poor care. Or emergency room staff may identify a pattern of problems from a particular facility. In these examples, the data itself may be a useful tool in facilitating detection of abuse and neglect. This type of information is accessible not only to health care providers but also to others (U.S. Department of Justice, 2002, p. 2).

Mandatory reporting laws and training have been used to improve the ability of professionals to identify suspected cases of elder abuse. Mandatory reporting laws are those that state that certain professionals must report suspected cases of elder abuse to the authorities (which in most cases means social services). In all, 42 states have some form of mandatory reporting law. Mandated reporters include health care professionals, social services professionals, long-term care employees, criminal justice professionals, financial employees, and other professionals who might come into contact with older persons vulnerable to victimization.

Mandatory reporting laws have both strengths and weaknesses. Supporters of the laws contend that they are necessary in order to offer protection to older persons at risk of victimization. They further contend that the laws offer a strategy to educate different groups about elder abuse. In addition, those who support these laws suggest that they send a message to the public that elder abuse will not be tolerated. Finally, supporters note that the laws offer immunity to those who report in good faith. Consequently, the laws protect reporters, thereby removing their concerns about being sued for reporting misconduct.

A number of criticisms have been levied against mandatory reporting laws. Some have pointed out that the laws were developed based on child abuse models and that there was no evidence that elder abuse dynamics were similar to child abuse dynamics. In addition, the lack of research on the need for the laws has been cited as problematic. Critics also note that the laws are ageist because they assume that at a certain point in the life course, individuals are in need of help. A lack of understanding about the laws also has been offered as a criticism. In addition, some have argued that there is no evidence that the laws work; in fact, some have suggested that mandatory reporting laws create more problems than they solve. Also, some have criticized the laws on the grounds that they are not responsive to the actual dynamics of elder abuse. On a similar point, some have noted that the laws were actually unfunded mandates because no funding came along with the passage of the

laws. As well, the laws have been criticized for being politically motivated as an ineffective strategy to respond to elder abuse. Finally, some have pointed out that the lack of awareness about how to abide by the law has been problematic.

The development and implementation of different training programs has been one strategy to increase adherence to mandatory reporting laws and promote detection of elder abuse. The United States Department of Justice has provided federal funding to support the development of training curricula on elder abuse. The Office for Victims of Crime has distributed the funding so that the training could actually be carried out. The American Probation and Parole Association recently developed a training curriculum to encourage better responses to elder abuse among probation and parole officers. As well, advocates at the local level have developed training packages and programs.

Despite this increased use of training, a number of concerns have made it difficult to train criminal justice professionals about elder abuse. First, the lack of adequate state laws makes it difficult to train regarding appropriate responses. Second, a lack of specific policies and protocols creates situations where curricula are more emotionally driven, rather than empirically grounded. Third, a lack of concern about elder abuse has made it difficult to get police recruits, law enforcement officers, police executives, court officials, judges, prosecutors, probation and parole officers, and other criminal justice officials willing to participate in the training. Fourth, training is typically given a lower priority when funding decisions are made. Fifth, elder abuse training curricula are not truly based on evidence-based practices simply because no such practices have been developed to guide the criminal justice response to elder abuse. Sixth, it has sometimes been assumed that training will improve the response to elder abuse, yet no evidence has actually made this connection. Finally, curricula are often developed that are devoid of criminological theory. Failing to understand the potential causes of elder abuse results in training packages that are destined for problems.

Explaining Elder Abuse

One of the most basic drives of any field of study involves efforts to explain the behavior being studied. Early elder abuse research tended to focus on the following four explanations:

- Intraindividual explanations
- Dependency explanations
- Caregiver stress explanations
- Cycle-of-violence explanations

More recently, criminologists have demonstrated how different criminological theories can be applied to elder

abuse. Criminological explanations that have been applied to elder abuse include the following:

- Deterrence theory
- Strain theory
- Social control theory
- Conflict theory
- Learning theory
- Neutralization theory
- Self-control theory
- Routine activities theory
- Social disorganization theory

In this section, the way that traditional and criminological explanations have been used to explain elder abuse is considered.

Intraindividual explanations suggest that something within either the older person or the offender caused the abuse. For instance, it has been suggested that abusers tend to be unemployed individuals who have drug problems or mental health issues. Among victims, it has been found that dementia and other health-related problems place older individuals at a higher risk for abuse.

Dependency explanations suggest that the care recipient's dependency on the caregiver places the older individual at risk for abuse. Those citing this explanation often refer to Susan Steinmetz's (1988) concept of *generational inversion* to demonstrate how this dependency manifests itself. When individuals are younger, they tend to be dependent on their parents for food, resources, housing, emotional needs, and so on. As the parent ages, and the child does as well, at some point the parent may become unable to care for himself or herself. The parent then may become dependent on the child. While this explanation makes some degree of sense, experts do not all agree that dependency causes elder abuse. Some say that it may cause financial abuse, but it does not necessarily cause physical abuse.

Caregiver stress explanations suggest that abuse occurs because caregivers are unable to cope with the stress that arises from the caregiving situation. From this perspective, it is argued that adult children are not adequately prepared to become caregivers for their parents. When they become caregivers, the burden that comes along with the caregiving creates a situation where individuals may become aggressive in order to cope with the stress. While all agree that caregiving can be stressful, fewer experts agree that stress actually causes abuse. Other factors and dynamics are likely more relevant.

Cycle-of-violence explanations have suggested that elder abuse may be attributed to living in violent families. Initially, it was believed that people who abused older persons were victims of child abuse who were "getting even" with their older parents. Note, however, that no studies have supported this belief. Indeed, it is now believed that child abuse victims, because of the dynamics of their victimization experience, would rarely become the primary

caregiver for their aging parents (e.g., an adult offspring will not be likely to become a caregiver for a parent that was abusive).

The above explanations were the early ones for elder abuse. As criminologists have become involved in studying elder abuse, it has become apparent that some criminological explanations can be applied to the phenomenon. For example, using deterrence theory as a guide, it is plausible that cases of elder abuse continue because individuals are able to get away with their offending with minimal, if any, punishment. Criminologist Brian Payne (2006) has argued that strain theory can be used to understand caregiver stress explanations, and self-control theory can be integrated with the intraindividual explanations. In addition, rather than looking at the cycle of violence specifically, criminologists have suggested an examination of how social learning applies to elder abuse. As well, criminologists have noted that routine activities theory easily applies to elder abuse, particularly in nursing homes. The abuser is the motivated offender, the victim is the vulnerable target, and the lack of criminal justice concern about elder abuse equates to the lack of a capable guardian. Criminologists are also now beginning to apply social disorganization theory to elder abuse. In particular, researchers are considering whether elder abuse is distributed equally across communities.

Conclusion

Compared with other forms of abuse, the study of elder abuse is relatively rare among criminologists. With increases in funding from the National Institute of Justice, criminologists are beginning to pay more attention to elder abuse. To better understand the phenomenon, it is imperative that criminologists work with social scientists and hard scientists from other disciplines. Doing so will help to generate increased understanding about this problem, one that is likely to increase as the proportion of older persons in society continues to grow.

ORGANIZATIONAL CRIME AND ILLEGALITIES

NEAL SHOVER

University of Tennessee

Organizational crime is the violation of criminal statutes committed in pursuit of the goals of legitimate organizations, organizational subunits, or work groups. Individuals and groups commit organizational crime when they transgress not primarily from self-interests but instead in pursuit of organizational ones. Reasons for interest in distinguishing and examining organizational crime begin with the fact that when individuals commit criminal acts, they do so while at work, in their employment roles. In the industrialized and postindustrialized world, overwhelmingly these are situated in organizations, whether they be charitable organizations, universities, religious organizations, military units, or other legitimate organizations. In contrast to crime, *organizational illegalities* are violations of state-enacted and state-enforced rules that do not rise to the level of criminal offenses. They consist primarily of violation of administrative or regulatory rules of the kind that are ubiquitous in modern states. They are regarded as civil violations and typically are met with warnings or minor civil fines. Diverse forms of rule breaking, from the felonious to the unethical, however, almost certainly have their origins in similar organizational contexts and conditions. Industries and organizations where there are high levels of crime almost certainly are places where illegalities are more common also. Historically, the study of organizational crime and illegalities has been seen as part of the effort to understand and explain *white-collar crime* (see Chapter 64, this volume).

One of the principal rationales for distinguishing organizational crime from other types of crime is the heavy financial, physical, and emotional toll it exacts from victims. In marked contrast to street crimes, the cost and impact of some organizational crimes can range into millions of dollars and victimize entire nations. Another reason for isolating organizational crime for study is the fact that organizational properties and dynamics can be autonomous and significant causes of it and the response it elicits. Characteristic features of organizations, from authority differentials and an emphasis on loyalty to task specialization and the situational importance of secrecy, can affect the odds of crime commission. By itself, hierarchy, which essentially provides that some will control the work activities of others, may do so. Organizational arrangements can obscure decision-making participation and dynamics and thereby increase the difficulties of oversight. They also can diffuse responsibility for misconduct, which may facilitate individual willingness to participate. The potential importance of organizational conditions as causes of crime is most obvious where there are long-standing patterns of criminal violation in organizations. In these circumstances, the pathologies of individuals fail as explanation.

The causes of organizational crime need not be confined to the organizations' internal worlds, however; the nature and dynamics of organizational environments also affect the odds of crime. This is exemplified by industries where there is evidence of significant criminality over

many years or where there are recurring cycles of crime and prosecution. The category of organizational crime excludes crime committed in the context and in pursuit of goals of organizations in which crime is the principal means of livelihood and collective success. The crimes of international drug smugglers and other syndicated criminals, for example, are organized, but they are not organizational crime.

Corporate crime is a subtype of organizational crime that occurs in profit-seeking organizations. It is distinguished from the parent category because of belief that criminogenesis is unusually characteristic of corporations and their environments. The emphasis in for-profit organizations, for example, of unalloyed economic calculation coupled with possibly distinctive structural and cultural features are examples of this.

The pages that follow describe sources of data and methods used in studies of organizational crime. They show that both aggregate rates of organizational crime and criminal participation by individual organizations vary substantially. Risk and protective factors that contribute to this variation are summarized and examined, and rational choice theory as an organizing framework for them is demonstrated. This is followed by description of what is known about state and private responses to organizational crime and illegalities. The chapter concludes by examining effects of economic globalization on competition, oversight, and the dominant regulatory approach to illegalities and organizational crime.

Counting and Mapping Organizational Crimes

Few sources of information or data on crime categorize and report information specifically on *organizational* crimes. Most reporting categories instead are based on and reflect statutory crime definitions. Fraud and antitrust offenses are prime examples. This means that investigators interested in organizational crime must construct a picture inferentially, however tentative, of the problem and key aspects of it. Many, if not most, investigators are more interested in corporate crime specifically, instead of organizational crime generally, but the two usually are treated as coextensive. Studies of corporate crime make up by far the largest part of what is known about organizational crime.

Official data on organizational crime and criminals pale in quality, comprehensiveness, and analytic utility beside data on street crime. Through its Bureau of Justice Statistics, the U.S. Department of Justice annually issues a torrent of information on robbers, burglars, drug offenders, and other street criminals. It publishes next to nothing on organizational or corporate crime. Information on illegalities is more bountiful and accessible; annual reports by federal and state regulatory agencies detail the number and types of regulatory violations recorded in the preceding

year. Increasingly, these reports on illegalities are available on the Internet. The net result of shortcomings in data is inability to measure with comprehensiveness or confidence the volume and distribution of organizational crime.

Past research on organizational crime includes a high proportion of case studies. Journalists and academics alike have provided detailed descriptions and post-mortem analyses of some of the most egregious, destructive, and costly organizational crimes. The crimes of Enron Corporation, for example, were the subject of several detailed print media reports, insider accounts, and cinematic productions in the years following its collapse. Industries in which notable crimes or long-term or cyclical patterns of criminality occur have been examined as well. What is often obscured through attention to newsworthy organizational crimes are the mundane organizations and crimes that more typically draw attention from regulators, police, and prosecutors. Case studies are useful, however, for the insight they provide on organizational and interpersonal dynamics that can result in crime. Some shed light also on the dynamics of denial and cover-up.

Explaining Organizational Crime

Rates of white-collar crime vary temporally, spatially, and across organizations. The sources of this variation are matters of considerable theoretical agreement. As an organizing framework, rational choice theory or approaches that are logically compatible with it predominate. Rational choice theory accommodates logically and integrates in a straightforward fashion a range of other theoretical approaches to organizational crime. When crime is viewed as a product of choice, crime results from a decision-making process in which actors balance diverse utilities with their respective potential risks and rewards. The latter are diverse, but where organizational personnel are concerned they include everything from increased organizational profit or market share to increased personal income, while the former includes loss of reputation or income and formal penalties imposed by the state. This in no way denies that contextually remote conditions may contribute to crime occurrence but assumes instead that they are important primarily because of their effects on situationally specific decision making. Discretion resides with the individual and group, which chooses whether or not to transgress. With its focus on decision making, rational choice theory provides a way of understanding how both the world beyond organizations and their internal conditions and dynamics shape the odds of crime.

Aggregate Level

Rational choice theory highlights two principal causes of variation in the aggregate rate of organizational crime: the volume of criminal opportunities, and the size of the

pool of tempted individuals and predisposed organizations prepared to exploit them. Organizational criminal opportunities are objectively given situations or conditions encountered by organizational personnel that offer attractive potential for furthering organizational objectives by criminal means. Understandably, many cluster in the workplace. In geographic areas, at times, or in industries where there are abundant opportunities for organizational crime, correspondingly high rates of it can be expected. Where there is a paucity of opportunities, the rate of organizational crime contracts.

Changes in the forms and supply of organizational criminal opportunities have been pronounced in the half-century since World War II. The onset and developmental pace of the financial services revolution, new technologies for information sharing and financial transactions, the globalization of economic markets, and relationships and state provision of tax incentives and subsidies to businesses vary from one nation to another, but these changes have affected the supply of criminal opportunities around the globe. In 2002 alone, U.S. corporations received \$125 billion in government subsidies.

The size of the pool of predisposed organizations in which individuals are at increased odds of crime commission is a function of (a) economic trends and the level of uncertainty in critical organizational markets; (b) competition over resources and markets; (c) cultures of non-compliance that gain acceptance and legitimacy in geographically circumscribed regions, in specific industries, or in historical eras; and (d) prevailing estimates of the certainty and severity of potential aversive consequences. Fluctuation in the business cycle has been linked repeatedly to changes in the size of the pool of white-collar offenders. Economic downturns depress both income and prospects for the future, which increases fear and competition. As larger numbers of citizens and organizations are pushed closer to insolvency, desperation escalates, which can cause respectable organizational employees to consider behavioral options they normally would find unacceptable. This may be true particularly for entrepreneurs and small businesses operating near the margin of insolvency.

Fluctuations of the business cycle are important also because they complicate and make more uncertain predictions of market trends. To acquire financing, personnel, raw materials, and other resources needed for production, organizations must participate in a variety of markets. Conditions in any combination of these markets may range from financially depressed or unsettled to strong and predictable. When the former is the case, market uncertainty increases. For officers and managers of business firms, this complicates planning, further escalates anxiety, and pushes an increasing proportion toward desperation and crime.

Organizations of all kinds compete with other organizations over the prices charged for their products and also in credit and labor markets. In competitive worlds, progress is

assessed by comparison with peers, and inevitably there are winners and losers. Desire to be the former is fueled in part by fear of becoming the latter. Competition need not be economic, however. Establishing or maintaining respect from peers for exceptional achievement is a priority for many, but humans compete for attention from superiors, for plum assignments, and for possible career advancement. Competition presumably operates also in the realm of nongovernmental organizations (NGOs). Charitable organizations, for example, must compete annually for funds and other resources to meet their operating budgets and philanthropic objectives. The pervasive insecurity generated in competitive environments provides powerful motivational pushes toward misconduct. By elevating and rewarding success above all else, they provide both characteristic understandings and justifications for misconduct. In these worlds, normative restraints are transformed into challenges to be circumvented or used to advantage.

As cultures of noncompliance gain strength and acceptance, they increase the supply of potential offenders by providing to organizational personnel perspectives and justifications that conflict with ethical maxims. Cultures of noncompliance are important because they make available to individuals and groups interactionally permissible rhetorical constructions of illicit conduct. These *techniques of neutralization* excuse, justify, or in other ways facilitate crime by blunting the moral force of the law and neutralizing the guilt of criminal participation. Techniques of neutralization need not be a determinant of decision making in all organizations, however. *Techniques of restraint* are linguistic constructions of prospective behaviors that dampen the proportion of firms where crime occurs by shaping preferences, perceived options, and the odds of criminal choice. Techniques of restraint are publicly spoken admonitions of the like that "virtue is its own reward," "honesty is the best policy," and "protection of the environment is part of our job." The proportionate mix of techniques of neutralization and techniques of restraint is the key determinant of the dominant culture of industries, regions, time periods, and individual organizations.

Prevailing estimates of the credibility of oversight occupy a prominent place in rational choice theory as partial explanation for variation in the aggregate rate of crime. Just as uncertainty rooted in economic conditions, market fluctuations, and cultural support for criminal actions increase the supply of predisposed offenders, weak or inconsistent oversight does the same. This is because the level of commitment to and resources invested in rule enforcement by the state shapes collectively held notions about the legitimacy and credibility of oversight. Oversight by the state and other organizations can take the form of direct observation or impersonal monitoring via periodic audits, television cameras, or computer programs. It can also include policies and programs supported by professional associations and trade groups. When it is widely believed that oversight is unwarranted or too costly, when the odds of detection and sanctioning for criminal conduct

are thought to be minimal, or when penalties threatened by the law or by others are dismissed as inconsequential, the pool of individuals and organizations predisposed to offend grows.

Organization Level

There is little doubt that the incidence of crime and illegalities varies across organizations or that some transgress repeatedly while others do so infrequently or never. Their variable structure, culture, and dynamics are major reasons for this variation. Four aspects of their internal worlds are significant for their potential effects on the odds of crime by executives, managers, or employees of legitimate organizations: performance pressure, doubt about the credibility of oversight, organizational cultures that excuse or permit commission of infraction, and signaling behavior by executives and managers that law obeisance is not an organizational priority. These as well as other organizational conditions present individuals with different understandings and beliefs about the likely consequences of their decisions. By constraining the calculus of decision making in organizational context, variation in these conditions can cause decision makers to believe alternatively that one runs grave risks in choosing crime or that the risks are improbable.

No cause of variation in organizational compliance is asserted with more confidence than belief that pressure and strain produced by the need to meet acceptable levels of performance increase the probability of crime. When the organizational employer is not doing well, and pressure is on to do better, it can embolden or make desperate decision makers and cause them to make choices recklessly. In market-based economies, the need for firms to maintain profitability is of paramount importance; declining income and falling profits are a source of pressure for improved performance. For-profit nursing homes, for example, are significantly more likely than nonprofit ones to deliver substandard care and break the law. Apparently, top-down pressure to meet the bottom line creates incentive to cut corners in patient treatment, to leave necessary maintenance unfinished, and to look the other way in the face of potentially hazardous working conditions. For employees, the source of performance pressure is a combination of organizational and personal determination to succeed.

Largely because of their effects on organizational performance, the dynamics of economic markets and relationships are among the strongest constraints on criminal choice. The relationship between economic conditions and performance pressure, and the supply of potential organizational criminals may be curvilinear, however; severe economic upturns and downturns alike may increase the number of individuals and organizations weighing criminal options. Crime is stimulated during boom times by widespread belief that “everyone is getting rich.” When everyone seems to be doing well, belief that it is foolish to hold back and not engage in the games of the moment

finds broad appeal. Many come to believe that to pass up any opportunity is to miss the boat. Those who choose crime may be emboldened by an assumption that a rising economic tide hides their activities and increases their chances of criminal success. Strong and sustained economic growth can also create both a sense of entitlement to the fruits of a thriving economy and belief that “now is the time to strike.”

Performance pressure is not a condition that occurs only in profit-seeking organizations. All organizations must acquire resources sufficient in quality and price to remain viable if not enhance their level of success. University faculty and researchers, for example, are not immune from performance pressure, and scientific misconduct, some of it criminal, is the result. Faced with pressures to produce new knowledge, publish, and gain promotion and tenure, scientists may tread carelessly or injudiciously along the boundary demarcating the unacceptable. The rapid corporatization of universities in recent decades presumably has increased the prevalence of scientific misconduct by administrators and faculty and possibly the prevalence of crime as well.

Nearly as important as performance pressure as a source of crime in organizations are organizational cultures that cause decision makers to emphasize the importance of goal achievement with less emphasis paid to how this is accomplished. The culture of an organization can make social outcasts of those who behave criminally or welcome them as close colleagues and suitable candidates for increased administrative responsibilities. More than two decades of research are the basis of striking agreement on culture as a “social force that controls patterns of organizational behavior by shaping members’ cognitions and perceptions of meanings and realities” (Ott, 1989, p. 69). Variation in organizational culture has been linked to an array of variables, including financial performance, adaptability, and goal effectiveness.

For the specific and narrow purpose of understanding how it affects the odds of criminal choice, organizational culture is the normative beliefs and shared expectations in an organization or organizational unit. It is well established that some organizational arrangements and cultures are more conducive to compliance than others. Just as the dominant culture of industries, regions, or time periods is determined by the proportionate mix of techniques of neutralization and techniques of restraint, the same is true of organizational cultures. An imbalance in the approved use of either constrains the odds of criminal conduct; where techniques of neutralization dominate, the odds of crime increase, and where techniques of restraint dominate, the odds are reduced.

Another cause of organizational variation in crime commission is the stance on criminal conduct communicated by executives and managers. Differentials of authority are inherent in work organizations; superiors and subordinates are unavoidable aspects of their structure and dynamics. Policies and decisions by executives and managers are

meant to influence subordinates' actions in ways that contribute to organizational success. Evidence is clear that in doing so they function also as moral exemplars for peers and subordinates. This *signaling behavior* by executives, managers, and team leaders communicates to all the degree to which lawful behavior is valued and expected. When they signal to colleagues and employees that misconduct will not be tolerated, the message is not lost. When they fail to insist upon obedience to law, it signals that compliance is not a priority. The result can be a steady if imperceptible growth of laxness and even indifference about ethics and compliance. If superiors treat in a cavalier fashion the standards of ethical conduct, subordinates will be quick to realize that the risks of misconduct for them are reduced as well. In these circumstances, the proportion of managers and employees who are criminally predisposed or tempted grows.

Responses to Organizational Illegalities and Crime

Regulatory Agencies

The regulatory state took shape in the decades before the dawn of the 20th century and consists of semiautonomous administrative agencies created by legislative bodies to oversee chiefly economic activities by corporate firms. An array of these agencies at all levels of government makes up the first line of oversight of potential organizational criminals. Historically, they are charged with promulgating and enforcing rules for the fair and safe conduct of organizational business in specified areas of activities. To accomplish their legislative charge, agencies employ technical staff to provide expertise, attorneys to draft regulations and pursue penalties in cases of serious or long-standing violations, and inspectors to monitor compliance by organizations. Agencies have considerable discretion in deciding how to exercise oversight and respond to violations.

Criticism of regulatory agencies has focused on their proneness to "capture" by the industries and businesses they are created to regulate. *Capture* is the tendency of agencies and their personnel over time to adopt the perspectives and agendas of business and to operate in a more cooperative than adversarial fashion in oversight. Decades of research have shown that agencies for the most part are "paper tigers" that spend their time and other resources disproportionately sanctioning small and midsize businesses. Referrals for criminal prosecution are exceedingly rare.

Investigation and Prosecution

In the United States, several federal investigative agencies have responsibility for organizational crimes, but the Federal Bureau of Investigation (FBI) investigates most cases of suspected organizational crime. During 2006, it

investigated 490 corporate fraud cases resulting in 171 indictments and 124 convictions of corporate criminals. The Environmental Protection Agency's Criminal Enforcement Program investigates the most significant and egregious violators of environmental laws that pose a significant threat to human health and the environment. Organizations can be targets of criminal investigation and stand as defendants in cases where culpable individuals cannot be identified or where the likely cost of prosecuting successfully those who are is considered prohibitive.

The technical challenges of detecting, investigating, and prosecuting organizational crime are several. Many crimes go unreported, either because victims are unaware when they fall prey or because they prefer not to make public their misfortune. Officials who are made aware of organizational crimes may lack the expertise needed to investigate them adequately. Routinely, task forces composed of personnel from multiple agencies are required. Identifying culpable individuals and establishing criminal intent can be difficult. These are chief among the reasons prosecutors frequently opt for civil prosecution and the lower standard of proof required to sustain a successful outcome. They are also among the reasons why primary responsibility for oversight rests with regulatory agencies and the regulatory process. Official campaigns against white-collar and organizational criminals are uncommon, rarely result in significant escalation of sanctions, are applied to few organizations, and generally are not sustained for long.

When they screen cases of reported white-collar and organizational crime, prosecutors pay attention particularly to the number of victims, the extent of harm to them, and whether there was evidence of multiple offenses. They carefully weigh local economic conditions and interests and sometimes elect not to pursue aggressively crimes committed by businesses for fear of harming employment and the local economy. Likewise, concern for possible economic repercussions occurs on a grander scale in crimes where massive financial losses caused by organizational crime potentially could destabilize important financial institutions or markets. At every level and stage of the oversight process, the potential economic impacts affect the way options are weighed. The same occurs in other English-speaking nations where judges are permitted broad discretion in sentencing.

Courts and Sentencing

When organizations are sentenced for committing criminal violations, the range of options available to prosecutors and judges differs somewhat from what is available when individuals are sentenced; incarceration, for example, is not an option, since organizations cannot be confined. In other ways, however, the range of options expands and allows for sentences that either cannot be imposed on individuals or would be illegal or unethical. Other sentencing possibilities available for individuals lack

a similar option when organizations are defendants, but functionally equivalent ones can be employed; organizations cannot be put to death as individuals can, but their license to do business can be revoked, and the effect of this for all intents and purposes may in some ways be comparable to death. Organizations can be compelled to change their internal structures in ways that would not be applicable when sentencing individuals; the latter cannot be ordered to develop a conscience, but organizations can be compelled to establish internal compliance units. The federal guidelines used when sentencing convicted organizations or officers permit sentencing judges to weigh as an aggravating factor the absence of an effective compliance and ethics program.

In 1991, the U.S. Sentencing Commission promulgated guidelines for sentencing convicted organizational defendants. The guidelines establish fine ranges meant to deter and punish criminal conduct, require full restitution to compensate victims for any harm, disgorge illegal gains, regulate probationary sentences, and implement forfeiture and other potential statutory penalties. The organizational guidelines apply to all felonies and serious misdemeanors committed by organizational defendants, but their fine provisions are applicable primarily to offenses for which pecuniary loss or harm can be more quantified (e.g., fraud, theft, and tax violations). In 1995, a total of 111 organizations were sentenced in U.S. district courts, and fine provisions were applicable to 83 of the defendants.

Between 2002 and 2007, there were 1,236 corporate fraud convictions in U.S. district courts (Shover & Scoggins, in press). Published tallies of organizational offenses are limited primarily to financial offenses and fraud, and they generally do not report on other types of crime. Environmental crime is a notable example. In the years 1995–2006, the number of organizational defendants sentenced annually in the United States fluctuated from a low of 45 (2006) to a high of 304 (in 2000). Given the extremely large number of organizations, these numbers seem minuscule and inconsequential.

As compared with what is known about the characteristics of individual white-collar offenders, the picture of *organizational* defendants is much less clear. Data on 601 organizations sentenced in U.S. district courts in 1988 and 1989 show that less than 1% were nonprofit organizations. Closely held companies represented 90.7% of sentenced firms, and 8.2% were publicly traded firms. Fraud and antitrust offenses accounted for 57.2% of all offenses, and environmental offenses comprised 9.3% (Shover & Scoggins, in press). Convicted organizational criminals disproportionately are small and midsize business firms. Apart from the question of whether or not this reflects higher levels of crime in smaller firms, studies in both the United States and other nations suggests that they are more likely than larger businesses to be singled out for investigation and prosecution. As compared with the risks and costs of targeting the large and powerful, criminal convictions or settlements are attained most economically by

concentrating efforts on firms less likely to mount vigorous or sustained resistance. For organizations convicted and sentenced for crime in 1988 and 1989, “the typical case [was] a fraud that [resulted in] a loss of approximately \$30,000” (Shover & Scoggins, in press). These are hardly crimes of the same sort or magnitude as those committed by Enron and other corporate criminals in the past decade, but they almost certainly are more typical of the larger population of organizational crimes; a substantial if undeterminable proportion is unremarkable, if not mundane.

Private Actions: Victims and Informants

As with crime victims generally, citizens and organizations victimized by organizational crime may be unaware of this fact. Because many of these crimes have the look and feel of routine transactions, they may not stand out in victims’ experience. In marked contrast to armed robbery, for example, billing customers for services that were not provided can get lost and remain hidden from victims in lengthy and complex financial statements. Understandably, those unaware of being victimized are in no position to respond to victimization.

The effects of victimization by organizational crime can ripple far beyond its immediate victims to harm others. When organizations dispose of hazardous materials in reckless and criminal fashion, the costs may be increased risk of health problems for innocent parties as well as the financial costs of cleaning up their poisonous legacies. The environmental damage caused by these crimes can make uninhabitable neighborhoods or communities and force the relocation of dozens of families. When victimized by organizational crime, small businesses may be forced into bankruptcy and their employees onto unemployment rolls. Where public bureaucracies are victimized, the larger community of taxpaying citizens may be the ultimate victim. They must pay the fare, for example, when local school districts are charged artificially high prices for products due to price fixing by ostensibly competitive suppliers.

Both individuals and organizations aware that they have been harmed by what they believe are criminal actions by others can pursue civil remedies to recover losses and press for punitive damages. It is impossible to determine from official data on civil litigation how many victims of organizational crime take civil action against organizations on the basis of alleged criminal conduct. *Class action* lawsuits usually are filed by a large number of parties, all of whom believe they have been harmed by a common offender. Class action suits make it possible for parties who otherwise could not afford litigation to pool their resources, form a class, and pursue redress. They originate in all areas of commercial life, including building and construction products, stocks and securities, drug and medical products, and motor vehicle products. In many class action suits, the cost of litigation exceeds the eventual settlement or court award.

Whistleblowers are citizens who divulge to enforcement agencies or personnel their suspicion or knowledge of wrongdoing in an organization. Some whistleblowers are officers or employees who report actions by their employer, but others are outsiders who learn about or observe suspicious conduct and report it. Internal informants and whistleblowers are one of the most important sources of discovery of crimes that victimize organizations. A global survey (Shover & Scoggins, in press) of more than 5,500 corporations found that law enforcement detected only 4% of crimes in which responding firms were victims of economic offenses perpetrated against them. Of the remaining cases in which companies were victimized, 60% learned from informants and 36% learned by accident. The number of firms that were victimized not by individuals but by organizations is not reported.

In the United States, federal legislation provides that whistleblowers can receive a proportion of any settlement or recoveries in cases where they provide key information. This is meant to spur insiders with knowledge of wrongdoing to come forward and report to authorities. Nearly all of the states also have enacted legislation providing employment protection and monetary rewards for whistleblowers.

Whistleblowers are targets of retaliatory and discriminatory actions by many organizations whose suspicious or illicit actions are reported to outside authorities. Organizational officials typically combat their accusations by questioning their motives and character and painting them as renegades. Faced many times with unwelcome notoriety and the financial costs of legal representation to resist retaliatory actions, the experience of whistleblowing can be extremely disruptive of life, work, and career routines. The toll on physical and emotional health can be devastating. Some organizations do not sit by when subjected to public criticism or rebuke; some use their resources not only to bully but also to retaliate against private citizens and civic groups. When they resist these actions, whistleblowers usually prevail, but the financial and emotional costs can be staggering.

Economic Globalization

Globalization designates the increasing number and complexity of political-economic relationships that cross national borders. Economic indicators make clear that it is on the march. Old barriers of time and distance have been obliterated, as technology enables conduct of complex commercial transactions almost instantaneously over enormous geographic distance. As the links between national economies strengthen and expand, and “because capital is at once mobile and in short supply, the desire to attract foreign capital makes it difficult to control a nation’s capital” (Best, 2003, p. 97). Globalization of production and markets is a powerful constraint on oversight, and it has set off a vigorous debate over how nations should respond.

Competition and Oversight

One of the most important reasons for this is another by-product of globalization: increased governmental and business competition for resources and markets. Growing global competition means that what once was commonplace but largely confined to the competitive dynamics of national economies now is produced on a grander scale. The difficulties of controlling corporations were enormous in a world of national economies and corporate actors, but efforts to impose credible oversight on their activities cause firms to locate elsewhere or to threaten relocation. Concern that jobs are in danger contributes to public reluctance to regulate industries and firms close to home. Corporate executives are astutely aware of pressures on governments caused by global competition. They demand access to state funds and weak oversight in return for favorable sitting decisions and permit requirements. This dynamic is played out across the globe as they negotiate with political leaders also for low taxes, low-cost government services, free infrastructure, and limited restrictions on their autonomy. In return, they promise jobs.

Industries and companies in one nation do not take lightly competitive recruitment by representatives of other nations with promises of largesse and pro-business environments unavailable to them. Nor are they willing to accept easily that because home offices are located within the borders, their operations should be regulated and taxed more stringently than companies that keep parts of the company abroad. As pressure to loosen regulatory requirements and oversight intensifies, the challenge of maintaining levels of oversight comparable to what some nations once exercised domestically becomes greater.

In contemporary cross-border exchanges, the variety, scale, and complexity of transactions also are significant barriers to credible oversight. The technical and administrative capacity to do so effectively is within reach of few, if any, nations. The signatories to international trade agreements typically pledge to adopt and enforce in their home countries elementary regulations for environmental protection, worker rights, and product safety, but police and prosecutors generally lack the budget, expertise, and other resources to pursue cases that arise. It seems clear that as oversight becomes more distant geographically and less certain in application, its efficacy suffers. This dynamic becomes more common in a world where state control increasingly is “bypassed by global flows of capital, goods, services, technology, communication and information” (Best, 2003, p. 97).

Self-Regulation and Compliance Assistance

In the closing decades of the 20th century, as economic globalization began increasing rapidly, Western nations witnessed a revolutionary change in the dominant approach to regulatory oversight. Traditionally, regulatory agencies promulgated regulations for their areas of responsibility, maintained an enforcement staff to monitor

organizational compliance, imposed small civil fines on organizations found to be in violation, and occasionally referred for possible criminal prosecution cases of egregious and serious offenses. The underlying justification for this approach is grounded in notions of deterrence. Dubbed “command-and-control regulation” by critics, by the beginning of the 1980s it came under increasing attack and eventually was displaced.

In its place, enforced self-regulation and “responsive regulation” de-emphasizes direct state oversight of production processes with insistence on organizational self-monitoring of compliance and creation of internal oversight mechanisms to ensure it. Common to nearly all the new programs is increasing trust and reliance upon industries and corporate firms for ensuring compliance with regulatory standards. At the same time, efforts are made to involve other parties in the regulatory process; professional organizations, business groups, and community organizations all are seen as playing roles in efforts to minimize noncompliance by organizations. The growth of the new regulatory style means that the state has shifted the bulk of its regulatory efforts to programs to educate the regulated entities about what is required of them and assist them in developing and operating internal compliance programs. Increased competition caused by rapid globalization of economic production and markets is a major factor contributing to the rapid diffusion of responsive regulation.

There have been remarkably few evaluative studies of the efficiency and effectiveness of organizational self-regulation and even fewer that are methodologically rigorous. Admittedly, the claims are not easy to evaluate. The difficulties start with the diversity of activities and processes to which self-regulation has been applied. Health care, machine parts quality, occupational health and safety, financial transactions, and environmental protection are examples. This variation is reason to believe that a straightforward and broadly applicable verdict on self-regulation will not come quickly, but this almost certainly will depend upon industry characteristics, the nature of organizational variation, and official resolve. The lion's share of investigations thus far have been focused on (a) differential receptiveness by corporate managers to self-regulation requirements, (b) the process of adoption and implementation by industries and firms, (c) changes by firms in self-reporting of regulatory violations, and (d) changes in the calculus of compliance decision making by corporate managers. The twin explanatory challenges are to identify characteristics of industries, regions, or time periods that are conducive to or limit adoption and use of self-regulation, and to isolate the characteristics or dynamics of organizations that adopt and employ self-regulation more readily than others.

Conclusion

There are good reasons to believe that a tide of organizational crime is occurring; criminal opportunities have increased as

oversight has not kept pace, and competition is stoked to new intensity by globalization of production and markets. Research into criminal deterrence suggests that the certainty of threatened punishment has a modest deterrent effect, but the severity of threatened punishment has little if any. The severity of penalties imposed on some organizational criminals increased noticeably in the decade before the new millennium, but what is significant about this development is the small number of organizational defendants during the same time period; the certainty of punishment for organizational criminals was and remains strikingly low. The small number of organizations prosecuted for and convicted of crime by the United States courts casts severe doubt on the deterrent effectiveness of current levels of punishment. The combined effects of this and the movement toward programs of cooperative regulation likewise give reason for doubt.

HUMAN TRAFFICKING

CLAUDIA SAN MIGUEL

Texas A&M International University

Human trafficking is arguably one of the most profitable transnational crimes today. According to Farr (2005), the sale of human beings is believed to be a \$7 to \$12 billion industry and ranks third, after the sale of drugs and arms, as the most lucrative international and illegal enterprise. There are some scholars who contend, however, that human trafficking may eventually surpass the net profits yielded from the sale of drugs and weapons (Farr, 2005; Shelley, 2005). Because drugs and weapons have a finite usage while humans can be sold multiple times, profits for the sale of humans accrue seemingly infinitely depending on how many occasions a sale is made.

The sale of humans is also one of the most deplorable crimes. Yet, it is not only a 21st-century phenomenon. The exploitation of humans, including the mass transportation of people from Africa to the Americas during the 18th century, has a rich history in the United States (Bales, 2005; Gozdzik & Collett, 2005).

Although slavery was abolished in the United States with the passage of the Thirteenth Amendment in 1865, the practice of selling and exploiting the will of humans continues to occur (Bales, 2005). In fact, the United States is ranked among the top five countries where human slaves are sold and exploited for labor or sexual purposes (Mizus, Moody, Privado, & Douglas, 2003). In 2000, the United States enacted legislation to stop the sale and exploitation of human beings. The law (Victims of Trafficking and

Violence Protection Act of 2000) prohibits both sex trafficking and labor trafficking. Sex trafficking involves the recruitment, harboring, transportation, provision, or obtaining of a person for the purpose of a commercial sex act (e.g., a transaction where money or other items of value are exchanged for sexual services) in which the act is induced by force, fraud, or coercion, or in which the person forced to perform such an act is under the age of 18. In contrast, labor trafficking is the recruitment, harboring, transportation, provision, or obtaining of a person for labor services, through the use of force, fraud, or coercion, for the purpose of subjection to involuntary servitude, peonage, debt bondage, or slavery (U.S. Department of State, 2008). While sex trafficking usually involves the forced prostitution of men, women, or children, labor trafficking can include situations where men, women, or children are forced into servitude in virtually any type of occupation such as domestic service (e.g., maids), restaurant work, janitorial work, sweatshop or factory work, and agricultural work. In simple terms, human trafficking is the sale and enslavement of human beings where, after being bought and sold multiple times, they are forced to labor against their will.

Globally, 4 million people are believed to be victims of this crime each year (Farr, 2005). Nationally, the U.S. Department of State (2008) estimates that 600,000 to 800,000 people are trafficked into the United States annually. The size and scope of this worldwide concern is difficult to truly estimate. Trafficking in humans is generally a

clandestine crime that tends to remain hidden from police authorities. Thus, scholars reason that more victims fall prey to this crime than is estimated by official government statistics (Laczko & Gozdzik, 2005). However, there is enough information to confirm that men, women, and children become vulnerable victims of this crime every day in virtually every country across the world.

There are many factors that contribute to this large-scale and covert problem, most of which are felt across the globe, such as economic and political instability, massive worldwide poverty, and the disenfranchisement of groups of individuals (Bales, 2005; Farr, 2005; Scully, 2001; Shelley, 2005). However, individual motivation to engage in a highly lucrative criminal enterprise coupled with law enforcement's difficulty in identifying victims and offenders make this crime very appealing to criminals who contemplate tax-free rewards and the likelihood of apprehension. The purpose of this chapter is to present a historical and contemporary assessment of human trafficking as well as discuss ways in which victims are recruited by those who make it their livelihood to sell and enslave human beings. Factors that contribute to modern-day trafficking of humans as well as offender, victim, and consumer/customer characteristics will be identified. Finally, the difficulty in identifying victims of this crime will also be explored along with the criminal justice system's response to human trafficking.

Historical and Modern-Day Slavery

Although human trafficking is described as the modern-day form of slavery, the practice of selling and enslaving humans is not a new occurrence. Ancient Egypt, for instance, used slaves to build its immense pyramids. Portugal, during the 15th century, bought and sold slaves from Africa and Europe. In the 18th century, the Transatlantic Slave Trade between Europe, Africa, and the Americas facilitated the sale of humans sometimes in exchange for weapons and molasses (Bales, 2005). The history of the United States is also immersed in slavery. Prior to the Civil War, it was not uncommon for southern plantation owners to sell their slaves at public auction. Although not yielding large profits, the sale of slaves was an established business, since they were so desperately needed for the economic subsistence of the South. Slaves were considered an inexpensive and dependable source of labor, albeit a forced and exploitative one. The passing of the Thirteenth Amendment, which abolished slavery in 1865, finally put a stop to the physical and sexual abuse endured by slaves in the United States.

Kevin Bales, author of *Understanding Global Slavery* (2005), argues that historical examples of slavery in the United States pale in comparison to contemporary examples of human trafficking. Though he does not negate the fact that pre-Civil War slavery was appalling, he contends

that at least southern slaves were considered valuable resources for plantation owners who were generally unwilling to quickly dispose of their revenue-making commodities. Thus, minimal steps were taken by slaveholders to maintain the existence of slaves, although with gross negligence. Today, victims that fall prey to human trafficking are usually considered disposable. Most victims are sold multiple times to multiple customers, and there is little attempt by traffickers or customers to maintain their well-being.

Though the above examples mainly demonstrate early instances of labor trafficking, sex trafficking also has an extensive history. Scully (2001) states that the history of human trafficking, particularly sex trafficking, can be divided into three distinct time periods: (1) the 1840s to the early 1890s, (2) the late 1890s to World War I, and (3) 1919 through World War II. During the first time period, the demand for indentured servitude around the world coupled with the mobilization and migration of non-Western males fueled the trafficking of humans. Places such as India, Burma, and Ceylon (present-day Sri Lanka, an island to the southeast of India) needed indentured slaves to help extract gold and diamonds from mines and for construction projects like railroads, while places such as Hong Kong, Singapore, and the cities of Shanghai and New Delhi became popular destinations for indigenous as well as foreign businessmen pursuing commercial endeavors. Poverty and economic depressions experienced by such locales as India, China, Japan, Vietnam, Indonesia, and the Pacific Islands additionally created not only a willing supply of migrants traveling in search of employment opportunities but also criminal entrepreneurs eager to make a profit by facilitating the sale and transportation of the most vulnerable groups of humans. The convergence of these factors generated a transnational sex market.

In the late 1890s, prostitution migratory routes became more prominent throughout Asia, the Middle East, the Americas, and Europe. Prostitution rings also became more organized. However, sex markets were highly stratified. Factors such as the race, ethnicity, and nationality of prostitutes were elements that determined not only their market value but also the type of employment environment for which they could dispense their sexual services. American and European women, for example, commanded an elite status and thus tended to set up their own business ventures, whereas Chinese women were driven into brothels owned by organized criminal groups.

The stratification of prostitution, particularly for those not in the privileged status and not controlled by a criminal organization, forced prostitution onto the streets, making it more visible and controversial. As a result, various civil and social organizations formed coalitions to end prostitution, regardless of whether sexual services were sold in high-priced brothels or on the street. The London National Vigilance Association (LNVA), for instance, rallied against what it called the "white slave trade"—the

coercion and forced prostitution of European women. Although some European women voluntarily chose such a profession and traveled across the world to establish bordellos, the LNVA sustained support from other coalitions in Germany, Holland, Denmark, Sweden, Russia, Belgium, France, Switzerland, and Austria. Support was so strong that an international agreement was signed in 1904 by several countries to address the white slave trade. The signatories of the agreement pledged to (a) establish a central repository to collect information on the number of European women forced into prostitution as well as share such information, (b) remain observant at ports of entry by asking women to declare their nationality and reporting to authorities which European women were forced to travel to foreign countries to engage in prostitution, and (c) supervise brothels to ensure that European women were not employed in such establishments.

The 1904 international agreement had no provision declaring the sale, transportation, and forced prostitution of European women illegal. Accordingly, the agreement served only to call attention to the problem and to reveal a racial divide. As noted by Scully (2001), 99% of prostitutes were women of color, yet the agreement made no attempt to protect them. It was not until 1921 that women of color were included in international agreements to combat forced prostitution or trafficking. It was also in 1921 that a new international agreement was signed by the League of Nations (now known as the United Nations), advocating for the prosecution of any person who trafficked women or children; however, despite international agreements, little changed in terms of eradicating prostitution. Even though there was more vigilance of forced prostitution by anti-trafficking coalitions, the demand for sex markets continued. Also, despite the universal consensus that no person should be coerced or forced into prostitution, there continued to be a lack of consensus around the world regarding the abolition of prostitution as a whole. There were some countries who opined that prostitution, so long as it involved the consensual exchange of services for money, should be legal.

Though the migration of prostitution was affected by the relocation of male businessmen (legitimate and illegitimate) throughout the world during the first and second time frames identified by Scully (2001), prostitution and sex trafficking were also affected by the deployment of troops. This was the case during World War I and also World War II. Farr (2005) notes that military troops have engaged in the rape of many women while deployed in foreign countries. In her book, *Sex Trafficking: The Global Market in Women and Children*, she writes that General Patton during World War II was believed to have told an aide that despite efforts to stop “wartime raping” (p. 165), it was an inevitable occurrence during warfare. The deployment of troops also contributed to establishment of brothels to provide the soldiers with access to prostitutes. Farr notes that some militaries around the

globe, including that of the United States, often organize “recreational prostitution” sites to reduce wartime rape. In fact, from the 1950s to 1970s, the United States together with South Korea agreed to set up R&R (rest and relaxation) centers, which at times entailed prostitution. D. M. Hughes, Chon, and Ellerman (2007) estimate that “over 1 million Korean women were used to service U.S. troops since World War II” (p. 904).

Today, the exploitation of humans for various types of labor and sex continues to thrive. Humans are used for a variety of servitude, including the following:

- Farm labor
- Domestic work and child care (domestic servitude)
- Begging/street peddling
- Restaurant work
- Construction work
- Carnival work
- Hotel housekeeping
- Criminal activities
- Any form of day labor

In the United States, prostitution is the most common form of trafficking, followed by agricultural work (U.S. Department of State, 2008). Prostitution is also the most common type of trafficking worldwide. Globally, as well as in the United States, women are most often victims of human trafficking followed by children, primarily girls (United Nations Office of Drugs and Crime [UNODC], 2006). Children are most often used in sex tourism operations. Sex tourism involves the enticement to travel abroad for the sole purpose of engaging in sexual escapades, usually with minors. Mexico and Latin America have been locations where sex tourism, particularly with children, has been occurring. It is estimated that 2 million children are forced into prostitution for the purpose of providing services to foreign travelers (U.S. Department of State, 2008). Children are also used for organ trafficking. It is not uncommon in locales such as India for children to be abducted, nurtured, and then killed for the sole purpose of selling their organs to the highest bidder. However, the sale of organs is so lucrative that some adults around the world consent to sell their organs so that they may be shipped to other countries (N. Hughes, 2000).

It is important to note that although human trafficking is generally a transnational crime, the U.S. Department of State (2008) believes that thousands of children in the United States are trafficked within the borders of the country. Similarly, other countries report incidences of internal or domestic human trafficking, where victims are sold and enslaved in their own country. For prosecution purposes in the United States, human trafficking is said to have occurred when a person is coerced or forced to labor against his or her will, regardless of the distance from where the victim was bought or sold to where he or she is eventually compelled to work. In fact, moving a person

from one location to another is irrelevant to a determination of whether a crime of human trafficking has occurred. The only relevant factors are whether the person was coerced or forced to labor against his or her will and whether the person is allowed to leave or flee his or her place of employment.

Recruiting Victims of Human Trafficking

Human trafficking is an elaborate crime that generally transpires over time. As will be discussed later, factors such as global political and economic instability in certain regions of the world, together with large-scale and epidemic instances of poverty and disenfranchisement of entire groups of people, contribute to making humans vulnerable victims of human trafficking. Because of these factors, it becomes too easy to trick individuals into believing that employment opportunities abroad will help alleviate their economic woes. Most victims of human trafficking are recruited and convinced to seek employment, usually in a foreign country (Farr, 2005). Recruiters are all too often acquaintances and friends from their town and sometimes even their spouse or significant other. Promises of a better life are used to deceive victims who already desperately long for a way to financially provide for themselves and usually for their families as well. At times, victims are recruited through advertisements in local newspapers. Again, the ads convey opportunities to work abroad as domestic servants, cooks, models, dancers, and anything else that would entice a person to answer such ads.

At first, those victims recruited for employment abroad are treated as valuable assets. The recruiter will usually take them to an established travel agency, and steps will be taken to prepare their visas for travel. Some victims may be asked for a down payment to aid in their travel, but most are told by the recruiter that a payment must be given after their first month of employment to cover the expenses of travel and the preparation of visas. Once the recruiter has finalized travel plans, another person in the trafficking operation will accompany the victims to their respective places of destination. Little do the victims know that their chaperone is in fact simply protecting the human cargo and preventing their escape. After reaching the place of destination, the victims will be delivered into the hands of their employer who will conduct an inventory of the human goods and assign them to work in various types of employment. The employer will also ask victims for their passports, visas, and any other type of identification under the guise that he or she will place them in a safe location.

With passports and visas confiscated, victims begin to realize that their promise of legitimate employment and a better life was false. Their employers will be quick to inform them of their enslavement and conditions of their occupation, usually in the sex industry. Threats of physical

violence and actual violence will be used to temper defiance. Victims will be told of an impending and accruing debt (e.g., rent, medical expenses, food, etc.), which they must pay through forced labor. Most victims will be sold, but their new employer will recount a similar tale of debt bondage and slavery. Although victims will be told that after paying their debt, freedom will be a reality, most will not be released. Most will also contract sexually transmitted diseases and turn to drugs and alcohol for comfort. Some will die trying to pay their debt or die trying to escape.

It is important to consider that in cases where victims are recruited through promises of a better life, some may consent to the initial offer to travel abroad, even if it means they will have to lie to authorities about their immigration status once they reach their country of destination. Some victims may pay for fraudulent documents. A few may also consent to work in the sex industry as exotic dancers and prostitutes. However, these victims do not consent to exploitation and forced labor. The U.S. law against trafficking states that consent is irrelevant to a determination of whether the crime of human trafficking has occurred.

Although most victims are recruited, some victims are abducted. Refugees and displaced individuals are prime targets. Most will be drugged and transported to faraway places. Nonetheless, they will soon realize that freedom is a distant reality and that forced labor is their destiny. Many children, after the Tsunami of 2004 in Indonesia, entered the human trafficking trade in this manner (U.S. Department of State, 2008).

Power and control of victims are keys to a successful trafficking enterprise. Violence and the threat of violence are essential, but psychological techniques are also powerful. Fear of retribution to the victim or family members quells attempts to escape and disobedience. Fear of deportation is also a way to maintain order, since victims are without passports and essentially at risk of being apprehended by authorities and sanctioned. It is not unusual, after months of enslavement, for victims to lose their will to even think about escape. "Stockholm syndrome" (loyalty to the hostage taker) will set in, and soon establishing compliance to the wishes of traffickers is an easy task (Aronowitz, 2001; Bales, 2005; Beeks & Amir, 2006; Farr, 2005).

Major Contributing Factors to Human Trafficking

Human trafficking is based on the simple economic principles of supply and demand (Shelley, 2003). Global poverty is one of the major contributors to human trafficking because it creates a vulnerable supply of victims. Conversely, the economic prosperity experienced by some countries over the last few decades has created vast wealth and exorbitant incomes for some individuals, with enough earnings to demand a market in the sale of humans (Farr,

2005). Globalization, political instability, civil unrest, culture, the disenfranchisement of certain groups, and of course the revenue to be made from selling humans are all factors that contribute to this global problem (Raymond & Hughes, 2001). Other reasons for its prevalence may be due to the belief that there is a relatively low risk of being apprehended and punished. Law enforcement preoccupation with stopping the sale of weapons and drugs and with terrorism leaves criminals with the impression that human trafficking laws will not be enforced and that their chances of being arrested and incarcerated are minimal at best (Shelley, 2005). Thus, this false sense of security also drives the willingness of traffickers to continue their economic venture.

Globalization is generally defined as the increased connectivity between countries around the world, so much so that changes in the economy of one country, or changes in any other area such as in government or government services, have the potential to affect all those who inhabit this world (Bales, 2005; Shelley, 2005). For instance, the advent of the Internet, the ease of travel or transportation between countries, and the fusion of world markets are all factors that affect this connectivity, which means that globalization can be thought of as global interdependency. There are some scholars, such as Shelley (2005), who believe that the North American Free Trade Agreement (NAFTA) and other such agreements that deregulated trade between countries contributed to an increase in transnational crime. Perhaps the first illegal business to profit was the sale of drugs, followed by the sale of weapons, and then the sale of humans. They believe so not only because these agreements facilitate the flow of goods (though not intentionally the flow of illegal good such as drugs, arms, and humans), but also because free trade agreements have a see-saw effect on global economies. Some countries will inevitably experience growth and economic prosperity as the result of open trade markets, while others will experience economic despair. For those countries in the latter category, illegal enterprises might be one solution to individuals' economic desperation. For others, economic desperation makes them vulnerable to human trafficking, since most victims fall prey to this crime out of a belief that the trafficker will provide them with a better life. In sum, free trade agreements economically marginalize some countries to a point where illegal activities seem to be one of the few constant methods to make a living.

Economic marginalization of countries tends to affect women more than men—a sort of disenfranchisement of women. A shortage in legitimate employment opportunities means that only a few will be able to work. Those few are usually men, which leaves women facing severe poverty and extreme vulnerability. Also, economic marginalization means that countries will not be able to sustain most governmental services such as educational opportunities for all. Women again will be left out of the only available chances to receive an education. With little hope of finding

employment in their countries, some women decide to take their chances at finding occupations abroad. Also, with little or no education, these women have no awareness of the dangers of human trafficking. The economic despair that occurs for women due to globalization has been referred to by some scholars as the *feminization of poverty* (Shelley, 2003, 2005), a term coined by Diana Pearce in 1978.

However, there are other scholars, such as Aronowitz (2001), who are of the opinion that political instability contributes to human trafficking. The fall of the Soviet Union in the 1990s is a prime example. Civil warfare in the region created people willing to sell humans for profit and to fund their political ideologies as well as fund their need for arms. Civil warfare also created destitute individuals vulnerable to be trafficked. The inability of the tumultuous government to provide citizens with basic necessities created a spiraling feminization of poverty in the region. There were some who fled the country only to fall prey to human trafficking schemes in other countries. For instance, many people fled the crumbling Soviet Union to the newly independent states formed as the result of the collapse, only to find that places such as the Ukraine, Uzbekistan, and Kazakhstan are rife with human trafficking operations. Communism, according to some scholars, may have been beneficial to the citizens of the former Soviet Union because at least the government provided just enough resources to keep a large segment of the population from abject poverty and to keep the feminization of poverty from spinning out of control (Shelley, 2005).

Today, Indonesia and Cambodia are both undergoing political instability. Both have been identified by the U.S. Department of State (2008) as hot spots for human trafficking. China has also been identified as a country with significant threats to human dignity since it experiences a large influx of refugees from North Korea, Vietnam, and Burma. Most of the refugees are women and children in search of a better life and easily deceived into believing that economic prosperity awaits them in their destination country. Thousands of children are believed to be forced to labor against their will in China, and most are beaten by their employers to prevent escape.

As mentioned, political instability and civil war contribute to human trafficking because they also cause people to flee regions and countries. Refugees and people displaced from their homes, in general, are vulnerable to human trafficking usually because dreams of a better life cloud their judgment regarding employment opportunities (Farr, 2005). Of course, most of these individuals are deceived into believing that employment opportunities are legitimate. Natural disasters such as the Tsunami in 2004 that affected Indonesia, Sri Lanka, Thailand, and India, contributed to substantial displacement of people. The unfortunate occurrence, however, created a perfect situation for traffickers. Reports indicated that a large percentage of children became victims of human trafficking as the result of this natural disaster (U.S. Department of State, 2008).

Culture also plays a role in human trafficking. There are some countries in Africa that practice what is known as child fostering (Bales, 2005). This means that underprivileged families that cannot otherwise provide an education for their children send them to live with relatives in hopes that the children will be educated or at least learn a trade. Some parents may even send their children to stay with nonrelatives. Every so often, relatives or nonrelatives will sell the children because the burden of taking care of them has taken a toll on the economic livelihood of the family, or they will sell them simply to make a profit. In some developing countries, abject poverty coupled with the need to ensure that daughters marry for the sake of alleviating the economic burden on the family make daughters vulnerable to human trafficking. Farr (2005) reports that in Nepal, for example, this type of trafficking is common.

All of the above factors (poverty, globalization, economic marginalization, the feminization of poverty, political instability, civil war, natural disasters, and culture) are also referred to as the *push factors* of human trafficking because they all serve to push the most vulnerable individuals into positions where the likelihood of becoming a victim is high. However, human trafficking also has *pull factors*. These are the factors that contribute to the massive transportation of humans from one side of the globe to the other. Wealth, economic prosperity, and countries willing to look the other way regarding the hiring of illegal immigrants are just a few examples of pull factors. Germany, Greece, France, Belgium, Italy, and the United States are all top destination countries for human trafficking victims (Mizus et al., 2003).

Global Transportation Patterns

Because human trafficking is driven by the rudimentary principles underscoring supply and demand, certain parts of the globe have been found to serve as sites of origin, transit, and destination for victims. UNODC (2006) has determined that there are several notable worldwide trafficking patterns or routes through which victims are transported and then sold. The continent of Africa, for instance, has been identified as a place of origin for victims of human trafficking, which means that victims are recruited or abducted from locations such as Nigeria, Benin, Ghana, and Morocco. They are then shipped across the world to locations where the demand for cheap labor or sexual services exists. Africa, however, is also a transit and destination country, meaning that although the countries listed above recruit many victims, they also serve as midpoint locations for traffickers whose distant and far-ranging transportation schemes necessitate a temporary rest stop as well as locations where victims finally learn their fate and are forced to labor against their will.

Asia also has been declared as a significant supplier of victims. Countries such as China and Thailand are considered core providers of trafficking victims as are countries

such as Cambodia, India, Laos, Myanmar, Nepal, Pakistan, the Philippines, and Vietnam. These countries, however, have also been identified as destination countries. Thus, Asia is a region of origin and a destination. Central and Southeastern Europe is predominately an origin subregion. Victims trafficked out of this subregion are sold to Western Europe. In particular, Albania, Bulgaria, Lithuania, and Romania are considered prime countries of origin, followed by the Czech Republic, Estonia, Hungary, Latvia, Poland, and Slovakia. On the other hand, Belgium, Germany, Greece, Italy, and the Netherlands, all countries in Western Europe, serve as destination sites for victims trafficked from Central and South Eastern Europe. Latin America and the Caribbean, particularly Brazil, Colombia, Dominican Republic, Guatemala, and Mexico, are also regions of origin.

Although all of the above-mentioned countries in Africa, Asia, Central and Southeastern Europe, as well as South America, are both origin and destination sites, most trafficking victims are supplied by Belarus, Moldova, the Russian Federation, Ukraine, Armenia, Georgia, Kazakhstan, and Uzbekistan. These countries are rarely places of destination for victims.

These trafficking routes exemplify that countries that supply victims of human trafficking are generally those undergoing political and economic instability, while the countries that demand the sale of humans are those experiencing modest or considerable wealth and prosperity.

Traffickers, Their Victims, and the People Who Buy Humans

Although worldwide data on offenders, victims, and customers are limited, the UNODC (2006) recently compiled a profile of both offenders and victims based on information provided by various law enforcement agencies, government reports, nongovernmental organizations (NGOs), research reports, and media reports.

Offender Characteristics

A significant number of people who earn a living buying, transporting, and selling humans live and conduct their illegal business from the following list of countries (listed in descending order based on frequency of either criminal convictions or research findings from the sources listed above):

- Russian Federation
- Nigeria
- Ukraine
- Albania
- Thailand
- Turkey
- China

- Poland
- Bulgaria
- Germany
- Italy
- Lithuania
- Mexico
- Romania

Surprisingly, human trafficking operations are not exclusively male-operated. There are schemes operated by both men and women, and there are also men-only and women-only operations. There are also husband-and-wife operations and sibling operations. It is not uncommon for traffickers to know their victims. In fact, most victims are deceived by the promise of a better life from acquaintances, neighbors, and even family members who then sell them into the sex trade. The U.S. Department of State (2008) indicates that recruitment of victims is sometimes done by spouses/boyfriends.

There is no requisite age to become a trafficker. Because of the large profits to be made, individuals as young as 15 years of age may be engaged in the sale of humans. In Latin and South America, for instance, it is not unusual for teens to set up an illegal business in the sale of other teens as well as children as young as 8 years of age. For older traffickers, it is quite common for them to have an extensive criminal past and diversify their illegal activities by also engaging in immigration fraud, money laundering, extortion, gambling, check forgery, child pornography, and drug trafficking.

In many cases, human trafficking can be linked to organized criminal syndicates such as the Russian Mafia and the Chinese Triads. Indeed, Finckenauer (2001), who has studied the link between human trafficking and organized crime, believes that all transnational crimes, such as the sale and transportation of humans across the globe, require a bit of planning, organization, skills, and other resources to carry out the criminal venture. Nonetheless, involvement in a specific and identifiable criminal organization is not necessary. All that is needed is a network of loosely organized individuals, all with specialized criminal skills. For instance, Farr (2005) notes that the network usually has the following types of personnel:

1. Recruiter: a person who finds vulnerable victims, usually from his or her own town or village
2. Travel agent: a person to facilitate travel for victims to other countries
3. Document thief/forgery: a person whose specialty is to steal or create false documentation
4. Employer: a person who initially purchases and then sells humans to customers
5. Enforcer: a person who protects the employer from police and who keeps victims from escaping

Scholars are of the opinion that a large portion of human trafficking is carried out by criminal networks or associates with no history of belonging to well-known

criminal organizations (Finckenauer, 2001). These associates may live and engage in criminal activity in different parts of the world, but they coalesce to sale and transport humans around the globe.

Characteristics of Victims

The following are the most frequently mentioned countries of origin for victims (in descending order):

- Ukraine
- Russian Federation
- Nigeria
- Albania
- Romania
- Republic of Moldova
- Bulgaria
- China
- Thailand
- Czech Republic
- Lithuania
- Poland
- Belarus
- Latvia

From a regional perspective, the Commonwealth of Independent States (which consists of 12 countries formed after the collapse of the Soviet Union, including Belarus, Moldova, the Russian Federation, Ukraine, Armenia, Georgia, Kazakhstan, and Uzbekistan) is where the most victims are recruited or abducted globally.

Again, age does not seem to be a significant factor in determining who is more likely to become a trafficked victim. But, it is believed that most victims are adult women and minors, primarily girls younger than 17 years of age. Men comprise the smallest category. It is important to note, however, that much less is known about male victims of human trafficking. Because trafficking is a clandestine crime that is underreported and because labor trafficking is not perceived to be a grave offense when compared to sex trafficking, male victims are often a forgotten population. Thus, even though statistical reports regard male victims as a small population, this may not be entirely accurate. In addition, in some countries human trafficking is a gendered crime, meaning that men who are exploited for sexual or labor purposes are not considered victims of this crime. This may be another reason for the limited information on male victims of human trafficking.

There are other common victim characteristics, including the following:

- Low level of education or no education
- Unemployment
- Limited employment opportunities in country of origin
- Dire economic circumstances
- Social and economic inequality in country of origin

- Armed conflict, military occupation, or regional conflict in country of origin

Although these are common characteristics, anyone can be a victim of human trafficking. Recruitment-by-abduction cases, although less common than recruitment-by-persuasion, do not require any of the above-mentioned characteristics to be present.

Characteristics of Customers or Consumers of Human Trafficking

Consumers of human trafficking exist in every part of the world, although certain locales, such as the United States, are ranked as top destination countries, or countries where humans are bought and forced into the commercial sex industry or into some form of forced labor. The profile of consumers is also diverse. Consumers can be men or women of varied ages. Occupations can range from the working class to professional men and women, some of whom are prominent businesspeople, doctors, lawyers, and politicians.

In 2000, a couple from Laredo, Texas, traveled to Veracruz, Mexico, on vacation. While in Veracruz, they befriended a family who begged them to take their 12-year-old daughter to the United States for a chance at a better life. The couple agreed to bring the girl to Texas to work as their maid. She was promised a bed, food, and wages. After smuggling the girl into the United States, the couple soon began to restrict her calls home. She was later not allowed to send money to her parents. Within weeks, the girl was kept outside the home where she slept and ate. She was later shackled to an old tire and beaten repeatedly (“Girl Reunited With Parents,” 2001).

A recent news report exemplifies the wide-ranging profile of consumers. In Long Island, New York, a millionaire couple who owned and operated a perfume business was arrested for holding two Indonesian women captive for 5 years. The couple, a 35-year-old woman and a 51-year-old man, traveled to Indonesia and recruited these women to work as maids, promising them \$300 a month. The women were forced to sleep on mats, not allowed contact with anyone, and forced to labor for long hours. The women were also beaten by the alleged female offender, and their passports were confiscated to prevent escape (“Wealthy Long Island Couple Keeps Slaves,” 2008).

In sum, consumers can be anybody willing to pay for the illegitimate services of another.

Why Do Victims Remain Hidden From Authorities?

There are diverse reasons why victims seldom come to the attention of the police, the first of which is that their ability to leave their place of employment is generally forbidden or highly restricted (Farr, 2005). Victims are rarely left

alone, not allowed to use the telephone, and are fearful of the ramifications if they try to escape or inform the police of their circumstances. Moreover, most victims do not speak the language in their new destination country, which impedes their ability to communication with authorities. Also, victims are not trusting of police. In their home country, authorities (whether local police or immigration officials) were more likely than not to be involved in the scheme to sell them. Farr (2005) reports that human trafficking would not be possible without the help of corrupt authorities, whether that means they receive money to look the other way or they receive money to actually facilitate the shipment of human cargo. Farr notes that in the United States, too, there is evidence that traffickers bribe border authorities in exchange for ease of entry into the country.

As mentioned, human trafficking is a physically and psychologically debilitating crime for victims; violence and the threat of violence quashes insubordination to a point where it breaks the human spirit and any attempts to escape or seek help. Victims are also frightened that their cries for help might be answered by a criminal conviction. The majority of victims are in their country of destination illegally and thus are apprehensive that talking to authorities may result in their arrest. In addition, traffickers continuously move victims to different locations to prevent police from uncovering the human trafficking enterprise.

The above reasons indicate that most victims will not disclose their status as trafficked victims to the police. It is up to police to proactively look for them. However, this also is problematic.

Victims remain hidden for several other reasons as well. As most victims work in the sex industry as prostitutes, and police have historically viewed prostitution as a victimless crime, the police inconsistently make arrests (Vago, 2006). The issue of consent is also problematic for police. Although consent is irrelevant with respect to rendering aid, police often believe that most trafficking victims consent to enter their destination country illegally and thus deserve to be arrested and deported. Consent also affects decisions to proactively look for victims (Kelly & Regan, 2000) as well as the way police classify this crime. Most classify trafficking cases as human smuggling and thus become complacent about launching investigations, since a special law enforcement branch of the government is charged with such investigations. The misclassification of human trafficking cases is common. Human trafficking and human smuggling are crimes that share common elements. For instance, victims of human trafficking sometimes consent to illegal travel as do individuals who pay to be smuggled into a country in which they are not a legal resident. However, human smuggling usually does not involve the force, fraud, or coercion of labor, and individuals who pay to be smuggled across international borders can return to their country of origin as opposed to being enslaved. It is important to mention that some human smuggling cases can quickly turn into cases of human trafficking if individuals are forced to labor against their will (Aronowitz, 2001).

Another reason why victims remain hidden is because of the organized nature of human trafficking. As mentioned, the workload for these illegal schemes is diversified and determining the network of associates may involve investigations in several countries. Diversification, however, makes it difficult to pinpoint where to start looking. Also, police are not usually trained to investigate these cases. Thus, police may not know how to go about finding and identifying victims and may not have the staff and resources to proactively launch investigations.

The problematic nature associated with identifying victims of human trafficking makes it appealing to traffickers who weigh the benefits and consequences of committing this crime. Clearly, the benefits outweigh the consequences since risk of apprehension is low. If the benefits continue to overshadow the risks, human trafficking will continue to thrive. Lawrence Cohen and Marcus Felson (1979) believe that motivated offenders can be dissuaded from engaging in crime if potential victims are better protected and if the community together with the police become more vigilant regarding such offenders. Cohen and Felson, in their discussion of routine activities theory, suggest that diminishing the suitability of a potential crime target or the potential for victimization is important. Although their theory is primarily applied to property-related crime, routine activities theory may be applicable to the crime of human trafficking. Current efforts are underway worldwide to prevent vulnerable individuals from becoming potential targets of human trafficking. In fact, the United States has been providing aid to the most vulnerable countries. It has also been trying to raise awareness of this crime worldwide. This latter element is crucial. As discussed by Cohen and Felson, it is not only important to diminish the vulnerability of potential victims but also to increase vigilance about possible offenders. In discussing what they call *capable guardians*, Cohen and Felson express that it is essential for the police as well as the community to help identify potential offenders in an effort to increase the risk of apprehension. Only then will the risk outweigh the gain of selling and trading humans, and the motivation to engage in this crime will diminish. Thus, it is imperative to increase awareness not only among the law enforcement or criminal justice community but also in the community at large. It will take a concerted effort by all to act as capable guardians.

Current U.S. Efforts to Stop the Sale of Humans

The United States is among many countries that have taken legislative action against human trafficking. Because of its prominent status as a world power, the United States has also been the leader in forcing others to do the same. Every year since 2000, the U.S. Department of State has published the Trafficking in Persons (TIP) Report, which details the extent of trafficking in the country as well as

abroad. The report also contains a ranking system whereby the Department of State issues a passing or failing grade to other countries' efforts to stop human trafficking. Using the U.S. law as the benchmark of excellence, the State Department conducts an investigation into every country around the globe that receives financial or military assistance from the United States. After its investigation, it ranks the countries into four categories or tiers: Tier 1 (the equivalent to a grade of A), Tier 2 (the grade of B), Tier 2 Watch List (the grade of C), and Tier 3 (the grade of D). Tier 1 countries, such as Australia, Belgium, Canada, Germany, and the United Kingdom, are praised for their excellent achievement in trying to eradicate human trafficking in their respective countries. Tier 2 countries such as Afghanistan, Mexico, and Turkey are also applauded for their efforts, but also told that a little more needs to be done to combat human trafficking. The Tier 2 Watch List countries are at the brink of failing in their efforts to end this problem. Argentina, China, Guatemala, and Tanzania are among several countries that are trying to squash human trafficking but are not taking significant action to do so. Tier 3 countries such as Iran, Cuba, and North Korea are completely failing to deal with this crime. Again, it is important to consider that the United States uses its own law as the gold standard and does not include itself in this ranking system.

The U.S. law against trafficking is not without criticism. There are some who contend that the law is not victim-centered but rather revictimizes those who have suffered through the ordeal of being sold and enslaved (Beeks & Amir, 2006). For instance, in order for victims to qualify for any governmental services (such as psychological, medical, and employment benefits), after being rescued by police, they must undergo a certification process in which they must petition the government for help. This petition requires victims to do the following:

- Write a personal narrative of their experience
- Prove that they would suffer extreme hardship if they were removed from the United States
- Comply with law enforcement investigation into the case
- Get the narrative certified by a law enforcement officer who must attest to the facts in the narrative
- Pay a processing fee (approximately \$200) to the U.S. Department of Health and Human Services, together with fees for a picture ID (approximately \$10–\$20), fingerprints (approximately \$50), and so on

This is not an easy feat in light of the fact that most victims do not speak or write English, are apprehensive about police, and do not have an income to pay for such fees. This certification is meant to ensure that only “severe victims” of trafficking are given access to government aid. If and when they receive certification as a victim, they can also petition for a visa to stay in the United States. However, the U.S. government limits the number of visas

it issues to trafficking victims each year to 5,000. From 2000–2006, the United States only issued 729 visas to victims of human trafficking.

Despite this disparagement, the United States has provided monetary assistance to foreign nations to try to tackle the *push* factors of human trafficking. Close to \$1 billion has been provided to help other countries raise awareness of the dangers of human trafficking, as well as establish vocational and technical training for the most vulnerable and provide them with an education. Also, the Bureau of Justice Statistics (2006) indicates that 555 cases were investigated by the U.S. Attorney's Office from 2001–2005. This led to 78 criminal adjudications with a mean prison sentence of 70 months. Furthermore, the federal government has been providing more assistance to local, state, and federal authorities in the United States to better identify and help victims of human trafficking. It has also provided aid to NGOs to help them better assist trafficking victims.

Conclusion

Human trafficking is one of the most antiquated and unforgivable crimes. Yet, it is also a contemporary crime that has been growing exponentially over the past few decades. Millions of people, including children, fall victim to this crime each year. Although generally a transnational crime, there is evidence that human trafficking occurs within the borders of most countries, including the United States. It is also a crime that does not discriminate—victims can be of any race, ethnicity, age, or gender. However, most victims are women and children. Global trafficking patterns signify that this global crime is driven by factors such as political and economic instability in certain parts of the world as well as by globalization, the feminization of poverty, and culture. In sum, it is driven by push and pull factors or by supply and demand. Worldwide efforts have been launched to combat the sale and enslavement of humans, with the United States flexing its power to bring countries into compliance with measures to end this crime. However, the United States has drawn criticism over its treatment of victims while it is at the same time praised for its generous monetary donations to help bring awareness of human trafficking to the most vulnerable places.

Because of the lucrative nature of this crime, some suggest that efforts to stop human trafficking should focus more on those who supply victims and those who purchase them. If traffickers contemplate risks and rewards of engaging in this crime, more should be done to dissuade them from selling humans. Thus, some suggest that more funding should be used to train police authorities to identify these criminals, and more should be done to increase the punishment if offenders are caught trafficking. However, others suggest that efforts to stop human trafficking would be better placed on those who purchase the

human cargo in destination countries. Currently, according to the U.S. law against trafficking, any person who sells or buys a human being can receive a sentence of 20 years in prison, or life in prison if the victim dies as a result of the torture endured at the hands of either the supplier or consumer. As mentioned, in the 78 criminal convictions of human trafficking between the years 2001–2005, the median prison sentence has been 70 months, or 5.8 years. Thus, perhaps the answer to stopping this crime is to tackle both the suppliers and the consumers, but tougher penalties are needed to deter the sale and consumption of forced labor.

PART VI

CRIMINOLOGY AND THE JUSTICE SYSTEM

CAPITAL PUNISHMENT

ROBERT M. BOHM

University of Central Florida

At one level, capital punishment, or the death penalty, is a minor issue. The media keep the public aware of all sorts of horrible crimes, but relatively few people are directly affected by those crimes, either as perpetrators or victims, or as family and friends of perpetrators and victims. Very few people are sentenced to die for their crimes, and still fewer people are ever executed.

At another level, capital punishment represents two profound concerns of nearly everyone: the value of human life and how best to protect it. For most people who support capital punishment, the execution of killers (and people who commit other horrible acts) makes sense. Death penalty supporters frequently state that executions do prevent those executed from committing heinous crimes again and that the example of executions probably prevents most people who might contemplate committing appalling crimes from doing so. In addition, many death penalty supporters simply believe that people who commit such crimes deserve to die, that they have earned their ignominious fate.

For opponents, capital punishment is about something else entirely. It is a benchmark of the “developing moral standards” of American civilization. As Winston Churchill once said, “The mood and temper of the public with regard to the treatment of crime and criminals is one of the most unflinching tests of the civilization of any country.” Put somewhat differently, for many opponents, the level of death penalty support in the United States is a rough estimate of the level of maturity of the American people. The not-so-subtle implication is that a mature, civilized society would

not employ capital punishment. Opponents maintain that perpetrators of horrible crimes can be dealt with effectively by other means and that it makes little sense to kill some people, however blameworthy they are, to teach other people not to kill. These opponents argue that although the perpetrators of terrible crimes may deserve severe punishment, that punishment need not be execution.

Capital punishment can be and has been addressed on many different levels. Only superficially is it a minor issue. Rather, it is a complex concern that encompasses fundamental questions of who a society is as a people and how some of its most vexing social problems are handled. This entry is divided into five sections. The first presents a concise history of capital punishment in the United States. The second addresses the Supreme Court’s regulation of capital punishment. The third describes Congress’s involvement. The fourth examines the practice of capital punishment under modern, or post-*Furman*, statutes, and the final section speculates on the future of capital punishment.

A Concise History of Capital Punishment in the United States

When the first European settlers arrived in America, they brought with them the legal systems from their native countries, which included the penalty of death for a variety of offenses. For example, the English Penal Code at the time, which was adopted by the British colonies, listed

more than 50 capital offenses, but actual practice varied from colony to colony.

The earliest recorded lawful execution in America was in 1608 in the Virginia Colony. Captain George Kendall, a councilor for the colony, was executed for being a spy for Spain. Kendall's execution was atypical for two reasons. First, he was executed for a relatively unusual offense (spying/espionage), and second, he was shot instead of hanged. More than 20 years would pass before the first murderer, John Billington, would be executed in 1630 in the Massachusetts Bay colony. Of the 162 colonists executed in the 17th century (for which the offense is known—85% of the total), nearly 40% were executed for murder, about 25% for witchcraft, and nearly 15% for piracy. No other crimes accounted for more than 8% of all executions. Most of the executed were hanged (88%), 10% were shot, an alleged witch was pressed to death, and a convicted arsonist was burned.

Since Kendall, about 20,000 legal executions have been performed in the United States under civil (as opposed to military) authority. The vast majority of those executed have been men; only about 3% of the total have been women. Most of the condemned women (87%) were executed before 1866. The first woman executed was Jane Champion in the Virginia Colony in 1632. She was hanged for murdering and concealing the death of her child, who was fathered by a man other than her husband. Since 1962, only 11 women have been executed in the United States (as of April 1, 2008) (Death Penalty Information Center, 2008).

In addition, about 2% of those executed in the United States since 1608 have been juveniles, those whose offenses were committed prior to their 18th birthdays. The first juvenile executed in America was Thomas Graunger in the Plymouth Colony in 1642, for the crime of bestiality. Between 1990 and 2005, the United States was 1 of only 7 countries that had executed anyone who was under 18 years of age at the time of the crime; the others were the Democratic Republic of Congo, Iran, Nigeria, Pakistan, Saudi Arabia, and Yemen. At this time, Yemen and the United States (as of March 1, 2005) no longer execute juveniles. The United States had executed 22 juveniles since 1976.

Among the first people in the United States to organize others against the death penalty was Dr. Benjamin Rush (1747–1813), a Philadelphia physician and signer of the Declaration of Independence. In the late 18th century, Dr. Rush attracted the support of such prominent Americans as Benjamin Franklin and William Bradford, who was the Pennsylvania and later U.S. Attorney General. It was at Franklin's home in Philadelphia that Rush became one of the first Americans to propose confinement in a "House of Reform" as an alternative to capital punishment. The houses of reform envisioned by Rush would be places where criminals could learn to be law-abiding citizens through moral education. At least in part because of the efforts of Rush and his colleagues, in 1790, the Walnut Street Jail in Philadelphia was converted into the world's first penitentiary—an institution devoted primarily to reform.

Largely as a result of Bradford's efforts, Pennsylvania became the first state in legal proceedings to consider degrees of murder based on culpability. Before this change, the death penalty was mandated for anyone convicted of murder (and many other crimes), regardless of circumstance. Pressure from opponents also caused Pennsylvania in 1794 to repeal the death penalty for all crimes except first-degree murder.

In 1830, Connecticut became the first state to ban public executions. Pennsylvania became the second state to do so in 1834. In both states, only a few authorized officials and the relatives of the condemned were allowed to attend. By 1860, all northern states and Delaware and Georgia in the South had shifted the site of executions from the public square to an enclosed jail yard controlled by the sheriff and deputies. By 1890, some states had moved executions to inside the jail or a prison building. At least three reasons have been given for this change in execution venue. First, many northern-state social elites began to view those who attended executions as contemptible "rabble out for a good time" and concluded that any educational value public hangings once had was being lost on the less respectable crowd. Second, execution attendees were increasingly sympathizing with the condemned prisoners, weakening the position of the state. Indeed, some of those who met their fate on the gallows became folk heroes. Third, increasingly being accepted was the belief that public executions were counterproductive because of the violence they caused. The last public execution was held in Galena, Missouri, in 1937.

In 1837, Tennessee became the first state to enact a discretionary death penalty statute for murder. All states before then had employed mandatory death penalty statutes that required anyone convicted of a designated capital crime to be sentenced to death. The reason for the change, at least at first and in the South, undoubtedly was to allow all-white juries to take race into account when deciding whether death was the appropriate penalty in a particular case. Between the Civil War and the end of the 19th century, at least 20 additional jurisdictions changed their death penalty laws from mandatory to discretionary ones. Illinois was the first northern state to do so in 1867; New York was the last state to make the change in 1963. The reason most northern states switched from mandatory to discretionary death penalty statutes, and another reason for southern states to do so, was to prevent jury nullification, which was becoming an increasing problem. *Jury nullification* refers to a jury's knowing and deliberate refusal to apply the law because, in this case, a mandatory death sentence was considered contrary to the jury's sense of justice, morality, or fairness. Discretionary death penalty statutes allowed juries the option of imposing a sentence of life in prison instead of death.

In 1846, the state of Michigan abolished the death penalty for all crimes, except treason, and replaced the penalty with life imprisonment. The law took effect the next year, making Michigan, for all intents and purposes, the first English-speaking jurisdiction in the world to abolish

capital punishment. The first state to outlaw the death penalty for all crimes, including treason, was Rhode Island, in 1852; Wisconsin was the second state to do so a year later. Although no other states abolished the death penalty during this period, by 1860, no northern state punished by death any crime except murder and treason.

A major change took place in the legal jurisdiction of executions during the time of the Civil War. Before the war, all executions were conducted locally—generally in the jurisdiction in which the crime was committed—but on January 20, 1864, Sandy Kavanagh was executed at the Vermont State Prison. He was the first person executed under state, as opposed to local, authority. This shift in jurisdiction was not immediately adopted by other states. In the 1890s, about 90% of executions were imposed under local authority, but by the 1920s, about 90% were imposed under state authority. Today, all executions are imposed under state authority, except those conducted in Delaware and Montana and by the federal government and the military.

More capital offenders were executed during the 1930s than in any other decade in American history; the average was 167 executions per year. The most executions in any single year occurred in 1935 when 199 offenders were put to death. This was a dramatic reversal from earlier in the century when the number of executions fell from 161 in 1912 to 65 in 1919. The 65 executions in 1919 were the fewest in 50 years. No state abolished the death penalty between 1918 and 1957. In contrast, after World War II, most of the advanced Western European countries abolished the death penalty or severely restricted its use. Great Britain did not join them until 1969.

The Supreme Court Regulates Capital Punishment

For more than 150 years, the U.S. Supreme Court (hereafter, “the Court”) has exercised its responsibility to regulate capital punishment in the United States and its territories. Among the principal issues the Supreme Court considered in relation to capital punishment before 1968 was the means of administering the death penalty. The Court upheld the constitutionality of shooting (*Wilkerson v. Utah*, 1878), electrocution (*In re Kemmler*, 1890), and a second electrocution after the first attempt had failed to kill the offender (*Louisiana ex rel. Francis v. Resweber*, 1947). Currently, there are five methods of execution authorized: lethal injection, electrocution, lethal gas, hanging, and firing squad. Lethal injection is the primary method of execution used by all executing jurisdictions in the United States.

Between 1968 and 1972, a series of lawsuits challenged various aspects of capital punishment as well as the constitutionality of the punishment itself. During this period, an informal moratorium on executions was observed, pending the outcome of the litigation, and no death row inmates

were executed. Some of the suits were successful, and some of them were not. Finally, on June 29, 1972, the Supreme Court set aside death sentences for the first time in its history. In its decisions in *Furman v. Georgia*, *Jackson v. Georgia*, and *Branch v. Texas* (hereafter referred to as the *Furman* decision), the Court held that the capital punishment statutes in those three cases were unconstitutional because they gave the jury complete discretion to decide whether to impose the death penalty or a lesser punishment in capital cases. Although nine separate opinions were written—a very rare occurrence—the majority of five justices (Douglas, Brennan, Stewart, White, and Marshall) pointed out that the death penalty had been imposed arbitrarily, infrequently, and often selectively against people of color. According to the majority, those statutes constituted “cruel and unusual punishment” in violation of the Eighth and Fourteenth Amendments. (The four dissenters were Chief Justice Burger and Justices Blackmun, Powell, and Rehnquist.) It is important to emphasize that the Supreme Court did not rule that the death penalty itself was unconstitutional, only the way in which it was being administered.

The practical effect of the *Furman* decision was that the Supreme Court voided the death penalty laws of some 35 states, and more than 600 death row inmates had their death sentences vacated and commuted to a term of imprisonment. Although opponents of capital punishment were elated that the United States had finally joined other Western industrialized nations in abolishing capital punishment either in fact or in practice, the joy was short-lived. By the fall of 1974, a total of 30 states had enacted new death penalty statutes that were designed to address the Court’s objections.

The new death penalty laws took two forms. Some states removed all discretion from the process by mandating capital punishment upon conviction for certain crimes (mandatory statutes). Other states provided specific guidelines that judges and juries were to use in deciding if death was the appropriate sentence in a particular case (guided-discretion statutes).

The constitutionality of the new death penalty statutes was quickly challenged, and on July 2, 1976, the Supreme Court announced its rulings in five test cases. In *Woodson v. North Carolina* and *Roberts v. Louisiana*, the Court rejected “mandatory” statutes that automatically imposed death sentences for defined capital offenses. However, in *Gregg v. Georgia*, *Jurek v. Texas*, and *Proffitt v. Florida* (hereafter referred to together as the *Gregg* decision), the Court approved several different forms of guided-discretion statutes. Those statutes, the Court wrote, struck a reasonable balance between giving the jury some guidance and allowing it to consider the background and character of the defendant and the circumstances of the crime. The most dramatic effect of the *Gregg* decision was the resumption of executions on January 17, 1977, when the state of Utah executed Gary Gilmore (at his own request) by firing squad.

What the Court found especially appealing about the guided-discretion statutes approved in *Gregg* is that judges and juries are provided with standards that presumably restrict, but do not eliminate, their sentencing discretion. Specifically, judges and juries, in most states, are provided with lists of aggravating and, at least in some states, mitigating factors. Aggravating factors or circumstances are facts or situations that increase the blameworthiness for a criminal act. Mitigating factors or circumstances are facts or situations that do not justify or excuse a criminal act but reduce the degree of blameworthiness and thus may reduce the punishment. The Court has since ruled that judges and juries must consider any mitigating circumstance offered by the defense, whether it is listed in the statute or not.

Besides the guided-discretion statutes, the Court also was optimistic about two other procedural reforms: bifurcated trials and automatic appellate review. A bifurcated trial is a two-stage trial—unlike the one-stage trial in other felony cases—consisting of a guilt phase and a separate penalty phase. If, in the guilt phase, the defendant is found guilty as charged, then at the penalty phase, the jury must determine whether the sentence will be death or life in prison (There are no other choices except, in most death penalty states, life imprisonment without opportunity for parole.). All of the procedures of due process apply to both phases of the bifurcated trial.

Currently, 35 of the 36 states with death penalty statutes provide for automatic appellate review of all death sentences, regardless of the defendant's wishes. South Carolina allows the defendant to waive sentence review if the court deems the defendant competent; also, the federal jurisdiction does not provide for automatic appellate review. Most of the 35 states automatically review both the conviction and the sentence. Generally, the automatic review is conducted by the state's highest appellate court. If either the conviction or the sentence is overturned, then the case is sent back to the trial court for additional proceedings or for retrial. It is possible that the death sentence may be reimposed as a result of this process.

Some states are very specific in defining the review function of the appellate courts, while other states are not. Although the Supreme Court does not require it (*Pulley v. Harris*, 1984), some states have provided a *proportionality review*, in which the appellate court compares the sentence in the case it is reviewing with penalties imposed in similar cases in the state. The object is to reduce, as much as possible, disparity in death penalty sentencing.

In addition to the automatic appellate review, there is a dual system of collateral review for capital defendants. In other words, capital defendants may appeal their convictions and sentences through both the state and the federal appellate systems.

Some death row inmates whose appeals have been denied by the U.S. Supreme Court may still try to have the Court review their cases on constitutional grounds by filing a *writ of habeas corpus*, which is a court order directing a

law officer to produce a prisoner in court to determine whether the prisoner is being legally detained or imprisoned. Critics maintain that abuse of the writ has contributed to the long delays in executions (currently averaging more than 10 years after conviction) and to the high costs associated with capital punishment.

In decisions since *Gregg*, the Supreme Court has limited the crimes for which death is considered appropriate and has further refined death penalty jurisprudence. In 1977, in the cases of *Coker v. Georgia* and *Eberheart v. Georgia*, the Court held that rape of an adult female (in *Coker*) and kidnapping (in *Eberheart*), where the victim was not killed, do not warrant death. Those two decisions effectively limited the death penalty to those offenders convicted of capital, or aggravated, murder.

In 1986, in *Ford v. Wainwright*, the Court barred states from executing inmates who have developed mental illness while on death row, and in 2002, in *Atkins v. Virginia*, the Court held that it is cruel and unusual punishment to execute the mentally retarded. In the 2005 case of *Roper v. Simmons*, the Court effectively limited capital punishment to offenders who are 18 years of age or older at the time of their offenses. Another death penalty decision of the Supreme Court is the 1987 case of *McCleskey v. Kemp*, in which the Court held that state death penalty statutes are constitutional even when statistics indicate that they have been applied in racially biased ways. The Court ruled that racial discrimination must be shown in individual cases.

Congress Gets Involved

In 1994, Congress passed a federal crime bill (the Violent Crime Control and Law Enforcement Act), which expanded the number of federal crimes punishable by death to about 50. All but four of the federal crimes involve murder. The four exceptions are treason; espionage; drug trafficking in large quantities; and attempting, authorizing, or advising the killing of any public officer, juror, or witness in a case involving a continuing criminal enterprise—regardless of whether such a killing actually occurs. In addition, the bill reinstated the death penalty for federal crimes for which previous death penalty provisions could not pass constitutional muster. The new law brought the earlier statutes into compliance with guidelines established by the Supreme Court. The U.S. government executed Timothy McVeigh and Juan Raul Garza in 2001, and Louis Jones Jr. in 2003. They were the first federal executions in nearly 40 years. Prior to those three, the last execution by the U.S. government was on March 15, 1963, when Victor H. Feguer was hanged at Iowa State Penitentiary.

The Antiterrorism and Effective Death Penalty Act was enacted in 1996, in part to speed up the process and reduce costs. The law requires that second or subsequent habeas petitions be dismissed when the claim had already been made in a previous petition. It also requires that new claims

be dismissed, unless the Supreme Court hands down a new rule of constitutional law and makes it retroactive to cases on collateral review. Under the act, the only other way the Supreme Court will hear a claim made for the first time is when the claim is based on new evidence not previously available. Even then, the new evidence must be of sufficient weight, by a clear and convincing standard of proof, to convince a judge or jury that the capital defendant was not guilty of the crime or crimes for which he or she was convicted.

The act also made the federal appellate courts “gatekeepers” for second or subsequent habeas corpus petitions. Thus, to file a second or subsequent claim under the new law, a capital defendant must first file a motion in the appropriate appellate court announcing his or her intention. A panel of three judges must then hear the motion within 30 days. The judges must decide whether the petitioner has a legitimate claim under the new act. If the claim is denied, the new law prohibits any review of the panel’s decision, either by a rehearing or writ of certiorari to the Supreme Court. A *writ of certiorari* is a written order, from the Supreme Court to a lower court whose decision is being appealed, to send the records of the case forward for review. So far, the Supreme Court has upheld the constitutionality of the law.

Some people argue that the appellate reviews are unnecessary delaying tactics (at least those beyond the automatic review). However, the outcomes of the reviews suggest otherwise. Nationally, between 1973 and 2006, a total of 35% of the initial convictions or sentences in capital cases were overturned on appeal, and, contrary to popular belief, those reversals were generally not the result of so-called legal technicalities. They were the product of such fundamental constitutional errors as denial of the right to an impartial jury, problems of tainted evidence and coerced confessions, ineffective assistance of counsel, and prosecutors’ references to defendants who refuse to testify. The percentage of death penalty cases overturned by the appellate courts since the reestablishment of capital punishment has far exceeded the percentage of appellate reversals of all other noncapital felony cases, which, in most states, probably does not exceed 1%.

The Practice of Capital Punishment Under Post-*Furman* Statutes

Currently (as of April 1, 2008), 38 jurisdictions in the United States have capital punishment statutes; 15 jurisdictions do not have capital punishment statutes. Jurisdictions with capital punishment statutes are the following: Alabama, Arizona, Arkansas, California, Colorado, Connecticut, Delaware, Florida, Georgia, Idaho, Illinois, Indiana, Kansas, Kentucky, Louisiana, Maryland, Mississippi, Missouri, Montana, Nebraska, Nevada, New Hampshire, New Mexico, North Carolina, Ohio, Oklahoma, Oregon, Pennsylvania, South Carolina, South Dakota, Tennessee, Texas, Utah, Virginia,

Washington, Wyoming, the U.S. Government, and the U.S. military. Kansas, New Hampshire, and the U.S. military have not executed anyone under their post-*Furman* statutes. Jurisdictions without capital punishment statutes are these: Alaska, Hawaii, Iowa, Massachusetts, Maine, Michigan, Minnesota, New Jersey, New York, North Dakota, Rhode Island, Vermont, West Virginia, Wisconsin, and the District of Columbia. In December 2007, New Jersey became the latest jurisdiction to abolish its death penalty.

Since Gilmore’s execution in 1977, a total of 1,099 people have been executed in 34 states and by the federal government, which, as noted, has executed 3 (as of April 1, 2008).

Nearly all of the offenders executed since Gilmore have been male, while the gender of the victims is divided nearly evenly between males and females. As for race, 57% of all people executed under post-*Furman* statutes have been white; about 34% have been black. Thus, the percentage of blacks who have been executed far exceeds their proportion of the general population (about 13%). Particularly interesting is that nearly 80% of the victims of those executed have been white. What makes this finding interesting is that murders, including capital murders (all post-*Furman* executions have been for capital murders), tend to be intraracial crimes. However, the death penalty is imposed primarily on the killers of white people, regardless of the race or ethnicity of the offender. The figures on defendant-victim racial or ethnic combinations further support this conclusion. Approximately 54% of executions have involved white killers of white victims, and about 21% have involved black killers of white victims. On the other hand, only about 11% of executions have been of black killers of black victims, and there have been only 14 executions of white killers of black persons (less than 2%) (Death Penalty Information Center, 2008).

The number of persons currently on death row in the United States is 3,350 (as of January 1, 2007). California has by far the largest death row population at 669; Florida is second with 388 death row inmates. About 98% of death row inmates are male, 45% are white, 42% are black, 11% are Latina/Latino, and the remainder are of other races or ethnicities. The size of the death row population in the United States does not fluctuate very much from year to year, despite the relatively few executions each year. (The largest number since 1977 was 98, in 1999.) One reason is that the number of new death sentences has been declining in recent years. In 1995, a total of 326 people were sentenced to death—the highest number since 1977; in 2002, the number was about half as many at 169; there were 153 in 2003, 138 in 2004, 128 in 2005, 115 in 2006, and 110 in 2007. Another reason for the lack of much fluctuation in the death row population is that since January 1, 1973, approximately 2,700 of the nearly 7,700 defendants sentenced to death (35%) have been removed from death row by having their convictions or sentences reversed. In addition, since January 1, 1973, a total of 341 death row inmates have received commutations (reductions in sentences, granted by a state’s governor), and

327 have died of natural causes or have been killed (Death Penalty Information Center, 2008).

What Does the Future Hold?

Worldwide, the death penalty is trending toward abolition. At the beginning of the 20th century, only three countries—Costa Rica, San Marino, and Venezuela—had abolished the death penalty for all crimes. By 1977, only 14 countries had abolished the death penalty for all crimes. Another 2 countries had abolished it for all but exceptional capital crimes such as those committed during wartime. As of January 11, 2008, a total of 91 countries had abolished the death penalty for all crimes; another 11 countries had abolished it for all but exceptional capital crimes; and 33 countries had abolished it in practice—that is, they retain the death penalty but have not carried out an execution for at least 10 years and are believed to have a policy or established practice of not using the death penalty.

More than 40 countries have abolished the death penalty since 1990. Since 1985, only 4 of those countries have reintroduced the death penalty. Two of those countries, Nepal and the Philippines, have since abolished it again, and the two other countries, Gambia and Papua New Guinea, have not executed anyone since reintroducing the penalty. Currently, nearly 70% of the countries in the world—135 of them—have abolished the death penalty in law or practice. Only 62 countries have retained the death penalty. Among Western, industrialized nations, the United States stands alone as the only nation to employ capital punishment. All major allies of the United States except Japan have abolished the death penalty.

Furthermore, the number of countries that actually execute anyone in a given year is much smaller. In 2006, there were 1,591 executions around the world, down more than 25% from the 2,148 in 2005. Of all known executions that took place in 2006, approximately 91% were carried out in six countries: China, Iran, Pakistan, Iraq, Sudan, and the United States. Of the 1,452 executions that took place in those six countries, approximately 70% were carried out in China; 12% in Iran; 6% in Pakistan, and 4% each in Iraq, Sudan, and the United States.

In the United States, as noted, 38 jurisdictions have a death penalty and 15 jurisdictions do not, and as of April 1, 2008, there have been 1,099 executions since the practice resumed in 1977. There were 60 executions in 2005; a total of 53 executions in 2006; another 41 executions in 2007; and, as of this writing, no executions so far in 2008.

Of the 1,099 executions since 1977, about 82% of them have been carried out in the South, 11.5% in the Midwest, 6% in the West, and .4% in the Northeast. Thus, for all intents and purposes, executions in the United States are a mostly southern phenomenon (including border states).

Of the 34 death penalty states that have carried out at least one execution since 1977, half of them have executed

fewer than 10 people. Only five of the executing states account for 65% of the 1,099 executions: Texas, Virginia, Oklahoma, Missouri, and Florida. Three of those states—Texas, Virginia, and Oklahoma—account for more than half of the 1,099 executions (53.5%). Texas and Virginia account for approximately 46% of the total, and Texas, alone, accounts for approximately 37%. Texas has executed more than 4 times as many offenders as any other state. Texas accounted for about 45% of the 2006 U.S. executions and 63% of the 2007 U.S. executions. In short, except for a handful of non-Western countries in the world and a handful of mostly southern or border states to the United States, the death penalty is a dwindling practice. This is an important point because it raises the question of why those death penalty—or more precisely, executing—jurisdictions in the world need the death penalty, while all other jurisdictions—the vast majority—do not.

There are several other reasons to believe that the death penalty in the United States may be a waning institution. First, although abstract support for the death penalty remains relatively high—it was 69%, according to a 2007 Gallup poll—when respondents are provided an alternative, such as life imprisonment with absolutely no possibility of parole (LWOP), support for the death penalty falls to about 50%.

Second, the American public continues to express some concern about the way the death penalty is being administered. For example, a 2005 Gallup poll found that 35% of the American public did not believe that the death penalty is applied fairly. However, the 73% of Americans in 2003 that believed an innocent person had been executed in the last 5 years dropped to 63% in 2006. Most people believe that the execution of innocent people is a rare occurrence. For example, in the 2005 Gallup poll, 57% of respondents believed that the execution of an innocent person happened no more than 5% of the time. Only about 11% of respondents believed that more than 20% of executions involved innocent people. Although concern about the death penalty's administration has decreased somewhat from the level of concern expressed in 2000, it remains higher than it was prior to revelations about the quality of justice in capital murder trials, the overturning of several convictions as a result of DNA tests, and the resulting moratorium on executions in Illinois and elsewhere.

A third factor involves the positions taken by respected organizations within the United States, such as the American Bar Association (ABA) and organized religions. In 1997, the ABA adopted a resolution that requested death penalty jurisdictions to refrain from using the sanction until greater fairness and due process could be assured. The leaders of most organized religions in the United States—including Catholic, Protestant, and Jewish—openly oppose capital punishment. A recent survey found that of the 126 religious organizations that responded, 61% (77) officially oppose capital punishment, 17% (22) officially support it, and 21% (27) leave it up to individual congregations or

individual religious leaders to determine their own position on capital punishment.

A fourth factor is world opinion. As noted previously, all major allies of the United States except Japan have abolished the death penalty. In Europe, the death penalty is viewed as a violation of human rights. A condition for admittance into the European Union (EU) and the Council of Europe is the abolition of the death penalty. The United Nations Commission on Human Rights has repeatedly condemned the death penalty in the United States, urging the U.S. government to stop all executions until it brings states into compliance with international standards and laws.

On the other hand, capital punishment in some states has proven stubbornly resilient. There are reasons to believe that in those states, the death penalty will remain a legal sanction for the foreseeable future. One reason is that death penalty support among the American public, at least according to the major opinion polls, remains relatively strong. It is unlikely that the practice of capital punishment could be sustained if a majority of American citizens were to oppose it. However, in no year for which polls are available has a majority of Americans opposed the death penalty. (The first national death penalty opinion poll was conducted in December 1936.)

Although life imprisonment without opportunity for parole seems to be a popular alternative to the death penalty in polls, a problem with the LWOP alternative is that many people are very skeptical about the ability of correctional authorities to keep capital murderers imprisoned for life. Thus, although more than half of the public may say that it prefers LWOP to capital punishment, in practice, people may be reluctant to make the substitution because they fear that the alternative might not adequately protect them from the future actions of convicted capital offenders.

The abiding faith of death penalty proponents in the ability of legislatures and courts to fix any problems with the administration of capital punishment is another reason for its continued use in some places. However, the more than three-decade record of “fine-tuning” the death penalty process remains ongoing. Legislatures and courts are having a difficult time “getting it right,” despite spending inordinate amounts of their resources trying. Former Supreme Court Justice Harry A. Blackmun, who for more than 20 years supported the administration of capital punishment in the United States, finally gave up. On February 22, 1994, in a dissent from the Court’s refusal to hear the appeal of a Texas inmate scheduled to be executed the next day, Blackmun asserted that he had come to the conclusion that “the death penalty experiment has failed” and that it was time for the Court to abandon the “delusion” that capital punishment could be administered in a way that was consistent with the Constitution. He noted that “from this day forward, I no longer shall tinker with the machinery of death” (*Callins v. Collins*, 1994).

As for the positions against capital punishment taken by respected organizations in the United States, “true believers” in the death penalty couldn’t care less what others think, especially in the case of organizations such as the American Bar Association. This holds true for world opinion as well. In the case of organized religions, the situation is probably more complex. Although most people who consider themselves religious and are affiliated with religions whose leadership opposes capital punishment probably respect the views of their leaders, they obviously live their daily lives and hold beliefs about capital punishment (and other issues such as abortion) based on other values.

Some death penalty opponents believe that a principal reason for the continuing support of capital punishment is that most people know very little about the subject, and what they think they know is based almost entirely on myth. It is assumed that if people were educated about capital punishment, most of them would oppose it. Unfortunately, research suggests that educating the public about the death penalty may not have the effect that opponents of the practice desire. Although accurate information about the death penalty can reduce support for the sanction—sometimes significantly—rarely is the support reduced to less than a majority, and any reduction in support may be only temporary.

What else, then, sustains the public’s death penalty support? At least two other factors appear to play a major role: the desire for vindictive revenge and the symbolic value capital punishment has for politicians and law enforcement officials. In a recent Gallup poll, 50% of all respondents who favored the death penalty selected “An eye for an eye/Convicted deserve to be executed” as a reason. The reasons selected second-most often (by only 11%) were “Save taxpayers money/Cost associated with prison” and deterrence. No other reasons were selected by more than 10% of the death penalty proponents. The choice of “An eye for an eye/Convicted deserve to be executed” indicates support of the penal purpose of retribution. Those who chose this reason wanted to repay the offender for what he or she has done. This response, at least the “eye for an eye” part, has a strong emotional component and thus has been called “vindictive revenge.”

The other factor that probably sustains death penalty support is the symbolic value it has for politicians and criminal justice officials. Politicians use support for the death penalty as a symbol of their toughness on crime. Opposition to capital punishment is invariably interpreted as symbolic of softness on crime. Criminal justice officials and much of the public often equate support for capital punishment with support for law enforcement in general. It is ironic that although capital punishment has virtually no proven effect on crime, the death penalty continues to be a favored political “silver bullet”—a simplistic solution to the crime problem used by aspiring politicians and law enforcement officials. Together with the movement to replace indeterminate sentencing with determinate sentencing and to

abolish parole, the death penalty is part of the “law and order” agenda popular in the United States since the mid-1970s. Whether this direction in criminal justice has run its course is anyone’s guess. However, it appears that the effort to “get tough” with criminals has not produced the results desired by its advocates.

COMMUNITY CORRECTIONS

LEANNE FIFTAL ALARID

University of Texas at San Antonio

Out of the nearly 7 million people currently on correctional supervision in the United States, only 30% of them are incarcerated in jail or prison. The remaining 70% of persons who have had contact with the criminal justice system are supervised within the community (Alarid, Cromwell, & del Carmen, 2008). This entry discusses community corrections, which is defined as a court-ordered sanction in which offenders serve at least some of their sentence in the community.

Three assumptions rest behind the idea of community corrections. First, most people who break the law are not dangerous or violent. The vast majority of offenders have violated a law that requires that they be held responsible through some sort of injunction or punishment, but most do not need to be locked away from the community. Keeping the offender in the community can be effective if the offender is able to maintain employment obligations and family relationships and to attempt to repair harm he or she caused the community or an identified victim—all of this at a reduced cost to taxpayers.

Second, a community sentence seeks to treat behaviors that are directly related to why the offender got into trouble in the first place, so that the risk of future reoffending is significantly reduced. The assumption here is that treatment programs are more numerous and accessible in the community than in jail and prison. This makes it easier for offenders to get the help they need while in the community and subsidize the cost with their own funds. A final assumption is that people who have been incarcerated in jail and prison

transition better when they are released with some supervision than without any supervision (Petersilia, 2001).

Understanding the concept of community corrections will be accomplished through a discussion of five main areas:

- Goals of a community sentence
- Types of community corrections programs
- Advantages and disadvantages of community corrections programs
- Cost of community corrections programs
- Do community corrections programs work?

Goals of a Community Sentence

Community corrections programs attempt to accomplish many goals. These goals include easing institutional crowding and cost; preventing future criminal behavior through surveillance, rehabilitation, and community reintegration; and addressing victims' needs through restorative justice. Each of these goals is discussed below.

Easing Institutional Crowding and Cost

Two things are abundantly clear. First, building jails and prisons is a costly endeavor. Second, there are legal limits that define how many prisoners a single correctional institution can hold. Correctional institutions that exceed their capacity may incur civil lawsuits and fines. Therefore, one

goal of community corrections programs is to ease institutional crowding in jails and prisons by drawing from the population of convicted offenders who are predicted to be less risky to the outside community. Given that there are far fewer beds available than the number of people arrested, community corrections programs control crowding by separating out the people who need to be in jail from the people who pose less risk (Harris, 1999).

Another way of controlling prison populations historically has been to allow prisoners who have served the minimum amount of time on their sentence the opportunity for early release on parole. Parole is the privileged and discretionary release from prison on community supervision until the remaining time on one's sentence has expired. Parole has thus been used to make room for incoming prisoners.

Surveillance

Safety of the public is an important concern for any offender supervision program. To maintain public safety, offenders under supervision should be assessed to determine the degree of risk posed by their participation in community programs. Offenders who pose a serious danger to society or to themselves should not be in a community corrections program. Instead, these offenders should be incarcerated in jail or prison until they are no longer dangerous to themselves or others. For those on community supervision, compliance with court-ordered sanctions is carefully monitored by trained community officers. Finally, violations of supervised conditions are taken seriously for those who cannot or will not comply with the conditions.

Addressing Problems Related to Criminal Behavior

Correcting some of the problems that are directly linked to criminal behavior and continued involvement in the criminal justice system is another goal. Some of these problems include drug or alcohol addiction, lack of emotional control, inadequate education or vocational training, parenting problems, and mental illness or developmental disability (Alarid & Reichel, 2008). The offender attends classes to address these issues while on supervision with greater access to treatment programs than the individual would have had in jail or prison. The basis of effective rehabilitation is the use of cognitive-behavioral techniques and selecting offenders who have the desire to change.

Community Reentry

Community reintegration is an important goal for offenders released from jail or prison to gradually ease their reentry into society. Community-based correctional programs help in this endeavor with a minimal level of supervision while simultaneously allowing the offender to assume responsibilities and parental roles. In this way, getting released from prison is not such a culture shock, and

this will hopefully decrease the probability of recidivism (Austin, 2001).

Restorative Justice

Restorative justice assumes that a crime harms the community and that sometimes there are individual victims involved. Often, victims of property crimes just want to be paid back or have things restored to their former condition—something that may not be possible if the offender goes to jail or prison. Restorative justice emphasizes offender responsibility to repair the injustice that offenders have caused their victims. Through victim and community involvement, such as face-to-face mediation sessions, victim impact panels, and volunteer mentoring, the offender remains in the community, completes community service, and pays victim restitution. Restorative justice is most effective for property crimes, particularly those committed by juveniles or first-time adult felony offenders (Bazemore & Stinchcomb, 2004).

Community-based programs are available at three decision points in the criminal justice process: at pretrial release before a defendant is convicted, after an offender is sentenced as an alternative to incarceration, and as an aid in reentering the community following a prison sentence (Alarid et al., 2008). Within these decision points, a wide variety of community programs are available, including residential halfway houses; nonresidential options such as probation, parole, and electronic monitoring; and economic sanctions such as restitution, fines, and forfeitures.

Community Corrections Programs Before Conviction

After the police arrest a suspect, the prosecutor's office decides whether to charge the suspect with a crime. If the prosecutor decides not to charge for lack of evidence, the suspect is automatically released. If the suspect will be charged with a crime, he or she becomes a "pretrial defendant" and appears before a judge to determine whether the defendant is eligible for release from jail. Although most defendants are released on their own recognizance with the promise to appear at their next court date, some defendants must be released on pretrial supervision, which is a form of correctional supervision of a defendant who has not yet been convicted.

Pretrial Supervision

The pretrial release decision is one of the first decisions judges make following an arrest so that some defendants can be released with supervision prior to their next court date. Pretrial release allows defendants who have not yet been convicted the opportunity to live and work as productive citizens until their next scheduled court date. Defendants can support their families and assist their attorneys in case preparation. In turn, the courts can be assured that the defendant

will be more likely to appear. Pretrial supervision involves compliance with court-ordered conditions for a specified time period. Examples of court-ordered conditions include calling in or reporting for appointments, obtaining a substance abuse or mental health evaluation, maintaining employment, and avoiding contact with victims. The court can issue a warning, or modify or add more conditions for noncompliance. Continued noncompliance or committing a new crime can result in the court removing the defendant from pretrial supervision and incarcerating him or her in jail until the case has been processed.

Another form of community supervision without a conviction is diversion. Defendants are technically not convicted—rather, they enter into an agreement with the court to complete various conditions of probation, with the understanding that *successfully* completing these conditions will result in having the charges completely dismissed without a conviction. If a defendant does not succeed or commits a new crime during supervision, the courts will change the paperwork so that the defendant's conviction will become a permanent part of the record (Ulrich, 2002). Forms of pretrial supervision and diversion may include house arrest and electronic monitoring.

Electronic Monitoring and House Arrest

Electronic monitoring (EM) is a technology used to aid in the community-based supervision either before or after conviction. Monitoring electronically has a variety of levels, ranging from a basic unsophisticated phone line system that monitors offenders very infrequently to a continuous Global Positioning System (GPS) that can pinpoint the offender's exact location at all times.

House arrest requires a defendant to remain at his or her residence for a portion of the day. House arrest is often used in conjunction with electronic monitoring because the technology can enforce the curfew conditions, which can range from nighttime hours through any nonworking hours. This practice is also known as *home confinement*, which refers to the same program for convicted offenders.

The rest of this section will be devoted to discussing the various types of electronic monitoring, beginning with the earliest phone line systems. All monitoring devices consist of a transmitter that is attached to the offender's ankle, a receiver, and a pager. The less sophisticated versions have a transmitter that emits a continuous signal up to a 500-foot radius, and the signal is picked up by a receiver, usually attached to the offender's home telephone. The receiver is programmed to expect the transmitter's signal during those hours of the day that the offender is supposed to be at home. If the signal is not received when it should be, a computer sends a report of the violation to a central computer. These systems are not able to track offenders' whereabouts once they leave home. Given the drawbacks with the early systems and the increased need to track offenders away from home, a variety of other means of offender tracking have become available, including remote monitoring and global positioning satellite devices (Greek, 2002).

Remote location monitoring systems provide offenders with a special pager that can only receive incoming calls from the probation officer. When the pager beeps, the offender must call a central number within a designated period of time (e.g., 15 minutes). Voice verification ensures a positive match between the voice template and the voice on the phone. The computer records whether or not the voice matched and the phone number where the call originated. Some remote location monitors that offenders carry emit signals that may be intercepted only by the probation officers who carry the matching portable receiving unit. This enables officers to drive by a residence or workplace without the offender's knowledge to verify his or her whereabouts.

When the military allowed Global Positioning Systems (GPS) to be available for civilian use, it became the tracking method of choice for offenders that posed a higher risk to public safety. Offenders carry a transmitter that picks up the offender's location via satellite and a receiver that records and transmits data via a phone and a computer. This allows law enforcement to know an offender's whereabouts at all times (Greek, 2002).

Types of Community Corrections Programs at the Sentencing Decision

Probation Supervision

Probation supervision is the most frequently used community sentence for convicted offenders. Probation is defined as the community supervision of an offender under court-imposed conditions for a specified time period during which the court can modify conditions for noncompliance. Probation is credited to Boston shoemaker John Augustus, who devoted his life to helping offenders who had been arrested. Beginning in 1841, using his own money, Augustus assured the court that the defendant would return if the court released the defendant to his care. Probation became a formalized practice in 1878, three decades after Augustus began his work. By 1900, probation spread to other states as a discretionary sentence for persons charged with any level of offense (Panzarella, 2002).

Probation continues to serve as the primary sanction for criminal offenders. Nearly 60% (4 million) of the almost 7 million adults currently under correctional supervision are on probation.

The duties of probation officers have changed very little since the practice began. Probation officers are involved in information gathering for the court to determine the offender's suitability for probation. The probation officer monitors the whereabouts of the probationer and ensures that the conditions of probation are being followed. Officers have a predefined number of times they must contact offenders that they supervise; contacts consist of face-to-face meetings, telephone calls, and home visits. The officer refers offenders out to specialists who provide individual and group counseling to clients in areas such as

drug and alcohol education, relapse prevention, and parenting education (Czuchry, Sia, & Dansereau, 2006).

Probation supervision includes standard conditions that every probationer agrees to abide by in return for remaining at liberty in the community. These conditions include full-time employment or attendance at school, obtaining permission before leaving the jurisdiction, submitting to searches without a warrant, avoiding association with persons having a criminal record, meeting with the probation officer on a regular basis, and paying monthly supervision fees. In addition, other more special conditions are ordered that relate directly to the crime or an identified victim. The offender may be required to repay the victim a specified sum of money or to perform a certain number of community service hours. The offender may also be required to pay for and participate in counseling, substance abuse treatment, or parenting classes.

Individuals on probation supervision serve 1 to 3 years, with an average of 2 years. An estimated 8 out of 10 people on probation successfully complete the supervision without any trouble. The remaining 2 people who do not complete their original probation sentence have either committed a new criminal act or have repeatedly failed to abide by multiple conditions of probation. When this happens, probation officers report the infractions to the judge. The judge makes the final decision, choosing either to modify existing probation conditions while the offender remains in the community or to revoke probation completely, which means that the offender is resentenced to jail or prison (Gray, Fields, & Maxwell, 2001).

Day Reporting Centers

Day reporting centers are a more intensive form of community supervision that occurs simultaneously with probation. Whereas probationers on regular supervision may be required to check in monthly or only every 3 months, day reporting centers require probationers to visit a specific center 3 to 6 days each week for an average duration of 5 months. Some visits may be merely checking in, and other visits require participation in classes or outpatient treatment. Day reporting centers aim to provide offenders with access to treatment or services, and they typically supervise offenders who have previously violated probation conditions, such as those who continue to abuse drugs. Therefore, day reporting centers serve as a sanction between probation and jail (Bahn & Davis, 1998).

Day reporting centers operate on a behavior modification model of levels or phases, with the beginning phase being the strictest, with the least amount of freedom. For example, offenders are tested for drug use at random, five times each month during the most intensive phase. As offenders successfully work the program, the freedom gradually increases and the supervision decreases. Day reporting centers also have partnerships with local businesses and treatment facilities to provide numerous on-site services to address employment, education, and counseling.

Community Drug Treatment Programs

For offenders who have problems with drugs or alcohol, community-based treatment programs offer meetings between 1 and 3 times per week for a designated period of time while the offenders live and work independently. It is estimated that drug or alcohol use or abuse affects about 7 out of 10 people who get into legal trouble. Outpatient treatment may be used during transition from inpatient drug treatment, transition from prison, or solely as a part of probation conditions. Several options are available depending on the extent of the problem. Some programs are tailored to chronic abusers, while others are for occasional users (Alarid & Reichel, 2008).

Outpatient treatment for more chronic abusers typically includes a combination of medication and counseling. Some medication is designed to react negatively with alcohol, creating severe nausea and vomiting whenever alcohol is ingested. Other medications ease the discomfort of withdrawal from substances like heroin and cocaine (similar to the way nicotine patches and gum work to help people stop smoking cigarettes). Forms of therapy include relapse prevention that continues to enforce sobriety and ways of dealing with cravings and stress, and Alcoholics or Narcotics Anonymous, based on a support system of recovery using a designated sponsor within a 12-step program. A third method includes involving the family as a social support system in the defendant's drug treatment. Often, family members are not aware of how they subtly contribute to their loved one's habit or how they neglect to provide healthy outlets for sobriety.

Community Service

Community service is a court-ordered requirement that offenders labor in unpaid work for the general good of the community. The appeal of community service is that it benefits the community through the offender's expenditure of time and effort in less-than-desirable jobs. Community service dates back to the Middle Ages when small towns in Germany allowed offenders to clean the town canal and pick up refuse for an unpaid fine. Community service was first used in the United States in the mid-1960s as punishment for juvenile delinquents, traffic offenders, white-collar criminals, and substance-abusing celebrities. Community service may be used in a variety of ways, such as with diversion or with probation. It provides an alternative sanction for poor offenders who are unable to afford monetary sanctions and is also appropriate for wealthy persons whose financial resources are so great that monetary restitution has no punitive effect.

Faith-based organizations, homeless shelters, and other nonprofit organizations have benefited from the community service labor. Offenders must labor between 40 and 1,000 hours before their service is considered complete. Community service ironically remains an underused sanction. Nationwide, only 1 out of 4 felons on probation is required to perform community service hours. Among the reasons behind this underutilization are the lack of

coordination with documenting the hours, the difficulty of enforcing compliance during the work, and the need to provide evidence of completion for the court.

Restitution

Restitution is court-ordered payment that an offender makes to the victim to offset some of the losses incurred from the crime. Victim compensation for harm caused is one of the oldest principles of justice, dating back to the Old Testament and to other early legal codes. Restitution is an essential means of repaying the victim and is a step toward offender rehabilitation (Ruback & Bergstrom, 2006).

In the past, restitution payments were cancelled if offenders went to prison. As a result of the victims' rights movement in the 1980s, victims demanded that offenders pay restitution and back child support regardless of their sentence. Restitution is now mandatory in some states for violent crimes such as sexual abuse, domestic violence, and property offenses. However, there are still areas of the country that do not require prisoners to pay restitution if incarcerated, paroled, or released from probation.

The other problem with restitution is its lack of enforcement, leading to low collection rates. Collection of restitution is enforced by probation and parole officers who collect the payment. The court mandates it as a condition of a sentence, but collection rates are surprisingly low. One reason for this is that offenders tend to be employed in low-paying jobs and have other financial obligations such as monthly probation fees and treatment costs. These obligations seem to take precedence over restitution, which is of lower priority. Research shows that offenders who were most likely to make full payments were the ones who were employed or had strong ties to their community.

One method of increasing compliance rates is to get the victim actively involved. Victims who attended offender mediation sessions were significantly more likely to receive full restitution payments from youthful offenders than were victims who were uninvolved. A second method of increasing compliance rates is the use of restitution centers—residential facilities that aid in restitution payment collection while an offender resides there (Outlaw & Ruback, 1999).

Fines

A fine is a fixed amount imposed by the judge, defined by the severity of the crime. In the United States, fines are typically used for traffic offenses, misdemeanors, and ordinance violations, where the average fine is \$100. Because traffic and misdemeanor violations are so numerous throughout the United States, fines are actually the most frequently used sanction of all. Fines are used more frequently in smaller jurisdictions than in larger urban counties.

If fines are used for felony crimes that are punishable by one year or more in prison, fines are typically in addition to probation or parole. An average fine for a felony case is \$1,000 and could go as high as \$10,000. The only exception here is organizational or corporate defendants involved in

corporate crime. Fines amounting to hundreds of thousands of dollars are routinely used in lieu of imprisonment for the vast majority of white-collar crimes. In other countries, fines are used for a wider variety of street crimes as stand-alone punishments—meaning a fine is used as a substitute for incarceration (Ruback & Bergstrom, 2006).

Correctional Boot Camps

Correctional boot camps are modeled after the military and target first-time felony offenders between the ages of 17 and 24. These young adults have committed a crime for which going to prison for 1 year or more was a possibility, and boot camp offers them an alternative chance to spend 90 to 180 days in an intense situation before being transferred out to community supervision. The programs use the military's philosophy of breaking down and rebuilding one's character, physical conditioning, labor, and drills to transform an offender into a responsible adult and hopefully to deter them from future law-breaking behavior (Wilson, MacKenzie, & Mitchell, 2005). Work assignments involve clearing land, digging ditches, or draining swamps in addition to facility maintenance and cleaning. Some boot camps involve inmates in projects benefiting the community such as cutting firewood for elderly citizens or separating recyclables. In addition, treatment and educational components enhance the needs of this young population.

Correctional boot camps began in 1983, and within a decade, over 7,000 offenders were in these programs in 30 states. Program participants often showed short-term positive attitude change, increased self-respect, and improved self-confidence after release. But it seemed that the positive attitudes were not sustained for the long term, and the recidivism rates were no different from comparison groups who had not been to boot camp. These were also the most expensive community corrections programs to operate because of the skills and abilities needed for drill instructors to work with each platoon. Over the last 10 years, boot camp programs have decreased in number or completely closed due to a high cost with negligible long-term benefits (Bottcher & Ezell, 2005).

Types of Community Correction Programs at Reentry

Community corrections programs assist offenders in community reentry after they have spent time in prison. Two of them are discussed here: a pre-release facility and parole.

Pre-Release Facility

A pre-release program is a minimum-security residential facility where offenders can live and work and be closely supervised by authorities. Pre-release facilities are also known as community centers, halfway houses, and residential community correction facilities. A 6- to 12-month stay in a halfway house allows time for offenders to gradually adjust to freedom, obtain employment, and save money for

independent living on parole. Pre-release facilities provide access to various community services that can help offenders with drug and alcohol dependency, job interviewing, or budgeting. Through a semistructured environment, pre-release facilities allow offenders temporary passes to leave the facility for a variety of reasons, including to reestablish family relationships; find affordable housing; secure employment; obtain a bus pass, identification, eyeglasses, or medication; and reconnect with other social service and community agencies. Residents are often expected to pay for treatment services and subsidize their living expenses with money earned from their job. The goal of pre-release facilities is for the offender to receive parole or some form of post-release supervision (Alarid & Reichel, 2008).

Parole and Post-Release Supervision

Parole is defined as the discretionary release of an offender by a parole board of 3–12 people before the expiration of his or her sentence. In deciding whom to release, the parole board considers factors such as the offender's conduct and participation in rehabilitative programs while in prison, the offender's attitude toward the crime, whether there is a solid release plan (housing, work, etc.), the reaction of the victim to the offender's release, and the need to provide space in the prison to receive newly sentenced prisoners (Petersilia, 2001).

A second form of supervision is called *mandatory* release, which is an automatic release to the community when a prisoner has completed a certain percentage of his or her sentence. While a parole board decides whom to release and who will stay in prison longer, mandatory release follows the law established by legislators in each state. Supervised mandatory release is used in states where parole boards have been abolished or where the parole board has limited powers with certain violent crimes. The rate of mandatory releases now outpaces discretionary releases (Petersilia, 2001).

Both forms of supervision involve conditions such as requiring the parolee to report to the parole officer; to get permission to move, change jobs, or leave the area; prohibition from having weapons; and so forth. Many parole or post-release conditions are similar to probation conditions discussed in a previous section. There is also the same possibility of revocation should the offender violate any conditions or commit a new crime. In the supervision of parolees, parole officers perform tasks similar to those done by probation officers. The two positions are enough alike that in the federal system and in most states, probation and parole departments are combined.

Advantages and Disadvantages of Community Corrections Programs

Community corrections programs offer some distinct advantages. The first is a cost issue. Compared to jail and prison, most community programs cost less. Offenders live at home,

and in the small number of residential programs where the offender lives at the facility, they help subsidize the cost of living. In addition, offenders who remain in the community can continue financially supporting themselves and their family through receiving wages and paying taxes. They are also more likely than incarcerated offenders to compensate their victim through restitution and to complete community service (Petersilia, 2001).

Second, community programs can ease jail and prison crowding by allowing convicted offenders the chance to complete a drug program, boot camp, or other corrections program, and are thus another form of cost savings.

A third aspect to community corrections is the flexibility of the programs in that they can be used at many points in the criminal justice process. Community punishments limit the freedoms of convicted offenders and mandate treatment. They can also be used as a pretrial release option and as a diversion to avoiding a conviction altogether. Community supervision also aids in the reentry process after a period of incarceration.

Finally, community corrections programs avoid exposing offenders to jail and prison conditions that may be unsafe and at times even violent. Some people might be helped more in other ways. For example, community sentences can be beneficial for those needing medical attention, such as terminally ill, physically disabled, or elderly offenders, who may be better suited for a sentence within their own residence. Other offenders such as developmentally disabled or mentally ill individuals experience higher rates of victimization in prison and may be appropriately placed and treated elsewhere. An institutional environment is not for everyone, and may cause more harm than good (Alarid et al., 2008).

Disadvantages

Perhaps the most prominent advantage of community corrections can also be its greatest disadvantage. As previously mentioned, drug programs and boot camps might ease crowding by placing prison-bound offenders in a program that allows them the chance to avoid incarceration, but such programs might also be filled with offenders who actually should have received a less severe sentence. This is a situation known as *net widening*, and it happens when judges and prosecutors fill the program spaces with offenders who do not necessarily require such a high level of care or intervention rather than the ones the program was actually designed for. Not only are prison-bound offenders not getting their chance to be placed in appropriate programs and have access to services, but the cost of punishment actually increases. Officials often feel they must maximize program capacity because it is there (Alarid et al., 2008).

Another disadvantage is that public safety may be compromised. Offenders are more easily able to continue criminal behavior than if they were confined in jail or prison. With funding going to jails and prisons, resources have not kept pace with community corrections growth. With resources

spread so thinly, officers now supervise more offenders and are able to spend less time on each person. Technology is slowly replacing human supervision. However, even when home confinement is combined with electronic monitoring technology, authorities cannot be completely assured that offenders will refrain from criminal activity. For example, being that home confinement programs allow offenders to leave their residences for activities such as work and shopping, it is possible that crimes can be committed even when offenders are legitimately away from home.

Many community supervision programs are disconnected from the various treatment services that exist to address the multitude of problems offenders face. This becomes a disadvantage to an offender's success when treatment attendance is lacking because of transportation problems and inability to miss work. Programs like day reporting centers that comprehensively address drug abuse, job training, employment, physical or sexual victimization, parenting education, and anger management all in one location tend to have higher completion rates (Bahn & Davis, 1998).

Daily Cost of Community Corrections Programs

A grand total of \$62 billion is spent on the punishment and treatment of 7 million offenders every year. Jails and prisons are the most expensive forms of punishment, costing between \$50 and \$100 per day per person depending on the level of custody and the region of the country (Alarid & Reichel, 2008). Jails and prisons also consume most of the correctional budget. Very little, if any, of that cost is subsidized by the offender.

Most community corrections programs are subsidized in part by the offender and thus are considered more cost-effective. Starting with a base cost for probation supervision at \$1 per day for low supervision, probation can range up to \$15 per day per person for intense probation supervision. In each case, the offender pays for about 10% of the cost. Pretrial supervision costs are generally lower than probation. Day reporting centers also vary widely, from \$10 to \$100 per day per person.

Other programs such as electronic monitoring require that additional staff be hired to supervise the technological devices, at an estimated cost of \$4 to \$20 per day, depending on the amount the offender pays. Typical home-based electronic monitoring supervision costs the offender nearly \$10 per day, and GPS monitoring is about \$16 per day (Alarid et al., 2008).

Residential community correction programs are significantly higher. A prerelease program may cost \$45 to \$60 per day, but one third of that cost is subsidized by the offender. A correctional boot camp is by far the most expensive option, costing more than jail or prison, with no financial support from the offender. As a result, the number of correctional boot camps has declined over the years because the benefits were not outweighing the high costs.

Do Community Corrections Programs Work?

In the 1970s, sentencing disparity drew attention in the courts and from the parole boards. People were concerned with the fact that some offenders served significantly longer periods of time than others for the same crime. Community treatment programs were also criticized for not being able to do much about preventing future criminal activity while offenders were under supervision. Studies concluded that some strategies worked and other programs did not significantly reduce crime. The lack of confidence in correctional programming sparked a national debate about the efficacy of rehabilitation and influenced treatment offerings within all community-based programs. One positive outcome of this was the increased attention paid to the different types of offenders and situations in which certain treatment modalities will perform better.

Today, with more sophisticated computer technology and statistical tests available, there are more rigorous tests to determine what does and does not work in terms of both treatment and supervision strategies. The most common way of measuring program effectiveness is to determine whether or not offenders return to criminal behavior. This is better known as recidivism and is measured by rearrest, reconviction, or another term of incarceration. Recidivism should be measured during the period of supervision and after supervision ends, for a period of 1 to 5 years. Other outcome data that could be used to measure effectiveness might be specific components unique to that program, such as the collection rate for fines and restitution, the percentage of offenders who remain employed or in school, the number of GED certificates or high school diplomas awarded, and the number of community service hours performed. Since one of the goals mentioned previously is to ease crowding, effectiveness could be measured based on cost savings or whether a new jail or prison had to be built to accommodate the overflow.

To properly evaluate a program, a "treatment" group of offenders could be selected at random to participate in a program, and a "control" group would consist of the offenders who are sentenced to a form of regular probation supervision. However, the political nature of elected judges and appointed prosecutors rarely permits this type of evaluation to occur. Furthermore, many sentencing laws mandate a certain form of punishment for certain crimes, so random selection may be illegal in some cases. The following is a summary list of principles of effectiveness from various community corrections programs (Bottcher & Ezell, 2005; Deschenes, Turner, & Petersilia, 1995; Fischer, 2003; Padgett, Bales, & Blomberg, 2006; Wilson et al., 2005):

- Offenders who are in day reporting centers, boot camps, and halfway houses have more complex problems and a higher risk of recidivism than typical probationers. As a result, offenders in residential facilities are more likely to

receive a wider variety of treatment and counseling services than are offenders on traditional probation or parole.

- Surveillance alone will not reduce recidivism. Regardless of the level of supervision or type of community corrections program, offenders need to be participating simultaneously in treatment programs while under supervision.
- The closer the supervision, the more likely the officer will catch the offender in some sort of a rule violation. Treatment options, as opposed to punitive options, are recommended for offenders who violate supervision regulations.
- Community programs that were the most effective tended to be longer in duration, offered treatment during the program, offered convenience to treatment services all in one location, and intertwined an aftercare program that gradually tapered off the supervision over a period of 2 years.
- Programs that have high completion rates are probation and electronic monitoring programs where the supervision term is for less than one year.
- Correctional boot camp participants overall had no difference in recidivism rates from groups of probationers and parolees. Although there may be some studies showing a small difference—particularly those programs with treatment programs—the overall effect is no different in terms of reducing crime in the future.
- Paying fines and restitution has little effect on recidivism.

Conclusion

Few studies have compared offenders sentenced to jail or prison with those sentenced to a community-based program. Although the rate of reoffending is lower for offenders sentenced in the community, when prior criminal record is controlled, there is little overall difference in recidivism rates between the two sanctions. If that is the case, it seems reasonable to choose the less expensive punishment option and reserve prisons for the select few persons who are true dangers to the rest of society.

CRIME PREVENTION

DAVID P. FARRINGTON
University of Cambridge

As described by Michael Tonry and David Farrington (1995), criminal justice prevention refers to traditional deterrent, incapacitative, and rehabilitative strategies operated by law enforcement and criminal justice system agencies. Community prevention refers to interventions designed to change the social conditions and institutions (e.g., families, peers, social norms, clubs, organizations) that influence offending in residential communities. These interventions target community risk factors and social conditions such as cohesiveness or disorganization. Situational prevention refers to interventions designed to prevent the occurrence of crimes by reducing opportunities and increasing the risk and difficulty of offending. Developmental crime prevention refers to interventions designed to prevent the development of criminal potential in individuals, especially those targeting risk and protective factors discovered in studies of human development. The focus in this article is on developmental or risk-focused prevention.

The main aim is to summarize briefly some of the most effective programs for preventing delinquency and antisocial behavior whose effectiveness has been demonstrated in high-quality evaluation research. The focus is especially on programs evaluated in randomized experiments with reasonably large samples, since the effect of any intervention on delinquency can be demonstrated most convincingly in these studies (see Farrington & Welsh, 2006).

Risk-Focused Prevention

The basic idea of developmental or risk-focused prevention is very simple: Identify the key risk factors for offending and implement prevention techniques designed to counteract them. There is often a related attempt to identify key protective factors against offending and to implement prevention techniques designed to enhance or strengthen them. Longitudinal surveys are used to advance knowledge about risk and protective factors, and experimental and quasi-experimental methods are used to evaluate the impact of prevention and intervention programs.

Risk-focused prevention was imported into criminology from medicine and public health by pioneers such as David Hawkins and Richard Catalano (1992). This approach has been used successfully for many years to tackle illnesses such as cancer and heart disease. For example, the identified risk factors for heart disease include smoking, a fatty diet, and lack of exercise. These can be tackled by encouraging people to stop smoking; to have a more healthy, low-fat diet; and to exercise more.

Risk-focused prevention links explanation and prevention; links fundamental and applied research; and links scholars, policymakers, and practitioners. The book *Saving Children From a Life of Crime: Early Risk Factors and Effective Interventions*, by Farrington and Brandon Welsh (2007), contains a detailed exposition of this approach.

Importantly, risk-focused prevention is easy to understand and to communicate, and it is readily accepted by policy-makers, practitioners, and the general public. Both risk factors and interventions are based on empirical research rather than on theories. This approach avoids difficult theoretical questions about which risk factors have causal effects.

What Is a Risk Factor?

By definition, a risk factor predicts an increased probability of later offending. For example, children who experience poor parental supervision have an increased risk of committing criminal acts later on. In the Cambridge Study in Delinquent Development, which is a prospective longitudinal survey of 400 London males from age 8 to age 50, a total of 61% of those experiencing poor parental supervision at age 8 were convicted by age 50, compared with 36% of the remainder—a significant difference. Since risk factors are defined by their ability to predict later offending, it follows that longitudinal studies are needed to establish them.

The most important risk factors for delinquency are well-known (Farrington, 2007). They include individual factors such as high impulsiveness and low intelligence, family factors such as poor parental supervision and harsh or erratic parental discipline, peer factors such as hanging around with delinquent friends, school factors such as attending a high-delinquency-rate school, socioeconomic factors such as low income and poor housing, and neighborhood or community factors such as living in a high-crime neighborhood. The focus is on risk factors that can be changed by interventions. There is also a focus on protective factors that predict a low probability of offending, but less is known about them.

Risk factors tend to be similar for many different outcomes, including delinquency, violence, drug use, school failure, and unemployment. This is good news, because a program that is successful in reducing one of these outcomes is likely to be successful in reducing the others as well. This chapter reviews programs that target family, school, peer, and community risk factors.

Family-Based Prevention

The behavioral parent management training developed by Gerald Patterson (1982) in Oregon is one of the most influential family-based prevention approaches. His careful observations of parent-child interaction showed that parents of antisocial children were deficient in their methods of child rearing. These parents failed to tell their children how they were expected to behave, failed to use punishment consistently or monitor their behavior to ensure that it was desirable, and failed to enforce rules promptly and unambiguously with

appropriate rewards and penalties. The parents of antisocial children used more punishment (such as scolding, shouting, or threatening), but failed to use it consistently or make it contingent on the child's behavior.

Patterson's (1982) method involved linking antecedents, behaviors, and consequences. He attempted to train parents in effective child-rearing methods, namely, noticing what a child is doing, monitoring the child's behavior over long periods, clearly stating house rules, making rewards and punishments consistent and contingent on the child's behavior, and negotiating disagreements so that conflicts and crises did not escalate. His treatment was shown to be effective in reducing child stealing and antisocial behavior over short periods in small-scale studies. However, the treatment worked best with children aged 3 to 10 and less well with adolescents. Also, there were problems achieving cooperation from the families experiencing the worst problems. In particular, single mothers on welfare were experiencing so many different stresses that they found it difficult to use consistent and contingent child-rearing methods.

The most important types of family-based programs that have been evaluated will now be reviewed. These are home visiting programs (and especially the work of Olds and rthur Reynolds), parent training programs (especially those used by Carolyn Webster-Stratton, Stephen Scott, and Matthew Sanders), home or community programs with older children (especially those implemented by James Alexander and Patricia Chamberlain), and Multisystemic Therapy or MST (used by Scott Henggeler and Alison Cunningham).

Home Visiting Programs

In the most famous intensive home visiting program, Olds and his colleagues (Olds, Hill, & Rumsey, 1998) in Elmira (New York) randomly allocated 400 mothers to receive home visits from nurses during pregnancy, to receive visits both during pregnancy and during the first 2 years of the child's life, or to be part of a control group that received no visits. Each visit lasted about 1.25 hours, and the mothers were visited on average every 2 weeks. The home visitors gave advice about prenatal and postnatal care of the child, about infant development, and about the importance of proper nutrition and avoiding smoking and drinking during pregnancy. Thus, this was a general parent education program.

The results of this experiment showed that the postnatal home visits caused a decrease in recorded child physical abuse and neglect during the first 2 years of life, especially by poor unmarried teenage mothers; 4% of visited versus 19% of nonvisited mothers of this type were guilty of child abuse or neglect. This last result is important because children who are physically abused or neglected tend to become violent offenders later in life. In a 15-year follow-up, the main focus was on lower-class unmarried mothers. Among these mothers, those who received prenatal and postnatal

home visits had fewer arrests than those who received prenatal visits or no visits. Also, children of these mothers who received prenatal and/or postnatal home visits had less than half as many arrests as children of mothers who received no visits. According to Steve Aos and his colleagues (Aos, Phipps, Barnoski, & Lieb, 2001) from the Washington State Institute for Public Policy, \$3 were saved for every \$1 expended on high-risk mothers in this program.

Like the Perry project, described later in this chapter, the Child Parent Center (CPC) in Chicago provided disadvantaged children with a high-quality, active learning preschool supplemented with family support. However, unlike Perry, CPC continued to provide the children with the educational enrichment component into elementary school, up to age 9. Focusing on the effect of the preschool intervention, Reynolds and his colleagues (Reynolds, Temple, Robertson, & Mann, 2001) found that compared to a control group, those who received the program were less likely to be arrested for either nonviolent or violent offenses by the time they were 18. The CPC program also produced other benefits for those in the experimental compared to the control group, such as a high rate of high school completion.

Parent Management Training

One of the most famous parent training programs was developed by Carolyn Webster-Stratton (2000) in Seattle. She evaluated its success by randomly assigning 426 4-year-old children (most with single mothers on welfare) either to an experimental group that received parent training or to a control group that did not. The experimental mothers met in groups every week for 8 or 9 weeks, watched videotapes demonstrating parenting skills, and then took part in focused group discussions. The topics included how to play with your child, helping your child learn, using praise and encouragement to bring out the best in your child, effective setting of limits, handling misbehavior, how to teach your child to solve problems, and how to give and get support. Observations in the home showed that the children of mothers in the experimental group behaved better than those of the control group mothers.

Webster-Stratton and Mary Hammond (1997) also evaluated the effectiveness of parent training and child skills training with about 100 Seattle children (average age, 5) referred to a clinic because of conduct problems. The children and their parents were randomly assigned to (a) receive parent training, (b) receive child skills training, (c) receive both parent and child training, or (d) be in a control group. The skills training aimed to foster prosocial behavior and interpersonal skills using video modeling, while the parent training involved weekly meetings between parents and therapists for 22 to 24 weeks. Parent reports and home observations showed that children in all three experimental conditions had fewer behavior problems than control children, in both an immediate and a one-year follow-up. There was little difference in results among the three

experimental conditions, although the combined parent and child training condition produced the most significant improvements in child behavior at the 1-year follow-up. It is generally true that combined parent and child interventions are more effective than either one alone.

Scott and his colleagues (Scott, Spender, Doolan, Jacobs, & Aspland, 2001) evaluated the Webster-Stratton parent training program in London and Chichester, U.K. About 140 mainly poor, disadvantaged children aged 3 to 8 who were referred for antisocial behavior were randomly assigned to receive parent training or to be in a control group. The parent training program, based on videotapes, covered praise and rewards, setting limits, and handling misbehavior. Follow-up parent interviews and observations showed that the antisocial behavior of the experimental children decreased significantly compared to that of the controls. Furthermore, after the intervention, experimental parents gave their children more praise to encourage desirable behavior and used more effective commands to obtain compliance.

Sanders and his colleagues (Sanders, Markie-Dadds, Tully, & Bor, 2000) in Brisbane, Australia, developed the Triple-P Parenting program. This program either can be delivered to the whole community in primary prevention using the mass media or can be used in secondary prevention with high-risk or clinic samples. Sanders et al. evaluated the success of Triple-P with high-risk children aged 3 by randomly assigning them either to receive Triple-P or to be in a control group. The Triple-P program involves teaching parents 17 child management strategies, including talking with children, giving physical affection, praising, giving attention, setting a good example, setting rules, giving clear instructions, and using appropriate penalties for misbehavior (a "time-out," or sending the child to his or her room). The evaluation showed that the Triple-P program was successful in reducing children's antisocial behavior.

Other Parenting Interventions

Another parenting intervention, termed *functional family therapy*, was developed by Alexander in Utah (see Sexton & Alexander, 2000). This aimed to modify patterns of family interaction by modeling, prompting, and reinforcement; to encourage clear communication of requests and solutions between family members; and to minimize conflict. Essentially, all family members were trained to negotiate effectively, to set clear rules about privileges and responsibilities, and to use techniques of reciprocal reinforcement with each other. The program was evaluated by randomly assigning 86 delinquent youths to experimental or control conditions. The results showed that this technique halved the recidivism rate of minor delinquents in comparison with other approaches (client-centered or psychodynamic therapy). Its effectiveness with more serious offenders was confirmed in a replication study using matched groups.

Chamberlain (1998) in Oregon evaluated treatment foster care (TFC), which was used as an alternative to custody for delinquent youths. Custodial sentences for delinquents were thought to have undesirable effects, especially because of the bad influence of delinquent peers. In treatment foster care, families in the community were recruited and trained to provide a placement for delinquent youths. The TFC youths were closely supervised at home, in the community, and in the school, and their contacts with delinquent peers were minimized. The foster parents provided a structured daily living environment with clear rules and limits, consistent discipline for rule violations, and one-to-one monitoring. The youths were encouraged to develop academic skills and desirable work habits.

In the evaluation, 79 chronic male delinquents were randomly assigned to treatment foster care or to regular group homes where they lived with other delinquent youths. A 1-year follow-up showed that the TFC boys had fewer criminal referrals and lower self-reported delinquency. Hence, this program seemed to be an effective treatment for delinquency.

Multisystemic Therapy

Multisystemic therapy (MST) is an important multiple-component family preservation program that was developed by Henggeler and his colleagues (Henggeler, Schoenwald, Borduin, Rowland, & Cunningham, 1998) in South Carolina. The particular type of treatment is chosen according to the particular needs of the youth. Therefore, the nature of the treatment is different for each person. MST is delivered in the youth's home, school, and community settings. The treatment typically includes family intervention to promote the parent's ability to monitor and discipline the adolescent, peer intervention to encourage the choice of prosocial friends, and school intervention to enhance competence and school achievement.

In an evaluation by Henggeler et al. (1998), 84 serious delinquents (with an average age of 15) were randomly assigned either to receive MST or the usual treatment (which mostly involved placing the juvenile in a setting outside the home). The results showed that the MST group had fewer arrests and fewer self-reported crimes in a 1-year follow-up. In another evaluation, in Missouri, Charles Borduin and his colleagues randomly assigned 176 juvenile offenders (with an average age of 14) either to MST or to individual therapy focusing on personal, family, and academic issues. Four years later, only 29% of the MST offenders had been rearrested, compared with 74% of the individual therapy group (cited in Aos et al., 2001). According to Steve Aos et al. (2001), MST had one of the highest cost-benefit ratios of any program. For every \$1 spent on it, \$13 were saved in victim and criminal justice costs.

Unfortunately, disappointing results were obtained in a large-scale independent evaluation of MST in Ontario, Canada, by Alan Leschied and Alison Cunningham (1998). Over 400 youths who were either offenders or at risk of

offending were randomly assigned to receive either MST or the usual services (typically probation supervision). Six months after treatment, 28% of the MST group had been reconvicted, compared with 31% of the control group, a nonsignificant difference. Therefore, it is unclear how effective MST is when it is implemented independently.

Is Family-Based Intervention Effective?

Evaluations of the effectiveness of family-based intervention programs have produced both encouraging and discouraging results. In order to assess effectiveness according to a large number of evaluations, Farrington and Welsh (2003) reviewed 40 evaluations of family-based programs, each involving at least 50 persons in experimental and control groups combined. All of these had outcome measures of delinquency or antisocial child behavior. Of the 19 studies with outcome measures of delinquency, 10 found significantly beneficial effects of the intervention and 9 found no significant effect. Happily, no study found a significantly harmful effect of family-based treatment.

Over all 19 studies, the average effect size (d , the standardized mean difference) was .32. This was significantly greater than zero. When it was converted into the percentage reconvicted, a d value of .32 corresponded to a decrease in the percentage reconvicted from 50% to 34%. Therefore, it was concluded that, taking all 19 studies together, they showed that family-based intervention had substantial desirable effects. Also, there was evidence that some programs (e.g., home visiting) had financial benefits that greatly exceeded program costs.

School-Based Prevention

The next section reviews school-based prevention programs, most of which also had a family-based component. The Perry preschool program is reviewed first. This is perhaps the most influential early prevention project, because it concluded that \$7 were saved for every \$1 expended. Then the famous programs combining child skills training and parent training, implemented in Montreal by Richard Tremblay and in Seattle by David Hawkins, are reviewed, and also anti-bullying programs by Dan Olweus in Norway and Peter Smith in England.

Preschool Programs

The most famous preschool intellectual enrichment program is the Perry project, carried out in Ypsilanti (Michigan) by Lawrence Schweinhart and David Weikart (see Schweinhart et al., 2005). This was essentially a "Head Start" program targeted at disadvantaged African American children. Members of a small sample of 123 children were assigned (approximately at random) to experimental and control groups. The experimental children attended a daily preschool program—backed up by weekly

home visits—usually lasting 2 years (covering ages 3–4). The aim of the “plan–do–review” program was to provide intellectual stimulation, to increase thinking and reasoning abilities, and to increase later school achievement.

This program had long-term benefits. John Berrueta-Clement (1984) showed that at age 19, members of the experimental group were more likely to be employed, more likely to have graduated from high school, more likely to have received college or vocational training, and less likely to have been arrested. By age 27, the experimental group had accumulated only half as many arrests on average as the controls. Also, they had significantly higher earnings and were more likely to be homeowners. Regarding the women in the experimental group, more were married, and fewer of their children were born to unmarried mothers.

The most recent follow-up of this program, evaluating the participants at age 40, found that it continued to make an important difference in their lives. Compared to the control group, those who received the program had significantly fewer lifetime arrests for violent crimes (32% vs. 48%), property crimes (36% vs. 56%), and drug crimes (14% vs. 34%), and they were significantly less likely to be arrested five or more times (36% vs. 55%). Improvements were also recorded in many other important life course outcomes. For example, significantly higher levels of schooling (77% vs. 60% graduating from high school), better records of employment (76% vs. 62%), and higher annual incomes were reported by the program group compared to the controls.

Several economic analyses show that the financial benefits of this program outweighed its costs. The Perry project’s own calculation included crime and non-crime benefits, intangible costs to victims, and even projected benefits beyond age 27. This generated the famous cost-benefit ratio of 7 to 1. Most of the benefits (65%) were derived from savings to crime victims. The most recent cost-benefit analysis of participants at age 40 found that the program produced \$17 in benefits per \$1 of cost.

School Programs

The Montreal longitudinal-experimental study combined child skills training and parent training (see McCord & Tremblay, 1992). Tremblay and his colleagues identified disruptive (aggressive or hyperactive) boys at age 6, and randomly allocated over 300 of them to experimental or control conditions. Between ages 7 and 9, the experimental group received training designed to foster social skills and self-control. Coaching, peer modeling, role-playing, and reinforcement contingencies were used in small-group sessions on such topics as “how to help,” “what to do when you are angry,” and “how to react to teasing.” Also, their parents were trained using the parent management training techniques developed by Gerald Patterson (1982).

This prevention program was successful. By age 12, the experimental boys committed less burglary and theft, were less likely to get drunk, and were less likely to be involved

in fights than the controls (according to self-reports). Also, the experimental boys had higher school achievement. At every age from 10 to 15, the experimental boys had lower self-reported delinquency scores than the control boys. Interestingly, the differences in antisocial behavior between experimental and control boys increased as the follow-up progressed. A later follow-up showed that fewer experimental boys had a criminal record by age 24 (Boisjoli, Vitaro, Lacourse, Barker, & Tremblay, 2007).

One of the most important school-based prevention experiments was carried out in Seattle by Hawkins and his colleagues (Hawkins, Catalano, Kosterman, Abbott, & Hill, 1999). They implemented a multiple-component program combining parent training, teacher training, and child skills training. About 500 first-grade children (aged 6) in 21 classes in 8 schools were randomly assigned to be in experimental or control classes. The children in the experimental classes received special treatment at home and school that was designed to increase their attachment to their parents and their bonding to the school. Also, they were trained in interpersonal cognitive problem solving. Their parents were trained to notice and reinforce socially desirable behavior in a program called “Catch Them Being Good.” Their teachers were trained in classroom management—for example, to provide clear instructions and expectations to children, to reward children for participation in desired behavior, and to teach children prosocial (socially desirable) methods of solving problems.

This program had long-term benefits. By the sixth grade (age 12), experimental boys were less likely to have initiated delinquency, while experimental girls were less likely to have initiated drug use. In a later follow-up, Hawkins and his colleagues (Hawkins, Catalano, Kosterman, Abbott, & Hill, 1999) found that, at age 18, the full intervention group (those who received the intervention from Grades 1–6) admitted less violence, less alcohol abuse, and fewer sexual partners than the late intervention group (Grades 5–6 only) or the control group. According to Steve Aos and his colleagues (2001), over \$4 were saved for every \$1 spent on this program.

In Baltimore, Hanno Petras, Sheppard Kellam, and their colleagues (2008) evaluated the “Good Behavior Game” (GBG), which aimed to reduce aggressive and disruptive child behavior through contingent reinforcement of interdependent team behavior. First-grade classrooms and teachers were randomly assigned either to the GBG condition or to a control condition, and the GBG was played repeatedly over 2 years. In trajectory analyses, the researchers found that the GBG decreased aggressive/disruptive behavior (according to teacher reports) up to Grade 7 among the most aggressive boys, and also caused a decrease in antisocial personality disorder at ages 19–21. However, effects on girls and on a second cohort of children were less marked.

There have been a number of comprehensive, evidence-based reviews of the effectiveness of school-based programs by Denise Gottfredson, David Wilson, and their

colleagues (see Sherman, Farrington, Welsh, & MacKenzie, 2006). Meta-analyses identified four types of school-based programs that were effective in preventing delinquency: school and discipline management, classroom or instructional management, reorganization of grades or classes, and increasing self-control or social competency using cognitive-behavioral instruction methods. Reorganization of grades or classes had the largest average effect size ($d = .34$), corresponding to a significant 17% reduction in delinquency.

After-school programs (e.g., recreation-based, drop-in clubs, dance groups, and tutoring services) are based on the belief that providing prosocial opportunities for young people in the after-school hours can reduce their involvement in delinquent behavior in the community. After-school programs target a range of risk factors for delinquency, including association with delinquent peers. Welsh and Akemi Hoshi identified three high-quality after-school programs with an evaluated impact on delinquency (see Sherman et al., 2006). Each had desirable effects on delinquency, and one program also reported lower rates of drug use for participants compared to controls.

Anti-Bullying Programs

School bullying is a risk factor for later offending, and several school-based programs have been effective in reducing bullying. The most famous of these was implemented by Olweus (1993) in Norway. The general principles of the program were to create an environment characterized by adult warmth, interest in children, and involvement with children; to use authoritative child rearing, including warmth, firm guidance, and close supervision, since authoritarian child rearing is related to child bullying; to set firm limits on what is unacceptable bullying; to consistently apply nonphysical sanctions for rule violations; to improve monitoring and surveillance of child behavior, especially on the playground; and to decrease opportunities and rewards for bullying.

The Olweus (1993) program aimed to increase awareness and knowledge of teachers, parents, and children about bullying and to dispel myths about it. A 30-page booklet was distributed to all schools in Norway describing what was known about bullying and recommending what steps schools and teachers could take to reduce it. Also, a 25-minute video about bullying was made available to schools. Simultaneously, the schools distributed to all parents a four-page folder containing information and advice about bullying. In addition, anonymous self-report questionnaires about bullying were completed by all children.

Each school received feedback information from the questionnaire, about the prevalence of bullies and victims, on a specially arranged school conference day. Also, teachers were encouraged to develop explicit rules about bullying (e.g., do not bully, tell someone when bullying

happens, bullying will not be tolerated, try to help victims, try to include children who are being left out) and to discuss bullying in class, using the video and role-playing exercises. Also, teachers were encouraged to improve monitoring and supervision of children, especially on the playground.

The effects of this anti-bullying program were evaluated in 42 Bergen schools. Olweus (1993) measured the prevalence of bullying before and after the program using self-report questionnaires completed by the children. Since all schools received the program, there were no control schools. However, Olweus compared children of a certain age (e.g., 13) before the program with different children of the same age after the program. Overall, the program was very successful because bullying decreased by half.

A similar program was implemented in 23 schools in Sheffield (U.K.) by Peter Smith and Sonia Sharp (1994). The core program involved establishing a “whole school” anti-bullying policy, raising awareness of bullying, and clearly defining roles and responsibilities of teachers and students so that everyone knew what bullying was and what they should do about it. In addition, there were optional interventions tailored to particular schools: curriculum work (e.g., reading books, watching videos), direct work with students (e.g., assertiveness training for those who were bullied), and playground work (e.g., training lunchtime supervisors). This program was successful in reducing bullying (by 15%) in primary schools, but had relatively small effects (a 5% reduction) in secondary schools.

Maria Ttofi and her colleagues (Ttofi, Farrington, & Baldry, 2008) completed a systematic review of the effectiveness of anti-bullying programs in schools. They found 59 high-quality evaluations of 30 different programs. They concluded that, overall, anti-bullying programs were effective. The results showed that bullying and victimization were reduced by about 17% to 23% in experimental schools compared with control schools.

Peer Programs

There are few outstanding examples of effective intervention programs for antisocial behavior targeted at peer risk factors. The most hopeful programs involve using high-status conventional peers to teach children ways of resisting peer pressure. Nancy Tobler and her colleagues (Tobler, Lessard, Marshall, Ochshom, & Roona, 1999) found that these were effective in reducing drug use. Also, in a randomized experiment in St. Louis, Ronald Feldman and his colleagues (Feldman, Caplinger, & Wodarski, 1993) showed that placing antisocial adolescents in activity groups dominated by prosocial adolescents led to a reduction in their antisocial behavior (compared with antisocial adolescents placed in antisocial groups). This suggests that the influence of prosocial peers can be harnessed to reduce antisocial behavior. However, putting antisocial peers together can have harmful effects.

The most important intervention program whose success seems to be based mainly on reducing peer risk factors is the “Children at Risk” program, which targeted high-risk adolescents (average age, 12) in poor neighborhoods of five cities across the United States. Eligible youths were identified in schools and randomly assigned to experimental or control groups. The program was a comprehensive, community-based prevention strategy targeting risk factors for delinquency, including case management and family counseling, family skills training, tutoring, mentoring, after-school activities, and community policing. The program was different in each neighborhood.

The initial results of the program were disappointing, but a 1-year follow-up by Adele Harrell and her colleagues (Harrell, Cavanagh, & Sridharan, 1999) showed that (according to self-reports) youths in the experimental groups were less likely to have committed violent crimes and used or sold drugs. The process evaluation showed that the greatest change was in peer risk factors. Experimental youths associated less often with delinquent peers, felt less peer pressure to engage in delinquency, and had more positive peer support. In contrast, there were few changes in individual, family, or community risk factors, which was possibly linked to the low participation of parents in parent training and of youths in mentoring and tutoring. In other words, there were problems of implementation of the program, linked to the serious and multiple needs and problems of the families.

Mentoring programs usually involve nonprofessional adult volunteers spending time with young people at risk for delinquency, dropping out of school, school failure, or other social problems. Welsh and Hoshi (2002) identified seven mentoring programs (of which six were of high quality) that evaluated the impact on delinquency. Since most programs had desirable effects, Welsh and Hoshi concluded that community-based mentoring was a promising approach in preventing delinquency. Similarly, a meta-analysis by Darrick Jolliffe and David Farrington (2008) concluded that mentoring was often effective in reducing reoffending.

Community Programs

In the interests of maximizing effectiveness, what is needed is a multiple-component, community-based program including several of the successful interventions listed above. Many of the programs reviewed in this article are of this type. However, “Communities That Care” (CTC) is an additional program that has many attractions. Perhaps more than any other program, it is evidence-based and systematic: The choice of interventions depends on empirical evidence about what are the important risk and protective factors in a particular community and on empirical evidence about “what works.” It has been implemented in at least 35 sites in England, Scotland, and Wales and also in the Netherlands and Australia.

CTC was developed as a risk-focused prevention strategy by Hawkins and Catalano (1992), and it is a core component of the U.S. Office of Juvenile Justice and Delinquency Prevention’s Comprehensive Strategy for Serious, Violent, and Chronic Juvenile Offenders. CTC is based on a theory (the social development model) that organizes risk and protective factors. The intervention techniques are tailored to the needs of each particular community. The “community” could be a city, a county, a small town, or even a neighborhood or a housing estate. This program aims to reduce delinquency and drug use by implementing particular prevention strategies that have demonstrated effectiveness in reducing risk factors or enhancing protective factors. It is modeled on large-scale, community-wide public health programs designed to reduce illnesses such as coronary heart disease by tackling key risk factors. There is great emphasis in CTC on enhancing protective factors and building on strengths, partly because this is more attractive to communities than tackling risk factors. However, it is generally true that health promotion is more effective than disease prevention.

CTC programs begin with community mobilization. Key community leaders (e.g., elected representatives, education officials, police chiefs, business leaders) are brought together with the aim of getting them to agree on the goals of the prevention program and to implement CTC. The key leaders then set up a community board that is accountable to them, consisting of neighborhood residents and representatives from various agencies (e.g., school, police, social services, probation, health, parents, youth groups, business, church, media). The community board takes charge of prevention on behalf of the community.

The community board then carries out a risk and protective factor assessment, identifying key risk factors in that particular community that need to be tackled and key protective factors that need enhancing. This risk assessment might involve the use of police, school, social, or census records or local neighborhood or school surveys. After identifying key risk and protective factors, the community board assesses existing resources and develops a plan of intervention strategies. With specialist technical assistance and guidance, they choose programs from a menu of strategies that have been shown to be effective in well-designed evaluation research.

The menu of strategies listed by Hawkins and Catalano (1992) includes prenatal and postnatal home visiting programs, preschool intellectual enrichment programs, parent training, school organization and curriculum development, teacher training, and media campaigns. Other strategies include child skills training, anti-bullying programs in schools, situational prevention, and policing strategies. The choice of prevention strategies is based on empirical evidence about effective methods of tackling each particular risk factor, but it also depends on what are identified as the biggest problems in the community. While this approach is not without its challenges and complexities (e.g., cost, implementation, establishing partnerships among diverse

agencies), an evidence-based approach that brings together the most effective prevention programs across multiple domains offers the greatest promise for reducing crime and building safer communities.

Conclusion

High-quality evaluation research shows that many programs are effective in reducing delinquency and antisocial behavior, and that in many cases the financial benefits of these programs outweigh their financial costs. The best programs include general parent education, parent management training, preschool intellectual enrichment programs, child skills training, mentoring, teacher training, anti-bullying programs, and multisystemic therapy.

The time is ripe to mount a large-scale, evidence-based, integrated national strategy for the reduction of crime and associated social problems, including rigorous evaluation requirements. This approach should implement programs to tackle risk factors and strengthen protective factors, and it could be based on “Communities That Care.” Primary prevention has been effective in improving health, and it could be equally effective in reducing delinquency and antisocial behavior in all countries.

CRIMINAL COURTS

RICHARD D. HARTLEY

University of Texas at San Antonio

DEAN JOHN CHAMPION (1940–2009)

Texas A&M International University

When most people speak of the law, they are probably referring to a body of rules of conduct that has been written down. This is what is known as the *substantive* law. The law, however, can also refer to the systems and persons that have the authority to put the substantive law into practice. The law may also mean many other things to many people. Quinney (1974) believes the law serves the needs of those in the ruling class. Others believe the reverse is true: The law serves as a means for those not in the ruling class to challenge the existing status quo. The law can be both and may at the same time be seen as liberating to some and oppressive to others (Vago, 2006). Throughout U.S. history, the law has been used to both enable and eliminate slavery and to control and liberate women, and it has served to both convict and acquit those accused of crimes, regardless of whether they were guilty or not (Champion, Hartley, & Rabe, 2008). Whatever the law has meant at various times to various people, the criminal courts are both the institution and the structure that bring these ideas of the law to life. Without the courts and criminal procedures, and without legal actors, the law could not function to do any of the above.

The criminal court system in the United States, however, can be a very complex and confusing system to study and understand. Every state and the federal government has its own court structure and procedures for prosecuting criminals. Adding to the complexity is the fact that each state can specify its own sentencing structure. Some states use indeterminate sentencing; others use determinate sentencing or

sentencing guidelines. Other jurisdictions also use sentence enhancements such as habitual offender statutes, truth-in-sentencing laws, or mandatory minimums. Finally, criminal courts are not the only avenue for dealing with those who have violated the law. Offenders in some jurisdictions may be processed in tribal court, drug court, or through a military tribunal. Others may be diverted to community-based correctional agencies with a more restorative justice ideal. These different types of courts and the lack of uniformity among them can at times be confusing to those attempting to study the U.S. criminal court system. The functions of criminal courts are more straightforward, however, and can be classified into two broad categories: social control and social change.

Social Control

Social control is characterized as the methods a society undertakes to control its citizens' behaviors. Social control can be differentiated by whether it is formal or informal. The process of socialization that each of us is subject to, starting from a very young age through adolescence and up to young adulthood, is a very important part of a society's informal social control mechanisms. Parents, teachers, and even friends are integral in forming a person's sense of right or wrong and what ultimately will shape the person's future behaviors. Through a system of rewards and punishments, these informal social controls become effective tools that

keep most people from displaying behaviors for which formal social control mechanisms would have to be invoked. Formal social controls include the police, the courts, and corrections. They usually need to be invoked because the informal social controls have broken down, or they were not in place to begin with. The formal social controls with which most people are familiar include being arrested by the police and being prosecuted, convicted, and sentenced by the courts. For most citizens, the formal social control mechanisms will never have to be summoned in order to keep their behavior law-abiding. This is because the socialization process and informal social controls are enough to keep their behaviors in check.

Social Change

Another function of the criminal courts has been social change. The law and the criminal court system is the main means of resolving important social issues. Legislators have made most of the laws society abides by, but the institution of the court is the avenue by which the laws of the nation are put into practice. Some believe that the judicial branch of the government plays a very important role in the functioning of society. The judiciary decides whether laws have been violated by individuals or whether the government has overstepped its bounds in charging individuals. Judges, especially those at the circuit court and Supreme Court level, often generate social change with the legal decisions they make. These decisions revolve around ideas about the correct interpretation and application of the U.S. Constitution and other legislation. The rulings of these courts in some instances establish precedents to which subsequent decisions must adhere. These precedents are the foundations on which social policy is made or transformed. Under common law and because of the idea of *stare decisis*, these precedents become law. *Stare decisis* literally means to stand by that which has been decided. This does not mean that every case must be decided in a similar way, nor does it mean that higher courts cannot overturn any of their previous rulings. It just means that the lower courts will adhere to the latest ruling on any given issue. This idea of judges making law is referred to as *judicial activism* and has been criticized by some who believe the legislative branch of government is the only body that has the power to create law.

This process demonstrates that the law and the courts and the citizen's relationship to them are not static. Rather, it is a dynamic relationship, and change comes through constant iterations of policy and practice. Black (1976) believes that law increases in quantity when society becomes more stratified and characterized by specialized groups with competing interests. In this sense, the law enters more areas of individual life as it increases in quantity. The courts in turn also intrude into more areas of daily life as the quantity of law increases. The citizenry may

resist and even protest if the law and the courts become too intrusive, and the law and the courts may eventually retreat from some areas of citizens' lives. This dynamic ebb and flow of intrusion and retreat of the courts in social life is social change being realized.

Structure of Courts

One way in which courts can be categorized in the United States is to say that there exists a dual-court structure, one at the federal level and one at the state level. The federal court structure consists of four different levels of courts: the magistrate courts, the district courts, the circuit courts of appeal, and the U.S. Supreme Court. State court structures are less consistent and more complex in their organization and function but generally also consist of four basic levels of courts: courts of limited jurisdiction, courts of general jurisdiction, intermediate courts of appeal, and courts of last resort. Although this duality is a simple way to categorize court structure in the United States because in reality 51 separate court structures exist, it makes understanding the system easier.

Federal Courts

The federal court has the authority to hear cases where there is an alleged violation of federal law. At the bottom of the federal court structure are the magistrate courts. Congress formed the office of federal magistrate in 1968 to provide extra help in alleviating caseloads of the district court judges (Smith, 1992). In 1990, under the Judicial Improvements Act, U.S. magistrates became U.S. magistrate judges. There are both full-time and part-time magistrate judges, and both are appointed by district court judges to tenures that are renewable every 8 years and every 4 years respectively (Champion, Hartley, & Rabe, 2008). Although the duties of magistrate judges vary by district and they have been given increased status and responsibilities by the Judicial Improvements Act, they generally have jurisdiction over petty crimes at the federal level as well as other procedural duties. Most of their work involves setting bail, conducting initial appearances, and issuing warrants, but they also may conduct evidentiary hearings, make rulings on motions, and oversee felony cases regarding any other pretrial matters. There were 486 full-time and 51 part-time magistrate judges in 2002 (Maguire & Pastore, 2005), and in 2006, U.S. magistrate judges drew average salaries of \$151,984 (Schwemle, 2006).

The trial courts at the federal level are the U.S. district courts. There are 94 districts in the United States. Interestingly, only about 15% of cases in federal court involve criminal matters; the rest involve civil disputes. Most states (31) have only one district court; the remaining states, either because of their large populations or due to bigger caseloads, have two or more district courts. In 2008,

there were 665 federal district judges (TRAC, 2009). Federal judges at the district level are appointed by the president and must pass Senate confirmation. Presidential appointment of district judges is a very partisan process; according to Maguire and Pastore, from President Johnson to President George W. Bush, over 80% of district appointees have come from the same political party as the president that appointed them. For presidents Johnson, Nixon, Carter, and Reagan, the number was over 90%. District court judges have lifetime tenure, and in 2006, their average salary was \$165,200 (Schwemle, 2006).

The U.S. circuit courts of appeal are the intermediate appellate courts in between the district courts and the U.S. Supreme Court. The circuit courts of appeal were formed by Congress in 1891 to ease the growing caseload of the U.S. Supreme Court (Champion, Hartley & Rabe, 2008). Federal circuit court judges are also appointed by the president. The number of judges each circuit has is mainly determined by the volume of cases it hears annually. The circuit courts have appellate jurisdiction in the federal system. In other words, they hear appeals on rulings from the district courts. There are 13 courts of appeal—one for each of the 12 circuits, and the 13th is the appellate court for the federal circuit. Each of the 12 circuit courts hears appeals from the states within its circuit. Like their district court counterparts, circuit court judges are appointed by the president, have to be confirmed by the Senate, and also have lifetime appointments. Each circuit also has a chief judge whose tenure in that position can be no longer than 7 years.

The U.S. Supreme Court is the court of last resort in the federal system. The Supreme Court consists of nine justices, eight associate justices, and one chief justice. Again, Supreme Court justices are appointed by the president and must be confirmed by the Senate. They also hold their appointments for life. Although the number of cases appealed to the Court varies each year, it has steadily risen up to almost 10,000 cases annually. The Court will never hear most of these appeals because they are not of a legal question that is significant enough to merit review. In order for the Court to hear an appeal, 4 of the 9 justices must vote to place the case on their docket. This is known as the *rule of four*, and annually between 100 and 200 cases make it onto the Supreme Court's docket. The Supreme Court therefore cannot ensure that justice has been served in every case; rather, they marshal their time to hear the most important constitutional cases or those that involve important federal questions.

For the 100 or so Supreme Court cases each year, both written and oral arguments will be presented to the justices. Other briefs may be filed as well; often, *amicus curiae* briefs are filed by other parties interested in the case on behalf of one of the parties. Oral arguments are presented before the justices by attorneys from the opposing parties. The justices can ask questions of the attorneys at any time during oral arguments. Once the case has been

presented, the justices meet to render an initial decision. Usually, the chief justice is in the majority and therefore assigns one of the other justices in the majority the task of writing the majority opinion. The justice that is most senior on the minority side assigns the task of writing the dissenting opinion to one of the justices in the minority. Opinions can become complicated when, for instance, justices agree but for very different reasons, and each justice in the majority could write a separate opinion. Dissenting justices may do the same. Some justices may even concur in part and dissent in part.

The Supreme Court is the final decision-making authority on all cases. The nine justices are the ultimate arbiters on all federal matters. The chief justice of the Supreme Court also has added responsibilities to supervise federal judges and to assign tasks to the eight associate justices. The annual salary of an associate justice was \$203,000 in 2006, while the chief justice earned \$212,100 (Schwemle, 2006).

State Courts

Each state has its own court organization and function. Therefore, there are 50 different court systems in place for dealing with criminal cases at the state level. The complexity of state courts sometimes stems from the fact that various courts may have conflicting or overlapping jurisdictions. The state courts are also diverse in their caseloads, depending on the population of the state. Millions of cases flow through the state court systems each year. In recent years, for instance, over 100 million cases were processed by state courts (Schauffler, LaFountain, Strickland, & Raftery, 2006). Most of these cases (54.7 million) were for traffic offenses. Other cases entering state courts in 2004 included 20.7 million criminal cases, 16.9 million civil cases, 5.7 million domestic relations cases, and 2.1 million juvenile cases (Schauffler et al., 2006). State courts are much busier than their federal counterparts.

State courts can be generally broken down into four levels: courts of limited jurisdiction, courts of general jurisdiction, intermediate courts of appeal, and state supreme courts. Not all states have these four levels, and some states may refer to some of the levels by different names. In some states, judges are not required to have a law degree, especially those who are presiding over courts of limited jurisdiction. This requirement, or lack thereof, stems from the fact that most of these judges are elected officials. In elections, the most popular but not necessarily the most “qualified” candidate will become judge.

The lowest courts in the state court system are the courts of limited jurisdiction. The jurisdiction of these courts is principally less serious criminal offenses and traffic violations. These courts make up the majority of those in the state court system (roughly 80%). It is not surprising, then, that they are also the courts with the largest caseloads in the United States (LaFountain, Schauffler, Strickland, Raftery, &

Bromage, 2007). Courts of limited jurisdiction are responsible for disposing of over half of the cases that come into the state court system.

At the next level in the state court system are the courts of general jurisdiction. These courts take care of all other criminal cases that the courts of limited jurisdiction do not have authority over. They differ from courts of limited jurisdiction because they are courts of record; that is, they keep transcripts of all court proceedings. In courts of general jurisdiction, judges normally have practiced law before coming to the bench, either as prosecutors or defense attorneys. This is not necessarily the case for all states, however, because in some states, judges at this level are also elected. A majority of states have requirements in place, including having a law degree or state bar association membership, as well as certain state residency requirements.

Despite their increasing caseloads, these courts have gotten more efficient at managing them. Indeed, it is the increase in cases that has compelled the state courts to more efficiently dispose of cases. More efficient management of cases, reductions of court delays, and increased use of plea bargaining have helped the courts to be able to process their increasing caseloads. Today, roughly 90% of all cases are disposed of through some type of plea-bargaining mechanism; relatively few cases go to trial. Obviously, other factors such as geography and population also affect state court caseloads. In 2005, Texas had the highest number of criminal cases in state court with more than 2.5 million. Just over 2.2 million of these cases were processed in courts of limited jurisdiction. Vermont, on the other hand, handled only 17,552 criminal cases. Per capita, however, North Carolina processed the most criminal cases at 19,741 per 100,000 population, and Kansas process the least with 2,167 per 100,000 persons (LaFountain et al., 2007). California had the highest number of full-time judges at 1,498, and Delaware had the least with 19 full-time judges. Per capita, however, the District of Columbia had the most judges with 10.7 per 100,000 population, while South Carolina had the fewest with only 1.1 per 100,000 people (LaFountain et al., 2007). As can be seen from the above statistics, the caseload in state courts varies by population, and efficiency may be related to the number of judges a state has.

There are intermediate courts of appeal in all but 11 states and the District of Columbia. Similar to the federal court structure, these courts were created to alleviate the caseloads of the state supreme courts. In states where there are fewer cases, there is no need for an intermediate court of appeals. The court of last resort in these states can handle all appeals. Three-judge panels rule on most of the cases that make it to intermediate courts of appeal. Most of the intermediate court of appeals judges are chosen by a nominating commission and are then appointed by the governor. Ostrom, Flango, and Flango (1997) outline at least seven different patterns of flow that appellate cases in various states can take. Some states, for instance, have no

intermediate appellate court; in these states, the court of last resort has to hear all appeals that are properly filed. In states that have intermediate courts of appeal, there are five case flow patterns: (1) In 5 states, appeals are filed with the court of last resort, but they can transfer some of those cases to the intermediate appellate court; (2) in 25 states, the appeal has to flow through the intermediate court before reaching the state supreme court; (3) in only 2 states, both the intermediate court of appeals and the court of last resort have discretionary jurisdiction; (4) in 5 states, there are two intermediate appellate courts divided by subject matter that all cases must flow through before reaching the court of last resort; and (5) in 2 states, Texas and Oklahoma, there is only one intermediate appellate court but two courts of last resort that divide their jurisdiction by subject matter.

The final level of court structure in the state court system is the state supreme court, or the state court of last resort. As just mentioned above, the structure of these final courts varies across the states. Some have mandatory jurisdiction, which means that they have to hear all cases that are filed properly, whereas others have discretionary jurisdiction and regulate their caseload by deciding to hear only the cases with the most significance. While most cases will not make it to the state supreme court, the workload of these courts has been gradually increasing every year. The number of justices on these courts also varies by state. Eighteen states have only five justices, seven have nine justices, and the rest all have seven justices (Ostrom et al., 1997). Annual salaries of these judges range from \$100,884 in Montana to \$182,071 in California (National Center for State Courts, 2006). The methods in which state court judges are selected also vary by jurisdiction.

State Judicial Selection Methods

Alfini (1981) has recognized five basic methods of selecting judges at the state level: partisan and nonpartisan elections, gubernatorial and legislative appointment, and merit selection. Partisan elections of judges involve judges running on a ticket, Republican, Democrat, or other. Candidates who garner the most votes fill the position of judge for a fixed term. Nonpartisan elections are the same as partisan elections except that candidates do not run for the position affiliated with any particular political party. There are numerous criticisms of using elections to seat judges. The first is that those running may not be learned in the law or know anything about the duties of a judge. Another is that in some cases, certain groups will spend money to try to get someone elected and then if elected, the judge may feel obligated to make decisions in the interest of his or her campaign financiers rather than in the interest of the law and justice. Another criticism deals with whether the voting public is aware of what qualifications make for a good judge. Most jurisdictions require some type of legal training for newly elected judges, but questions

arise concerning whether this training can give judges the tools necessary to make important decisions. Last, research has shown that the dominant force in state election outcomes is party affiliation (Volcansek, 1983). Despite this, the leading method for selecting judges today is still through partisan and nonpartisan elections. Citizens like to have choices regarding who will preside over the courts in their jurisdiction, and alternative methods like gubernatorial and legislative appointment of judges are also not without criticisms.

According to Maguire and Pastore (2005), governors appoint the highest appellate judges in only four states. Local bar associations sometimes make recommendations to governors regarding potential candidates who may be qualified to fill positions, but these are often not considered because of political pressures. Appointing judges, therefore, is also a very political method of judicial selection. Governors often give more credence to the wishes of their key campaign contributors (Pinello, 1995). Some argue that in certain jurisdictions, gubernatorial appointment of judges has led to unfairness based on the race and gender of the candidates (Louisiana Task Force on Women in the Courts, 1992; Pinello, 1995). Others contend that many of the methods result in an equally small number of female and minority judicial appointments (Glick & Emmert, 1987).

Legislative appointment of judges has also been criticized as very political. Whichever party is in control of the legislature at the time of an appointment will most always appoint a judge with the same political affiliation. This is almost an expectation among those in power, and therefore the qualifications of the appointee mean very little. Although very few states use this method to elect their highest judges, those judges selected by legislative appointment tend to be more passive in making legal decisions than their governor-appointed or elected counterparts; they also tend to favor state interests over individual interests (Pinello, 1995).

The appointment of judges, by either governor or legislature, suffers from some of the same problems that election of judges does. The question becomes whether the most qualified candidates are selected. Research tends to be inconclusive when it comes to deciding which method results in the best qualified and most responsible judges (Blankenship, Janikowski, & Sparger, 1992). A fifth method of judicial selection was created in the hope that it would solve the problems and curb criticisms of either election or appointment. It attempts to remove politics from the selection process, basing selection on the merit of the candidates.

Selecting judges based on merit is a method that slowly gained popularity, and no state used merit selection until 1933 (Uppal, 1974). Merit selection became more popular in the 1990s, and by 2004 there were 25 states that set up nominating commissions to select judges based on merit for their highest appellate vacancies (Maguire & Pastore, 2005). One of the most popular merit selection methods is known as the Missouri Plan. It was founded in 1940 and

has four essential features: a nominating committee made up of lawyers and others who are appointed by the governor and presided over by a judge, a list of candidates nominated by the committee who are all qualified for judicial vacancies, appointment of a judge from this list by the governor, and retention of that judge based upon the person's performance while on the bench (President's Commission on Law Enforcement, 1967). The merit selection process is designed to take politics out of the judicial selection process by putting forth a list in which all those nominated are qualified to perform the duties of a judge (Champion, Hartley & Rabe, 2008).

Merit selection, however, is also criticized by those who argue that politics can never fully be removed from the judicial selection process (Blankenship et al., 1992). Some states that use nominating commissions include Delaware, Georgia, Maryland, Massachusetts, Minnesota, New Mexico, New York, North Carolina, Pennsylvania, Rhode Island, and West Virginia (Maguire & Pastore, 2005). Debate over which method to use for selecting judges continues despite the fact that most experts believe there is no one method that results in better judges (Blankenship et al., 1992). These experts believe that neither elections nor appointments of judicial candidates are good at achieving judicial independence and accountability.

Issues Surrounding Pretrial and Trial Procedures in Court

Bail and Preventative Detention

Bail can be defined as money provided in exchange for release from custody. Bail is basically money or some other surety given as promise that a defendant will appear for court. However, bail is more than money as an assurance to appear for court proceedings. The decision about release or detention represents one of the most important in the U.S. system of justice. Throughout history, bail could range from simply a defendant's word that he or she would appear to trial. Through the industrial revolution and as the United States became more urbanized, one's oath or property no longer sufficed as a guarantee of appearance for trial. Bail eventually became a monetary provision given in exchange for release of a defendant. This spawned the business of bail bonding and bondsmen as the main method for release from custody. As money became the main method for release, criticisms began to arise that bail was a form of economic discrimination against poor defendants. Defendants who could afford bail were released; defendants who could not were kept in detention.

Some believe that all defendants should be entitled to bail. However, the Eighth Amendment of the Constitution is not a guarantee of bail, only a protection against excessive bail. Although bail is not intended to be a form of punishment,

judges generally have unlimited discretion on the imposition of a bail amount. In the case of *Stack v. Boyle* (1951), the Supreme Court defined *excessive bail* as that which is above a reasonable amount necessary to guarantee a defendant's appearance for trial. The ruling also advised judges to impose similar bail in similar cases and stated that bail should not be frivolous, unusual, or beyond a defendant's ability to pay.

On any given day, over 50% of the U.S. jail population is composed of pretrial detainees (U.S. Department of Justice [USDOJ], 2006). Holding these detainees who are awaiting trial or disposal of their cases costs the criminal justice system a great deal of money. Research on convictions and sentences of defendants reveals that those who are held in detention are more likely to be convicted, and if convicted are more likely to be sent to prison and also receive lengthier sentences. Nonetheless, despite these statistics the Supreme Court, in the case of *United States vs. Salerno* (1987), ruled that the practice of preventative detention is constitutional. This ruling justified preventative detention in an attempt to protect the community and as a method of crime control. The Supreme Court also upheld the constitutionality of preventative detention for juveniles in the case of *Schall v. Martin* (1984).

The Preventative Detention Controversy and Bail Reform

Controversy surrounds how best to preserve the idea of innocent until proven guilty while attempting to protect the community from dangerous offenders or those likely to recidivate. The Bail Reform Act of 1984 allows the detention of a defendant prior to trial if a judge does not believe that any conditions exist that will ensure that the defendant will appear in court. Numerous states also have statutes authorizing detention of those considered dangerous or likely to reoffend.

However, because of continuous criticisms that bail discriminates against poor defendants, many attempts have been made at reforming bail. The Vera Institute of Justice and its famous Manhattan Bail Project in 1961 changed the practice of money as the primary mode of bail. Prior to this, those who had money could make bail and those who did not were detained. The Vera Institute and the Manhattan Bail Project used law students who provided judges with more detailed information about defendants, thereby allowing them to make more informed decisions about which defendants would be most likely to appear or not reoffend. Because the project was such a success, the Bail Reform Act of 1966 was passed and release-on-recognizance (ROR) programs were implemented in courts across the country. The 1966 Bail Reform Act set forth that ROR was to be considered in lieu of monetary bail; it also created a form of bail, referred to as *deposit bail*, in which defendants would pay 10% of their bail amount.

This act and the practice of ROR would soon fall out of favor because of fears that defendants who were released

were reoffending. The Bail Reform Act of 1984 was passed, setting forth new rules regarding bail. These new rules stated that judges should consider protection of the community as well as the defendant's likelihood of appearance in court when making decisions about bail. Under the 1984 act, many more persons were held in detention. Bail as a method of ensuring a defendant's appearance in court continues to undergo changes, and more jurisdictions are utilizing nonmonetary methods of bail. Criticisms have also surfaced that race and other extralegal factors may play a more important role in decisions about bail than the risk of either absconscion or community safety.

On both sides of the preventative detention controversy, arguments can be made for reforming bail. Those who believe bail is a form of monetary discrimination that leads to jail overcrowding believe that the principle of innocent until proven guilty should be at the forefront of all bail decisions. Those advocating for tougher standards believe that the primary concern is protection of the community. Until Congress or the Supreme Court decides to modify the rules regarding bail, the debate about what is a just, fair, and protective method of bail decision making is likely to continue. Judges must weigh both sides in making a determination of bail on a case-by-case basis.

The Courts and the Adversary System

As stated at the beginning of this chapter, the primary function of law is perhaps its application in maintenance of the existing social order. The law and legal structure are charged with maintaining order; this task is accomplished through the adversary system that characterizes the U.S. courts. This adversary process places the prosecution against the defense in a search for the truth. Skolnick (1967), however, questions whether the current system is in fact adversarial; he believes that the U.S. system of criminal justice engenders a relationship between prosecution and defense that is more reciprocal than adversarial and is in actuality more one of cooperation. In other words, the prosecution, defense, and judge (the courtroom workgroup) have broader common interests to efficiently process the court's caseload. Considering that roughly 90% of cases annually result in convictions through plea bargaining, it is hard not to believe that perhaps the system is more negotiative than adversarial.

Courtroom Workgroup

The notion of the courtroom workgroup is based upon the idea that the courtroom actors must work together to process cases efficiently. Eisenstein and Jacob (1977) believe that the courtroom workgroup has many shared goals, and thus, there are incentives for working together. Eisenstein, Fleming, and Nardulli (1988) believe that the daily procedures of the courtroom strain the relationship

between defense attorneys and other members of the courtroom workgroup toward cooperation. The courtroom workgroup, then, consists of prosecutors, defense counsel, bailiffs, clerks, and even defendants whose interactions on a daily basis affect court outcomes.

Under this notion, the contextual characteristics of the court are important to criminal court outcomes. There have been two basic metaphors set forth for understanding the functioning of courts (Eisenstein et al., 1988). One is a legal metaphor where justice is the ultimate result; the other is a metaphor portraying the court as a community. The legal metaphor sees the court as symbolic, an institution that focuses on the rules and procedures set forth. The court as a community assumes that the courtroom actors are all interdependent and rely on each other. Here, the relationships of courtroom actors, technology, and even physical location will affect outcomes. Eisenstein et al. (1988) further argue that the courts are indeed more than just a metaphor for the law. They point out that criminal courts are complex political institutions, and as such, different courtroom communities will dispense different kinds of justice.

The Sixth Amendment Right to Counsel

The Sixth Amendment to the Constitution states that “in all criminal prosecutions, the accused shall enjoy the right to have the assistance of counsel for his defense.” This is a fundamental right to criminal court proceedings based on the fact that most defendants are not learned in the law and therefore have very little knowledge of courtroom rules and procedures. The Supreme Court has made rulings purporting that a fair trial cannot be realized without the assistance of counsel. There have been many decisions affording expanded counsel rights to those accused of crimes. For instance, in *Powell v. Alabama* (1932), the court decided that indigent defendants who are charged with capital offenses must be afforded the assistance of counsel. In *Johnson v. Zerbst* (1938), the court ruled that assistance of counsel is mandatory for indigent defendants in federal criminal cases. *Gideon v. Wainwright* (1963) expanded this requirement to defendants in state courts. *Argersinger v. Hamlin* (1972) further stated that no person may be imprisoned, for any offense, unless represented by counsel. The court in *Scott v. Illinois* (1979), however, ruled that counsel need be provided only where the prosecution is seeking imprisonment as a punishment. These rulings and others like them have ensured that indigent defendants are given the provision of counsel at most critical stages in the criminal justice process.

Public Defenders Versus Private Attorneys

Many have argued that because of the courtroom workgroup, public defenders do not have the best interests of their clients in mind (Blumberg, 1998; Sudnow, 1965). Mather (1974) contends that it is not that public defenders

do not have their client’s best interests in mind but rather that they are more realistic about the possible outcomes for them. Neubauer (1974) supports this idea; his research shows that attorneys with good relationships to the courtroom workgroup were better able to predict court outcomes for their clients. Sudnow (1965), however, found that public defenders were more likely to assume that their clients were guilty, whereas those who hired a private attorney were deemed to be innocent and were therefore afforded a better defense.

Whether the type of attorney a defendant has affects case outcomes continues to be an issue because of criticisms that the criminal justice system processes are biased based on the socioeconomic status of the defendant (Nardulli, 1986). Discrimination of public defenders continues because they hold an ambiguous role in the criminal court system (Eisenstein & Jacob, 1977). They are advocates of individual rights and the representatives for indigent defendants. They are also, however, seen as double agents (Blumberg, 1998). In other words, they not only work for indigent defendants but also for the state. They are seen as being co-opted to the courtroom workgroup, and in order to ensure that cases flow through the system effectively and efficiently, they are likely to negotiate with prosecutors. Although most research finds that offense seriousness and prior criminal history are the most significant predictors of courtroom outcomes, extralegal factors still have an effect in some contexts. Eisenstein and Jacob say that the nature of charges, the strength of evidence, characteristics and background of the defendant, and characteristics regarding type of attorney and judge all influence criminal justice outcomes. These factors are all in some manner related to the framework of the courtroom workgroup.

Theoretical Perspectives Regarding Criminal Court Outcomes

Outcomes in court regarding decision making of courtroom actors generally are viewed through two theoretical perspectives. The first is that outcomes are dependent primarily on legally relevant factors such as the seriousness of the crime committed by the defendant and the defendant’s prior criminal record. This view of decision making is referred to as *formal rationality* (Dixon, 1995). This theoretical perspective posits that the formal legal rules are what govern courtroom decisions; therefore, extralegal factors like attorney type, socioeconomic status, gender, and race/ethnicity of the defendant will have no influence on criminal justice outcomes.

The second theoretical perspective posits that outcomes in the criminal justice system are influenced by both legal and extralegal factors. One such theory along these lines was proposed by Albonetti, (1987, 1997), labeled *bounded rationality*. This theory suggests that courtroom actors often

have little time or information when making decisions and may rely therefore on stereotypes regarding the dangerousness and risk a defendant poses based on extralegal factors. According to this perspective, judges and prosecutors make decisions using both legal and extralegal factors.

A similar theory called the *focal concerns perspective* (Steffensmeier, Ulmer, & Kramer, 1998) proffers that judges use three focal concerns when making decisions. The three focal concerns are blameworthiness, protection of the community, and practical or organization implications. According to this theory, “Judges may rely not only on the defendant’s present offense and prior criminal conduct, but also on attributions linked to the defendant’s gender, race, social class, or other social positions” (Steffensmeier & Demuth, 2006, p. 151). Due to limited time and information, judges use a perceptual shorthand to make decisions about an offender’s dangerousness and risk for recidivism based on the three focal concerns, which then predicts sentence severity.

The first theoretical perspective, formal rationality, would predict no difference in criminal court outcomes based on extralegal factors. The second perspective, which encompasses bounded rationality and focal concerns, would predict that variables such as type of counsel, gender, race/ethnicity, and socioeconomic status would in some circumstances have an effect on decisions surrounding criminal court outcomes.

Conclusion

Courtroom outcomes and the decision-making processes of courtroom actors will continue to be a very complex issue. At the outset, the court structure in the United States is somewhat confusing, as there is little uniformity among jurisdictions. The criminal court system is a very important institution in society; it is the structure that breathes life into the law and the avenue through which social control is maintained. Without the courts and criminal procedures, the law could not function. It is also a means for social change in society.

The U.S. court system is best characterized as a dual-court system. Each state and the federal government has its own court system and organization to deal with cases that come under its authority. These systems, however, are not perfect. There are criticisms at all stages and of all members of the courtroom workgroup. Criticisms have also been levied at the idea that the system is adversarial; arguments are that because a majority of cases are plea-bargained, the system is better characterized by cooperation and negotiation. It has been said that the prosecution and defense are co-opted and are more concerned with efficiently processing cases than ensuring that justice has been done. Public defenders are further criticized for not zealously defending their clients. Indeed, their caseloads are high and their resources low, but most research shows that they are effective and do achieve outcomes for their

defendants that are similar to, or, in some cases, better than those who privately retain attorneys.

Although the structure and function of the American criminal court system can be somewhat confusing, scholars continue to study and research the courts and their decision-making practices. Decisions and processes are continually being examined and assessed to ensure that procedural rules are adhered to and due process rights are being fulfilled. Court structures across the country continue to experience increases in their caseloads. Judges in some jurisdictions are appointed and in others, elected. The adversary process that characterizes courts may be a myth because of characterizations of courtrooms and their actors (the courtroom workgroup) as negotiators and not adversaries. Most jurisdictions rely on plea bargaining in order to efficiently and effectively manage their caseloads. The courts have in the past been avenues for change and have always been important mechanisms for the maintenance of order in society. The courts will continue to be criticized, but it may be because they will continue to hold an important place in the democratic ideals of United States society.

CRIMINAL LAW

ROGER ENRIQUEZ

University of Texas at San Antonio

J. C. BARNES

Florida State University

This chapter examines the principles that underlie substantive criminal law from a historical context by chronicling the influences that led to its development and evolution. It also examines the foundation on which existing criminal law doctrines are premised. Topics like federalism and the U.S. Constitution are assessed, and the impact on criminal law is discussed. The chapter also identifies the ever-changing forces involved in redefining crime and criminal liability. Together, these ideas illustrate the rapid changes in criminal law.

Principles of Criminal Law

Criminal law is the area of law that deals with crimes and their respective punishments. Like other laws, criminal law has evolved over hundreds of years and remains in a constant state of flux (McClain & Kahan, 2002). Today, modern criminal law is merely the culmination of a great many influences. Those influences are as old as the traditional common law or as current as the Model Penal Code (Low, 1998). These influences tend to increase and decrease over time. In time, new laws will be adopted and old laws will be repealed (Frase, 2002). However, there is one overarching principle that remains constant: The goal of all criminal laws is the protection of the health, safety, and welfare of society.

What Is Criminal Law?

Laws seek to control the conduct of a community or society while providing for the rights of the citizenry (Dressler, 2001). Most laws developed over the centuries relate to resolving disagreements between people that arise in the daily conduct of their affairs. One of the earliest known sets of laws dates back to 1750 BC (Garland, 2003). King Hammurabi of Babylon created a set of 282 laws, known as the Code of Hammurabi. However, it was not until the development of English common law in the Middle Ages that the process of creating modern written law began. Once William of Normandy conquered England, he established the Eyre, a circuit court held by itinerant royal justices who heard cases throughout the kingdom and recorded its decisions. These decisions integrated the unwritten common law of England based upon custom and usage throughout the land (LaFave, 2003).

Today, the practice of recording a court's opinion is still in use. In the United States, the opinions of some trial and most appellate courts are preserved in a book of decisions called a reporter. Typically, decisions interpret the law, both substantively and procedurally, and decide the constitutionality of both the statute and the action of government officials in enforcing the law.

What Isn't Criminal Law?

Criminal law and torts, a branch of civil law, are very similar in some respects. Typically, tort law includes negligence, libel, slander, assault, battery, and fraud. In some instances, a tort can be a crime. However, it is important to note that tort law is primarily concerned with a financial loss, and bad conduct is only of secondary importance. Conversely, criminal law is concerned with bad conduct irrespective of financial losses (Singer, 2002). A central theme in criminal law is that conduct that jeopardizes the health, safety, and welfare of the community should be punished despite the absence of actual harm. For example, if Fred, unbeknownst to Barney, aims and shoots a handgun outfitted with a silencer at Barney but misses, he is still criminally culpable. The fact that Barney is completely unaware of the attempted murder does not clear Fred of wrongdoing. However, Barney would likely be precluded from suing Fred at tort, having suffered no visible physical or mental damages because he is totally unaware of the attempt. The social harm that a criminal statute seeks to address distinguishes criminal law from tort law.

Tort law addresses a personal harm, and monetary compensation is typically the goal of a tort lawsuit. Moreover, the party that is harmed bears the responsibility of bringing suit and proving its case (Schulhofer, 2001). Conversely, under the criminal law regime, the government brings suit irrespective of the desires of the victim. Even when a victim does not desire a prosecution for a criminal offense, the state decides, through a prosecutor, whether to charge an individual with a crime. The prosecutor seeks to enforce the interests of the community and government, not the desires of a victim (Kadish, 1987). For example, suppose that Fred strikes Wilma and is arrested for spousal abuse. Shortly thereafter, the couple reconciles and Wilma does not want to pursue the charges against her husband, Fred. It is solely the prosecutor's decision, however, to pursue the charges against Fred. Moreover, Wilma might be compelled to appear and testify despite her desire to have the charges dropped.

Federalism

The American system of government follows the principle of federalism. Although the federal government, through the

U.S. Constitution, has a duty to prevent states from infringing upon the rights of citizens, the majority of powers to regulate the conduct of citizens rest with the states. Only those powers expressly granted to the federal government by the Constitution are outside state control. For the most part, all state criminal laws and procedures must be adhered to unless they conflict with the U.S. Constitution. For example, under the police powers of the Tenth Amendment of the Constitution, Texas has the right to regulate conduct that is dangerous to its citizens. However, when Texas forbids the broadcast of any beer commercials within its state, it has created an unconstitutional law. The power to regulate commercial speech has been specifically granted to the federal government by preventing any state regulation of commercial speech in this area (Hazard, 1983).

Each state has the power to create its own criminal statutes pursuant to the police powers clause of the Tenth Amendment of the U.S. Constitution. Each state is free to define its crimes as long as the statute satisfies the principle of legality. Moreover, the statutes must also be understandable, not subject to ad hoc interpretation, and applied in favor of the accused when there is any ambiguity (Wallace & Roberson, 1996, p. 225). These requirements are mandated by the due process clause of the Fifth and Fourteenth Amendments (Torcia, 1995). In most states, there are no longer any common-law crimes. An act or omission is not criminal unless it is defined as a crime in a statute (Frase & Weidner, 2002). The power of the federal government to prosecute crime is restricted by the U.S. Constitution. Crimes can be prosecuted by the federal government when they are among the following:

- Crimes that involve interstate commerce or the use of federally controlled communications: These crimes include wire fraud, crossing across state lines to avoid prosecution, interstate prostitution, and interstate kidnapping.
- Crimes committed in areas of federal jurisdiction that do not fall within state jurisdiction: These areas include aircraft, ships on navigable waters, and the District of Columbia.
- Crimes that impact federal government activities: These include crimes that use the U.S. mail, robbery of federally insured banks, attacks upon federal personnel, and violation of federal tax laws.

Differences Between Criminal and Civil Law

In a criminal case

Fines are payable to the government and restitution is limited to actual loss.

The government has the burden of proving the charges against the defendant beyond a reasonable doubt.

In a civil case

The money awarded goes to the plaintiff, not the government, and punitive damages can be assessed against the defendant.

The plaintiff has the burden of proof by a preponderance of the evidence.

Prosecutors and Defense Attorneys

The sworn duty of a prosecutor is to seek justice, regardless of the result. However, some have argued that the adversarial system, which pits each attorney against the opposing side in a case, sometimes interferes with that duty (Neubauer, 2008). For example, if a complaining witness lacks credibility, justice demands that the case be dismissed. However, if the prosecutor is convinced of the truth of the charges, he or she should vigorously seek a conviction, irrespective of the challenges.

Most prosecutors are employed by counties within each state. The district attorneys of each county are elected officials, with offices that include assistant or deputy district attorneys. Some prosecutor's offices are small, and the district attorneys try their own cases. In most major cities, however, the district attorney's office has hundreds of deputies divided into teams that prosecute specific types of cases, such as gang or drug crimes (Greenwalt, 2002).

Pursuant to the Sixth Amendment to the U.S. Constitution, the law provides that "in all criminal prosecutions, the accused shall . . . have the Assistance of Counsel for his defense." If a person accused of a crime cannot afford an attorney, the Supreme Court has recognized a constitutional right to have an attorney appointed for the accused at public expense. The Supreme Court held in *Gideon v. Wainwright* (1963) that the Sixth Amendment requires indigent defendants in state court proceedings to have appointed counsel. This right was expanded in *Argersinger v. Hamlin* (1972), in which the Court ruled that an indigent defendant must be provided an attorney when imprisonment is a possible punishment, even when the offense is only a misdemeanor.

A defense attorney's duty is always to the justice system, but he or she has a duty to zealously advocate on behalf of his or her client within the bounds of the law, regardless of the outcome. The defense attorney must protect his or her client's rights while vigorously challenging the evidence and seeking the best result possible. To hear a criminal case, a court must have jurisdiction over the offense charged and the person charged with the offense (Neubauer, 2008). Under the Sixth Amendment, the accused has a right to have a speedy public trial by an impartial jury in the state and district where the crime was committed. If the offense was committed in several counties or across state lines, the prosecutor bears the burden of proving that an essential part of the offense was committed in his or her jurisdiction (Fletcher, 2002).

In hearing the criminal case, the court applies the law of the jurisdiction in which it sits (Reitz, 2002). For example, a trial court in Hennepin County (Minneapolis) is governed by Minnesota law. If a kidnapping starts in Minneapolis and ends with the arrest of the defendant in New York, jurisdiction lies in Minnesota, New York, the federal courts, and any state where it can be proven that some part of the kidnapping was perpetrated.

State courts are usually set up as follows (Robinson, 1992):

- A court of last resort (supreme court)
- An intermediate appellate court (court of appeals)
- General trial courts (superior courts)
- Limited jurisdiction courts (probate and small claims)

The Constitution and Criminal Law

When a law is said to be unconstitutional, it is usually because the law is in conflict with the provisions of the U.S. Constitution or one of the amendments to the Constitution. In addition, the law can be declared unconstitutional when it violates a provision of a state constitution (Demleitner, Berman, Miller, & Wright, 2007). Not all laws are constitutional. A statute can be deemed unconstitutional for one of two reasons (Chevigny, 2002):

- The content of the statute seems unconstitutional at face value. For example, if a statute made it illegal to practice one's religion or a statute made it a crime for men to operate a sewing machine.
- The law was enforced by the government in a manner that violated the Constitution. For example, if the chief of police targeted members of an unpopular church for arrest for disturbing the peace with their singing but left other acceptable churches free to be loud without fear of arrest, this is an unconstitutional application of the public disturbance statute. The chief of police is applying a lawful statute in an unlawful way that violates the constitutional right of freedom of religion.

Due Process

The due process clauses of the Fifth and Fourteenth Amendments provide that a person must be afforded due process (the principle that laws must be fair) if the federal, state, or local government intends to take away his or her life, liberty, or property. In other words, a person has the right to be treated fairly under the law. Due process has elements that are both procedural and substantive (Tiffany, McIntyre, & Rotenberg, 2003, p. 210).

Under procedural due process, flexibility is applied to the amount of due process that must be afforded. If you are going to lose your liberty for the rest of your life, the level of due process must be more intense. If a person is going to be fined only \$100 for a traffic ticket, the degree of procedural safeguards need not be as great. As a general rule, due process requires fundamental fairness.

Substantive due process means that the state is without power to deprive a person of life, liberty, or property by an act having no reasonable relation to any proper governmental purpose. For example, the government has no authority to deny a person the right to a jury trial because it costs money to heat the courthouse in the winter.

Equal Protection

The equal protection clause of the Fourteenth Amendment, which states that no state shall deny any person the equal protection of the laws, provides that all persons must be treated equally when a law is applied. Distinctions or applications of laws that treat people differently because of gender, religion, race, or socioeconomic status are unconstitutional. For example, if there is a law that punishes men who have improper sexual relations with children and does not punish women for the same offense, that statute would be in violation of the equal protection clause of the Fourteenth Amendment.

Illegal Laws: Bill of Attainder and Ex Post Facto Law

The U.S. Constitution specifically prohibits bills of attainder and ex post facto laws (Dressler, 2001). The following is an example of what is referred to as a *bill of attainder*: The Bedrock Water Buffalo Lodge invites political extremists from another country to participate in a symposium discussing all that is wrong with America. The state legislature then passes a law stating that the members of the Water Buffalo Lodge have engaged in treason, shall all be put to death, and all their property shall be forfeited to the government.

Although some government officials might not be happy with the members of the lodge because of their activities, the law passed by the legislature is an illegal bill of attainder. Such laws are prohibited by the U.S. Constitution. The legislative branch has invaded the province of the courts (in other words, the legislative branch has violated the separation of powers clause—it has overstepped its bounds) and singled out the lodge members, declaring them guilty of a crime without a trial or any of the other due process safeguards.

An *ex post facto law* is a law passed after the criminal act has been committed that retroactively creates a new crime, aggravates the punishment for the existing crime, or inflicts a greater punishment than the law allowed when the crime was committed (Dressler, 2001). The following is an example of an ex post facto law: Fred commits his third drunk-driving offense, but his two prior convictions are 8 years old and priors can be used only to increase the offense to a felony if the convictions were during the past 5 years. The Bedrock legislature then passes a law that makes drunk-driving priors viable for 10 years. The prosecutor amends the charges against Fred and charges him with a felony. Because Fred can receive greater punishment for a crime he committed prior to the new law being enacted, the new drunk-driving law is an ex post facto law.

Void for Vagueness Doctrine and Fair Notice

For a statute to be constitutional, it must give fair notice of the conduct that violates the statute. The law must give

a clear definition to allow a person to conform his or her conduct to the law (Frankel, 1983). The following is an example of what is referred to as a *fair notice doctrine*: Wilma is charged with violating a state statute that prohibits conduct that “causes others to be concerned with their safety or is generally annoying to the public at large.” In this case, it is unclear what might cause others to be concerned for their safety or what other members of the public might find annoying. Acts that are made criminal must be clearly and appropriately defined. A person of common intelligence must be able to ascertain the standard of guilt. Moreover, statutes that lack the requisite definiteness or specificity as to which persons come within the scope of the act are usually struck down by the courts because it is said that they are “void for vagueness” or that they violate the doctrine of overbreadth (Frankel, 1983, p. 140).

Elements of a Crime

To punish someone, the government must prove that a crime was committed. Generally speaking, there are five elements to every crime: (1) actus reus, (2) mens rea, (3) concurrence of the actus reus and mens rea, (4) causation, and (5) harm (Garland, 2003). The criminal law does not punish for moral wrongs, and no criminal liability is attached to an act unless it is forbidden in a criminal statute.

The *actus reus* of any criminal offense is the act or an omission that the accused engaged in that was against the law. Although there are a few crimes that punish a person for failure to act when a statutory duty demands it, the vast majority of criminal offenses involve some act by the perpetrator (LaFave, 2003). The actus reus for a crime might be performed in several ways. For example, all three of these acts supply the actus reus for a murder:

- Fred helps Barney and Betty plan a murder.
- Barney commits the murder.
- Betty acts as the lookout.

Although the typical crime involves an affirmative physical act, crimes can be committed by a person’s failure to act. Definitions of various crimes refer to an omission that provides the basis for criminal liability. The omission might be specifically designated in the statute. For example, it could be illegal to not pay child support or income taxes. Some states criminalize the failure to carry appropriate worker’s compensation insurance or vehicle liability insurance. Other omissions are based upon a special relationship, which creates a duty to act. The accused might fail to perform altogether or be grossly negligent in his or her performance. For example, parents have a duty to provide children with food, shelter, clothing, and medical care or be liable for child neglect. The relationship can be created by contract (such as a lawyer–client relationship) or by the defendant’s act of creating a risk (such as the

requirement to help put out a fire that the defendant accidentally started) (Schulhofer, 2001).

Under special circumstances, words alone can be the basis of criminal liability. The criminal statutes of many states contain crimes where the spoken word creates criminal culpability without any further action. In other words, just talking about committing a crime can be a crime. There are five areas where words can be the basis for criminal liability (Frase, 2002):

- Solicitation occurs when a person asks another to commit a crime, such as solicitation of murder or some other felony, or solicitation of a misdemeanor, such as prostitution. In many states, solicitation can only be committed for crimes named in a specific solicitation statute.
- A criminal threat involving threats to harm another with the apparent ability to carry out the threat can be the basis of criminal liability.
- The use of offensive, annoying, or disruptive speech that would offend a reasonable person could become the basis of criminal liability. This includes annoying or indecent phone calls or interruption of a lawful assembly, such as when a person disrupts a meeting or church service.
- Providing false information when a person has a duty to tell the truth, such as giving false information to law enforcement during an investigation or making a false criminal accusation could be criminally liable.
- Intentionally providing a false directive can result in criminal sanctions. For example, a person that intentionally gives instructions that harm another, such as telling a person to take incorrect medication or instructing someone to mix dangerous chemicals so that she harms herself. (p. 599)

Similarly, there are times when merely possessing an item can be the basis of criminal liability. Every state has possessory offenses where the actual or “constructive” possession of an illegal substance or object is deemed illegal. To establish constructive possession, the government must prove that the accused knew of the location of the illegal item (e.g., controlled substance, illegal weapon, improvised explosive device) and that he or she had both the power and the intention to exercise control over it (McClain & Kahan, 2002). For example, Fred is in actual possession if drugs are in his pocket. Moreover, he is in constructive possession of drugs if they are located in his garage. However, if Fred shares his garage with his neighbor Barney, proving constructive possession might be difficult.

The second requirement of criminal liability is the *mens rea*, or the guilty mind. There is a Latin maxim in law that states *actus non facit reum nisi mens sit rea*, which means “An act does not make a person guilty unless the mind is guilty” (Garner, 2004). To show that the mind is guilty, it must be proven that the person acted with criminal purpose, knowledge of the wrongfulness of the conduct, and an evil intent. Typically, a statute will require a particular

mental state or intent that must be proven to sustain a conviction. For example, a statute might require that a person act purposely, knowingly, recklessly, or negligently. At times, proving intent can be difficult. However, the prosecution can prove the mental element of the crime by demonstrating the actions of the defendant, showing the circumstances that surrounded those actions, and offering evidence of an admission or a confession by the defendant (Reitz, 2002).

The actions of the defendant are important to show because the law states that it is reasonable to infer that a person ordinarily intends the natural and probable consequences of his or her acts. In fact, a jury is permitted to infer that the defendant intended all the consequences that a person in that position, acting under similar circumstances and possessing the same knowledge, should reasonably have expected to result from the defendant’s actions. That is the definition of something the law calls the *general intent*. For example, if you brandish a weapon, show it to the bank teller, and pull the trigger all while pointing it in her direction, it is reasonable to infer that you intended to kill her. That was your general intent (Schulhofer, 2001).

Some crimes are not general-intent crimes but require a *specific intent*—a special mental element above and beyond any mental state required with respect to the actus reus of the crime. It is set forth in a statute by one of the following: an intention to do an act for the purpose of accomplishing some additional act (Frankel, 1983)—a good example would be kidnapping for the purpose of raping at another location; an intention to do an act to achieve some further consequences beyond the conduct or result that constitutes the actus reus of the offense—for example, the filing of a false tax return to avoid payment of taxes.

When a defendant commits a criminal act but accidentally harms an unintended party, the accused might still be criminally liable under the *theory of transferred intent*. The rationale for the theory is that a person should not be absolved of liability simply because he or she has poor aim. Transferred intent keeps a perpetrator from avoiding liability when he misses his intended target and injures an innocent third person (Schulhofer, 2001). For example, if Fred throws a stone at Barney but Barney ducks and the stone hits Wilma instead, Fred is still criminally liable.

Model Penal Code and Mental States

The Model Penal Code (MPC) is a set of principles that many states rely upon when drafting criminal statutes. The MPC covers four types of mental states:

- *Purposely*: You intend the actual result. For example, when you buy a gun, load the weapon, wait in the parking lot for your victim, hide in the bushes when you see him approach, and then leap out and discharge your weapon

into the other person, there can be little doubt that you have purposely taken the life of another.

- *Knowingly*: Perhaps you didn't want to hurt anyone, but you did. For example, you might keep a gun in your desk for self-defense. Then your coworker tells jokes at your expense and insults you in front of others. Angry, you shoot him dead. Maybe you didn't plot and scheme to kill your coworker, but you knowingly took the life of another because everyone knows that if you shoot a person with a gun, the person can die.

- *Recklessly*: You are actually aware that you were involved in an activity that created a substantial and unjustified risk, but you ignored the risk and the likely outcome. For example, if you decide to street race another car and reach speeds of 70 miles per hour on a residential street, and an 80-year-old lady walking home from church steps off the curb to cross the street and you strike and kill her, you have recklessly taken the life of another.

- *Negligently*: You should be aware that a substantial and unjustified risk is created by your conduct. For example, if it is nighttime and you fail to turn on your headlights and a 10-year-old boy riding his bicycle is playing in the street and you strike and kill him with your car, you have negligently taken the life of another because driving without headlights creates a substantial and unjustifiable risk to bicyclists or pedestrians.

Causation and Concurrence

For crimes that result in a harm to someone, the state must prove that the act or omission of the accused was the ordinary and probable cause of the resulting harm. In cases where the harm is direct and immediate, determining that the defendant was the cause of the harm is not difficult. For example, when Barney hits Betty on the head with a baseball bat and she dies from a massive brain hemorrhage, causation is not an issue. However, when there is a chain of events that eventually leads to death, causation is more difficult for the state to prove. In those instances, the prosecutor must show that the defendant was both the cause-in-fact and proximate cause of the death. Typically, courts will first ascertain whether the actions were the cause-in-fact of the injury. This is sometimes called the "but-for" test (Dix, 1993). For example, if Fred cuts the brake line on Barney's car and Barney crashes and dies, Barney would not have been killed "but for" the act of cutting the brake line by Fred.

After the accused is shown to be the cause-in-fact of the harm, the state must also prove that the defendant's act was the proximate cause of the resulting harm. Determining this is often made difficult by the occurrence of intervening causes (Beale, 2002). For example, using the previous example, would it be fair to charge Fred with murder when

Barney was only slightly harmed in the accident and was taken to the hospital where he dies after waiting for a physician for 16 hours in the emergency room?

Determining proximate cause depends upon the factual situation of each case. It must be determined whether the intervening cause was a dependent intervening cause or an independent intervening cause. A dependent intervening cause is foreseeable and does not relieve the defendant of liability. For example, if Barney stabs Fred and a doctor is negligent in treating Fred at Bedrock Hospital, it was foreseeable that a victim might die from subpar treatment. An independent intervening cause gives the opposite result, relieving the defendant of criminal culpability. Using the example above, if Fred is operated upon by an intoxicated doctor who slices through an artery and is so drunk that he can't even attempt to stop the bleeding, this is not foreseeable and the chain of causation between the defendant and the result is broken. Again, the key is foreseeability (Katz, 2002).

Equally important is the union of the act and the intent. Thinking about committing a criminal act is not a crime. A person might fantasize about robbing a bank or killing a spouse, but if the individual does nothing to act upon these thoughts, the person is guilty of nothing. Moreover, if someone accidentally gives her spouse the wrong medicine or picks up the wrong money bag at the bank, the person has done an act that caused harm, but she had no mens rea or evil intent. There must be a joint operation of act and intent that results in the social harm (Beale, 2002).

Parties to a Crime

Discussing parties to a crime establishes the conditions under which people incur liability for the conduct of another person for the second party's acts before, during, and after the crime was committed. At times, the acts and criminal intent of one person are assigned to the acts and intent of someone else (Chevigny, 2002). For example, in a plot to kill Wilma, if Fred buys the bullets, Betty is a lookout, and Barney shoots the victim, all are equally culpable for the murder.

The area of law that helps to determine who is a party to a crime is sometimes referred to as the *law of parties*. It has been simplified in modern times, and the old common law labels of principal in the first degree, principal in the second degree, accessory before the fact, or accessory after the fact are rarely used. The categories have been reduced to just two: the principal and the accessory. Anyone who knowingly and willingly participates in the commission of a crime with others or who aids and abets the commission of a crime is an accomplice (LaFave, 2003).

A person aids a crime when he or she does an act that assists in the commission of a crime. A person abets a crime when he or she has knowledge of the perpetrator's unlawful purpose to commit a crime, and as the accomplice, has the intent to facilitate the perpetrator's unlawful

purpose and engages in any of the following acts of instigating, encouraging, promoting, counseling, directing actions, or supporting by presence. Some examples of aiding and abetting include driving a getaway car, acting as a lookout, drawing a diagram to assist with a burglary, or loaning a gun with knowledge that it will be used in a murder (Robinson, 1992).

Determining if someone is an accomplice or an accessory can be tricky. Whether a person has accomplice liability or is only an accessory depends upon whether he or she assisted the perpetrator before or during the offense, or merely assisted a principal after the crime was completed. Obviously, a principal is anyone who commits the crime, but it can also include anyone who commits the following: aiding and abetting the crime, advising and encouraging the crime, or forcing another to commit a crime. Conversely, an accessory aids a principal whom he or she knows has committed a felony by assisting the principal in avoiding detection, avoiding arrest, disposing of or destroying evidence, avoiding prosecution, or avoiding punishment (McClain & Kahan, 2002, pp. 400–412).

Since all crimes require an *actus reus* and an accomplice does not commit the underlying crime, it can be difficult to determine what constitutes the *actus reus*. The law states that an accomplice, by his or her assistance in the commission of the crime, has committed the *actus reus* part of the crime. There is no requirement that the accomplice's affirmative acts be a major part of the crime. All efforts, no matter how small, that aid the perpetrator suffice as the *actus reus* of the crime. Seemingly insignificant acts that have been deemed sufficient to serve as the *actus reus* for an accomplice include loaning a screwdriver, buying a sweatshirt, providing a piece of rope or tape, and loaning money for gas (LaFave, 2003, p. 671).

In some instances, an omission can be the basis of criminal liability for an accomplice. For example, if Fred works as a part-time security guard at the rock quarry and he permits Barney to steal valuable equipment from the quarry, his dereliction of duty can be the basis of accomplice liability. If an omission is for the purpose of facilitating a crime, that person is liable if he or she has a legal duty to act or intervene. It is important to note that the law will only attach criminal liability when it is reasonably safe and possible to protect the victim or property. Therefore, a schoolteacher would have a duty to stop a schoolyard fight and a parent might have a duty to stop someone from abusing his or her child if it is reasonably safe and possible to protect the victim. However, in some states, mere knowledge of the crime and failing to take action to stop it is insufficient to finding criminal liability (Dressler, 2001).

Traditionally, an accomplice cannot be found guilty of the crime unless the principal is convicted. Liability flowed through the principal to the accomplice. Today, however, states can get a conviction of the accomplice regardless of

the outcome of the principal's case as long as the prosecutor can prove that a crime was actually committed. The accomplice can be convicted even if the principal is never found, has fled the jurisdiction, or has been acquitted (Garland, 2003).

When an aider and abettor decides that she desires to remove herself from the commission of the target offense (before it has been committed), she must take active steps to undo the aid she has provided in order to avoid liability. The aider and abettor cannot go home and hide and hope that all of her troubles just go away. She must (1) inform the principal that she wishes to withdraw her support, (2) indicate that she no longer wants the crime to be committed, and (3) attempt to make any aid she has provided ineffectual. For example, if the accomplice has loaned her shotgun to a potential bank robber, she must state her intent to withdraw and attempt to do everything within her power to recover the weapon and prevent the crime. If major steps have already been accomplished toward the commission of the robbery, she might also have to inform law enforcement so that the crime can be stopped (Tiffany et al., 2003).

There is a difference between criminal liability based upon a conspiracy theory and accomplice liability. A conspirator agrees to be part of a criminal enterprise that might encompass numerous crimes committed by various members of the conspiracy. Conspirator liability extends to crimes that individual conspirators might not even know about or consent to. A conspirator does not have to do any act to aid in the conspiracy. All that is necessary to establish criminal liability is an agreement to achieve a criminal purpose with at least one conspirator committing an overt act (Frase, 2002).

A conspirator is liable for all acts of his or her coconspirators that are committed during the course of and in furtherance of the conspiracy. If Fred steals a getaway car to be used in a robbery, all conspirators are guilty of car theft, even if they never consented to or agreed with Fred's act. This liability is based upon agency theory. Each conspirator acts as an agent for every other conspirator. Any act, planned or unplanned, committed by a coconspirator that is a foreseeable consequence of the criminal agreement, creates liability for each conspirator under the *extended liability theory*, also known as the *Pinkerton doctrine* (Demleitner et al., 2007).

Incomplete Crimes

Because society wants to prevent serious social harm before it happens, governments created the crime categories of solicitation, conspiracy, and attempt. Even though these offenses are crimes all by themselves, the main reason for their creation was the understanding that each crime was a preliminary or anticipatory offense that was committed with the same evil intent but a greater target in mind (Scheb &

Scheb, 2006). The inchoate offenses of solicitation, conspiracy, and attempt are discussed below.

Solicitation

Solicitation is a substantive crime in and of itself. This crime occurs as soon as the solicitation is made. Simply put, the crime of solicitation is in the asking. It does not matter if the solicited person accepts the offer or rejects the advance. The *actus reus* of solicitation consists of words that create an inducement, which is defined as any of the following: begging, ordering, counseling, commanding, inducing, instructing, advising, tempting, imploring, asking, instigating, urging, requesting, entreating, persuading, inciting, procuring, or enticing another to commit a crime included in the list of prohibited target offenses in a state's solicitation statute. The elements of solicitation for most jurisdictions include the soliciting of another to commit a crime specified in the statute with the intent that such crime will be committed. Most states also include the following evidentiary burden: The charge must be supported by the testimony of two witnesses or one witness and corroboration (Hazard, 1983). Solicitation was first recognized in 1801 in the case of *Rex v. Higgins* (1801). In this case, a person asked a servant to steal the property of his master. The servant refused. Though the facts of this case were simple, it demonstrates that solicitation is committed when a person requests another to commit a crime, even if the person solicited refuses to cooperate.

Solicitation remains a specific-intent crime in most states, as it was a common law. In other words, one must have the *mens rea* (guilty intent) for solicitation. The reason for this element is to protect First Amendment rights of speakers (e.g., it is lawful to advocate for civil disobedience) and to keep people from being prosecuted for solicitation when their comments to another were made in jest, with no intent that the crime actually be committed. Solicitation can be committed even if it is impossible to commit the target offense due to a circumstance unknown to the solicitor. For example, if Fred solicits Barney to kill Mr. Slate but Mr. Slate was killed in a car accident the day before, Fred can still be convicted of solicitation of murder if he did not know that Mr. Slate was deceased. If the specific intent exists at the same time as the solicitor's request, the crime of solicitation has been committed.

Conspiracy

The definition of *conspiracy* is an agreement between two or more people to commit an unlawful act or to do a lawful act by unlawful means. This common law definition does not require any act beyond the agreement (Scheb & Scheb, 2006, p. 97).

Most state statutes now require the following five elements to prove a conspiracy has occurred: There must be (1) an agreement or understanding (2) between two or

more persons (3) with the specific intent to commit (4) either a crime or a lawful purpose by unlawful means (5) when accompanied by some overt act beyond mere agreement (Singer, 2002, p. 1546).

An overt act doesn't have to be part of an attempt to commit the target crime. It can be any act, even a trivial one that is done in furtherance of the conspiracy. A single overt act by any party to a conspiracy is sufficient for the prosecution of all participants of the conspiracy. A conspirator can join the conspiracy after the overt act is done and still be liable. This overt act does not have to be a crime itself. Some examples of overt acts include the following: paying a hit man, telephoning a supplier to arrange delivery of drugs, calling a friend to give an insider tip in a stock-trading conspiracy, buying gasoline in an arson conspiracy. Overt acts provide proof that the agreement to commit a crime was sincere (Scheb & Scheb, 2006, pp. 92–96).

Attempted Crimes

Unlike solicitation and conspiracy, which are infrequently charged, attempts to commit crimes are regularly prosecuted. This is due to the increase in reporting by victims and witnesses and the availability of more obvious evidence of guilt. In general terms, an attempt consists of the following: (1) an overt act, (2) beyond mere preparation, that moves toward committing a crime that is legally possible to commit, (3) done with the specific intent to commit the target crime, (4) which, if it is not interrupted or stopped, would result in completion of the crime (Neubauer, 2008, p. 351).

Immoral thoughts alone are not enough to charge an attempt. Each statute requires that the defendant try to commit the crime he or she is charged with attempting. The prosecutor must show some overt act that demonstrates this. The acts must go so far that they would result in the completion of the crime if not prevented by factors unknown to the defendant. All attempts are specific-intent crimes. Even if the target offense is a general-intent crime, the defendant must intentionally commit the acts that constitute the *actus reus*, and these acts must be done with the specific intention of committing the target crime (Kadish, 1987). For example, Fred shoots a gun at Barney and misses. Fred intended to kill Barney and committed an act—shooting the gun—which would have resulted in murder if the act had been completed. The act was not completed because the bullet did not strike Barney. Fred has committed an attempted murder.

Actus Reus of Attempt

When looking at an attempt to commit a crime, the primary issue is determining when a perpetrator has gone from mere preparation to beginning actual commission of

the target offense. To aid in making this determination, courts from various states have created the following tests that will be examined here in more detail: the last act test, physical proximity test, dangerous proximity test, indispensable element test, unequivocal test, and substantial step test (Dressler, 2001).

The *last act test* looks at whether an attempt has occurred, at least by the time a person has performed all the acts believed to be necessary to commit the target offense. For example, an attempted robbery does not occur until the robber displays his or her gun and demands property (Dressler, 2001).

The *physical proximity test* determines that the defendant's conduct need not reach the last act but must be "proximate" to, or near, the completed crime. The conduct must be a first or subsequent step beyond planning. For example, Fred's attempted robbery of a store occurs when Fred leaves his car and walks toward the door of the store with his gun in his hand (Dressler, 2001).

The *dangerous proximity test* decides that an attempt occurs when the defendant's conduct is in "dangerous proximity to success," or when an act "is so near to the result that the danger of success is very great." For example, Barney and Betty plan a home invasion robbery. They wait in the park next to the victim's home with tape, guns, and ski masks. The intended victim appears. Police spot Barney and Betty and make an arrest for attempted robbery (Dressler, 2001).

The *indispensable element test* looks at whether an attempt occurs when the defendant has obtained control of an indispensable feature of the criminal plan. This test is disfavored because it does not give enough weight to criminal intent. For example, a robber is outside a jewelry store, but she is waiting for her brother to show up with a gun. She is missing her indispensable element: the gun (Dressler, 2001).

The *unequivocal test* looks at whether an attempt occurs when a person's conduct, standing alone, unambiguously manifests his or her criminal intent. This test focuses on the overall conduct of the accused. An example with ambiguous conduct would be when Fred goes to the area of a jewelry store with a gun but does not approach the store. An example of a more obvious robbery attempt occurs when Fred drives to the store and walks across the parking lot toward the store with a gun (Dressler, 2001).

The *substantial step test* decides if an attempt occurs when the suspect has done something that constitutes a substantial step toward the commission of the target offense that strongly corroborates the suspect's criminal intent. For example, the suspect purchases a handgun for the purpose of robbing a store. This substantial step test is the easiest for the prosecutor to apply to prove an attempt. The suspect does not have to be in close proximity and might be lacking the instrumentality to commit the crime. This test is criticized because ambiguous conduct can create criminal liability (Dressler, 2001).

When a suspect is interrupted and does not complete the crime, he is probably guilty of an attempt. However, if a suspect voluntarily and completely renounces her criminal purpose before the crime is completed, the affirmative defense of abandonment can be argued. There can be no circumstance that caused the suspect to abandon her efforts. If the crime is interrupted by another person, a barking dog, or the suspect's tools break or malfunction, then abandonment does not apply. In those instances, the defendant did not voluntarily cease commission of the crime and would have continued if not for the interruption. When a suspect does completely stop her efforts and demonstrates her intent to not commit a crime, she is rewarded for her good judgment, and it is found that she never had a fully formed intent. Therefore, no crime was committed (Beale, 2002). For example, Barney is planning on robbing a store in Bedrock. After purchasing the gun, he will use in the robbery, he has second thoughts the morning before the crime is scheduled and decides that he will not carry out his plan and returns the gun for a full refund.

Defenses to Crimes

The law recognizes that people engage in conduct that is considered criminal but that might be excused or justified because their mens rea was negated or society excuses their conduct. These justifications and excuses are defenses to criminal offenses. The U.S. system places the burden of proof upon the government to prove the charges beyond a reasonable doubt. The defendant is presumed innocent until proven guilty. Moreover, as part of the criminal process, the accused is given an opportunity to present a defense. There are many types of defenses, from alibi to self-defense. Sometimes, the defense can be based upon the prosecution's inability to prove the charge, or the defense can be a so-called affirmative defense where the defendant presents evidence and witnesses to disprove an element of the offense (Torcia, 1995).

Failure of Proof or True Defenses

When a defendant is on trial, she might rely upon the prosecution's inability to prove the case against her. The accused might remain silent throughout the trial and have no duty to present any evidence. The defense might attack the government's case through cross-examination or simply take the position that the government has failed to prove the case against her. These strategies rely upon a *failure of proof* for the defense (Greenwalt, 2002).

When the defendant actively presents evidence of an excuse or a justification, it is said that he is presenting a *true defense*. If a true or affirmative defense is established, the defendant is entitled to an acquittal, even if the government has proven all the elements of the crime against him. After the defendant has presented evidence of a true defense, the burden is on the prosecution to disprove the

defense beyond a reasonable doubt. When a defendant relies upon an affirmative defense, he is admitting that there is a basis for criminal liability but is offering a legally recognized reason why he should still be acquitted. When an affirmative defense is used, the burden of raising the defense lies with the defendant. After the defense is raised, the burden of proof shifts back to the government, and the prosecutor must prove beyond a reasonable doubt that there is a lack of justification or excuse (Reitz, 2002). Suppose Fred walks into his home and finds his wife, Wilma, injured on the bedroom floor. He then encounters a burglar and kills him. Fred admits that he intentionally killed the burglar but insists that the killing was justified. The prosecutor must prove that Fred did not kill the intruder in self-defense. If the defense is accepted by the jury, Fred will be acquitted even though he admitted a homicide.

There are two general categories of affirmative defenses. Under a justification defense, conduct by the accused that is otherwise criminal is deemed to be socially acceptable and is not subject to punishment because of the circumstances of the case. This defense focuses on the nature of the conduct and the surrounding circumstances. Under an excuse defense, the defense focuses on the accused's moral culpability and whether he possessed the mens rea (guilty intent) required to commit the crime. In such a case, society recognizes that the defendant has caused some social harm but agrees that he should be excused from blame or punishment (Frase, 2002).

Affirmative Defenses

<i>Justification Defenses</i>	<i>Excuse Defenses</i>
Self-defense	Duress
Defense of others and habitation	Age/Infancy
Necessity	Intoxication/Diminished capacity
Use of lawful force for crime prevention	Insanity
	Mistake

The law permits self-defense (a) when you are not the aggressor, (b) when you reasonably believe it is necessary to defend yourself, and (c) to avoid an unlawful and imminent attack. Moreover, most states have adopted a rule that allows defense of another when it reasonably appears that unlawful force is being applied to the defended person by an aggressor. Note that the use of deadly force is appropriate only when a person must defend herself or another person in an effort to prevent imminent death or serious bodily harm (Garland, 2003).

When an aggressor uses any force to gain entry into a residence, the resident can stand his or her ground and use all force reasonably necessary to defend himself or

herself. This is the so-called *castle doctrine*. In some states, reasonableness is presumed, and the resident can use deadly force whenever an aggressor enters his or her home by force. The force can be as simple as opening a door or window (Dressler, 2001).

Necessity is sometimes referred to as the *lesser-of-two-evils defense*. A person can avail herself of the necessity defense when the following conditions are met: (1) The person must be faced with a clear and imminent danger; (2) the greater harm must be the direct cause of the law violation; (3) the person cannot have a lawful legal alternative to the law violation; (4) the harm that the defendant causes by violating the law must be less serious than the harm she seeks to avoid; and (5) the defendant must come to the situation with “clean” hands—that is, she must not have wrongfully placed herself in a situation that requires the choice of evils (LaFave, 2003, p. 523).

In addition to the five requirements that show when a person is justified in violating criminal law, some states place three additional limitations on the use of the necessity defense: (1) The defense might be limited to situations created by natural forces—for example, looting a store might be a necessity following a hurricane or earthquake; (2) the defense does not apply to homicide case—a person cannot kill someone to save his own life; (3) the defense can be used only to protect persons and property, not to protect pure economic interests or personal reputation—a person cannot assault someone merely to protect his own honor (Frankel, 1993, pp. 138–139).

Defenses Based on Excuses

To assert a defense of duress, the defendant must admit that he committed the crime but did so under the following circumstances (all circumstances must be met): (1) Someone threatened to kill or cause great bodily harm to the defendant or a third party unless he committed the offense; (2) the actor reasonably believed that the threat was genuine; (3) the threat was present, imminent, and impending at the time of the criminal act; (4) there was no reasonable means of escape other than for the defendant to commit the crime; and (5) the defendant must not be at fault in exposing himself to the threat. However, it is important to note that duress is not an acceptable legal defense for murder (Perlin, 2002, p. 650).

The defense of infancy has been asserted for hundreds of years. Courts have recognized that children under a certain age were incapable of forming criminal intent. Today, states have set this age at anywhere from 10 to 14 years. Some states, such as California, allow for culpability under a set age of 14 if there is clear proof that at the time of committing the act charged against her, the child knew its wrongfulness. Oklahoma uses the same language but sets the age at 16. In addition to allowing prosecution in a juvenile court setting, most states allow juveniles to be prosecuted as adults when they have committed a violent felony

and are a certain age. Some states set that age as low as 10, whereas others set it as high as 16. Juveniles tried as adults can be sent to prison (LaFave, 2003, p. 485).

Voluntary intoxication is not a valid defense for crimes that have a general intent. For crimes with a specific intent, voluntary intoxication can be used to negate the element of intent if the level of intoxication was so high “as to render [the accused] incapable of purposeful or knowing conduct” (Lafave, 2003, pp. 472–473). Several states have eliminated the defense of intoxication in its entirety. A jury is not allowed to consider evidence of intoxication. The judge can consider it only as a mitigating fact at sentencing. Involuntary intoxication is a defense if the jury finds evidence that both of the following happened: (1) The defendant did not voluntarily take the drug or intoxicant and was forced or tricked into taking it, and (2) the defendant was so intoxicated that he couldn’t form the requisite mens rea for the charged offense (Fingarette & Hassle, 1993, p. 742).

In many states, a defendant who has insufficient evidence to prevail on an insanity plea might still present evidence of a mental condition on the issue of whether he had the requisite mental state for the offense. This is a *diminished capacity* defense. This is not a true defense as much as it is a failure-of-proof defense that negates mens rea. However, diminished capacity can be used as a true defense in a murder prosecution to mitigate the offense to manslaughter. During the past 20 years, there has been a movement to abolish diminished capacity in several states (Garland, 2003).

The law recognizes that people are not criminally liable for acts committed when they are not sane at the time of the offense. Sanity is determined by the jury applying the irresistible impulse test, the substantial capacity test, or the so-called M’Naghten Rules. Four states have abolished the insanity defense altogether, while only four use the irresistible impulse test. A person is insane under this test if, at the time of the offense, (1) she acted from an irresistible and uncontrollable impulse, (2) she was unable to differentiate between right and wrong behavior, and (3) she did not have the will necessary to control her actions (Fingarette & Hassle, 1993, p. 744–746).

The substantial capacity test provides that a person is not responsible for her criminal conduct if, at the time of the conduct, as the result of a mental disease or defect, she lacked substantial capacity to do one or both of the following: (1) appreciate the criminality or wrongfulness of her conduct and (2) conform her conduct to the requirements of the law. The substantial capacity test has been adopted by just under half of the states (McClain & Kahan, 2002, p. 412).

Half of all states determine sanity by applying the M’Naghten Rules. A defendant is not legally responsible for his acts if at the time he was “laboring under such a defect of reason, from diseases of that mind, as not to know the nature and quality of the act he was doing, or if he did

know, that he did not know that what he was doing was wrong” (Neubauer, 2008, p. 306).

In general terms, mistake of law is not a defense. If, however, a law is ambiguous and might prevent a reasonable person from knowing whether her conduct is prohibited by the statute, the defendant might have a defense against application of the law to her. This is actually a constitutional defense because an ambiguous law fails to meet the requirements of due process under the Fifth and Fourteenth Amendments to the U.S. Constitution (Chevigny, 2002).

A mistake of fact is a defense if it negates the mental state required to establish any element of the offense. If a defendant makes a mistake and takes the wrong coat from a closet at a party, his mistake negates the intent to steal that is necessary for a theft to have occurred (Chevigny, 2002).

Conclusion

This chapter has outlined many of the most salient aspects of the criminal law. In so doing, historical and traditional applications of law were discussed en route to an examination of more recent developments. The criminal code is continuously evolving because it continually adapts to new environments and situations. Recall that one of the first known sets of laws, the Code of Hammurabi, dates back to 1750 BC. Since that time, societies have of course developed and recorded new laws, reworked existing laws, and discarded antiquated laws. The Code of Hammurabi, for example, included some 282 laws. Today, developed nations like the United States have authored volumes of criminal sanctions that would require a vast library to compile. Although idiosyncrasies of the historical evolution of criminal law are more complex than could be outlined here, it is important to note that the overarching goal of the criminal law is to protect the health, safety, and welfare of society. As societies develop and face new and unforeseen circumstances, the criminal law must, and will, follow suit. It is in this way that the criminal law protects its citizens and remains one of the hallmarks of civilized societies.

CRIMINAL SPECIALIZATION

CHRISTOPHER J. SULLIVAN

University of South Florida

Since early in the study of crime, criminologists have been interested in the taxonomic identification of offenders. This interest dates as far back as the research of Lombroso, which attempted to define “born criminals” based on certain individual physical and psychological features (Gibbons, 1988). More recently, the study of criminal careers has brought renewed interest to whether, and to what degree, criminal offenders might concentrate, or “specialize,” in particular offense types. This gives rise to questions as to whether certain offenders engage predominantly, or exclusively, in drug offenses only, sex offenses, violent offenses, and so on. In short, research on specialization asks, can offenders be placed in distinct categories defined by their focus on particular types of crimes?

The answer to the specialization question has important implications for both criminological theory and criminal justice practice. Consequently, criminologists have made a number of explanatory propositions about the potential for specialization in offending, and empirical research has attempted to uncover its presence and nature. If there is no offense specialization, then criminologists would be wise to adhere to general explanations of crime, such as Gottfredson and Hirschi’s (1990) self-control theory, and policymakers and justice officials would be well served to treat all offenders in a similar manner based on their frequency of offending. On the other hand, findings of specialization suggest it would be prudent to consider more

specific explanations of criminal behavior, such as differential opportunity theory (Cloward & Ohlin, 1960) or Moffitt’s (1993) developmental taxonomy of antisocial behavior. If notions of specialization in offending are sustained, policymakers and practitioners might then look to make use of such information in developing intervention strategies and sanction structures.

Paternoster and colleagues (Paternoster, Brame, Piquero, Mazerolle, & Dean, 1998) define specialization as “the extent to which an offender tends to repeat the same specific offense or offense type on successive criminal events” (p. 133). According to Osgood and Schreck (2007), specialization reflects systematic individual differences in forms of criminal behavior engaged in by offenders. The concept of specialization may imply similarities in consecutive offenses or span an offender’s entire career (Miethe, Olson, & Mitchell, 2007). While specialization is often defined as the tendency to repeat specific types of offending, often in a direct, sequential form (see Kempf-Leonard, 1987), some believe this is too strict a definition (Francis, Sothill, & Fligelstone, 2004). Earlier studies focused somewhat more on offense-switching in consecutive criminal events or arrests, while more recent work tends to look at a particular period in time to assess the degree to which individuals exhibit a tendency to commit certain types of offenses during that time frame. Overall, specialization refers to a concentration in particular types of offenses. Clearly, the

manner in which specialization is defined has important implications for theory and empirical findings.

Theory

Some of criminology's major theories make assumptions, directly or indirectly, about specialization. These statements about specialization and generality in offending patterns derive from the positions that theories take on both criminals and criminal events. In contemporary criminology, two separate bodies of theory hold viewpoints on the existence and nature of specialization in offending. On the one hand, general theories that make few distinctions among offenders in terms of type and the explanation of behavior suggest that offenders do not specialize in particular offenses. Alternatively, taxonomic perspectives of criminal careers that make distinctions among offenders are more accepting of the idea that there may be qualitative differences in offending patterns.

In the general theory of crime, offending is viewed as only one of a host of activities undertaken in pursuit of short-term pleasure or gain at the expense of potential long-term consequences (Gottfredson & Hirschi, 1990). One of its fundamental propositions is that offenders have low levels of self-control, and this leads them to engage in a variety of criminal offenses. Thus, the theory suggests that there should be no discernable patterns of offenses. Criminal acts are seen as providing the potential immediate gains that will be attractive to those who have lower levels of self-control (Britt, 1994). Therefore, in the view of these theorists, offenders are unlikely to demonstrate specialization as this short-term, pleasure-seeking orientation will manifest itself in a variety of distinct deviant activities across different situations and shifting life circumstances. An offender who commits auto theft one week might get involved with a physical fight the next or commit another auto theft. The specific nature of the deviant behavior is likely to arise mainly out of the opportunities presented to the offender and will not reflect a coherent pattern of offending within a particular type.

The criminal career paradigm, outlined by Blumstein and colleagues (Blumstein, Cohen, Roth, & Visher, 1986), suggests that, in addition to onset, continuance, and desistance in offending, the qualitative issue of offense type is also worthy of focus. In short, this framework focuses on individual-level variation in offending over time, arguing that such patterns are worthy of empirical investigation and, potentially, theoretical explanation. The issue of specialization represents one such area of study. Criminal career researchers believe that there may be certain groups of offenders who warrant distinct behavioral explanations and may require some sort of specialized treatment or intervention. For example, there may be a group of serious, generalized offenders who engage in a lifelong pattern of antisocial behavior and will engage in a variety of deviant

activities. This reflects the small group of serious, chronic offenders that are often identified in studies focused on criminal behavior in general populations (e.g., Wolfgang's Philadelphia Birth Cohort Study; see Wolfgang, Figlio, & Sellin, 1972). On the other hand, it is possible that certain individuals tend to engage in less serious deviant behavior during adolescence only and desist from that behavior as they near adulthood. This is the premise of Moffitt's (1993) taxonomy of antisocial behavior, which provides an example of a theory that outlines subgroups of offenders that may be distinct in terms of the manner and origin of their behavior. For example, Moffitt's adolescent-limited offenders may specialize in relatively more benign forms of antisocial behavior (e.g., status offenses, substance use), while life-course persistent offenders commit an array of offenses over a longer period of time.

The criminal career view of distinctions in offender type has been criticized by proponents of more general views of crime and criminals. Such criticism extends even to the use of the term *career*, which implies some coherent pattern of behavior (Gibbons, 1988). Osgood (2005) summarizes this discussion in terms of the emphasis on generality and explanatory simplicity as a means of advancing understanding versus the criminal career alternative that looks at a series of specific benchmarks (e.g., onset, persistence) and considers individual differences in those properties. Specialization and versatility in offending represent one such parameter. The discussion also presents an issue for further consideration in terms of understanding the nature of criminal behavior. Consequently, the question of specialization serves as a touchstone for criminologists who hold different views regarding the nature and etiology of criminal behavior.

Empirical Evidence

As noted above, some key theoretical propositions in criminological research assert different degrees of specialization in offending. This has given rise to a fair amount of empirical research seeking to examine the presence or absence of such properties of offending. These studies have drawn on a variety of methods, and in many cases their differences may be partly attributable to alternative approaches to measurement or analysis.

Most studies tend to find only marginal levels of specialization in offending. Gibbons (1988) suggests that the typological schemes offered by criminologists and practitioners tend to lack support when attempts are made to identify cases that provide a "real world" match to their expectations. In general, the literature on this aspect of the criminal career tends to indicate fairly low levels of specialization among offenders (Piquero, Farrington, & Blumstein, 2003). Relevant early research, for example, found that having information about the number and type of an offender's previous crimes was not a good predictor of later offenses (Wolfgang et al., 1972).

Farrington, Snyder, and Finnegan (1988) studied the question of specialization in a sample of juvenile offender court records. They found an average coefficient value of .10, which was statistically significant, but quite small relative to the value of 1.0 that would be expected in the case of complete specialization in offending. They also compared the actual number of specialists for each offense to that expected by chance and found that only about 20% could be designated as specialists. While identifying somewhat higher levels of specialization in an adult sample, coefficient values identified by Blumstein et al. (1988) were all below .50 and were generally closer to .20. As in these studies, Paternoster et al. (1998) identified fairly low levels of specialization in juvenile and adults when they analyzed crime patterns for a sample of British offenders.

Using the Philadelphia Birth Cohort data set, Kempf-Leonard (1987) examined five measures of specialization (e.g., specialization coefficient, transition probabilities) and found that, in general, offenders exhibited low levels of specialized criminal activity. Piquero and colleagues (Piquero, Paternoster, Brame, Mazerolle, & Dean, 1999) and Mazerolle and colleagues (Mazerolle, Brame, Paternoster, Piquero, & Dean, 2000) examined the relationship between specialization and versatility of offending and key covariates (e.g., age of onset, gender). Mazerolle et al. calculated diversity index values across three crime types and found observed values ranging from about .28 to .50, depending on the number of offenses, suggesting fairly diverse offending profiles. Piquero et al. utilized several measures (e.g., diversity index, transition matrices) and similarly found fairly low degrees of specialization. For example, the specialization coefficients were below .35 in all cases (with 1.0 representing complete specialization). Focusing on violent specialization, Piquero (2000) likewise found no discernable evidence that certain offenders tend to concentrate on such offenses and suggested that individual volume of offending is the primary correlate of whether offenders are violent or nonviolent.

Some recent evidence suggests that the question of specialization in offending may be more nuanced than first thought. For example, in work drawing on ethnographic accounts, Shover (1996) found that, in contrast to specialization over the entire criminal career, offenders make short-term adjustments in offense patterns that suggest some degree of temporary specialization. Sullivan, McGloin, Pratt, and Piquero (2006) report a similar finding with the diversity index in a sample of incarcerated felons when studying short pockets of time (e.g., months and years). Francis et al. (2004) also found evidence of offender "types" when studying longitudinal crime patterns in a U.K. offender sample. Like Shover, both of these studies also suggested that criminals may shift their offending preferences over time, which would aggregate to versatility over a career.

Using a novel measurement and analytic approach, Osgood and Schreck (2007) report clear and consistent evidence of specialization in violent offending. Their study incorporated self-reported delinquency measures across

three prominent studies of juvenile delinquency (e.g., Monitoring the Future). They also found that the propensity to specialize in violent behavior was relatively consistent over time and was systematically related to some expected correlates (e.g., risk seeking). Thus, they assert fairly strong evidence of specialization using their approach.

It is also important to consider different correlates of offending patterns that might be important in connecting this aspect of the criminal career to theoretical propositions and policy considerations. Piquero et al. (1999) and Mazerolle et al. (2000), for instance, attempted to tie the degree of specialization to important aspects of the broader criminal career. Lynam, Piquero, and Moffitt (2004) looked at specialized offender groups and found some differences in the extent of their respective developmental risk factors (e.g., childhood conduct).

Although these findings do suggest some degree of specialization in offending, it is important that they are viewed in the context of a larger group of studies that have identified offenders who tend to commit a variety of different criminal acts over their careers. Britt (1994) suggests that researchers sometimes lose sight of the fact that even studies identifying purported specialized offenders tend to suggest that they represent a fairly small portion of the overall pool. So, in considering empirical results, it is important to keep the findings of generality in criminal careers in mind but also consider potential segments of that career where there might be specialized pockets of offending.

Methods

As research on the question of specialization and diversity in offending has grown, so too have discussions about how it should best be studied and measured from a methodological perspective. The question of specialization is one of a few areas related to criminal career research that has generated a fair deal of disagreement among criminologists. This debate has often played out in arguments about how best to measure and analyze specialized or diverse patterns of offending. Consequently, several different measurement and analytic approaches have been proposed and utilized in the study of this property of the criminal career.

Measures

Some early specialization research relied on the use of transition matrices, which are aggregate measures indicating how often an offender "switches" from crime to crime over the course of a criminal career (Blumstein, Cohen, Das, & Moitra, 1988). Such studies provide a sense of the average sample probability that individuals would switch offenses or maintain the same type across a series of arrests. Although one can examine a number of transitions, this method has been criticized as it may give too much weight to consecutive offenses at the expense of a broader sense of offending patterns. For example, if a substantial

proportion of an offender's arrests are for the same crime type but they are not ordered, this approach might still suggest a generalized offending pattern. Alternatively, an offender with a smaller proportion of arrests for the same crime, occurring consecutively, would demonstrate a greater degree of specialization on that measure.

Farrington (1986; Farrington et al., 1988) introduced a single summary measure drawn from transition matrices called the forward specialization coefficient (FSC) (see also Paternoster et al., 1998). This measure extends the traditional transition matrix approach to include observed and expected frequencies in an offense array so that the pattern identified in the data can be benchmarked against what one would expect if there were no relationship between consecutive offenses. Using these basic elements, one can then calculate an estimate that reflects cases where there is no specialization in offending (i.e., the observed values perfectly match those expected when there is no relationship between consecutive offenses) ranging to those with complete specialization (i.e., offense two is the same as offense one in all cases). While this approach provides a concise summary, it has also been criticized because its interpretation is somewhat murky and it lacks statistical properties that would open it up to further analysis (Britt, 1996).

Another criticism of both the transition matrix and specialization coefficient approach is that they are aggregate measures of offending patterns. As such, their interpretations are based on the offense patterns at the group level, not for individual offenders. As a result, attempts to make statements about individual patterns of specialization or versatility may lead to mistakes in the attribution of results to individuals versus groups (Piquero et al., 1999). This may be problematic since the criminal career framework (Blumstein et al., 1986), which in part prompted renewed interest in these questions, generally focuses on individual patterns of offending, not on aggregate crime rates. So, the transition matrix, and those measures derived from an aggregate array of offenses, may get away from the foundation of criminal careers research, which tends to seek out more individual-centered explanations for the nature and etiology of offending.

Partly as a result of this limitation, some have used the "diversity index," which provides an estimate of the likelihood that any two offenses selected from an individual's offending profile will differ (Mazerolle et al., 2000). The total number of offense types included in the measure creates an upper boundary on its value, and the lower value lies at zero. A diversity index value of zero indicates that the offender engages in complete specialization (i.e., all offenses come from the same category). As the value of the index increases toward its upper limit, the offender is identified as having committed a greater variety of offenses (i.e., covers more categories). One of the key features of the diversity index is that it measures offense specialization at the individual level (Mazerolle et al., 2000). So, relative to other measures, the diversity index approach is a closer fit to criminal career research and life course criminology. Also, unlike

transition matrices, the order of offenses does not figure into its calculation, so the same offense type need not occur successively to denote specialization. Rather, it considers the pattern of offenses in the particular time period as a whole and then makes an assessment regarding their mix (or lack thereof). It can also be incorporated in further statistical analysis of individuals. Still, this measure may be influenced by the number and type of offenses included in its calculation and also the observed time window (Sullivan et al., 2006).

Analytic Approaches

Osgood and Schreck (2007) outlined a number of characteristics necessary for the appropriate measurement and analysis of specialization in offending. According to these authors, key facets in the measurement of specialization include a focus on the type of crimes committed rather than their ordering, definitions of specialization at the individual level, separation of specialization from the more general frequency of offending, and consideration of an individual's pattern of offending in relation to the prevalence with which particular offenses are committed in the sample as a whole. These suggestions were drawn from a review of the methodological difficulties apparent in previous studies of specialization.

Working from this foundation, Osgood and Schreck (2007) used a statistical modeling approach that nests individual offense patterns within individuals to determine whether or not they engage in more offenses of a particular type (violent vs. nonviolent) than would be expected by chance alone. In this approach, specialization is captured by an individual's relative balance of violent and nonviolent offenses. This method also allows researchers to account for other factors, such as the offender's overall frequency of criminal activity, which may be important in the study of specialization.

Another method of assessing specialization, adopted in some inquiries, involves statistically identifying individuals who fall into relatively distinct categories of offending. One statistical modeling approach that can provide some evidence of both prevalence and type of offending patterns is latent class analysis. This method draws on observed offender response patterns to conditionally place individuals into classes based on specific offending types. In this procedure, an offender is asked (or his or her record might be checked) whether he or she has committed any of an array of offenses, and a statistical model is then used to place the offender in a class based on those responses. For example, Britt (1994) found that individuals in the Seattle Youth Study were best represented by two groups, which largely reflected those who committed delinquent acts and those who did not. This suggests a lack of specialization, providing support for general theories of offending. More recently, Francis et al. (2004) undertook a similar type of analysis with a wider array of offense categories and found distinct classes such as shoplifting offenders and fraud/general theft offenders. Where measures like the diversity index and forward specialization

coefficient demonstrate the level of observed specialization, these latent class models can help researchers to determine the nature of the offense type clusters that may be present in the data. These models also offer extensions that allow researchers to discern whether and how offenders may move or transition across offending types over time. Knowledge from such an approach can help in understanding findings of specialization at fixed points in time in the context of versatility over the longer criminal career.

Time Window

While several studies have shifted away from aggregate, population-level measures of offending specialization, they still tend to aggregate offending careers across a number of years. Sometimes studies pool offenses across more than a decade's worth of time. Therefore, despite the use of measures that tap into individualized offense patterns, the findings that emerge from studies of specialization must be considered in relation to the time frame in which the data are viewed. One recent study, for example, found that the observed level of specialization shifted gradually as the time window was lengthened (Sullivan et al., 2006). This point is also partly supported by Osgood and Schreck's (2007) finding of lower stability in individuals' likelihood of violent specialization as the range of time in focus grew longer.

As mentioned above, operational definitions concerning specialization vary from study to study in terms of the use of time frames and also the order of offenses. Clearly, the degree to which the length of offending career is aggregated or disaggregated in a particular study may impact the degree of specialization or diversity observed. It might also be necessary to use longer time intervals in order to obtain enough volume in individual offending to make an assessment about the presence or level of specialization. As a result, it is important to contextualize findings of specialization and diversity in their observed time window and consider whether a full portrait of the criminal career is desired or a segmented view of some portion of that career is more relevant. Differences in the time window studied will inherently impact findings, so it is important to take note of how specialization is being assessed in a particular study so that it can be properly considered in relation to theory and practice.

Data Source

Offending has traditionally been measured in two main ways: self-reports and official records. Both have identified strengths and weaknesses for understanding the general prevalence of offending, which also extend to the study of criminal specialization. While official records may allow for the ordering of particular offenses and facilitate transition matrix-based analysis of offense patterns (Farrington et al., 1988), they also have shortcomings in terms of understanding the full scope of offending. It is

well understood that official records capture only a fraction of the overall offenses committed by an individual. In the case of the study of specialization, this has important implications as it may distort the observed pattern of criminal activity toward more serious offense types and not fully capture the array of crimes engaged in by individuals. For example, Lynam et al. (2004) compared levels of specialization in violent offenses across official records and self-reports. Specifically, they examined the observed distribution of violent acts relative to what would be expected based on the overall distribution of offenses to determine whether their values differed, thus indicating specialization. They found evidence of violent specialization in self-reports, but not in official records.

Osgood and Schreck (2007) suggest that self-report information is preferred to the use of official records in studying specialization because it provides more depth of coverage of individual offense patterns and is less susceptible to biases of the type mentioned above. Still, there may be some problems with the use of self-reported offending as a foundation for understanding specialization. Bursik (1980) notes, for example, that self-report data may carry a specific form of risk in the context of such research. He argues that an offender who commits fewer offenses is likely to have better recall regarding their precise nature than a high-rate offender. This results in estimates of offending patterns that may be systematically biased. Clearly, for both official records and self-report methods, any potential systematic inclusion/exclusion of particular offense types might distort findings related to the question of specialization. So, as with offending prevalence in general, it is important to consider the source of the data in making sense of estimates of offending diversity and specialization.

Underlying Classification of Offenses

In addition to the methodological considerations noted above, the categorization of offenses that underlies a particular measure of specialization has important implications for research findings. Miethe et al. (2007) point out that the potential for finding specialization will decrease as the array of offenses included in its calculation increases. This owes to the fact that finer classification of offense types inherently reduces the likelihood that the same offense(s) would be observed on multiple occasions. Often, researchers investigate specialization based on some configuration of the three overarching crime types—violence, property, and drugs (see Mazerolle et al., 2000). Studies relying on broad “violence,” “property,” and “other” categorizations of crime might generate less observed diversity than those that fully distinguish among offenses that fall within these wider umbrellas (e.g., auto theft, larceny, and fraud for “property”). Also, the manner in which offenses might fit together empirically may be different from initial researcher and practitioner perceptions about which types are similar.

Applications

Despite some questions from theorists and empirical researchers, the categorization of offenders nonetheless retains some appeal, particularly among policymakers, practitioners, and the general public (see Lieb, Quinsey, & Berliner, 1998; Matson & Lieb, 1997). Differential incarceration and treatment plans, for instance, often assume some offender types, whether in terms of specific groups like sex offenders or the general consideration of violent/nonviolent behavior. Legislation directed against particular subgroups of offenders may be enacted when public outcry regarding a well-known case is high. Simon (1997) points out that few outside the research community understand that offender specialization is a relatively rare occurrence. Consequently, an understanding of the degree to which offenders specialize can inform debates about key aspects of justice processing and crime prevention (Blumstein et al., 1986). For example, specific sanctions and treatment for drug offenders may be more palatable (and effective) if it can be demonstrated that such offenders tend not to engage in other offenses that pose a greater threat to public safety.

Clearly, attaching generalized labels to offenders offers practitioners and policymakers an opportunity to simplify decision making because officials can develop a template for dealing with a particular group and then apply that approach to those who fall in that classification. At the same time, in practice, the viability of this perspective does in part hinge on the reality of whether or not such types, or at least concentrated behavioral patterns, truly exist. Thus, this becomes an important information point in balancing the cost and benefit of particular forms of justice response to such offenders. Although there are others (e.g., domestic violence offenders) (Simon, 1997), two groups that have been a specific focus of policy-related discussion of specialization are drug offenders and sex offenders.

Drug Offenders

The question of sentencing for low-level drug offenders has been a matter of some debate. Very little empirical literature has examined this question in relation to its specialization assumption, however. DeLisi (2003) addresses the argument of some who contend that there is a group of “drug offenders” who are generally nonviolent and do not pose much of a threat to public safety as they are only users. The held belief is that imprisoning these individuals represents an overly harsh and wasteful reaction on the part of society. DeLisi examined the criminal arrest histories of 500 detained offenders to assess whether their offending careers reflect specialization in drug offenses or generalized criminal behavior. He found that drug offenders, characterized as having a history of imprisonment for drug use/possession, tend to engage in a variety of offenses over their careers and were actually more likely than nondrug offenders to engage in violent, property, and nuisance

offenses. Based on these findings, DeLisi casts doubt on the contention that drug offenders are specialized and therefore should be treated with leniency because they pose little risk to society. Unfortunately, work in this area is quite limited, so it is important that the issue is studied further in the context of specialization. Still, the issue of response to drug offenders provides one example of the important policy discussions inherent in the study of specialization and versatility in criminal behavior.

Sex Offenders

Due in large part to its policy implications, specialization among sex offenders has received a great deal of attention (e.g., Lussier, 2005; Miethe et al., 2007; Simon, 1997). This comes at least in part because there has been a move toward specialized sanctions and treatment for sex offenders (Simon, 1997). For example, Megan’s Law provides for public notification regarding known sex offenders in the community, and civil commitment procedures permit authorities to house these offenders in secure, residential treatment facilities beyond the completion of their criminal sentence if they are still deemed to be a threat to the community. Both approaches imply some degree of specialization.

Specialization studies focused on sex offenders seek to better understand whether this particular group of offenders differs from others in ways that justify considering them as a distinct group for the purposes of treatment and sanctions. Studies by Lussier (2005) and Simon (1997) looked at this question specifically. Using the proliferation of measures aimed specifically at sex offenders as a pretext, Lussier undertook a comprehensive review of the literature related to specialized and generalized offending among that group. Based on studies that compare recidivism rates for sex offenders to those of nonsex offenders, he concluded that sexual crime does not engender greater levels of specialization than other crimes. Other studies did find, however, that there were differences in degree of specialization between offenders who victimized children compared to those whose offenses were perpetrated against adult women. Overall, Lussier reported mixed findings with regard to specialization and generality in offending but states that sex offenders do not appear to limit themselves strictly to that area of criminal behavior. Simon (1997) came to a similar conclusion in a review of the literature on domestic violence offenders, sex offenders, and general population criminals. In looking at sex offenders specifically, she indicates that findings of generality in criminal histories are often implicit even in studies that treat them as a distinct group.

Drawing on a similar premise as Lussier (2005), Miethe and colleagues (2007) examined the offending patterns of a large sample of sex offenders released from prison in the mid-1990s. They found that, in comparison to other offender groups, sex offenders exhibited lower probabilities of committing the same offense for adjacent arrests.

Furthermore, they identified offending versatility regardless of whether they examined raw probabilities of repeated sex offenses, the forward specialization coefficient, or the diversity index. Thus, the sex offenders in this large, nationally representative sample did not appear to be “persistent specialists” as is often assumed. Studies of the type mentioned here further emphasize the importance of fully considering the available evidence regarding potential specialization of offending in determining whether policies aimed toward specific groups of offenders are likely to be successful.

Future Directions

In the future, further consideration of specialization of diversity and specialization of offending is needed to inform criminological theory and public policy and practice. Presently, much of the research regarding criminal specialization is descriptive in nature and does not necessarily consider the context of contemporary theory and practice. On the theoretical side, it is important to consider this characteristic of the criminal career in the context of emerging integrated perspectives. For example, identification of specialized offending patterns in shorter segments of the life course may provide important insights regarding situational influence on criminal behavior. At the same time, stringing shorter portions of the life course together will likely show an aggregate pattern of versatility. The process of merging those segments may provide greater insight into the trajectory of offending careers by identifying the social circumstances in which an offender might limit or expand his or her repertoire of offenses.

In the case of sex offenders, Lussier (2005) notes that limitations in the existing literature may help explain the disparate findings observed in his review. This is also likely the case in more general considerations of specialization and diversity (e.g., Osgood & Schreck, 2007; Sullivan et al., 2006). Lussier criticizes existing studies for not fully capturing the key theoretical issues surrounding specialization in offending. Specifically, researchers have not focused enough on within-individual change across the criminal career in their consideration of the issue of specialization. He suggests that use of the knowledge drawn from the foundation of the criminal career framework is an important aspect of understanding findings that demonstrate both generality and specialization in sex offender careers (see also McGloin, Sullivan, Piquero, & Pratt, 2007; Sullivan et al., 2006). Such a focus may help to reconcile patterns of short-term specialization with the more abundant findings of versatility in criminal careers.

As with much research in criminology, and the social sciences generally, it is important to assess substantive findings in the context of the samples and methods used in specialization studies. A variety of approaches have been used in order to assess the presence and nature of this property of criminal careers. The use of different measures,

analytic approaches, and data sources has caused some difficulty in terms of fully understanding the level of specialization and its meaning for theory and policy. Gradually, emergent methods have begun to deal with some of the criticisms raised about the existing evidence. For example, Osgood and Schreck (2007) identified a variety of guidelines for studying specialization that may serve as a foundation for future research. It is important that findings from studies of specialization are viewed in relation to their operational definitions, time window, data source, the number and type of offenses used, and the analytic procedure.

Policy makers and practitioners make implicit assumptions about categorizations of offenders that allow them to execute prevention, processing, sentencing, placement, and treatment planning. These assumptions allow for simplified decision making, but they may also limit the ability to deal with offending problems in the long term. For instance, treating a versatile offender who just happened to commit a sex offense using a modality designed around assumptions regarding the psychological makeup of “sex offenders” may contribute to a squandering of already limited justice resources. Similarly, a policy that treats drug offenders as a pure category and deals with them as if they are specialized offenders may compromise public safety if those underlying assumptions turn out to be false. As Miethe et al. (2007) point out, if policies and treatment approaches for criminal offenders are based on false assumptions regarding specialized behavior patterns, they may be destined for failure before they are even initiated. Clearly, in the future it is important that policies and practices built on assumptions of specialization be carefully considered in relation to information obtained from actual offenders. In addition, theory and existing empirical findings should be utilized to explain why particular types of offenders might be more or less likely to specialize.

Conclusion

The notion that offenders can be categorized in some fashion has been around for as long as criminal behavior has been studied. The potential for specialization continues to be a question of some importance in contemporary criminological theory and justice policy. The ongoing study of criminal careers has led to a great deal of further research in this area. Still, many scholars believe that offenders commit criminal acts based on desire for short-term pleasure and do not regularly engage in specific patterns of offenses. A variety of research methods and analytic approaches have been used to examine this research topic; some focus on offense patterns across groups of offenders, and others attempt to assess specialization and diversity of offending at the individual level. Empirical research tends to suggest that the majority of offenders generalize over the course of their active criminal careers. This raises some questions about theories, policies, and treatment modalities that assume offender types.

Some recent evidence, however, suggests that offenders may specialize during short time periods of their overall careers. Therefore, it is important that further research on specialization accommodate the fact that most offenders will commit a variety of different types of crime over their careers, but the specific nature of those activities may be tied to particular life events and situations. Emerging measurement strategies and analytic techniques offer some opportunity to better understand this property of criminal careers. Incorporating these approaches with greater emphasis on theoretical understanding has the potential to advance knowledge of the degree to which criminal specialization exists and its origins. This area of criminological study has some important implications for how offenders are sanctioned and treated by the justice system as well and should be pursued further to inform responses to crime.

DRUGS AND THE CRIMINAL JUSTICE SYSTEM

RALPH A. WEISHEIT

Illinois State University

Drugs have had a major impact on the criminal justice system for decades. Each year since 1996, more people have been arrested on drug charges than for any other single offense. If one were to include arrests specifically for alcohol (driving under the influence [DUI], liquor law violations), then nearly one third of all arrests have been directly related to alcohol or illicit drugs. If one were to count robberies, burglaries, and assaults conducted under the influence of alcohol or drugs, then it could be said with confidence that no other factor has demanded so many criminal justice resources or has caused communities so many problems. To understand the current situation, it is helpful first to look back to the beginning when drug abuse first came to be defined as a criminal justice problem.

In the Beginning

Americans like to look to the past as a time of innocence, but substance abuse problems have been a feature of American society from the beginning. At first, alcohol was a problem; by the early 1800s, Americans were consuming perhaps twice the amount of alcohol per person as in the 2000s. Immigration, industrialization, and the rise of cities led to an increase in social problems associated with alcohol and the rise of anti-alcohol groups. Numerous state and local laws were put in place to restrict or even ban alcohol,

but the federal government did not become involved until passage of the Eighteenth Amendment to the Constitution, in 1919. With that amendment, the manufacture, sale, or transportation of alcohol became a federal crime to be enforced by the newly created Bureau of Prohibition, located within the Treasury Department. Prohibition remained in place until 1933.

The social environment that led up to Prohibition also ushered in a host of state and local laws designed to control a wide range of behaviors thought to be a problem—including gambling, prostitution, sex, drugs, the length of women's skirts, and the size of bathing suits. It was during this period that the criminal justice system saw the spread of prisons, the rise of probation, and the creation of the juvenile court. The late 1800s and early 1900s was also a time of relatively widespread drug use. This was a time when medicine was crude, to put it mildly, and a number of drugs were marketed for a variety of ailments. Codeine was discovered in 1831. Morphine was rather freely administered as a pain killer to wounded Civil War soldiers—to the point that morphine addiction was sometimes called the “soldier's disease.” In 1898, Frederick Bayer and Company marketed heroin as a treatment for respiratory problems, and the drug was used by some as a treatment for morphine addiction. Marijuana has a long history of use as a medicine in the United States and by the late 1800s was administered for more than a dozen ailments, from rheumatism to alcohol withdrawal to asthma.

At that time, many of the street drugs known today were freely available, often in over-the-counter medicines known as *patent medicines*. There was no requirement that over-the-counter medicines list their contents. Consequently, consumers were unwittingly taking medicines laced with opiates, cocaine, or other drugs. Medicines sold as treatment for morphine addiction sometimes had morphine as a main ingredient. Similarly, elixirs sold to combat alcoholism sometimes were heavily loaded with alcohol.

Finally, with magazines and newspapers running stories about these unregulated medicines, and with Upton Sinclair's exposé *The Jungle* revealing disgusting practices in the meatpacking industry, Congress felt compelled to act. The result was the Pure Food and Drugs Act of 1906. This act did not ban such drugs as heroin, morphine, or cocaine, but required that the content of medicines and packaged food be clearly labeled. Having been made aware of the presence of addicting drugs in these medicines, the public increasingly turned away from them. While the problem of drug addiction had diminished, it had by no means disappeared.

For so long as the drug problem was defined primarily as one of the white middle class, the government emphasized regulation, not criminalization. However, narcotic drugs (opium, morphine, and heroin in particular) and cocaine were seen as a growing problem among minorities, and there were concerns about violence arising from the use of these drugs. In addition to concerns about domestic abuse, the United States was in the awkward position of encouraging other nations to enact restrictions on the trafficking in narcotics while having no national law of its own.

The Harrison Narcotics Act

Efforts to enact strict laws were initially turned back by the pharmaceutical industry. In the end, a compromise was struck in which those who sold or otherwise dealt in narcotics were required to register with the government and pay a tax. This new law, the Harrison Narcotics Act of 1914, was ostensibly a tax act, but was clearly intended to limit the availability of narcotics, such as heroin, morphine, and opium. And, although cocaine is a stimulant and not a narcotic, it was treated as a narcotic in the law. Even today, the Federal Bureau of Investigation's (FBI) annual report on the number of drug arrests lumps cocaine and narcotics into a single category.

At the time of the Harrison Act, the FBI and Drug Enforcement Administration (DEA) did not exist, and enforcement fell to the Treasury Department, which would later be called upon to enforce the prohibition against alcohol. The Harrison Act limited but did not completely ban narcotics. The wording of the act suggested that doctors could use their professional judgment to decide how much of a drug could be prescribed and to whom. The language was vague, however, and the meaning of the law had to be

interpreted—a task that also fell to the Treasury Department. The result was the establishment of a precedent in which law enforcement officials had the final word on what was to be considered proper medical practice. This model is still followed today in that the DEA has the authority to decide which drugs may be used in medical practice, which drugs require a prescription, which doctors may write a prescription, which pharmacists may fill a prescription, and the volume of prescription drugs that pharmaceutical companies are allowed to produce. Thus, from the very beginning in the United States, law enforcement has been viewed as the primary tool for controlling the drug problem.

This was also a time when there were few federal crimes on the books, with nearly all criminal justice functions left in the hands of states. Consequently, drug law enforcement was a major component of the federal criminal justice system. By the late 1920s, for example, nearly one third of federal prison inmates were incarcerated for violating federal drug laws, more than for any other category of federal offense.

The Federal Bureau of Narcotics

At first, enforcement of the Harrison Narcotics Act was the responsibility of a division within the Prohibition Unit of the Treasury Department. However, as alcohol prohibition became increasingly unpopular, and as scandals hit the Prohibition Unit, there was pressure for change. That change took place in 1930 when the Prohibition Unit was moved into the Justice Department and a new agency was formed within the Treasury Department specifically to deal with national and international issues regarding illicit drugs. The newly created Federal Bureau of Narcotics was headed by Harry J. Anslinger, who had been the Assistant Commissioner of the Prohibition Bureau. Anslinger's approach to the drug problem was to promote criminal enforcement and harsh penalties as a deterrent to drug trafficking and use. Congress was sympathetic to this approach and passed increasingly harsh penalties, and many state laws were even harsher.

The 1914 Harrison Act explicitly addressed cocaine and opiates, leaving the control of other drugs, including marijuana, up to the states. The Federal Bureau of Narcotics eventually had jurisdiction over marijuana with passage of the Marijuana Tax Act of 1937. Today, while most think of cocaine and heroin when they think of illegal drugs, there are more drug arrests for marijuana than for cocaine and heroin combined.

Though there is a tendency to think of the era of the Bureau of Narcotics as one of only harsh punishments, there were glimmers of treatment. As regards the criminal justice system, the most notable of these treatment efforts was the creation of two prisons specifically designed to treat heroin addicts. These so-called narcotics hospitals

were created in the mid-1930s and housed both inmates convicted on federal drug charges and addicts who voluntarily admitted themselves. Though opened with great fanfare and optimism, over time these facilities came to be seen as failures. For the most part, treatment occurred outside of the criminal justice system.

A New Era: The 1960s and 1970s

While government agencies are by their very nature political, it was during the 1960s and 1970s that drug abuse moved into the forefront of the political arena. By the mid-1960s, drug abuse had spread into the middle class, particularly among college-age people, the very people most vigorously protesting the Vietnam war, perhaps because they were also the group most likely to be drafted. Thus, in addition to becoming a more visible problem in itself, drug use also came to be associated with antigovernment sentiments and activities. Richard Nixon, then president of the United States, became the first president to declare a war on drugs and to explicitly tie illicit drug use to more general criminal activity.

With the help of Congress, Nixon took a series of steps that launched the efforts against drugs into a new era. First, Congress passed the Comprehensive Drug Abuse Prevention and Control Act of 1970. This act replaced numerous laws scattered across agencies and combined them into a single law to be enforced by the Bureau of Narcotics and Dangerous Drugs (combination of the Bureau of Narcotics and the Bureau of Drug Abuse Control, formed in 1968). The act was intended to eliminate unnecessary duplication of efforts across agencies and consequently increase efficiency and accountability. It also created the system, still in place today, by which drugs are placed into one of five categories or schedules. Schedule I drugs are those that have no legitimate medical use and therefore cannot be prescribed by doctors. At the other extreme are Schedule V drugs. These drugs have little or no addictive potential and are considered the least dangerous. The act also gave the Bureau of Narcotics and Dangerous Drugs the power to regulate doctors and pharmacists who distribute prescription drugs and to decide production levels of individual drugs. The act gave the Bureau, and later the DEA, the power to decide the category into which drugs were to be placed, the power to take away the ability of physicians and pharmacists to prescribe drugs, and the power to monitor drug distribution to prevent diversion to the illicit market. Reflecting the historical emphasis on law enforcement, the act did not require the agency to reflect the opinion of medical professionals.

Having streamlined drug laws, Nixon then turned to streamlining the bureaucracy of federal drug enforcement. In 1973, he signed a reorganization plan that combined the Bureau of Narcotics and Dangerous Drugs, the Office of Drug Abuse Law Enforcement, and other federal offices

into a “super agency,” the Drug Enforcement Administration (DEA). The DEA began an ambitious effort to more aggressively counter the drug problem and to gather information about emerging drug use trends. The DEA also dramatically expanded the number and capacity of federal drug laboratories to assist investigators and prosecutors.

Drugs and Crime

Nixon’s war on drugs—and the wars that followed—was predicated on the notion of a direct link between drugs and crime. It was believed that much of the street crime and domestic violence in America could be directly traced to the use of illegal drugs. Researchers have spent years studying this issue, and a clearer picture is emerging. First, there is a distinction between crime linked to the business of drugs and crime linked to drug use. There is no question that the business of drugs is linked to crime, particularly violent crime, as battles emerge over sales turf or as disputes arise over price or the quality of the product. More complex is the link between drug use and crime. Not all drug users engage in crime. In fact, most drug users are experimental users whose drug using career is short, for whom drugs cause no major disruption in their lives, and for whom there is little crime. More problematic for the criminal justice system are chronic drug users, many of whom are actively involved in crime. While fewer in number than the experimental user, their impact on the criminal justice system is substantial. The best evidence is that for chronic drug users who are engaged in criminal activity, their criminal careers began before their drug-using careers, but that once drug use began, their involvement in crime escalated. In other words, drugs do not create crime but amplify existing criminal tendencies. What would happen to crime if illicit drugs were to suddenly disappear? Crime related to the business of drugs would almost certainly go away. Crime by drug users might go down, but this is not a certainty. Users might simply switch to legally manufactured prescription drugs, or they might increase their use of alcohol, the drug most closely connected to violence.

The Modern Era

Nixon may have been the first president to declare a war on drugs, but he was not the last. In November of 1980, Ronald Reagan was elected president and by 1982, he was declaring a war on drugs. Like Nixon, Reagan’s war was to include both legislative action and bureaucratic restructuring, all with the help of Congress. He began by creating the Drug Abuse Policy Office (a.k.a. the “Drug Czar’s” office), accountable directly to the president. Next, every federal agency was required to submit a budget indicating what it was doing in the war on drugs. Members of the

president's cabinet were also asked to explain what they were doing in the war on drugs. In short, the entire federal bureaucracy was directed to attack the drug problem. Even the military was expected to provide support for civilian drug enforcement efforts.

President Reagan had made the war on drugs one of the cornerstones of his presidency. During that time, Congress was controlled by Democrats, who were also seeking to gain political advantage from the war on drugs. The opportunity for Congress to make a bold public statement came in 1986, following the death of Len Bias, a college basketball star who within 48 hours of being drafted by the Boston Celtics died from an overdose of cocaine. The media frenzy surrounding his death presented a highly public opening for Congress to quickly pass sweeping legislation that would fund additional antidrug efforts and give the government unprecedented power to apprehend drug traffickers. State lawmakers followed suit, enacting harsher penalties and giving criminal justice unprecedented power to attack the drug problem. Out of this general environment arose a host of programs and practices. Some of these programs arose from grassroots citizens organizations, such as parent groups. Others, such as extensive drug testing for job applicants, arose from private businesses. However, the focus in this chapter is on the criminal justice response, and it was sweeping. Though the various components of the system often worked in concert to respond to the drug problem, to simplify the discussion the police, courts, and corrections will be discussed separately.

Police

Given the historical precedent of treating the drug problem as a crime problem, as opposed to a public health problem, it should not be surprising that the modern war on drugs is weighted heavily toward interdiction and law enforcement. Each year since 1996, more people have been arrested on drug charges than for any other offense, with the number approaching 2 million people annually. As many as 80% of those arrests are for simple drug possession.

Enforcement has always been the top priority, but within the law enforcement community, there has been some recognition of the value of prevention. Although in the past, the DEA and FBI have provided modest support to prevention programs, by far the most visible of the law enforcement prevention efforts has been the Drug Abuse Resistance Education (D.A.R.E.) program administered by local police.

Drug Abuse Resistance Education (D.A.R.E.)

Created in 1983 by the chief of the Los Angeles Police Department, D.A.R.E. trained local police all across the country to visit local elementary and senior high school classrooms to educate students about the harmful effects of

drugs and to teach them techniques for resisting drug use. The program became immediately popular and at one point was taught in as many as 80% of the schools in the United States. Although well received by parents, school officials, and local police, systematic evaluations of the program were generally disappointing, suggesting little or no effect on subsequent student drug use. In 2003, the General Accounting Office summarized the existing research on D.A.R.E. and concluded that the program did not reduce drug use. While there was some evidence that the program increased negative opinions about drugs, those effects were short term at best. Others questioned whether D.A.R.E. encouraged children to turn in their parents and friends, and wondered whether this was an appropriate value to instill in students. Despite scientific evidence suggesting its ineffectiveness and concerns about the ethical implications of the program, D.A.R.E. continues to be popular, and the model has been adapted to an antigang program called Gang Resistance Education and Training (GREAT).

Even at its peak, D.A.R.E. represented only a small fraction of police efforts against drugs. The primary task for police is to find and arrest those who possess and sell drugs. The problem for police is that drug possession and sales are what are known as consensual crimes. That is, all parties involved have an interest in keeping their activity from the police. There is no victim in the sense that there is a victim in a homicide or robbery. This means that police must actively seek out drug dealers and users who are actively seeking to avoid detection. This has several implications for the nature of drug enforcement. First, it means that the number of drug-related arrests will be a direct reflection of the amount of resources police put into drug enforcement. Second, it means that police are encouraged to use a variety of surreptitious means to make drug cases, such as using informants and undercover officers. Third, criminal justice officials who handle drug cases may be particularly susceptible to corruption. For example, a drug dealer with 10 kilos of cocaine is not likely to complain if the case against him or her is based on 2 kilos, with the other 8 kilos having been taken by an undercover officer. Attention is now directed to some of the more controversial issues raised in drug enforcement cases.

Profiling

The idea of identifying drug dealers and drug couriers through the use of profiles appeals to people's sense that humans follow predictable patterns of behavior and that science can identify those patterns and use that knowledge to apprehend drug offenders. The idea of profiling has several dimensions. First is the use of behavioral and environmental cues to identify offenders. This was first tried in the late 1960s to identify potential airplane hijackers. This early effort failed, and hijacking was only reduced when all passengers were screened for weapons, a process that intensified

after the 2001 attack on the World Trade Center. The first efforts to use profiling to identify drug couriers happened in the mid-1970s when a DEA agent at the Detroit airport developed a list of 11 characteristics that would suggest someone was a drug courier.

Ordinarily, the courts have rather strict rules about what scientific evidence may be admitted in court, but behavior-based profiles have been accepted as valid even though there is no scientific proof as to their effectiveness. The courts have ruled that the full profile need not be revealed in court, to protect the integrity of the profile. Instead, officers need only identify the key element used in the profile. An examination of court cases in which profiles were used reveals that over time the list of identifying characteristics became so expansive that nearly everyone could be said to fit the profile. For example, the key identifying characteristics named in various court cases have included the following: first to deplane, last to deplane, and middle to deplane. Some cases were triggered by the individual acting too nervous, while others were triggered by the individual acting too calm, and so on. Eventually, this model was applied to highway stops with an equally wild variability in the factors that were used to identify someone as a drug courier. The public's faith in profiling was bolstered by sensational cases involving serial killers. The agents who developed these profiles became minor celebrities, and a host of movies and television programs touted the accuracy of serial killer profiles. Despite the public fascination with this approach, no serial killer has ever been found because of a profile. Behavioral profiling may someday prove a valuable tool, but to date it has yet to prove its value.

More controversial is a second form of profiling in which race is the key identifying characteristic. This has proven to be one of the more explosive issues in criminal justice. Many minority drivers believe they are stopped simply because of their race, while police typically deny that race plays a role in traffic stops. What is known is that in many (but not all) communities, minority drivers are stopped and searched by police at a disproportionately high rate. Further, even if most police don't engage in race-based profiling, the actions of a few can lead minority drivers to accurately feel they are targeted. Thus far, research has done little to resolve the issue, partly because a conclusive answer requires entering the heads of individual police officers to accurately know what motivated their decision. Unfortunately, police themselves have only reluctantly cooperated with research, generally oppose collecting data that would allow individual officers to be identified, and have opposed programs that would use profiles to identify problem officers. This resistance further arouses the suspicions of minority drivers.

Research has yet to prove that race-based profiling is ubiquitous, as some believe, or has been greatly exaggerated, as is believed by others. Whatever the reality, the *perception* of minorities that they are targeted by police does

a tremendous amount of damage to police–community relations and undercuts broader enforcement efforts.

Informants

Another controversial issue in drug law enforcement is the use of criminal informants. Informants are people who provide information about criminal activity to the police. While informants provide valuable information for many types of crime, the consensual and secretive nature of drug dealing requires that informants be used more frequently in drug cases than for any other type of criminal case. Nearly all drug cases in some way utilize informants.

The assistance of honest citizens is often valuable in solving crime. Controversy arises, however, when criminals provide information to the police. Criminals are often in a unique position to observe the criminal activity of others, but their motives are not always pure, and they sometimes provide misleading information that frames innocent citizens or exaggerates the criminal involvement of others. Some may cooperate in exchange for cash payments and others to exact revenge. The most common reason why criminals cooperate with police is to have their own charges reduced or dropped altogether. A drug dealer facing 20 years in prison has strong incentives to have his or her charges reduced by telling police about people with whom the dealer has done business, or to even seek out additional co-offenders. The larger the number of names they can provide the police, the greater the sentence reduction such informants can expect. Consequently, they may face considerable pressure to fabricate information.

Particular problems can arise when criminal informants are released with instructions to build cases over time. In order to move among fellow drug dealers, it may be necessary for informants to buy and sell drugs. This, in turn, puts the police in the curious position of shielding someone who is making drugs available in the community. In some cases, the drug-dealing activity of the informant may be greater than that of the people upon whom he is informing. Some informants have used their positions to eliminate competitors while expanding their own drug businesses. In other cases, police may look the other way when the informant pockets a portion of seized drugs in exchange for continuing to provide information to the authorities. Sometimes the drug dealer is also a drug user, and the informant may be allowed to continue using in order to effectively gather information on the street. This becomes particularly problematic when the user overdoses while working for the police or when juveniles are allowed to continue buying and using drugs while gathering information for the authorities.

The use of criminal informants is a dilemma for the police. Without informants, it would be difficult or impossible to make many drug cases. At the same time, using criminal informants presents a host of legal and ethical problems. It may mean tolerating criminal activity by

informants, obtaining false or misleading information, or putting the addict who is discovered to be an informant at risk of being killed, while doing work that ultimately should be done by the police themselves.

Asset Forfeiture

By any account, the drug business is one that generates enormous revenues. Much of the effort to control drugs has focused on arresting buyers and sellers, and for many years, the revenues from drugs were secondary to enforcement efforts. Asset forfeiture represents a shift in focus from the criminal actor to the financial gain derived from criminal acts. In principle, this is perfectly reasonable and just. In practice, however, the law can be misused. To understand how this can happen, it is important to recognize there are two types of asset forfeiture—criminal and civil. Criminal forfeiture, about which there is little controversy, applies after someone has been convicted of a crime. As an example, no one expects a convicted bank robber to keep money gained from the robbery. Controversy arises with civil forfeiture, which is very different.

The distinguishing feature of civil forfeiture is that it is an *in rem* proceeding. That is, the legal action is against the property itself. The issue is not the guilt or innocence of the owner but the guilt or innocence of the property. For example, the legal title of a criminal case might be “The State of Texas versus John Smith,” whereas in a civil case the title might be “The State of Texas versus a 2008 Ford Mustang.” For much of the history of the United States, there were rather strict limits on the ability of the government to apply civil forfeiture. In the mid-1980s, as part of sweeping legislative changes to provide more tools to fight the war on drugs, Congress enacted legislation giving federal authorities broad powers to seize cash and property under civil law. States soon followed suit, passing their own civil forfeiture statutes.

There are numerous implications of treating forfeiture as a civil matter. Most serious is that as a civil procedure, many of the basic constitutional protections afforded by the Bill of Rights do not directly apply. This was particularly problematic in the early years of these statutes, which were passed with few restrictions on law enforcement. Consequently, hearsay (rumors) could be used as the basis for seizing property. The property owner had no absolute right to be present at a forfeiture hearing. If the property owner was present and asserted his or her right to remain silent, exercising that right could be used as proof of the property’s guilt. If the owner chose to speak and said anything incriminating, those statements could later be used in a criminal case against the owner. While the innocence of the owner could be considered in the decision to forfeit property, the owner’s innocence was no absolute defense against forfeiture because the issue was the guilt of the property, not the owner. Thus, an innocent landlord could

lose his property if a tenant conducted a drug deal in one of his apartments. Further, the property was considered owned by the government from the moment it was used in a drug transaction. Consequently, an innocent citizen who purchased a house that had been used in a drug deal by the previous owner might lose that house. Unlike a criminal case, in which the burden of proof was on the state to prove the defendant’s guilt, in civil forfeiture cases, the burden of proof was on the property owner to prove the property’s innocence. In effect, the property was guilty until proven innocent. Because the property was assumed guilty, it could not be used as collateral for a loan to hire a defense attorney. In some cases, the owner was required to post a bond of as much as \$5,000 for the privilege of asking for the return of his or her property. And, even if the property was returned, the courts were allowed to keep all or a part of that bond to cover the cost of the proceedings. Civil forfeiture does not require that the owner of the property be convicted of a crime, and in as many as 80% of forfeiture cases, there is no criminal conviction.

Law enforcement agencies were initially allowed to keep seized assets, and for many agencies, forfeiture became an important way to supplement their budget. Some drug agents were under greater pressure to seize cash than to seize drugs or to arrest dealers. Consequently, there were instances of agents luring drug dealers into their community so they could seize their cars and cash, or allowing large drug shipments to be sold on the street so that cash could be seized. Stories of misused funds and innocent owners losing their property made their way into the press and put on pressure for change. In many ways, states led the way in reforming forfeiture laws. Stories of the gross misuse of the law and of the forfeited funds, along with the realization that seized assets could be used to shore up sagging state budgets, led most states to require that seized assets go to general revenue rather than the agency. Although it became possible through something called “adoptive forfeiture” for local agencies to keep a portion of the seized assets by having the forfeiture done in cooperation with federal authorities, the pressure to make large seizures was substantially reduced. At the federal level, three Supreme Court cases in 1993 and a change in federal law in 2000 placed some restrictions on the application of federal civil forfeiture. Civil forfeiture remains an area with a high potential for abuse, but as a consequence of changes at the state and federal levels, there are fewer stories today of the law’s misuse. Still, the possibility of the misuse of civil forfeiture remains, and there are concerns that the model created for drug enforcement is now being exported to a range of other crimes.

In the United States, police are at the front line in the war on drugs. Because drug enforcement requires that police seek out offenders, the number of cases they generate depends not only on how many dealers and users exist in a community but also on the resources the police commit to drug enforcement. If money for drug agents is cut, one can

expect a corresponding reduction in the number of drug cases. For police, the size of the war is very much a reflection of the size of the budget. Those elements of the criminal justice system that follow—courts and corrections—do not have the luxury of deciding how many cases they will handle. For the most part, their workload is determined by the decisions made by police and prosecutors. Attention is now turned to their role in the war on drugs.

Courts

While each year, the FBI assembles data about the work of police agencies across the country, there are no comparable annual reports on the kinds and numbers of cases handled by state and federal courts. However, given the volume of drug arrests, it is safe to say that drug cases make a substantial contribution to the workload of courts. The handling of drug cases has led to two major developments affecting the courts, one from outside the court system (mandatory minimums) and the other from within (drug courts).

Mandatory Minimums

Mandatory minimum sentences are not new, as they go back to the biblical notion of an eye for an eye. Regarding drugs, the first U.S. mandatory minimums at the federal level were enacted in 1956 and continued until 1970, at which time they were overturned because they were seen as ineffective and unjust. At the state level, mandatory minimums were begun in New York and were specifically aimed at adult, street-level drug dealers. Within a decade, a majority of states had followed suit. In the flurry of legislation passed by Congress in 1986, a new round of mandatory minimums was enacted out of concern that different judges were handing down very different sentences for similar offenses, with a particular concern about some judges being too soft on drug offenders. The idea was to take discretion out of the hands of judges so as to produce more uniform sentencing. The reality was a deeply flawed system that could be criticized on a number of levels, only a few of which will be discussed here.

First, mandatory minimums took discretion from the hands of judges, who are supposed to be neutral, but left discretion in the hands of prosecutors, who are not expected to be neutral. Sentences for similar drug offenses continued to vary widely, but this time they varied across prosecutors, who had the power to decide which specific charges were to be brought and consequently which sentences would apply.

A second criticism is that mandatory minimums are racist. This judgment is based on the federal system by which those arrested on crack cocaine charges face substantially harsher sentences than those arrested on powdered cocaine charges. The majority of crack cocaine arrestees are minority, while the majority of powdered

cocaine arrestees are white. While racism did not appear to play a role in the initial decision to make a 100:1 distinction between crack and powdered cocaine, the result was clearly one of racial bias.

A third criticism of the system is perhaps the most serious. At the federal level, sentence severity is determined entirely by the weight of the drug, not by the actor's role in the drug organization. Consequently, the "drug kingpin" and the lowly gopher who sweeps the floor of the drug house are to receive the same sentence, with an important exception: The only way to have one's sentence reduced is to provide "substantial assistance" to the prosecutor—that is, provide names and information that will enable the government to prosecute others. Of course, the drug kingpin has considerably more information to provide the authorities. As a result, the kingpin is positioned to have his or her sentence substantially reduced, while the gopher who sweeps the floor is likely to receive the maximum sentence. By anyone's calculus, this is an unjust arrangement.

As a change imposed from outside the judicial system and one that severely limits the power of judges to make decisions, it should not be surprising that judges have expressed strong objections to mandatory minimums. Mandatory minimums have had a substantial impact on the prison system by not only increasing the number of offenders sent to prison but also by keeping them there longer, contributing to an imprisonment rate in the United States that is the highest in the world.

Drug Courts

Drug courts represent a change in the role of judges and courts that grew from within the judicial system. There are two types of drug court—case flow courts and drug treatment courts. Case flow courts began in the 1970s in New York City and have since arisen throughout the country. Case flow courts handle only drug cases, and in exchange for a quick guilty plea, the accused is offered a much reduced sentence. The objective is to move cases through quickly, and in this case, flow courts appear to succeed. More recent is the rise of drug treatment courts, which began in Miami, Florida, in 1989, when a local judge grew tired of seeing the same drug offenders appear in court repeatedly. His model has since been copied across the country so that today, there are more than 1,200 drug courts operating in the United States. While there are many variations, the basic model has several key features: (a) There are frequent random drug tests, and successful completion of the process requires the offender remain drug free; (b) a judge is specifically assigned to the drug court as are drug court staff, including probation, the public defender, the prosecutor, and treatment staff; (c) all members of the drug court staff receive extensive training in the nature of addiction and the requirements of successful drug treatment; (d) treatment occurs in phases, beginning with detoxification, followed by intensive group counseling, and then by

continued drug counseling with the addition of such issues as anger management, job-seeking skills, and parenting; (e) although completion of the program can occur in as few as 12 months, 18 to 24 months is more common because it is understood that relapse will be part of the recovery process for many offenders. Offenders who relapse are identified through frequent drug screens, and the court will quickly respond with immediate and escalating penalties for those who test positive for drug use; and (f) upon completion of the program, there is a graduation ceremony and the offender's record is sealed.

There is some debate about the effectiveness of court-based treatment. It appears that drug courts show some success, but it is likely due to frequent monitoring with immediate sanctions rather than to the particular treatment approach utilized. Success is also enhanced because the most serious offenders—those with a history of violence, drug dealing, or several prior imprisonments—are often not eligible for drug court.

The long-term nature and impact of drug courts remain to be seen. The criminal justice system is, at its heart, a system designed to punish offenders. Past programs (such as probation) that initially emphasized treatment and helping services for offenders have, over time, morphed into systems whose primary function is monitoring and punishing. Only time will tell if a similar transformation occurs with drug courts.

Prisons

Much like the courts, the U.S. prison system has little voice in the number of cases it must handle. Both the number of inmates entering the system and the length of time they will stay is beyond the control of prison administrators. Like the courts, there is no annual reporting of the types of crimes for which individuals are imprisoned in state and federal institutions combined. It is clear, however, that drug offenders comprise a substantial proportion of prison inmates in the United States. At the federal level, for example, drug offenders make up about 60% of prison inmates, and nationally, both the number and the rate of people in prison is at its highest level in history.

To focus only on the number of inmates in prison on drug-related charges misses the bigger picture. Many who are in prison on other charges have a drug problem. Drug-using offenders enter prison with a host of other problems that burden the system. They are likely to have more health-related problems than other inmates, including HIV and hepatitis C. Drug-using offenders are also more likely to have mental health problems. In addition, inmates with a drug problem may try to smuggle drugs into the institution.

Prisons have responded to the surge in drug-using inmates through a variety of programs. Most institutions allow for 12-step programs, such as Alcoholics Anonymous

and Narcotics Anonymous. Beyond that, some institutions have set aside separate units as therapeutic communities in which everyone living in the unit is involved in drug treatment. Some states have gone even further and set aside entire institutions as treatment facilities.

Future Directions

Predicting the future is always a challenge, and this is particularly true regarding illicit drug use. While many users have their favorite drug, users are notorious for using whatever drug is most available, making interdiction difficult as users switch from one substance to another. In an era when television and print media are flooded with advertisements for legal drugs that will treat any condition, real or imaginary, it's difficult to see a time when America will truly be drug free. It is not surprising that the most recent trend is the illicit use of legally manufactured prescription drugs.

Tackling the problem of illicit drugs requires recognition of differences between experimental or casual users and hard-core addicts. Something like an 80–20 rule seems to be true for illicit drugs—20% of drug users consume 80% of the drugs. That hard-core 20% is also the group most likely to be involved in crime and to come to the attention of the criminal justice system. That group is also least likely to respond to prevention or treatment programs. The criminal justice system may be a useful tool for identifying this hard-core group, but the important question is what happens to those hard-core users after they have been identified. The rise of drug courts and therapeutic communities in prisons represents responses to the problem, but a frustratingly large number of new drug offenders continue to enter the system. This suggests that the United States cannot arrest its way out of the drug problem and that more must be done to prevent drug use and drug-related crime.

Conclusion

From the beginning, Americans have chosen to define the drug problem as a criminal justice problem. Consequently, no other issue demands so many criminal justice resources and causes so much controversy. Aggressively enforcing drug laws can mean using controversial tactics while placing a heavy burden on the courts and correctional system. While the public is generally enthusiastic about tough enforcement, it is less willing to provide the tax revenues to properly fund the demands that drug cases place on courts and prisons.

Some argue for viewing the drug problem as a medical problem, as is done in Britain. Others argue for a social work approach, as is used by the Dutch. In many ways, these three approaches—the American, the British, and the Dutch—reflect broader cultural differences in how these

societies view social problems. Those hoping for a radical shift in the American approach should not hold their breath, for it is deeply engrained in the collective psyche.

DRUG COURTS

FAYE S. TAXMAN AND MATTHEW PERDONI

George Mason University

Drug courts are the most successful innovation to address the treatment needs of substance-abusing offenders. After their launching in 1989 by the Dade County, Florida, local prosecutor, Janet Reno (U.S. Attorney General, 1994–2000), the number of drug courts has proliferated to nearly 800 adult treatment courts and another nearly 1,200 problem-solving courts. The innovation alters how the court handles sentencing and monitors the case, and it integrates treatment into the primary goal of the sentence.

Drug courts provide a seamless system of care involving the judge, treatment agencies, probation/parole agencies, prosecutors, defenders, and other actors in the criminal justice system that are central in assisting offenders in achieving sobriety. This model provides a different framework for handling the drug-involved offender, including the recognition that sobriety is a process where decreased drug use occurs over a period of time. The use of drug testing, treatment, and sanctions also provides for an avenue to modify the existing process for handling offenders with substance abuse disorders.

The following discussion outlines the rationale for the model, the research results on drug treatment courts, the results of a current survey on drug courts, and next steps to advance the concept. The survey results presented are from the recent Criminal Justice Drug Abuse Treatment Studies National Drug Court Survey, the first survey to describe the characteristics of treatment in drug treatment courts.

Needs of the Offender Population

Research has consistently shown that the rate of substance abuse and mental and physical health problems is much higher among the offender population than it is for the everyday person. While just under 2% of the general population is infected with hepatitis C (Centers for Disease Control and Prevention [CDC], 2007), roughly 31% of incarcerated populations are infected (Beck & Maruschak, 2004). While one tenth of 1% of the general population is HIV-positive (Glynn & Rhodes, 2005), 2% of inmates are infected with the virus (Maruschak, 2006). A majority of prisoners (56%) and jail inmates (64%) have mental health problems (James & Glaze, 2006), while 16% of prisoners, jail inmates, and probationers could be classified as mentally ill (Ditton, 1999). This is compared to estimates that approximately 10% of adults had some form of serious psychological distress in the past year (Substance Abuse and Mental Health Services Administration [SAMHSA], 2006). The offender population is also at a higher risk for other physical health problems, such as asthma and diabetes, and findings have also shown that offenders returning home following incarceration are subject to higher rates of fatality as a result of substance abuse and violence (Binswanger, Stern, & Deyo, 2007).

Less than 10% of adults in the general population have substance abuse or dependency problems (SAMHSA, 2006). However, studies conducted by the Bureau of Justice

Statistics found that over 80% of prisoners reported past drug use (Mumola, 1999), while two thirds of those in jail classified themselves as regular drug users (Karberg & James, 2005), and roughly half of probationers reported regular drug use (Mumola & Bonczar, 1998). Overall, offenders are 4 times as likely to have a substance abuse problem (SAMHSA, 2006), yet recent studies have shown that the availability of comprehensive treatment service is low across all correctional settings (Taxman, Perdoni, & Harrison, 2007) and that less than 8% of adult offenders have access to the level of care that they need.

Dealing with the pronounced needs of the offender population has proven troublesome for the criminal justice system, but the enactment of legislation creating stiff penalties for drug-related offenses has only compounded these difficulties. The laws meant to deter potential offenders from drug use instead resulted in a massive influx of offenders into the justice system. The Bureau of Justice Assistance (BJA) Drug Court Clearinghouse and Technical Assistance Project found that over 83% of the offenders who were scheduled for release from prison had been involved in drugs or alcohol during the time of their offense.

To reduce the burden of drug offenses on the criminal justice system and in an effort to provide treatment in the hopes that it will aid in preventing offender recidivism and improve their quality of life, drug treatment courts have become a common institution in communities across the United States.

A Brief History of Drug Courts

In response to an explosion in the use of illicit drugs in the area, the first drug court was established in Dade County, Florida, in 1989. Though the drug problem in this particular jurisdiction was substantial, it mirrored similar issues arising across the United States: a majority of arrestees tested positive for drug use upon arrest, and recidivism rates for drug abuse were close to 67%. As a result, drug court programming became a viable alternative for dealing with drug-involved offenders, and these courts have continued to permeate the criminal justice landscape since their inception (according to the National Association of Drug Court Professionals [NADCP], there are now more than 2,000 drug courts in operation), to the point that all states are now reported to have an operating drug court or are in the planning phases of implementing one (Belenko, 1999).

Drug courts were initially designed to provide adequate rehabilitation for drug abusers by combining treatment with formal supervision and judicial sanctions. The core tenets of drug courts, as outlined by the Drug Courts Program Office, are early identification, referral, and screening; ongoing and continuous criminal justice supervision; comprehensive substance abuse and rehabilitation services; mandatory drug testing on a regular basis; judicial status hearings in which a judge reviews

the progress of participants; appropriate sanctions and incentives given for levels of compliance with program requirements; and coordination among all actors (treatment, courts, probation, etc.).

The underlying notion driving each of these concepts is that drug court programming links the various stages and systems within the criminal justice process to provide a comprehensive and efficient means of supervising and treating offenders with substance-related problems. Members of the legal system work together with drug court and treatment staffs to determine who is the best fit for their programs, to lay out treatment and supervision plans, and to help bring the mission of treating offenders' substance abuse problems to the forefront. This structure allows for the construction of supervision plans that will best fit each offender's needs and is consistent with research findings showing that such a differential approach to supervision planning is best in most cases (Taxman & Bouffard, 2002).

While drug courts provide a means to specifically target and treat offenders' drug problems and research shows that "drug courts outperform virtually all other strategies that have been used with drug-involved offenders" (Belenko, 1998), knowledge regarding the overall state of drug courts across the United States is still in its infancy, due both to the nature of research conducted to date and to the lack of substantive knowledge on these courts' constitution.

What Is Known About Drug Courts?

Drug courts may "work" for many reasons, but perhaps the most fundamental of these is the fact that drug-abusing offenders, simply put, need drug treatment. Drug-abusing offenders tend to respond better to treatment than other dispositions (Marlowe, DeMatteo, & Festinger, 2003). However, these offenders tend to have difficulty remaining in treatment of their own accord, and even when they do, this treatment is often not available to them for durations long enough to yield impacting changes in behavior. What drug courts provide is a means of integrating treatment into the criminal justice process (Rossman & Rempel, 2007; Taxman & Bouffard, 2002) in a manner that stresses offender accountability through formalized responses to their behavior, and provides the continuous presence of representatives from a broad range of criminal justice agencies.

Effectiveness of Drug Courts

Though drug courts are a relatively recent innovation, a growing body of literature has been devoted to investigating their working components and overall impacts. Studies continue to find that drug courts and other alternative methods of sanctioning, which tend to be tailored more to the needs of the individual offenders, have positive outcomes

both in regard to the offenders themselves, as well as to the public at large.

Marlowe (Marlowe et al., 2003) begins his investigation by considering the merits and shortcomings of the public health perspective and the public safety perspective for dealing with offenders and suggests that a better way of looking at the problem is by integrating both of these positions.

The public health perspective holds that clients are best served by focusing on treatment and having minimal involvement with the criminal justice system. In this view, drug abuse is a disease needing treatment, not punishment. This approach requires that clients attend sessions and participate for a minimum of 3 months for effective treatment, with 6 to 12 months of participation being ideal. However, about 70% of clients drop out of treatment programs within the first 3 months, and only 10% generally stay for an entire year.

On the other hand, the public safety perspective argues that offenders require constant supervision to prevent them from reoffending. This approach requires imprisonment or intermediate sanction programs such as probation and parole. A potential drawback of this approach is that imprisonment has to date generally failed in deterring future drug use. Many drug offenders return to drug use and criminal behavior after release. In-prison treatment tends to reduce recidivism by 10%, but without follow-up treatment, there is no significant difference in results for those who had in-prison treatment. Likewise, intermediate sanction programs typically yield a 10% decrease in recidivism, but 50% to 70% of offenders fail to meet the program requirements. These programs are also usually administered without treatment, with high emphasis on sanctions.

Integrated strategies, which are embodied through programs such as drug courts, work release, and therapeutic communities, are structured so that substance abuse treatment makes up the core of the program, while criminal justice agents ensure attendance and adherence to program parameters. These programs incorporate community treatment, opportunities for clients to avoid formal charges, close supervision, and certain consequences for noncompliance.

Such integrated programs have consistently been found to be effective in reducing drug use and recidivism. Work release programs and therapeutic communities have shown a 30% to 50% reduction in rearrests for clients. In drug courts, an average of 60% of clients complete at least a year of the program, and about 50% successfully graduate. Although rearrest rates do not appear to be different for drug court clients at 12 months, there is a “delayed effect” at 36 months according to studies of an Arizona drug court (Deschenes, Turner, & Greenwood, 1995; Turner et al., 2002).

Turner et al. (2002) explored prior research conducted on the effectiveness of drug treatment courts over the past decade, beginning with a discussion of the experimental field evaluation of the Maricopa County (Arizona) First-Time Drug Offender (FTDO) Program. The program targeted first-time felony drug offenders with treatment needs.

It was designed to last from 6 to 12 months and consisted of orientation sessions and monthly status reports in front of the drug treatment court judge. The FTDO Program was evaluated on a four-cell randomized track. Three tracks varied the intensity and frequency of drug abstinence testing (none, monthly, biweekly), and the last track was the drug user treatment court program. A total of 630 offenders sentenced between 1992 and 1993 were randomly assigned to either the drug user treatment court or one of the three testing conditions and tracked for a period of 12 months. During this time, data were collected on outcomes such as employment, drug use, and recidivism.

Findings from the FTDO Program study showed that 40% of those in the drug treatment court successfully completed the program within 12 months. In addition, 61% of those assigned to the drug treatment courts either completed the program or were still enrolled at 12 months. The study also found that 85% of drug treatment court respondents were more active in drug education programs and outpatient counseling. However, participants in both tracks (the treatment court and the testing conditions) tested positive for drug use at least once during the 12-month follow-up, and 30% of all offenders were arrested within the first 12 months of probation for a new offense. Despite being successful in providing drug-using offenders with access to treatment, drug treatment court programs had little impact on officially recorded recidivism.

The FTDO study left open questions regarding the longer term impact of drug courts (longer than 12 months). Turner et al. (2002) summarize a 36-month follow-up study, which tracked 80% of the original 630 drug user offenders from the FTDO program. The results from the follow-up reveal that drug treatment court participants were less likely to commit a drug-related violation as compared to their testing condition counterparts (64% versus 75.2%), and fewer were arrested in the 36-month period (33.1% versus 43.7%).

In another study that looked at the long-term impact of drug courts, Wolfe, Guydish, & Termondt (2002) studied the Southern San Mateo (California) County Drug Court during its first 3 years of operation (1995–1998). Primary results showed differences between individuals who participated in the drug court program versus those who did not. The researchers conducted a follow-up 2 years after their initial study in which there were similar findings: Arrest rates were lower for graduates of drug court treatment program than for the control group.

Listwan and colleagues (Listwan, Sundt, Holsinger, & Latessa, 2003), in their study of the Hamilton County Drug Court in Cincinnati, Ohio, found that drug court programming indeed has an impact on those involved. Participation in a drug court had an effect on recidivism for drug crimes, but did not have an effect on general rearrest rates. The more involvement someone had in the drug court, the more likely the person was to reduce his or her criminal behavior.

Preliminary findings from Rossman and Rempel (2007) also suggest that drug courts are a more effective means of

processing drug-abusing offenders through the criminal justice system. Drug court participants fared better than comparison groups in all measures of drug use (less use) and criminal activity (less), while they logged more time in treatment; had more contact with case workers; and had overall better opinions of judges and the system, which is hypothesized to influence offender readiness and willingness to work toward treating their substance abuse problems. According to Brocato and Wagner (2008), offenders who enter treatment abuse programs with positive motivation to not only change their habits but to change their lifestyles are more successful than individuals who lack such motivation.

Judicial Review Hearings

One of the more heralded aspects of drug courts is their position within the justice system, and their ability to bridge the various interests of the many agencies in the system. Rather than focusing on one aspect of supervision such as compliance, or attendance in treatment, drug court participation is structured to view each of the single components of an offender's involvement with the justice system as a part of a larger mission to effectively address his or her problem behaviors and formulate plans for preventing future criminal activity and substance use.

Programs such as the drug court use an integrated strategy to produce consistent reductions in criminal drug use and recidivism. These programs combine community treatment and case management services with consistent criminal justice supervision and monitoring, give the offender education and employment support, and allow for close contacts with family and social connections. Furthermore, they add the power of judicial interaction, which creates a means of formal sanctioning if the guidelines and requirements of the program are not adhered to (Wilson, Mitchell, & Mackenzie, 2006). However, the influence of the judicial component has come into question. The notion that judicial reviews help to formalize the drug court process is not in doubt, but rather, it is the idea that this judicial interaction impacts offender outcomes that has been questioned.

Marlowe, Festinger, et al. (2003) recognize the judicial component as "the single-most defining component" of a drug court, but openly question how much this aspect influences outcomes. In this study, all drug offenders were randomly assigned to receive biweekly judicial status review hearings or to a group where they were monitored by case managers or treatment providers (who could ask for such hearings but only in response to offender noncompliance). The remainder of drug court programming was identical for both groups. Baseline interviews were conducted with clients, then monthly follow-ups, and follow-ups at 6 and 12 months after completion. Findings showed that more frequent hearings did not result in lower rates of reported substance use or other illegal activity or increase offenders' likelihood of attending treatment sessions. However,

biweekly hearings did result in a greater likelihood of intervention and in detection of noncompliance.

The authors stress that while these findings begin to shed light on what may be a common misconception (that increased presence of a judge has a significant impact on offender behavior), more detail must be gathered on what exactly happens *during* these status review hearings: In other words, it is not enough only to know that they occur; what takes place and how must also be understood.

Festinger et al. (2002) examined whether different types of offenders respond differently to judicial progress hearings, hypothesizing that the hearings would prove more effective for clients who are antisocial and more drug dependent. Results showed that participants diagnosed with antisocial personality disorder (APD) achieved more weeks of abstinence in the biweekly (requisite) hearings group, and the same was true of those with a history of substance abuse. However, participants without APD fared better in the group that attended hearings as needed. More antisocial clients in drug court programs may require more supervision and structure than those without. The same can be said for those with a prior history of drug abuse and treatment. Conversely, clients without antisocial personality disorder or prior drug abuse may have more negative reactions to intense supervision by the criminal justice system. Such findings highlight the point made by Marlowe, Festinger et al. (2003) that each aspect of drug courts must be examined individually and thoroughly in order to fully understand their effectiveness and impact.

Marlowe and colleagues (Marlowe, Festinger, Lee, Dugosh, & Benasutti, 2006) continued this research by examining the effectiveness of matching certain offenders to more or less frequent status review hearings. This study, like the first, divided participants between two groups, but used a prospective matching design rather than completely random placement. In the first group (matched), high-risk offenders (those with diagnosed APD or history of drug abuse) were assigned to biweekly status hearings, and low-risk offenders were assigned to hearings only when deemed necessary by the case manager. In the second group (unmatched), all participants were assigned to the standard hearing schedule imposed in the drug court program (every 4–6 weeks). Participants were randomly assigned to groups.

Results were as expected: High-risk participants in the matched group had significantly more drug-negative tests than any of the other three groups, and high-risk participants in the unmatched group had significantly fewer consecutive weeks of drug-negative screenings. Also, those in the high-risk matched grouping were referred by the judge for IDD (intellectual and developmental disabilities) counseling more than their unmatched counterparts, which suggests that their treatment was more individually tailored to their needs. There was no significant difference between the matched and unmatched groups in terms of low-risk clients, which indicates that judicial status hearings may not be a necessary component of treatment for these individuals.

Marlowe and colleagues (Marlowe, Festinger, Dugosh, Lee, & Benasutti, 2007) repeated this study and found consistent results. Within high-risk participants, graduation rates from the matched group were 75%, compared to 56% from the unmatched group. Again, there was no major difference within low-risk participants, though those from the unmatched group had a 3% higher graduation rate than those from the matched group. Similar results were found in terms of urinalysis results and change in Addiction Severity Index (ASI) scores.

The Role of Treatment in Drug Courts

While participation in drug courts would seem to imply access to substance abuse treatment, this component of drug courts is perhaps the most difficult to generalize or expand upon. From state to state and court to court, the type of treatment services available to offenders varies greatly. This is a function of the resources available in particular communities, as well as factors such as treatment programs' allowance of criminal justice clients. Treatment services are even proscribed differently from case manager to case manager, or counselor to counselor, making an accurate depiction of the role of treatment in drug courts and how it is delivered to clients even more of an exercise in imprecision. Regardless, evidence points to the positive impact that treatment has on drug court outcomes, making a more definitive understanding of this concept critical.

Taxman, Pattavina, and Bouffard (2005) examined use of a manualized treatment curriculum in drug courts in Maine. The Differentiated Substance Abuse Treatment (DSAT) curriculum formalized the treatment process in the participating courts by implementing screening for substance abuse, employing a multiphase approach to treatment, and providing staff with training on the curriculum. The researchers observed reductions in various risk factors, as well as changes in attitudes and behaviors that would position the offenders to be more open and ready for treatment.

In another study, Taxman and Bouffard (2005) examined how treatment impacts graduation rates. The researchers cite evidence that the graduation rate in drug courts sits in the 35% to 40% range (Belenko, 1998, 1999, 2001; Taxman & Bouffard, 2003), but underscore the critical point that there is little evidence to explain the differences between those who complete drug court versus those who do not. In this study, they looked at the effect of treatment on graduation rates in four drug courts and found that individuals participating in more treatment had a greater likelihood of graduating. However, they are careful to point out that even graduates had a hard time following the complex drug court program requirements.

As noted above, various factors can influence the type and dosage of treatment delivered to clients. One such factor is the staff members within agencies. Taxman and Bouffard (2003) examined the philosophies of treatment

counselors and how they impact the services delivered to drug abusers. In this study of four adult drug courts, the researchers administered surveys, conducted in-person interviews, and observed treatment sessions led by counselors. The counselors were found to support several causes for substance abuse, did not have a strong affiliation with any one model of treatment, and were observed employing various approaches to treatment during counseling sessions. Counselor characteristics, such as education or recovery status, were found to have some influence on their beliefs regarding the causes and solutions for substance use problems, and these factors in turn have a role in influencing the types and effectiveness of treatment services provided to clients.

On one hand, the researchers found these diverging opinions on the causes and means of dealing with substance abuse problems to acknowledge the complicated nature of offender addiction (Taxman & Bouffard, 2003). On the other hand, counselors' "eclectic" approach to providing services may further muddy an already elaborate situation, as these methods (or lack thereof) do not give the client a clear picture of how to deal with their problems, and the messages given by counselors from one session to the next may vary considerably. The authors conclude by recommending a manualized approach and the implementation of proven techniques to help standardize care to make it more lasting and effective.

Similar findings on the beliefs of staff in correctional facilities were uncovered by Taxman, Simpson, and Piquero (2002). While the authors did observe more consistency in beliefs than they had hypothesized, there was still a disconnect between the theories that impact causation and those that are the basis for interventions. In other words, while there was semblance in terms of their opinions of the separate ideas of the causes and responses to substance abuse, there was little connection between these ideas.

The problem of differing messages and approaches is further compounded by what is often a systemic disconnect between criminal justice agencies and those providing treatment services to drug court clients. While a driving principle behind drug treatment courts is that participation will result in decreased substance use and a decrease in substance use will result in reductions in criminal behavior, little research has focused on the delivery of these treatment services and how they are interconnected with the overall programmatic features of drug courts. Taxman and Bouffard (2002) cite previous research illustrating the great variation in the types and amounts of treatment services offered in treatment facilities, but point to the lack of consistency in messages and goals between these facilities and criminal justice agencies as the major issue facing effective programming.

In assessing the integration of goals and activities between treatment and criminal justice agencies, the authors identified what appears to be a "compartmentalized" system of care, in which treatment is not generally

integrated into overall drug court philosophy, and when it is, it is integrated with specific segments of court operations, as opposed to throughout the process as a whole. Screening and assessing for substance abuse problems are often done separately by treatment and criminal justice agencies, and there does not appear to be integration at the “key decision point” of determining clients’ appropriateness for treatment. Further complicating the issue is that most treatment services are rerouted into existing community treatment networks, meaning that the criminal justice agencies often have little knowledge of what type of treatments take place and, just as important, how frequently. Add this to the discussion from above, where findings showed great variance in the methods and intentions of treatment services, and another layer is added to this ever-growing problem of effective service delivery in drug courts.

To help deal with these issues, Taxman and Bouffard (2002) recommend formalizing integration of treatment and criminal justice agencies at several critical points. First, a shared philosophy of substance abuse is recommended. Though cooperating agencies may differ in terms of their roles in dealing with these problems, fostering a shared view of the causes of substance abuse problems is vital for working out fluid and effective responses to them. Along these lines, unified or joint policy decisions are beneficial, as they solidify these shared philosophical views and establish means for dealing with the problem itself. The most important recommendation, however, is information sharing across these agencies. With this, criminal justice agencies will be better informed of the extent of offender problems and the response given to them, and likewise, treatment agencies will have a better understanding of the other risk factors associated with the offenders’ substance abuse needs.

The Importance of Tailoring Treatment to Individual Offenders

Public health advocates claim that clients are disadvantaged by criminal justice involvement, in that it can increase antisocial behavior and cause distrust of treatment providers, not to mention its high financial burden. However, public safety advocates argue that drug-involved offenders are characteristically impulsive and irresponsible, and they need close monitoring and supervision to foster a sense of accountability and help them stay on the right path. Research suggests that both arguments may be accurate, but that they describe different types of clients. The risk principle provides that intensive supervision and criminal justice involvement are useful for high-risk offenders with a strong inclination to engage in drug abuse or criminal activity, but such severe monitoring tends to be impractical for low-risk offenders. Risk factors such as age, start of criminal activity/drug use, and antisocial personality disorder (APD) can influence which

method is best for dealing with these individuals, making the consideration of individual circumstances and characteristics imperative.

Harrell, Cavanagh, and Roman (1998) examined the impact of differing court dockets on offender drug use and criminal activity in their study of the Washington, D.C., Superior Court Drug Intervention Program (SCDIP). Offenders were randomly assigned to one of three dockets. The sanctions-driven docket offered drug-involved defendants a program of graduated sanctions with weekly drug testing, referrals to community-based treatment, and judicial monitoring of drug use, while the treatment docket offered drug offenders weekly drug testing and an intensive, court-based day treatment program. The remaining participants were placed in a standard docket, which offered drug offenders weekly drug testing, judicial monitoring, and encouragement to seek community-based treatment programs.

Records obtained from the Pretrial Services Agency provided data on defendant characteristics to determine intervention eligibility including criminal history, case processing, and drug test results. Semistructured interviews were also conducted annually on each docket to gather information on those who were offered treatment or programs. Focus group interviews were conducted to gather insight on the defendants’ views on drug court procedures and programs. The evaluation assessed the extent to which SCDIP sanctions and programs reduced drug use and criminal activity, increased voluntary participation in drug treatment services, and improved socioeconomic functioning of participants in the year following the program.

Many of the defendants participating in the standard docket voluntarily participated in community-based treatment programs during pretrial release. One third reported detox services and one quarter reported outpatient treatment. Approximately two thirds (65%) were sentenced to probation: 88% of those who consistently tested drug free in the month before sentencing and 63% of those who tested positive for drugs or skipped tests. Graduated sanctions program participants were more willing to receive detox during the program, while 60% of participants reported attending drug treatment services such as Alcoholics Anonymous (AA) as did 63% of those on the standard docket. Overall, 19% of the 140 participants graduated from the treatment program, whereas 9% left the program in good standing. Two thirds of the participants, including all graduates from this program, received probation.

The entire target group of drug-using defendants on both sanctions and treatment dockets were more likely to test drug free in the month before sentencing. There was a lower likelihood of arrest with sanction program participants who had more days on the street prior to their first arrest after sentencing than with the standard docket group. Treatment participants were not significantly less likely to be arrested in the same year as sentencing or to have more street days

before first arrest during the year. Treatment participants were significantly less likely to be arrested for a drug offense than those of the standard docket.

DeMatteo, Marlowe, and Festinger (2006) analyzed the benefits of utilizing secondary prevention services for low-risk drug court clients. Most substance abuse treatment programs are tailored to be beneficial to high-risk clients with serious substance abuse programs, but these programs may be unnecessary or even harmful to those without serious problems. Secondary prevention strategies are designed to interrupt the acquisition of addictive behaviors, rather than trying to treat addiction directly, and are intended for those who have been exposed to risk factors related to certain behaviors but have not yet displayed said behaviors.

Standard drug court procedures incorporate several programs that are ill-suited to the needs of low-risk clients. For example, group counseling sessions often combine high-risk and low-risk offenders and can lead to learned deviance in the low-risk clients. Twelve-step programs are not considered appropriate for individuals who are not addicted to drugs or alcohol and can actually weaken their resistance to such addictions. Motivational interviewing, which is designed to help drug abusers realize the extent to which drug use has negatively affected their lives, may lack effect for those on whom drug use has yet to have a major detrimental effect. It is recommended, then, that interventions for low-risk clients should focus more on interfering with the reinforcing properties of drugs, rather than treating what may be emerging problems as full-fledged addictions.

Marlowe and colleagues (Marlowe, Festinger, Lee, & Patapis, 2005) examined whether perceived deterrence theory helps explain the success of drug courts in dealing with drug-involved offenders. Perceived deterrence theory reasons that the likelihood of an offender engaging in drug use or criminal activity is affected by the perceived likelihood of being detected and the certainty of being punished or rewarded based on behavior. This research used data from three experimental studies on the effect of judicial status hearings on drug court outcomes, in which participants were randomly assigned to either Group 1 (biweekly hearing schedule) or Group 2 (hearings only as needed).

In addition to testing for program success, ASI, and APD, participants were subject to a “perceived deterrence questionnaire,” which was a 6-item Likert scale assessing participants’ perceptions of the likelihood that they would be detected/sanctioned for infractions and recognized/rewarded for achievements, and the likelihood that sanctions/rewards would be meaningful for them. This questionnaire was administered 3 times monthly over the course of the study.

Based on data from the questionnaires, participants were classified into one of five clusters: believers (34%), average (27%), skeptics (11%), disillusioned (14%), and learners (14%). Believers had high perceived deterrence over the

whole course of the program, while skeptics had the opposite. Average had consistently moderate scores. Disillusioned had initially high perceived deterrence, but scores diminished over time, while learners experienced the opposite effect. Believers tended to be older and female, while skeptics were younger and less frequently female. Participants with prior treatment history tended to be disillusioned. Males (who tended to not be believers) had lower graduation rates. Cluster groupings were not significantly linked with ASI scores, alcohol problems, or legal problems.

Findings From Meta-Analyses

Though the studies discussed to this point have gone to great lengths in establishing a base of knowledge on drug courts, many of these efforts have been limited to one or a handful of study sites or have looked at only one or a few aspects of drug court operations. To address the need for more generalizable information on drug courts, recent research has focused on evaluating knowledge from the field as a whole, in the form of systemic reviews and meta-analyses.

In his review of 37 drug court process evaluations, Belenko (2001) found that participants are predominantly male (72%), are unemployed (49%), or have poor employment and education; have prior criminal records (74% had at least one felony charge); and had at least one failed attempt in treatment (76%). These offenders tend to have serious physical and mental health problems that complicate the recovery process. In addition, drug court clients have a high prevalence of reported prior physical and sexual abuse and suicide attempts. In accordance with post-indictment recidivism, the evaluations are consistent with previous findings that a majority of the studies reveal a reduction in recidivism rates for drug court participants.

Turner et al. (2002) reviewed the Nationwide Evaluation of 14-Site Drug Treatment Court Programs conducted by the Drug Court Program Office in 1995–1996. The program was designed to describe and evaluate eligibility requirements, court and treatment requirements, and program implementation of 14 drug treatment courts representative of drug treatment court programs across the country. It was determined that the programs met the key qualifications of effective drug treatment court programs by integrating alcohol and drug user treatment services with justice system processing; following a nonadversarial approach, which promotes public safety while protecting the due process rights of the offender; providing access to drug-treatment-related services; frequently testing for abstinence; coordinating strategies to govern drug treatment court responses to participants’ compliance; and facilitating ongoing judicial interaction with each participant.

However, the authors conclude by stating that while drug treatment courts continue to grow in popularity, and while they have been found to be generally effective, there is still

much to learn about how drug treatment courts work and how influential they are in reaching desired outcomes.

Belenko (1999) points to several weaknesses in existing research and gaps in knowledge. One of the major limitations of existing research revolves around outcome measures. While drug courts are often commended for their impact on recidivism, the meaning of this reduction is often limited, and it varies from study to study. Estimates on program retention and outcome measures on recidivism would wield more power if time periods were clearly specified. This would allow a more accurate comparison of findings for more established drug court programs, as compared to those early in their development, or on their last legs. Furthermore, these outcomes are most often defined by rearrest, while few evaluations include follow-up information outside of formal arrest data. Studies also tend to ignore those participants who quit or are discharged from drug court programs, leaving major questions about an even more at-risk segment of this already high-risk population and potentially overstating the benefits of participation.

The use of comparison groups in extant research is also troubling. Comparison groups are either not utilized or are composed of participants that differ from the typical drug court client, making true-to-form comparisons of drug court participants versus the general offender population difficult (Belenko, 1999).

Similar sentiments are shared by Wilson et al. (2006). In their meta-analysis, these researchers looked at the results of 55 evaluations on drug courts. These evaluations often showed a reduction in criminal offending in drug court groups as compared to control groups, but although the general findings suggest that drug offenders taking part in a drug court are less likely to reoffend than those sentenced to traditional corrections methods, these authors also point to flaws in study samples and methodologies as evidence that any congratulatory marks should be viewed through a critical lens. In other words, as stated by Goldkamp, White, and Robinson (2001), research as presently constructed tends to show that “successes succeed and the failures fail.”

Wilson et al. (2006) point to several improvements in future research that would advance the field. First, they state that the overall quality of study design should be improved so that more reliable and generalizable data can be gathered. They also point to the need for an expanded view of program effectiveness to include deeper measures of a program’s impact on substance use (not simply rearrest or failed drug tests) and the need for more detailed accounts of comparison groups.

What Is Missing From Current Research?

Though research has steadily increased and, perhaps more importantly, improved in recent years, the field is still lacking in several key areas. There exists a base of recommended

drug court treatment practices and operations, and while it is known how these factors work in specific courts, there is not yet comprehensive knowledge of how they are implemented at a national level. The field needs expanded information regarding not only the number of drug courts and participants within them, but also knowledge of *what* these courts do and *how* they do it.

The National Drug Court Survey was conducted to help fill these gaps in knowledge. The study provides a picture of the national drug court landscape and the treatment delivery structure within it, giving the field a glimpse of the current state of drug courts, which can be used to form a baseline from which future growth and a plan for improvements can be established. The following will highlight findings from this study.

The National Drug Court Survey

To fill the gap in knowledge on drug courts, the National Drug Court Survey was administered to drug court coordinators and treatment providers across the United States as a project of the Criminal Justice Drug Abuse Treatment Studies (CJ-DATS) research cooperative. The focus of this study was to provide a more accurate picture of the characteristics of courts and their administrators and employees, the types of treatment services offered within drug courts, arrangements with treatment and other service providers, the integration of evidence-based practices, as well as a host of other information. With this data, more focused and informed improvements for drug courts can be designed.

Methodology

The sampling frame for the National Drug Court Survey was composed of drug court coordinators and the agencies that provide treatment services to these courts. The first portion of the sample, drug court coordinators, was generated in two parts. First, the sampling frame from another CJDATS study, the National Criminal Justice Treatment Practices Survey (NCJTP), was used. The NCJTP sampling frame was drawn from a representative sample of prisons and community correctional facilities using a two-staged stratified sampling technique.¹ This left 72 counties from which all active adult drug courts were selected. The second portion of the coordinator sample consisted of all adult drug courts that have received an implementation or enhancement grant from the Office of Justice Programs since 2002. The final coordinator sample consisted of 208 adult drug courts. Each coordinator was then asked to give the contact information for the treatment agencies providing services to their clients, and surveys were mailed to each of these agencies. A response was received from 68% of courts (141 of 208), and a matching pair of coordinator and treatment surveys was received for 75% of courts in the sample (100 of 141).

Characteristics of Drug Courts

On average, drug courts had 102 participants on any given day.² Thirty-two percent of courts had an average daily population of under 40 drug court participants (DCPs), while 41% ranged from 41 to 100 DCPs, and 27% had over 100 DCPs on any given day. The average court graduates 38 DCPs on an annual basis, while discharging an average of 29 due to noncompliance with program requirements. Sampling weights were applied to the NCJTP portion of respondent data to generate a national estimate of drug court participants. This resulted in an estimate of 49,000 DCPs across the country on any given day. This figure is higher than the last estimate of DCPs generated by Huddleston and colleagues (Huddleston, Freeman-Wilson, Marlowe, & Roussell, 2005), a result of the continued increase in the number of drug courts across the country.

Administrators and Staff

A total of 87% of drug courts reported having a singularly focused coordinator, while the remaining courts used existing positions (judges, case managers, etc.) to administer the program. On average, coordinators or those in charge of drug courts reported having been in their position for just over 4 years. The majority were between the ages of 36 and 55 (65% of coordinators fell within this range) and were women (65%). A total of 32% reported having a bachelor's degree, while 44% reported having a master's degree or higher.

On average, courts had 12 full-time and part-time staff members working with the drug court, with an average of 3.2 new hires in the past year. Courts had an average of 2.8 treatment counselors assigned to the court, and 1.2 treatment coordinators on staff.

Determining Eligibility and Admission

In determining eligibility for drug court, legal criteria are far more integral in making admission decisions than issues related to severity of offenders' substance use problems or treatment needs. Furthermore, legal staff, such as prosecutors, defense attorneys, and judges, are far more influential in reaching admission decisions than other members of the drug court team. Whereas members of the legal team are involved in reaching admission decisions in over 92% of courts, coordinators and case managers are involved in 79% of courts, and only 48% of courts involve treatment providers in making this decision.

Screening and Assessments

Overall, 68% of drug courts reported using a standardized substance abuse screening tool. The most commonly used tools are the Addiction Severity Index (ASI) (used in 45% of courts) and the Substance Abuse Subtle Screening Inventory (SASSI) (23%). Only 21% use risk assessment

tools, most commonly, the Level of Service Inventory-Revised (LSI-R) (18%) and the Wisconsin Risk and Needs (WRN) tool (4%), and less than 4% use mental health screening tools. Thirty-three percent of courts use a tool created by the state or a tool of their own design.

Policy-based reassessments are extremely rare, with only 4% of courts having written protocol for doing so. On the other hand, 77% of courts reassess as a reaction to DCPs' performance or compliance. A total of 18% of courts do not reassess for severity of substance use disorders.

About Phases and Treatment Within Drug Courts

Though the phase approach is a hallmark of drug courts, this structure is not universally adopted. Roughly three quarters of drug courts reported using formal phases, with approximately half using a four-phase structure and 25% using a three-phase structure. The remaining 25% of courts do not have a set phase structure. The typical drug court program lasts approximately one year.

"Low-impact" services such as drug testing, self-help meetings, and group counseling are those most frequently integrated within drug courts. While these less intensive services are pervasive across all courts, more intensive, treatment-oriented services are not as common, particularly as participants move further along within the phase structure. Though clinical treatment services such as motivational enhancement, psychosocial education, individual counseling sessions, or family therapy sessions are offered in 61% of programs' Phase 1, by Phase 3 only 54% of programs provide clinical services. By Phase 4, only one third of programs (36%) provide clinical treatment services.

The same trend is seen in regard to attendance at status review hearings. Though in earlier phases, DCPs are required to attend status review hearings in front of a judge twice per month or more (88% of courts require such attendance in Phase 1, and 80% in Phase 2), as they move further along within the program, their required attendance decreases substantially. By Phase 3, only 21% of courts require appearances in front of judges every 2 weeks or more frequently, and by Phase 4, this drops to 15%. In addition, by Phase 4 over half (53%) of courts have no set schedule for DCPs' attendance at status review hearings.

These low rates of continuous attendance at status review hearings are symbolic of an overall pattern of a lack of judicial involvement across the drug court process. Though it is one of the "key components" of drug courts, ongoing judicial interaction with DCPs is practiced in less than 10% of courts (7.8%). In addition, nearly half (45%) of courts reported that judges do not review or modify treatment plans.

Service Delivery in Drug Courts

Coordinators and case managers are more frequently involved in case planning and treatment activities than members of the legal team. Where nearly 80% of coordinators and

case managers maintain contact with treatment providers, 25% of judges, 14% of defense attorneys, and 13% of prosecutors engage in this activity. Coordinators and case managers are also far more likely to contact other service providers in the community, to identify short- and long-term goals for the DCP, and to adjust the treatment plan when the DCP is doing poorly.

Overall, the legal team is less involved than its drug court or treatment counterparts in such treatment activities, engaging in an average of 1.3 (of 8) activities, as compared to 4.5 for the core drug court team and 6.3 for treatment agencies and providers. This pattern also holds true for legal teams' involvement in drug-court-related activities as a whole. Whereas judges, defense attorneys, and prosecutors are involved in an average of 4.9 (of 19) activities, coordinators and case managers are involved in an average of 11.3, and treatment providers in an average of 12.5.

Treatment Arrangements With Outside Agencies

Most courts reported having an agreement or contract for treatment services with an outside treatment agency (23% had no such arrangements). One third (33%) of courts reported having a formal agreement for services, which often laid out the types of services to be provided (62%) or dealt with issues related to confidentiality (53%). In addition to formal agreements, 43% of courts reported also having contracts with treatment providers, through which money changes hands in exchange for services. Within these arrangements, 13% required the drug court to pay service fees, 20% required the DCP, and 68% had some combination of court and DCP fees. Nearly half (46%) of courts had formal written agreements with up to three treatment service providers, while 27% had agreements with more than three providers.

Treatment Agencies and Staff

Treatment agencies reported serving an average of 75 clients. Though over three quarters of agencies reported being licensed, only 32% reported accreditation by the Commission on the Accreditation of Rehabilitation Facilities (CARF) or the Joint Commission on the Accreditation of Health Care Organizations (JCAHO).

A total of 57% of respondents fall between the ages of 36 and 55, 55% are female, and on average they have spent 7 years with their agencies and 3 years in their positions working with the drug court. A total of 20% of respondents reported having a bachelor's degree, and 55% have an advanced degree, with the most common fields of education being counseling (30%), social work (27%), and psychology (16%).

Staff in treatment agencies have an average caseload of 25 clients (both drug court clients and their general client caseload). Sixty percent of staff have credentials in substance abuse treatment (such as CADC, CASAC), while

75% have specialized training in substance abuse treatment (credits toward CADC, CASAC), and 30% have certification in a general mental health specialty. Seventy-six percent of agencies allow staff to be in recovery, with 37.5% of staff actually in recovery, while 46% of agencies allow ex-offenders on staff, though only 12% of staff are ex-offenders. Roughly one third (34%) of staff have a bachelor's degree, one third (34%) have a master's degree or higher, and the remaining staff have a 2-year degree (17%) or less (15%).

Characteristics of Treatment Services Provided by Outside Agencies

Only 56% of agencies reported using a standardized substance abuse screening or assessment tool, while 54% use a state- or agency-designed tool. Slightly over half (52%) of agencies reported using a written treatment protocol or curriculum, with 26% of these agencies using the Martix model, while others tended to develop their own protocol. One third (33%) of agencies trained staff on their protocol for up to 2 days, while 23% of agencies trained staff by having them watch other counselors. Ten percent of agencies do not train staff on their treatment protocol.

A total of 31% of agencies provide specialized services for co-occurring disorders, while 42% provide specialized services for adult offenders. Roughly 60% of agencies reported providing cognitive-behavioral services 2–3 times per week or more, though only 23% offer short-term residential programs (28 days or less), and less than 20% offer detoxification (19%) or long-term residential programs (18% offered programs that were 6 months or longer). Mental and physical health services are more common across treatment agencies. Roughly half of agencies reported providing counseling or assessment for mental health problems, whereas 32% provide HIV/AIDS testing, and 38% provide counseling for HIV/AIDS.

Pharmacological services are rarely provided by treatment agencies. Only 17% of agencies prescribe buprenorphine, while 16% report prescribing Antabuse, 15% report prescribing naltrexone, and 12% prescribe methadone. More troubling is the fact that very small percentages of DCPs in treatment agencies are recommended for these medications, with no more than 6% (Antabuse) being recommended for any of those listed.

Utilization of Evidence-Based Practices

Compared to national findings on their use in community correctional settings (Friedmann, Taxman, & Henderson, 2007), drug courts are more likely to implement consensus-driven, evidence-based practices (EBPs). On average, drug courts utilize 5.5 (of 11) EBPs, compared to 4.6 for probation and parole agencies.

Addressing co-occurring disorders is the most commonly utilized EBP (present in 96% of treatment agencies), followed by the use of incentives for positive DCP

behavior (89%) and the presence of a continuum of care (84%). The use of standardized risk tools (21%) is quite low. Other important EBPs are also widely uncommon, as only 38% of agencies use engagement techniques, and 41% involve family in treatment. Less than three quarters (72%) of agencies report planned service durations of over 90 days, while half (53%) report that the staff in their agencies are qualified to address the needs of DCPs.

An important difference in the use of EBPs is found between agencies that have a written agreement or contract for services with outside treatment agencies and those that do not. In particular, agencies with agreements or contracts are much more likely to implement standardized substance abuse tools, to involve family in treatment, to report systems integration, and to use graduated sanctions.

Adherence to Key Components

On average, drug courts implement 6 of the 10 key components, with nearly all courts reporting drug and alcohol treatment with case processing (99%), 87% supporting continued staff training or education, 77% establishing partnerships with other community agencies to enhance effectiveness, and 77% monitoring substance use through frequent drug testing. However, only 25% of courts identify eligible participants early on in the criminal justice process, 22% report that a coordinated strategy determines responses to DCPs' compliance, and 8% report ongoing interaction with the drug court judge.

Integration

Perhaps the most innovative aspect of drug courts is their unique position within the criminal justice system. Bringing together key players from the legal, treatment, and corrections communities, drug courts have the ability to bridge the services and functions of these agencies to more effectively supervise offenders and target their specific needs. With this, meaningful integration among these agencies becomes critical.

Drug courts collaborate with treatment agencies on an average of 7.2 (of 12) activities—activities such as sharing DCPs' needs for types of treatment, developing joint policy and procedures manuals, cross-training staff, holding joint staffing, pooling funding, and so forth. While this degree of integration indicates relatively formal working relationships with substance abuse agencies, a more informal system exists in regard to working relationships between the drug courts and prosecutorial agencies, in which these agencies collaborate on an average of 4.7 of the aforementioned activities.

Conclusion

Drug courts are still growing, and much is needed to understand how each of the parts contributes to the overall

functioning and outcomes generated. Drug courts continue to demonstrate positive findings. The National Drug Court Survey fills a gap by providing a picture of how drug courts operate. While improvement needs to occur, it appears that the drug court model is viable. The proliferation of the drug court means that the innovation is working well. Although it appears that more work needs to be done to develop the model, particularly in terms of adopting evidence-based treatments, the drug court model is thriving.

Notes

1. See Taxman, Young, Wiersema, Rhodes, and Mitchell (2007) for a complete discussion of NCJTP survey methodology.
2. Three cases were excluded from this average due to their having an average daily population of over 1,000 participants.

FORENSIC SCIENCE

DAVID N. KHEY AND IAN TEBBETT

University of Florida

For many Americans, the word *forensics* evokes a cascade of vibrant imagery that entails crime and intrigue. It is a buzzword for DNA, bite marks, bullet wounds, fingerprints, autopsy, gore, death investigations, semen stains, and rape kits. This, however, is only a small part of a much larger picture. Forensics itself is extremely broad—it is the application of the scientific method to assist the law. This can mean almost anything—accountants who perform analysis to assist the courts are forensic accountants; computer enthusiasts who hack into the hard drives of sexual predators are forensic computer technicians; physical anthropologists who study bones in a legal investigation are forensic anthropologists. The field of forensics is growing, and the list becomes even longer as more divisions of labor and specialization occur. With this large influx of experts in fields that expand with technology and multitudes of new techniques, it is amazing that the courts can even keep up.

The many different disciplines that make up forensic science have been embedded in popular culture since their inception. Long before criminal investigations incorporated the use of fingerprints, document examination, blood spatter pattern analysis, gunshot trajectories, accident reconstruction, and the like, these were the topics of fiction. Most familiar to many, Sherlock Holmes and his partner, Dr. Watson, applied the scientific method and stellar detective work to solve crimes and thereby introduced these concepts to the masses. Broadly speaking, this is the definition of *forensic science*: applying science

and technology to legal investigations, whether civil or criminal. From the “medicolegal” examination of a human body postmortem (after death) to analyzing the breath of a driver who had a few too many drinks, the reconstruction of how the Twin Towers collapsed, and the identification of unknown soldiers and civilians in battlefields in mass graves, these practices have now long been integrated into Westernized contemporary court and justice systems. Yet, it was only in recent decades that the abilities of forensic scientists have vastly expanded due to a renaissance of scientific breakthroughs. The purpose of this chapter is to give an overview of the primary areas of forensic science and to review the breakthroughs and controversies within each of its disciplines. Secondly, this chapter provides an introduction into how the courts screen expert witnesses and concludes with a summary of important recent developments in forensic science.

Primary Areas of Forensic Science

Many of the foundations of forensic science are rooted in keen criminal investigative principles adjoined with analysis using the scientific method. The work of Edmond Locard is a case in point. In the early 1900s, Locard developed a simple investigative principle that has stood the test of time and is very much incorporated in today’s detective work. Basically, Locard realized that as individuals interact with others or come in contact with objects in an environment, a

“cross-transfer” of microscopic and macroscopic elements will occur. A bit of a dog owner’s hair will remain on the person’s clothes and may be left at a crime scene along with some skin cells, and perhaps some of the carpet fibers at the crime scene will cling to the cuff on an individual’s pants; either way, evidence of this transfer may serve as a substantial piece of circumstantial evidence in a case. This principle, called “Locard’s exchange principle,” is at the heart of trace evidence and criminal investigations. Much of the forensic investigation performed at a crime scene, such as utilizing the exchange principle to collect and subsequently analyze evidence, is in the area of criminalistics.

Criminalistics

The majority of the forensic services provided in a robust crime laboratory are of a discipline called *criminalistics*. Put simply, this area of forensic science seeks to process physical evidence collected from a crime scene and produce a final report based on analysts’ findings. It is also the broadest category of forensic science, with many subspecialty units and much expertise. The easiest way to classify these services is to divide them by the units typically found in a robust crime lab: controlled substances, serology/biological screening, DNA, trace analysis, firearms/explosives, toolmarks, questioned documents, latent prints, and toxicology. While a vast amount of different analyses fall within these areas, these highlighted areas are nonexhaustive. It is also important to note that the widest amount of contemporary controversies revolve around many of the more subjective analyses performed by these analysts.

Over the last decade, the Bureau of Justice Statistics (BJS) commissioned a census of publicly funded crime labs to gain a better understanding of the collective trends in forensic services in the United States. By order of usage of service, controlled substances examination has persisted in being the most requested over the years of the census (Durose, 2008). Simply put, these requests concern seized substances thought to be illicit or unidentified controlled drugs. To perform the examination, analysts use a two-pronged process to first screen substances and then use this preliminary data to run a confirmation analysis if the initial one screens positive for a controlled substance. This secondary analysis has the power to examine the unknown substance both qualitatively and quantitatively with high levels of statistical certainty. Thus, at the end of a controlled substance analysis, investigators will learn the consistency of the substances submitted for testing, down to their molecular makeup. For example, if an unknown white powder is examined, controlled substance analysis will show the different components that constitute that powder and to what extent these components make up the whole sample—perhaps 85% cocaine, 5% lidocaine, and 10% baking powder (sodium bicarbonate).

This differs slightly from toxicological services, as the analyses in this area serve to qualify and quantify controlled substances and their metabolites in biological matrices (e.g.,

blood, saliva, hair, urine, and vitreous fluid of the eye), as well as toxic substances (e.g., mercury, arsenic, and cyanide), alcohol, over-the-counter products, and many other foreign compounds to the body. Depending on the circumstances, investigators typically request only a certain subset of toxicological examinations to be performed, as a full “tox” screen is costly and wasteful. In particular, two situations call for a more comprehensive toxicological examination: in cases of offender/probationer/parolee drug screening and in post-mortem toxicology. In the BJS census, toxicological services were requested a far second (298,704 requests in 2002; 251,585 requests in 2005) behind controlled substances (844,183 requests in 2002; 855,817 requests in 2005). There is limited subjectivity in these areas of forensic science—thus, controversies are limited to individual cases.

Latent print analysis seems ubiquitous in forensic science and police investigations. Examining visible (*patent*) or invisible (*latent*) fingerprints and comparing them to known samples or a computer database called AFIS (Automated Fingerprint Identification System) is a long-standing tradition in the field, and is the third most common type of request for forensic services (Durose, 2008). Based on the premise that no two fingerprints are alike—even identical twins have fingerprints that differ—the criminal justice system as well as private security firms have invested heavily in a fingerprint-driven identification system. Using *proficiency tests*, or controlled examinations designed to gauge the accuracy and reliability of forensic analyses, researchers have proven to be very accurate in their identification, given typical casework circumstances. Thornton and Peterson (2002) find that the existence of misidentifications is a rare event in typical casework (fewer than 0.5% of comparisons); correct identification lies within the 98%–99% range under normal circumstances. Fingerprints are among only a few other analytical tests, such as DNA typing and blood typing, that share such high success rates.

Firearm and toolmark analysis, the next most requested service, is an example of a subset of forensic analysis that contains elevated amounts of subjectivity, which increases the likelihood of error. Shotgun shells and shot pellets, discharged bullets, bullet casings, and any sort of firearm and its ammunition can be examined to understand the origin of a spent bullet, the trajectory of shots fired, and much more. The physical construction of firearms and their mechanisms make relatively unique impressions on fired bullets suitable for these analyses. Forensic science examinations dealing with toolmarks work in a remarkably similar manner. Impressions left by screwdrivers, crowbars, knives, saws—any tool imaginable in a garage—can give investigators an idea of what tools were used in the commission of a crime. If these tools can be identified, additional evidence left on these objects may be collected, if found.

It is true that as time passes, unique wear and tear on these items may produce remarkably unique impressions on objects (e.g., bullets, walls, bone, etc)—especially when these items are frequently used. When this occurs, the ability of forensic firearm and toolmark examiners to make a

determination of whether the suspect impression embedded in an object shares a “common origin” with a sample impression made by the firearm/tool in a laboratory increases in confidence. Regardless whether if these conditions are met or not, these forensic examiners have good success in making these determinations; however, their success can wane in comparison to objective analyses such as DNA testing and blood typing. It is important not to overweigh the probative value of these examinations, especially when environmental conditions such as decay or damage make these analyses exceedingly more difficult.

DNA analysis, what has become the gold standard in forensic identification, is the next most requested service in the United States (Durose, 2008). According to the BJS, this service has remained the most backlogged during the census of publicly funded crime labs in the country. This should not be surprising, as this type of forensic analysis is demanding on both human and operational resources. While the field has come a long way from the origins of the use of DNA in the criminal justice system over three decades ago, the average time to complete these requests is typically much longer than for any other forensic service. For example, a typical forensic toxicological analysis may take anywhere from a week to a month, but comparing DNA samples from a suspect or several suspects to biological samples gathered from a crime scene may take anywhere from a few months to a year. Many times, if backlogs become a surmounting problem and local or state funding permits, outsourcing to private labs may be an option. In fact, about 28% of the crime labs included in the BJS census have outsourced their DNA casework to private labs (Durose, 2008).

The value of DNA analysis is twofold: (1) Several kinds of DNA analyses are embraced by robust methodologies that include error rates that can be measured, calculated, and interpreted to yield results that are concrete and objective. These results can be interpreted to estimate the likelihood of both a false positive (e.g., the likelihood of finding a “match” when, in fact, the samples from a crime scene and a suspect do not “match”) and a false negative (e.g., the likelihood of not finding a “match” when, in fact, the samples from a crime scene and a suspect should “match”). (2) These types of requests also have the power to provide exculpatory and inculpatory evidence with the same amount of certainty, accuracy, and reliability. Both types of evidence are equally important in criminal justice, particularly when a person’s freedom is on the line: *exculpatory* evidence includes any proof of an individual’s innocence, while *inculpatory* evidence provides proof of guilt.

Even years after a crime occurs, DNA analysis has proven itself to be the chief piece of analysis in many criminal cases. The past few decades have seen wrongful convictions overturned by DNA analyses at the cost of proving other forensic science evidence (or at least the *interpretation* of this evidence) wrong. Saks and Koehler (2005) point out that forensic science testing errors and false or misleading testimony by forensic expert witnesses are the second and fifth most common issues (respectively) in the

wrongful conviction cases overturned by Project Innocence. This organization consists of a group of attorneys and advisors working pro bono that have been highly critical of many components of the criminal justice system, including a variety of areas in forensic science. Since the late 1980s, over 225 convicted felons typically serving life sentences have been exonerated by the efforts of Project Innocence using DNA analysis as the cornerstone of their litigation. On their Web site and in their promotional literature, Project Innocence echoes Saks and Koehler’s calls for reform in forensic science, particularly within areas that only give limited probative value. This includes much of the remaining facets of criminalistics not previously discussed: serology and biological screening, trace evidence analysis (e.g., hairs, fibers, glass, paint, etc.), impressions (e.g., bite marks, shoeprints, tire marks, etc.), fire and explosive examination, and questioned documents.

Each of these areas of analysis has its strengths and weaknesses, but all of them have been shown to assist investigators in their casework. Serology and biological screening is an example of a subset of forensic services that allows any investigator to narrow down the possibilities of suspects or helps the investigator understand the circumstances and nature of the event(s) in question, yet it has limited probative value. While a variety of these forensic services are able to produce results with reliable statistics and defined error rates, critics remain steadfast that these results can be misleading to jurors. Blood grouping methods are a good example: These methods allow analysts to examine a sample of blood and produce a report that identifies the blood type of the “donor.” In stark contrast to the cost and effort of DNA analysis, these reports can be produced rapidly and at a low price. The issue, however, becomes the lack of power these analyses have in narrowing suspects with a good degree of certainty, as many people share the same blood type. “Presumptive tests” for suspected semen and saliva samples are examples of less powerful biological analyses that can yield useful results, giving investigators reasonable evidence that these samples do, in fact, consist of seminal fluid or saliva. If there is sufficient biological material and these samples are viable enough to run DNA analysis (e.g., the material has not been contaminated or degraded below qualifying levels), further analysis can be run to refine these preliminary results. Forensic analysts may also choose to use other methods, such as microscopy and species typing, to refine these results if DNA analysis is not an option.

Other kinds of forensic tools, such as particular types of trace analysis and questioned document analysis, do not have as good a track record of producing reliable, accurate, and powerful results. Observers, however, should not cast them off as not being useful. For example, if an analyst were to find a hair in the trunk of a car bound to a piece of duct tape that was *consistent* with a victim’s head hair, the car owner would have a lot of explaining to do. This is not to say that this hair couldn’t have come from another source—in fact, the analyst would be hard-pressed to come up with a statistic of the likelihood that the hair came from the victim’s

head. If, in fact, the analyst offered this statistic, it would be a disservice to a jury, the defendant, and even the victim since this information is uncertain and not based on sound statistical principles. If DNA material—whether nuclear DNA material or a kind called mitochondrial DNA material—were available for examination, then analysts would gain the power to include specific statistics in the present case to aid in the interpretation of the findings. Otherwise, a certain degree of caution should be used in interpreting the results and weighed accordingly when making a decision based on the information found in a final report.

In particular, questioned document analysis has received a significant amount of criticism, particularly in its ability to determine “matched” writing samples (or more accurately stated, *consistent* writing samples). Proficiency testing has proven to yield weak results in this area (see Peterson & Markham, 1995b). Yet, handwriting comparisons are the most commonly requested service in the area of questioned documents. Based on the reasonable assumption that people’s handwriting evolves over time, and that writing habits contain idiosyncrasies, both conscious and subconscious, analysts look for consistencies in writing samples for particular classes and characteristics of writing behavior. This holds true even when a person tries to disguise his or her writing to conceal authorship. For the most part, these services are more critical in civil trials where the burden of proof does not have to meet the “beyond a reasonable doubt” standard. Other types of questioned document analysis can fortify these results to offer more resolute findings. These include the analyses and comparisons of paper, inks, and printer and typewriter output. It must be stated, however, that few of these analyses come with the ability to include standard statistics and error rates, leaving them open to the aforementioned criticism.

While the above is not an exhaustive list of forensic services performed by many crime labs, it should offer a sampling of analyses that make up a spectrum from objective to subjective. While those from the subjective end of the spectrum may not be able to conclusively yield the proverbial finger pointed at a wrongdoer or give black-and-white answers, they can further clarify what occurred or did not occur with a series of events under investigation. Obviously, very few pieces of evidence can offer a smoking gun, so to speak, on their own. It is not the sole responsibility of the forensic analyst to make this clear; it is the responsibility of all of the key players in the courtroom work group—judges, prosecutors, attorneys, jury foreman, and the jury—to use their role to get the most out of each analysis, report, and expert testimony to be able to reach a just verdict. While many of the critiques of the more subjective aspects of forensic science merit close attention, the importance should be stressed on the proper weighing of this evidence when offered at trial. As mentioned above, these analyses do hold scientific value but only to a limited extent. The results must be weighed carefully with all of the other evidence, testimony, and circumstances about a particular trial in question.

While the forensic services at a crime lab play an important role in contemporary criminal justice and civil courts, other key services are offered outside of the crime lab that are important to mention. Two areas in particular stand out—forensic pathology, since these services are utilized so regularly, and forensic anthropology, for its topical importance in solving identification mysteries worldwide. The following two sections describe these aspects of forensic science, often considered off in their own realms and separate due to where they are organizationally located, in the government (pathology, and a minor part of anthropology) and in academia (anthropology).

Pathology

In the case of a sudden and unexpected death, an autopsy has become a mandatory public health and legal investigation to ensure that any disease threat—or more typically, wrongful death—does not go uninvestigated. A variety of organizational schemas exist to accomplish this in the United States. At the heart of these schemas are inherently two systems, the medical examiner system and the coroner system (Hanzlick & Combs, 1998). While it was previously important to speak of the differences between these two systems, these differences are narrowing as medically trained forensic pathologists are becoming the core of both. In earlier coroner systems, individuals of various backgrounds—undertakers, sheriffs, and farmers—served as the lead investigators in forensic death investigations. In the present day, this elected position still exists in rural areas; however, if there is a questioned death, most coroners have easy access to a district medical examiner or forensic pathologist with specialized training to thoroughly investigate a death. Famed pathologists DiMaio and DiMaio (2001) describe the duties of the death investigation system in their comprehensive overview of forensic pathology:

- To determine the cause and manner of death
- To identify, if the deceased is unknown
- To determine the time of death and injury
- To collect evidence from the body that can be used to prove or disprove an individual’s guilt or innocence and to confirm or deny the account of how the death occurred
- To document injuries or lack of them
- To deduce how the injuries occurred
- To document any natural disease present
- To determine or exclude other contributory or causative factors to the death
- To provide expert testimony if the case goes to trial (p. 1)

While this list is comprehensive, it ignores the most fundamental roles both medical examiners and coroners play in public health and epidemiology (Hanzlick & Parrish, 1996). For example, medicolegal investigation may uncover environmental hazards, poisons, or communicable diseases that have the potential to harm others.

In this case, medical examiners or coroners can warn the appropriate authorities to take proper action to prevent harm. They also monitor trends in disease and drug overdose over time to fuel public health and drug abuse research.

Forensic pathology centers on the autopsy process. This process serves to answer two questions: What is the cause and the manner of death? The cause of death is the injury/condition or set of primary and secondary injuries/conditions that result in and contribute to the death in question. For example, myocardial infarction (heart attack), liver failure, asphyxia, alcohol poisoning/overdose, gunshot wound, blunt force trauma, and emphysema can be causes of death. The manner of death consists of only a few categories: natural, homicide, suicide, accident, and undetermined/unclassified. This determination takes the circumstances surrounding the death, including the activity of the decedent just before death, and blends it with the findings at autopsy, toxicology reports, medical history, and police narratives among other sources to categorize the individual into one of these pathways of death. This is the most subjective part of the autopsy process, and is only finalized at the end of the forensic death investigation—typically a few days before the certificate of death is printed.

The controversies in this discipline are by and large localized to disagreements over the cause and manner of death in particular investigations—and since the determination of the cause of death can be documented and preserved for years past autopsy, these disagreements are quite limited. It is the manner of death that can be the most controversial, second only to outright malfeasance and malpractice. As this determination has bearing on life insurance policies, criminal and civil trials, and individuals' reputations, challenges are relatively frequent in today's society.

Anthropology

Sometimes death investigation, particularly human identification, requires the expertise of professionals who can interpret clues derived from the skeleton. Forensic anthropology, a specialization within physical anthropology, has particular import when the typical means of identification are destroyed, decomposed, or otherwise damaged. The determination of age, race/ancestry, sex, and living height/stature can be assessed by the advanced anthropometric methods available in the discipline to aid investigators by providing an antemortem (before death) profile of the unknown individual. These methods are based on the forensic skeletal collections of leading anthropologists around the world, particularly in the United States (Ousley & Jantz, 1998). The skeletons in these collections have been meticulously measured and documented, and have been programmed into specialized computer statistical packages that give forensic anthropologists the ability to estimate most individuals' living profile with reasonable statistical

confidence. As more contemporary skeletons are contributed to this data bank, and particularly as these collections become more diverse in their sampling, the statistical confidence of these practitioners will be enhanced.

Beyond this profile, the physical examination of the skeleton can reveal injuries, damage or wear by occupational stress, unique genetic variations, surgical modifications, and an estimate of time since those events that all can assist in identification. For example, someone who broke his or her forearm 2 months before death will show evidence of trauma and healing in the ulna or radius in that arm. The healing process comes to a stop once a person dies, so this evidence gets frozen in time, so to speak. Evidence of perimortem (around the moment of death) trauma to the skeleton may also be helpful to investigators in determining the circumstances of death. In fact, the timing of injuries can be imperative in determining wrongdoing in homicide cases (Sauer, 1998).

In contemporary times, forensic anthropologists have been key players in the investigation of mass disasters and mass graves. These individuals are highly trained in the gentle excavation and analysis of skeletal remains in many different environments. In fact, one of the leading research programs in the world—the Forensic Anthropology Center at the University of Tennessee—has made many contributions to scholarly literature on the impact of environmental and circumstantial factors on the human skeleton. This literature continues to aid forensic anthropologists in the field as they travel to distant corners of the globe in which different climates, soils, environmental factors such as acid rain and salt water, and so much more have differential impacts on skeletal remains over time.

Handling of Scientific Testimony by the Courts

With the increased use of forensic science testimony in the courts, there also must be safeguards against so-called junk science being admitted into trials. The manner in which the courts perform this task is being debated among many experts that offer their services to the court, litigants, plaintiffs, and defendants. In the days before any guidance was issued by the courts, justices used to rely on the “marketplace test” for expert witnesses. Basically, if the expert witness could sell his or her craft and survive in the marketplace, and if he or she offered testimony that was not common knowledge or within the grasp of the average juror, more than likely that testimony was admitted. Note that this did not screen out those who practice mumbo-jumbo science, and it could not distinguish between astrology (a very old tradition that still can make money today) and astronomy. Today, this strategy would not work. Psychic detectives would not be allowed to testify to their experiences in speaking with the dead—something that cannot be verified by any sort of empirical tests, which leaves the court and other experts skeptical. However, a

homeopathic doctor who has credentials from a nonaccredited institution may be able to give testimony on the effects of the sage plant on insanity from his self-documented case studies. Thus, the courts must have some sort of method to be able to distinguish between what could be considered science and what can be considered bogus.

The first black-and-white method of screening expert testimony was offered in *Frye v. United States* (1923). In this case, the defendant was accused of murder, to which he offered an expert to testify to his innocence by analyzing the results of a very primitive lie detection exam (the systolic blood pressure deception test). This witness and subsequent testimony were rejected, since they did not yet receive *general acceptance* in the field from which they came. This type of lie detection device was new on the scene, and the court made the stand that testimony given and evidence offered should have a real-world basis and be generally accepted among the experts in the field. This will prevent evidence “in the twilight zone” from prematurely influencing court decisions before it can be perfected within the expert’s field.

Frye’s general acceptance test survived until contemporary times, and was hardly mentioned until talk about updating the Federal Rules of Evidence began to stir up controversy. In 1993, this controversy came to a head in *Daubert v. Merrell Dow Pharmaceuticals* when the Court revised the judge’s role in admitting expert testimony. The decision was to make the judge act as the gatekeeper to screen out junk science and allow the expert testimony that is reliable, valid, testable (falsifiable), and generally accepted. The Court did not mandate that these criteria should be limiting nor inflexible, but it did stress that judges should utilize, to the best of their ability, their analytical skills in making a judgment call on the evidence or testimony’s methodology and standing in the field from which it came. Two more key decisions were made by the Court to enhance the role of trial judges as gatekeepers of expert testimony. In *Joiner v. General Electric Co.* (1997), the method of appealing lower courts’ decisions on allowing or disallowing expert testimony was set to *abuse of discretion* instead of a *de novo* review of the proffered expert testimony. This means that trial judges should be challenged on their decisions to accept or disallow expert testimony only if a plaintiff or defendant can prove that this judge broke a procedural rule in the process of coming to this decision. Complete overviews of this judicial decision were deemed inappropriate. The second was *Kumho Tire Co. v. Carmichael* (1999), which expanded the *Daubert* decision to include all expert witnesses, not just those with a scientific background (auto mechanics, accountants that have worked closely with the FBI on fraud cases, and many others without advanced degrees but who have specialized knowledge).

So, the courts are set with the precedent to keep out junk science, but can they actually perform the task well? The Court has spoken about the ability to utilize “special masters” to aid the court in coming to a conclusion on the veracity of offered expert testimony. Some scholars

suggest that a research foundation be created, at least for the Supreme Court, similar to what the Congress currently has the capacity to do. This way, the parties can offer expert testimony, but the court can make a counteroffer with nonbiased (as much as this is possible) research that can guide the trial in the right direction. The issue of whether these safeguards, if instituted regularly, assist in keeping out junk science is an empirical question that desperately needs answering.

Today, decisions have been made at the state level to continue to follow a *Frye*-based system, or a *Daubert*-based system, or a third system that is a hybrid of the two. The federal system works solely on *Daubert* principles. As can be anticipated, there are advocates of both *Frye*- and *Daubert*-based systems—the differences between them are outside of the scope of this chapter. However, readers should take note that challenges to expert testimony are constantly being litigated. The decisions of these trials will serve to be the most important shaping factors in what will be deemed appropriate in U.S. courts.

Conclusion

Due to the wide variation of facets in the forensic sciences, the undertaking of sifting through all methods and techniques of all forensics is the stuff that makes up a complete book, if not a series of books. As outlined in this chapter, a variety of types of examinations performed in forensic laboratories cannot even be assessed with conventional statistics with the exceptions of DNA analysis and blood group typing (which has lost prevalence as DNA analysis gained popularity), and certain analyses of gunshot residue models (Faigman, Kaye, Saks, & Sanders., 2002). Therefore, it is important to cite the variability of the subjectivity and objectivity within these methods and techniques to gain some insight into the overall utility of these analyses as stand-alone pieces of information. David Faigman et al. begin taking on the task of typing many techniques used within the vast fields of the forensic sciences in terms of amount of subjectivity, reliability in the minds of forensic scientists, and their individual susceptibility of attack when measured by the criteria posited by *Daubert*. Since no aggregate data are available to seek relative frequency probabilities, it is up to the experience of the individual examiner to establish levels of confidence around his or her determinations. The complexities of placing these confidence intervals around scientific testing are apparent to those with even an elementary knowledge of statistics.

The future of forensic science has much to do with evolving with the standards the courts will set over the coming years. If more states were to move to the *Daubert* criteria for evaluating expert testimony, it is more likely that a portion of the more subjective-heavy analyses of forensic science would be decommissioned. While many would argue that this is a necessary and overdue development in forensic science, a good portion of these forensic

services do offer value to investigators that may or may not be lost. For example, there is no reason that investigators or litigants should not continue to use these services to provide this value—it is just that the information found in the final reports of these investigations must be used only to help someone make a case and would not be allowed at trial. As previously suggested, these analyses can lead to further inquiries, which may break cases wide open, whether they are civil or criminal.

As a conglomerate of professions, the forensic sciences are actively overhauling their professional codes of ethics to address the rash of cases in which rogue forensic scientists were falsifying reports, doing bad science, and egregiously overstepping their bounds as expert witnesses. While frauds exist in every aspect of life, any person who harms the liberty of another person just for personal gain or lack of professionalism is surely the most despised from both within and outside of the professions. Even entire crime labs have been identified as corrupt. Accreditation that is monitored by professional organizations, and making these accreditation processes more robust, have been seen as ways to begin to root out such problems before they begin. This accreditation must be maintained throughout one's professional career and through the duration of a lab's existence.

On a final note, much investment has been made in professionalization and the encouragement of continuing education and training to assist forensic practitioners in expanding their knowledge base. This will assist these professionals in keeping up with the state of the art in the fast-paced world of science and technology, and their advancement. The most recent U.S. presidents have also made commitments to expand forensic science research and development, particularly in the DNA analysis and human identification areas. Such advances in technology will be key for many years to come in the U.S. criminal justice system's capacity to solve crimes, seek justice, and learn truths about the many mysteries that will confront it.

YOUTH GANGS

LORINE A. HUGHES

University of Nebraska at Omaha

JAMES F. SHORT JR.

Washington State University

After some time out of the media spotlight, youth street gangs have made their way back. News coverage of drive-bys and crimes committed by persons with “possible gang ties” appear regularly alongside *Gangland* documentaries chronicling the rise and fall of notorious gangs and their leaders. Occasionally, these stories tell of successful law enforcement efforts to dismantle the gang by “cutting the head off the snake,” as anonymous informants reveal coveted gang secrets and boast of their role in bringing down those who had somehow betrayed or disrespected them. Joining the usual suspects in Chicago and Los Angeles at the center of public scrutiny and fear are gangs and gang nations such as the United Blood Nation and Double II’s on the East Coast, Nortenos and Surenos in the Southwest, and MS-13 (Mara Salvatrucha) everywhere in the United States.

By contrast, with few exceptions, recent scholarly attention to gangs has become stagnant, lacking fresh insights and the intellectual spirit out of which it was born. Not everyone will agree with this assessment, noting that more than two decades passed between Frederic Thrasher’s (1927) landmark study and the pioneering work of Albert Cohen (1955), Walter Miller (1958), Richard Cloward and Lloyd Ohlin (1960), Irving Spergel (1964), James Short and Fred Strodbeck (1965), Gerald Suttles (1968), and Malcolm Klein (1969, 1971). Attention to gangs has followed a sometimes cyclical and faddish course, and important research occurred in the United States and elsewhere

during the 1980s and 1990s. However, movement forward requires greater recognition of the problematic nature of gangs, better integration of empirical research concerning the efficacy of gang control efforts, and new research tools that are both theoretically and empirically reliable and valid. Roughly a decade into the 21st century, it is time to take stock and to assess the relevance of gangs to criminology and vice versa.

Definitional Issues

Definitional issues distort and confound understanding of what gangs are, why they behave as they do, and what to do about them. Disagreements exist in law, and among and between law enforcement agencies, social agencies, schools, media portrayals, the general public, and academic researchers. One knowledgeable observer likens the process of “deciphering and doing something about modern street gangs” to “interpreting inkblots” (Papachristos, 2005).

Despite such ambiguity, a great deal is known about the history of gangs and the forms they take in modern societies. In addition, it is universally agreed that gangs contribute substantially to such social problems as juvenile delinquency, crime, and racial/ethnic and community tensions. In extreme form, they may also be involved in ethnic wars and terrorism. More will be said about each of these problems below, but first the definitional issues are addressed.

The main concern in this chapter is with a particular type of gang, namely, the *youth street gang*. All definitions of youth street gangs include the following elements: They are unsupervised groups of young people that meet together with some regularity and are self-determining with respect to membership criteria; organizational structure; and the sorts of behavior that are considered acceptable and, in some cases, necessary for belonging. Rather than being products of adult sponsorship (such as church-, social agency-, or school-sponsored groups), they form and develop out of interactions and decisions among young people on their own terms.

For most young people in most societies, “hanging out” with one’s friends is an important part of growing up, and for many, “that old gang of mine” is a normal part of making the transition from childhood to adulthood. Gangs become problematic when they engage in crime or delinquency; conflict with each other; or otherwise disrupt families, schools, and other institutions. Perhaps because most of the gangs studied by social scientists are involved in delinquent or criminal behavior, many social scientists include law breaking in their definitions of gangs. Others do not, preferring to avoid the logical problem of including in their definitions the very behavior they wish to explain.

The most systematic attempt to overcome this problem has been made by the Eurogang Research Program (ERP), an international effort to understand gangs and other troublesome youth groups in European nations. Although the primary goal of the ERP is to study groups involved in crime and delinquency (which is included in the ERP definition of gangs),¹ the opportunity exists to study other collectivities, and to follow changes in their membership, structure, behavior, and other characteristics helpful in explaining their differences from gangs.

A commonly adopted solution is to be as specific as possible about the group(s) being studied: why they are of interest (because they have been identified as problematic by the police, by a social agency, or by observation, for example), their members and criteria for membership, behavior and organizational structure, cultural style and symbolic markers (often including speech, group colors, tattoos and scars, clothing, and jewelry), and location in social space—that is, how they relate to each other and to their communities.

The Chicago School of Urban Sociology

Specific definitional criteria have long influenced the way in which criminologists think about and study gangs—and, consequently, what has been learned about them. Rooted in the tradition of the Chicago School of Urban Sociology, early studies tended to view and present gangs as products of their environment, directly and indirectly shaped by (and shaping) their relations with neighborhood adults, local agencies and institutions, and each other. Gangs, therefore,

were to be understood as part of a complex story *unfolding* in the real world. Even as disciplinary emphases shifted to grand theory and opportunity structures in American society, researchers remained open to new discoveries in the field and to identification of mechanisms by which problems in the broader class system translated into behavior on the streets. Having intentionally exposed themselves to “data not specifically relevant to existing hypotheses concerning gang delinquency,” for example, Short and Strodtbeck (1965, pp. 24–25) and their research team (with the Program for Detached Workers of the YMCA of Metropolitan Chicago) quickly realized that there was more to gangs than suggested by the macrolevel theories they had set out to test, that the behaviors observed by street workers and graduate students in situ could not be fully explained without reference to the specific contexts in which they occurred.

“Keeping a window open” on the daily lives of gang members and their behavior, individually and collectively, Short and Strodtbeck (1965) conceptualized street gangs and their behaviors as products of ongoing processes rather than as a series of disjointed pathological outcomes. Much like Thrasher (1927), they came to view the gang as the primary social world of its members, and they suggested that the decisions of members, especially leaders, to engage in violence and other serious delinquency were better understood as a product of group dynamics than as exaggerated reactions to middle-class America. Indeed, much of what previously had been taken as evidence of short-run hedonism and flouting of conventional norms appeared, under closer scrutiny, to reflect a rational balancing of immediate status losses or gains *within specific gang contexts*.

Klein’s research (1969) identified gang cohesiveness as the “quintessential” group process. Based on analysis of research data from a 1960s street worker program (the Group Guidance Project) in Los Angeles County in California, Klein suggested that “a group-work approach to gang intervention may inadvertently defeat its own purpose” (p. 135), increasing feelings of attachment to the gang and willingness to engage in delinquency with other gang members. Before this link could be examined systematically, however, street worker programs faded in popularity. As a result, there have been few opportunities to consider more “active development of alternatives to gang participation” (p. 135) or to reconcile Klein’s findings with other research showing the risk of gang delinquency to be highest during periods of low, not high, group cohesion.

Outside the academy, multiple social and political movements, some quite militant, converged during this period, polarizing society and fostering a climate in which some street gangs became politically and economically active in Chicago’s black ghetto and elsewhere. In Chicago, with the help of private foundation and federal agency grants, programs attempted to promote and institutionalize efforts begun by a few street gangs to better themselves and their

communities. Money poured into the hands of three black gangs boasting membership in the thousands and expressing publicly their intent to “go conservative,” that is, legitimate: Black Stone Rangers, Devil’s Disciples, and the Conservative Vice Lords. Almost as soon as these programs were launched, however, they were overshadowed by massive rioting touched off by Dr. Martin Luther King Jr.’s assassination and by growing resentment among police and local businesspeople toward what they viewed as preferential treatment of predatory teens. Allegations of fraud, mismanagement of funds, and downright failure quickly followed. Recalling this history, as noted elsewhere (Hughes & Short, 2006),

Defenders of the projects attributed failure to resistance by police and local authorities or to the lack of expertise required of such enterprises. Critics charged that the projects were riddled with fraud and that the gangs used government resources as a front to their continuing criminal activities. The U.S. Senate Permanent Subcommittee on Investigations of the Committee on Government Operations (named the McClellan committee, after its chairman, Senator John McClellan) documented massive fraud in the Manpower project and the tortured path by which the grant from the Office of Economic Opportunity was secured. Running throughout the committee hearing documents are the political struggles between The Woodlawn Organization (TWO, which received the grant), Reverend Fry (minister of the church in which many gang meetings occurred), and Chicago officialdom, including the Police Department and the Mayor’s office. Although the committee’s findings were tainted by charges of committee bias and harassment by police and other authorities, the troubles it highlighted were followed shortly after, in 1969, by Chicago Mayor Richard Daley’s “war on gangs.” Controversy continues concerning both the programs and official responses to them, including charges that some prominent gang leaders were “framed” by officials. (pp. 45–46, citations omitted)

During this turbulent era, major changes also occurred in the academy. Study of the human ecology of the city and the diverse and sometimes conflicting forces within local communities grew increasingly rare in sociology, as survey research methods and preoccupation with grand theory came to dominate the discipline. Although the Chicago School tradition continued to live on in the work of gang researchers such as Joan Moore (1978), whose *Homeboys* study extended Suttles’s (1968) *The Social Order of the Slum* to analysis of barrios of East Los Angeles, the 1970s may be best remembered as a decade of transition, in between the social problems approach of Chicago-style inquiry and the research paradigm that followed.

The Variables Paradigm

Hoping to correct common misconceptions of Chicago sociology in the 1920s and 1930s, Martin Bulmer (1984)

noted that an “emphasis on field research and personal documents, though certainly a distinctive feature, is far from the whole story. . . . Notable developments in early quantitative methods took place which tend to have been ignored” (p. 188). For evidence of such methodological coexistence in the study of gangs, one need look no further than Thrasher (1927), whose commitment to the collection of social facts demanded both qualitative and quantitative approaches. Picking up where Thrasher left off, the subsequent generation of researchers tended to blend then-sophisticated quantitative analyses with qualitative insights, relying on both to bring gangs into clearer focus.

As the popularity of the group work approach to gang intervention waned, comprehensive research efforts became increasingly difficult to sustain. Throughout the 1980s, and especially the 1990s, studies of gangs divided sharply along methodological lines. The survey data approach, with its ease of administration and quick turnaround to publication (compared to field research), fit well within the new “variables paradigm” dominating sociological inquiry. Surveys and statistical manipulation of data obtained from official records also suited the interests of government funding agencies in quantitative findings obtained quickly, objectively, and for purposes of gang control policy. In addition, crack cocaine had exploded onto the American scene, and despite conflicting evidence, the frequency of hustling activities among individual gang members convinced many within and outside of law enforcement that gangs had assumed violent control over the drug trade and become virtually synonymous with organized crime. Furthering this perception were soaring rates of gun violence and gang homicides; high-profile convictions of ranking members of the Gangster Disciples and their imprisoned leader, Larry Hoover; big-screen movies, such as *Colors* (1988) and *Boys N the Hood* (1991), which drew national attention to the often deadly rivalry between L.A.’s Crips and Bloods; news reports of drive-by shootings claiming the lives of gangbangers and innocent bystanders alike; and the growing prominence of hypermasculine gangsta rap and related industry feuds. What everyone now wanted to know was how many gangs and gang members were out there, who these people were, and how much crime they were committing.

Such questions required answers only quantitative studies could provide. Surveys of law enforcement officials, analyses of police and court records, and self-reports by youth in institutionalized and noninstitutionalized settings were all employed in an effort to determine the overall scope of gang problems.² In addition, although the data occasionally were contradictory, a consensus emerged identifying the typical gang member as a young minority (black or Hispanic) male living in an inner-city urban area plagued by a host of neighborhood, educational, or family challenges. Bolstered by analyses of longitudinal self-report data, quantitative studies also provided the clearest

and most convincing evidence that *something* about gangs *causes* its members to behave badly.

Explanation of this “something,” together with the reasons behind the formation and evolution of gangs, should have been the next order of business, but the shift toward quantitative research methodologies was so strong and pervasive that etiological inquiry suffered. By their very nature, survey research and analyses of official records focus primarily on *individual* gang members, rather than on the complexity and dynamics of gangs as *groups*. Even field research came to be based primarily on in-depth interviews with former and current gang members. Although these studies yielded important insight into the attitudes, experiences, and activities of gangs and gang members, including females and Asians in the United States and elsewhere, too often they lacked attention to the contexts of these young people’s lives.

Bringing Context Back In

Mercer Sullivan (2006) questions whether studies of gangs distract attention from the larger problem of youth violence. His point is well taken inasmuch as gang research obscures the nature of young people’s associations with one another and the influences that shape their lives. Viewing gangs as “fractals” of crime and violence, as “official” definitions and data would have it, ignores the myriad forms of behavior among gang youth and the conditions under which they behave badly as individuals, clique members, or in large (possibly, named) groups. Understanding such varied patterns requires attention to context.

Toward this end, it is especially important to build on the insights of ethnographic studies of gangs, a few good examples of which must suffice. Ruth Horowitz (1983) carefully documented status considerations within the gang and the complex interplay between gangs and their environments. Other ethnographers, sensitive to process, likewise situate their observations of gangs within broader contexts. Mark Fleisher’s (1998) study of the day-to-day lives of the Fremont Hustlers, a “gang” of white teens in Kansas City, chronicles the changing nature of the group and its influence on behavioral choices by individual members, and how they add to already troubled family and other problems. Researchers such as Sullivan (1989), John Hagedorn (1988), James Diego Vigil (1988), and Sudhir Venkatesh (2000, 2008) document the subtleties and complexities of local social orders in which gangs play an important role.

In addition to ethnographic research, network analyses in Chicago and elsewhere add to knowledge of the social relationships within and between gangs, and the integration of qualitative and quantitative methods offers new insights into the group processes leading to violence and the avoidance of such behavior. Comparative multisite, multimethod, and substantively diverse analyses are also

beginning to develop, highlighting the need to understand gangs from more than one perspective.

“Levels of Explanation,” “Capital,” and the “Code of the Street”

Attempts to explain gangs take many forms: examination of characteristics of individual gang members or their communities, for example, or the nature of group behavior or the worldwide forces that impact each of these. Such different levels of explanation require different methods of research and data that serve different purposes. Although findings occasionally may seem contradictory, they are, and should be, complementary. Like all other phenomena of interest to criminologists, gangs and gang members cannot be understood apart from the extremely varied spatial, temporal, social, and cultural contexts in which they are embedded.

Among the most important of these contexts in the United States are historical patterns of immigration, migration, social and cultural conflict, accommodation, and assimilation. Following the Revolutionary War, as the country became more industrialized, immigrants flooded into rapidly growing cities and intensified existing problems of social control. Ethnic conflict involving gangs of immigrant Irish (young and old) versus “nativists” were common (Asbury, 1927), a pattern repeated throughout the 19th-century influx of new white ethnic immigrants. Youth street gangs were problematic during this time, but even they tended to follow the paths of their ethnic progenitors, assimilating and accommodating to America as part of an ethnic enclave or without primary ethnic identity.

The historical pattern of ethnic succession characterizing U.S. communities and their gangs has changed a great deal since these early years. Recent immigration streams to the United States have come from a large number of Central and Latin American countries, as well as from Asia and the Near East. Street gang formation and distribution within this country reflect these patterns, showing especially high concentrations among rapidly growing Latino populations. Contrary to trends observed among white gangs, however, the problem of black street gangs only worsened during this period, and Henry McKay’s (1969) optimistic conjecture that blacks in northern U.S. cities would follow the path of their European predecessors (i.e., assimilation into middle-class American society) proved sadly mistaken.

Despite advances in the civil rights of minorities and changed economic conditions that have provided opportunities for the integration of many, those who have been left behind increasingly are relegated to the status of a “permanent underclass” in many U.S. cities. This underclass can be located ecologically in terms of such conditions as unemployment, welfare, educational deficits, and broken families, but William Julius Wilson (1978, 1987, 1996) points to concentrated poverty and isolation from mainstream social and economic opportunities as the defining characteristics of this population and as the primary

villains in the production of crime; gang delinquency; “off the books” illegal enterprises; and, ultimately, ineffective social control (cited in Venkatesh, 2006).

Recent empirical and theoretical research linking the structural characteristics of neighborhoods to individual behaviors has helped bridge macro-, individual, and micro- (interaction and situational) levels of explanation. Building on the “social disorganization” thesis of the Chicago School of urban sociology, which attributed contrasting trends among communities to the relative effectiveness of their social control organizations and institutions, Robert Sampson and colleagues (Sampson, Morenoff, & Earls, 1999; Sampson, Raudenbush, & Earls, 1997) link crime to specific dimensions of neighborhood social capital, including *intergenerational closure*, *reciprocated exchange*, and *informal social control and mutual support of children*. Together, these dimensions comprise what they term “collective efficacy,” a property of neighborhoods and communities based on mutual trust and shared expectations that residents will take responsibility for each other’s children. When neighborhood characteristics hinder collective efficacy, crime and disorder flourish alongside street gangs and other troublesome youth groups. A major consequence for young people in such environments is limited “street efficacy,” that is, the “perceived ability to avoid violent confrontations and to be safe in one’s neighborhood” (Sharkey, 2006, p. 920).

Growing up in deprived neighborhoods and families, capital-deficient youth search for other ways to *be somebody*. Many young black males find themselves, in Elijah Anderson’s (2008) felicitous phrasing, “against the wall” in American society and, in the interest of survival and the search for self-respect and status, craft a public image out of unique styles of dress, mannerisms, and behaviors compelled under the “code of the street.” Described by Anderson (1999) as an emergent but pervasive value system based on achieving respect through violence, street codes have been documented in a variety of settings, especially the most disadvantaged neighborhoods in which gangs and gangbanging flourish. To outsiders, what transpires in these environments is evidence of depravity and perversity, attributable mainly to personal problems and shortcomings. For those more directly involved, however, adherence to the code of the street may simply be common sense. Reviewing *The Violent Gang* (Yablonsky, 1962), for example, R. W. England (1965) noted that description of the “Balkans” gang as an unstable “near-group” led by five sociopathic youth can be interpreted just as readily in a manner consistent with the code-of-the-streets thesis:

In a society that motivates toward the achievement of success and notoriety, the disadvantaged slum boy with limited social ability and training can achieve a simulacrum of these goals through the use of an elemental violence which serves as a ready means for upward social mobility within the gang and, to some extent, in the larger society. (p. 639)

Like other subcultural adaptations, the code offers to its adherents status criteria that are within reach. Those who succeed are afforded street credibility and given their due “props,” some even rising to the rank of “ghetto star,” “badass,” “O. G.” (original gangsta), or “veterano.” Such street capital is the currency among those lacking in economic, political, social, cultural, and human capital and resources. Gangs are an important part of this picture, offering young people the chance to negotiate, albeit not always successfully, the difficult world around them and their place in it.

Global Contexts

Although disagreement exists concerning the precise nature of the forces comprising globalization, it is impossible to deny the human impact of worldwide changes in economic and political systems, international criminal enterprises, and responses to crime. Global trends, often driven by advances in technology and transportation, have transformed economies on many levels of organization. The most devastating effect for inner-city local economies has been the loss of well-paying manufacturing jobs. Once providing avenues of mobility out of poverty and poverty-stricken neighborhoods, these jobs have moved to the suburbs and, in many cases, to developing and third world countries in which human labor is easily exploited.

Extending the argument of Wilson (1987) in the United States, Hagedorn (2008) argues that an important result of global trends has been the emergence of large-scale underclass populations in many cities throughout the world. Hagedorn’s “world of gangs” thesis paints a very different picture of gangs than did research carried out during much of the 20th century. Contrary to Thrasher’s (1927) emphasis on the spontaneous emergence of street gangs out of common interests and play groups, for example, Hagedorn argues that the forces of globalization have transformed and *institutionalized* traditional street gangs and created new collectivities of “armed young men.” Hagedorn adopts the view that a “new geography of social exclusion” increasingly affects the “Fourth World,” comprising “large areas of the globe, such as much of Sub-Saharan Africa and impoverished areas of Latin America and Asia,” and is “present in literally every country, and every city” (cited in Castells, 2000, p. 168). Large numbers of young people in these places have been displaced by intertribal conflict and genocide, pressed into military service, sexually enslaved, recruited into drug distribution, and forced to adapt to other extreme conditions. Although such devastations are not limited to young people, the effects of exposure to violence and posttraumatic stress disorder—previously observed among military veterans, street gang members, and victims of crime and torture—may be especially harmful and lasting among youth. In some countries, entire generations of children have become victims.

Despite Hagedorn's (2008) defense that "gangs are not a unique form but one of many kinds of armed groups that occupy the uncontrolled spaces of a 'world of slums'" (p. xxiv), his amorphous definition of gangs as "alienated groups socialized by the streets or prisons, not conventional institutions" (p. 89) obscures important distinctions among and between "street gangs" and other gangs in levels of alienation, armament, and unconventional socialization. Child soldiers and other groups of armed young men (and young women) have become a tragic reality, no matter their differences from street gangs. However, Hagedorn's impressive documentation that such groups exist in many parts of the world fails to provide the sort of rich, locally contextualized information needed to answer questions of how, why, and under what conditions they develop into a street gang or "morph into an ethnic militia, a fundamentalist paramilitary group, or a drug cartel" (p. 22). His overall theme that the ubiquity and permanence of racism and the black/white divide trumps social class and the underclass thesis fits uncomfortably with armed conflicts involving other groups and with huge variations in intergroup relations based on class distinctions in the United States and elsewhere.

However, Hagedorn's (2008) insistence that gangs are "social actors" rather than passive reactors to oppressive conditions is surely correct, as confirmed by a number of researchers. Venkatesh (2000) links the emergence of street gang control of the distribution of crack cocaine in Robert Taylor Homes (on the South Side of Chicago), the largest public housing complex in the world, to a combination of the disappearance of legitimate work, weakened police and Chicago Housing Authority control, and the compensatory rise of indigenous forms of social control within the massive complex. Indigenous forms of control included gang leaders and members who provided "protection" for legitimate as well as underground businesses and "enforcement" of informal contractual arrangements. Such arrangements were successful for a time, but in the absence of effective police protection, they proved to be too fragile to contain excesses of gang violence and harassment. Venkatesh and Murphy (2007) concur with Hagedorn in suggesting that local indigenous behaviors, including those of gangs, "can be understood as a reaction to and a manifestation of greater, global shifts that have transformed both the formal and informal structures under which communities balance local demands and relations with those of a broader, global order" (p. 153).

Gang Control

Thus far, little has been said in this chapter about efforts to address the problem of gangs, saving for last what has become an enormously important and controversial topic. Reflecting multiple points of view, the history of gang control in the United States has changed drastically since the

early days of street worker programs, an indirect descendent of the Chicago Area Project emphasizing community organization. Fast forward roughly 50 years, and the picture appears quite different. Weapons, drugs, money, and cars have all made gang violence more deadly, fueling American society's long-term reliance on the police and the nation's prisons for "suppression" of such problems.

Although programs emphasizing suppression have dominated gang control policy, little success can be demonstrated that is based on rigorous evaluation. Malcolm Klein and Cheryl Maxson (2006) express skepticism, however, noting that the vast majority of gang control programs in the United States have targeted individuals rather than groups, thus ignoring the group processes and structures that are so important to gang behavior. A few consequences of this approach are illustrated by anthropologist Elana Zilberg's (2007) ethnographic study of criminal, immigration, refugee, and human rights law within and between the United States and El Salvador. Zilberg studied the rise and decline of Homies Unidos, "a transnational youth violence prevention organization," an organization of young people, many of them members or former members of Salvadoran gangs who had been deported from the United States:

Homies functions as a liaison between gangs, civil society, and the state, and is one of the only alternative spaces of representation available to gang and deported gang youth. While the organization works with gang-affiliated, -alleged, and -impacted youth in general to redirect the gang structure, its disciplines, and its solidarities into tools for stopping the violence committed by gangs and against gangs, it also functions as a support group for gang members deported from the United States who are seeking an alternative to violence. (p. 62)

Pointing to the paradox that the United States has championed both human rights legislation and draconian law enforcement policies with respect to street gangs, Zilberg (2007) attributes the declining effectiveness of Homies Unidos to the "boomerang effects of the globalization of zero tolerance policing strategies" (p. 83), which undermine their efforts by treating members of the organization as active gang members. Further, to earlier criticisms that deportation globalizes gangs and gang violence, she adds that the U.S. policy of forced exile has had especially devastating effects on the identity and future prospects of targeted youth.

As indicated by recent calls for expanded police gang units and punitive legislation such as the Gangbusters' Bill, suppression is likely to remain for some time the single most popular strategy for dealing with gang problems. However, there is growing consensus concerning the need to get past "business as usual" and focus on community involvement, investment, and institutional support. In California, for example, authorities continue to experiment

with civil gang injunctions and other civil—as opposed to criminal—remedies, albeit often involving legal controversy. The Office of Juvenile Justice and Delinquency Prevention has supported the (Irving) Spergel model for a comprehensive, community-wide approach to gangs, seemingly embracing the importance of prevention and intervention as well as suppression. The Gang Resistance Education and Training (GREAT) program brings gang education to many classrooms throughout the country, and encouraging results have been reported for Operation Ceasefire, an initiative of the Boston Gun Project. Father Gregory Boyle's Homeboy Industries, offering "at-risk and former gang involved youth . . . a variety of services [e.g., tattoo removal, job training, counseling, and so on] in response to their multiple needs," emphasizes mentoring, life skills, and "first chances" (<http://www.homeboy-industries.org>). Several other programs have placed workers (i.e., ex-gang members) back on the streets, in an effort to build capital and promote collective efficacy among gang youth and their communities.

Determining the efficacy of such programs is extremely complex, if not impossible. Few systematic evaluations have been conducted, and criteria for "success" among existing studies are often defined and measured narrowly in terms of arrest, prosecution, and incarceration. The issues discussed in this chapter underscore the need for an expanded view of gangs and strategies for their control. In addition to problems of capital and their effects on families, communities, and individual socialization, both in the short and long term, much greater attention must be paid to the relationship between prison and street gangs. In view of America's heavy reliance on incarceration and suppression as means of crime control, it is also important to understand the nexus of prison and street. Since James Jacobs (1977) documented the dramatic rise of Chicago gangs in an Illinois maximum security prison during the 1970s, the consequences of prison gang influences on the street, as well as street gang activity behind bars, have received little consideration.

Conclusion

Understanding gangs and the control of their behavior has become much more complex as a result of social change at global, national, and local levels. Immigration continues to change the face of this country, as people come from all over the world in search of a better life. Most will be welcomed and assimilate rapidly, adding to the growth of the country and American culture. Some will do much worse, contributing to and confirming stereotypes that both fuel and reflect intergroup conflict and competition over scarce resources.

To young people facing the impacts of such broad changes in society, in school, at home, on the streets, and in their communities, gangs represent an attractive means by which to negotiate and capitalize on their daily

lives. In return for the often high, sometimes deadly, costs of "putting work in," gangs offer protection, friendship and belonging, status, and material comforts. David Brotherton (2008), long-time student of the Almighty Latin King and Queen Nation street gang in New York, suggests that gangs also provide members and associates with opportunities for political resistance against oppression and social control. This contrasts sharply with the history of Latino gangs elsewhere, and with the work of Thrasher (and Asbury before him), who documented the participation of white ethnic street gangs *in the service of* politicians in Chicago and New York. Latino and white gang histories, in turn, contrast with the history of failed attempts by black street gangs to achieve political power. Despite the apparently sincere efforts of some gang leaders and their followers to "go conservative," continued violent and other types of criminal behavior by gangs and their members made them easy targets for Chicago officials threatened by the prospect of politically organized black gangs.

Whatever their consequences for the politicization of gangs, it is clear that arrest, prosecution, and incarceration did not make gangs go away back then, and they are unlikely to do so today. These are strategies for dealing with the problem of individuals. Gangs are part of ongoing processes played out in the lives of young people, but heavily influenced by the world around them. Insight into these processes has been slow to develop, but decades of hard work have brought them into much clearer focus. More hard work is needed, however, to bridge levels of explanation and existing gaps in knowledge. Problems of youth violence and troublesome youth groups (including street gangs), and what to do about them, will always be present. The least that can be done is to try to better understand them.

Notes

1. The ERP consensus definition is this: "A gang is any durable, street-oriented youth group whose involvement in illegal activity is part of its group identity" (Klein & Maxson, 2006, p. 4). Although durability is subjective, this stipulation is meant to distinguish street gangs from ad hoc groups or milling crowds that engage in delinquent, criminal, or other types of troublesome behaviors.

2. Recent estimates place the number of gangs in the United States at 24,000, with approximately 760,000 active members in 2,900 jurisdictions (Egley, Howell, & Major, 2004).

JUVENILE JUSTICE

STEVEN P. LAB

Bowling Green State University

JOHN T. WHITEHEAD

East Tennessee State University

Juvenile justice is barely over 100 years old but has undergone a range of transformations. It began by introducing a new philosophy of *parens patriae* into the handling of youthful offenders and has since been transformed into a hybrid of the new philosophy and the due process approach of the adult criminal justice system. Today, juvenile justice is still seeking out its appropriate form and place in society. While it is unlikely to totally disappear anytime soon, it is unknown exactly what it will look like in the future.

History

The history of juvenile justice is a relatively short one. While deviance on the part of young persons has always been a fact of life, formal, organized societal intervention and participation in the handling of juvenile transgressors has gained most of its momentum in the last 100 to 150 years. Throughout most of history, youthful members of society did not enjoy a separate status that brought with it a distinct set of expectations, behaviors, and privileges. Once an individual reached the age of 5 or 6, he or she became a full-fledged member of society and was expected to act according to the same mandates placed on all “adults.” This extended to the realm of legal sanctioning, where children were viewed as adults and were subject to

the same rules and regulations as adults. There did not exist a separate system for dealing with youthful offenders. The law made no distinction based on the age of the offender. While the law allowed for and prescribed harsh punishments, there is some question regarding how frequently the more serious actions were actually used. Indeed, a process of nullification, or refusal to enforce the law against children, took place because of the lack of penalties geared specifically for juvenile offenders.

Changes in how to deal with problem youths emerged in the early 1800s as American society was undergoing major shifts. During this time, industrialization was drawing people to the cities. This movement resulted in overcrowded cities inhabited by people from diverse backgrounds with limited skills and education. Such growing diversity was especially true of cities in the United States, which were attracting immigrants from a wide range of European countries. This population growth also resulted in a great deal of poverty in the cities.

Methods for dealing with offending youths grew out of the establishment of ways to address the growing urban poverty. The primary method for dealing with the poor entailed training the children of the poor. Key to this training was removing children from the “bad influences” and substandard training of their poor parents. The institutions in the early 1800s in the United States were intended to provide skills training to the youths so they would become

productive members of society and not threats to others. The failure of these early institutions to adequately address poverty and juvenile offending led to the establishment of a formal system for handling problem youths.

The Juvenile Court

The beginnings of the juvenile justice system are pegged to the establishment of the juvenile court in Cook County, Illinois, in 1899. The legislation that established the Illinois juvenile court reflected the general belief in the ability to alter youthful behavior. First, the court was to operate in a highly informal manner, without any of the trappings of the adult court. Lawyers and other adversarial features of the adult system (such as rules of evidence and testimony under oath) were discouraged. The judge was to take a paternal stance toward the juvenile and provide whatever help and assistance was needed. The emphasis was on assisting the youth rather than on punishing an offense. Second, all juveniles under the age of 16, regardless of whether they had committed an offense or not, could be handled by the new court. The court could intervene in any situation where a youth was in need of help. In practical terms, this allowed intervention into the lives of the poor and immigrants, whose child-raising practices did not conform to the ideas of the court. Third, the new court relied extensively on the use of probation for both administrative functions and supervising adjudicated youths.

The reforms that led to the establishment of juvenile courts also had other influences. One impact was a gradual widening of the juvenile court's mandate to include intervention for criminal activity, dependency, and neglect, as well as status offenses such as curfew violation and incorrigibility. A second area of change involved the development of new institutions for handling youths who needed to be removed from their families. These institutions closely followed the family/cottage model used throughout the late 1800s, with the greatest distinction being administration by the juvenile court. Third, the court relied on full-time, paid probation officers. A final major movement was the institution of court-affiliated guidance clinics. These clinics relied on the emerging psychological and sociological explanations for behavior. Central to these explanations was the need for the expert examination of each juvenile in order to identify the unique factors contributing to the individual's behavior.

The Legal Philosophy of the New System

Perhaps the greatest challenge to the growth of juvenile justice entailed debate over the philosophy of the court and the question of a juvenile's constitutional rights. Critics of the

court and earlier interventions often claimed that the state was subjecting juveniles to intervention without regard to their rights and those of the family. In many instances, the state was forcibly removing a youth from his or her parents' custody. These new interventions were viewed as an abrogation of the family's position in society. However, the problems of constitutional rights and the new juvenile justice system were deemed inconsequential compared to the possible benefits that could accrue from intervention. Indeed, the state relied on the doctrine of *parens patriae*, or the state as parent, for justification of its position.

The case *Ex parte Crouse* (1838) stated that the Bill of Rights did not apply to youths and argued that the public's interest in the education of its members gave it the right to intervene despite the wishes of the parents. In essence, the state could intervene, regardless of the reason, if it found that the child was in need of help or assistance that the parents and family could not or would not provide. This belief in the court's right to intervene at any time, providing the goal was to help the youth, remained largely unchallenged until the late 1960s.

Challenges to the *parens patriae* doctrine through a growing number of court cases in the late 1960s and early 1970s were signals of major changes in society's approach to both juvenile misbehavior and adult criminality. Cases including *In re Gault* (1967), *In re Winship* (1970), *Kent v. United States* (1966), and *McKeiver v. Pennsylvania* (1971) challenged the good intentions of the juvenile court and introduced the need for providing some constitutional due process protections to youths. In addition, the strong reliance on and belief in rehabilitation and treatment that dominated throughout the 20th century were joined by retribution, just deserts, and deterrence in the juvenile justice system.

Despite these changes, *parens patriae* remains the key philosophy underlying juvenile courts in the United States. This is illustrated in an inspection of the "purpose clauses" for juvenile courts found in state statutes. There are five general categories of juvenile court purpose clauses—Balanced and Restorative Justice clauses; Standard Juvenile Court Act clauses; Legislative Guide clauses; Punishment, Deterrence, Accountability, and Public Safety clauses; and Traditional Child Welfare clauses (Griffin, Szymanski, & King, 2006). In only 1 of the 5 categories (Punishment, Deterrence) is *parens patriae* largely excluded and the emphasis shifted to an adult court/criminal law orientation for the juvenile court. The other four categories maintain *parens patriae* as at least a key component (if not directly named) in addressing problem youths.

The shift in juvenile justice to a more adversarial, due process model elicits a wide range of problems and issues within the system. Among these is the introduction of attorneys (on both the prosecutorial and defense sides), the transfer or waiver of youths to adult court processing, divesting the court of jurisdiction over status offenders, and various transformations in the juvenile court itself.

Attorneys in Juvenile Court

The introduction of attorneys to juvenile proceedings raises several concerns, among which is the availability of attorneys, their role in the court, and their effectiveness. First, it is important to note that many juveniles do not have attorneys. It is not uncommon for juveniles to waive their right to an attorney, often because they do not fully understand their rights, especially the importance of the right to legal representation. When juveniles do utilize an attorney, they often rely on public defenders who are burdened by very high caseloads that can range from 360 to 1,000 cases per defender (Jones, 2004). The public defender system often faces problems of insufficient funding, lack of training, high turnover, low prestige, and low salaries. Low pay rates in juvenile justice do not help to attract or retain competent attorneys. In addition, the juvenile court (often called “kiddie court”) is not considered prestigious, and judges may pressure attorneys into taking cases and cooperating.

Many public defenders and private attorneys are reluctant to fight as hard as possible for all youthful defendants, even those who have admitted that they are factually guilty. They argue that such advocacy is inappropriate when the goal is to help the youths rather than punish them. In juvenile court, some attorneys and judges worry that strong advocacy can result in an outcome where a child who “needs help” will not get it because a failure to establish a delinquency petition leaves the court with no jurisdiction over the child. As a result, at least some attorneys assume a concerned adult role rather than a zealous advocate role, encouraging youths to admit to petitions in cases in which an adversarial approach may have resulted in a dismissal of the petition. In a survey of 100 court workers in three juvenile courts, Sanborn (1994) found that 8 out of 10 workers thought that attorneys gave inadequate representation. In fact, 1 out of every 3 was of the opinion that attorneys engaged in behaviors that undermined a fair trial for their juvenile defendants. In addition, about 25% of the respondents thought that defense attorneys would not vigorously represent their youthful clients, and 29% claimed that attorneys acted like guardians rather than zealous advocates.

One qualitative study indicated that attorneys expressed considerable concern for their youthful clients but that they were not always sure of the correct course of action. Attorneys felt that their youthful clients were often passive about decisions such as pleading guilty, and thus the attorneys were unsure of who was making the decisions and the degree to which the youths were making informed choices (Tobey, Grisso, & Schwartz, 2000).

The increased participation of attorneys in the juvenile system is also evident in the growth of prosecutorial participation. Where the initial decision on whether to file a petition and detain a youth traditionally rested with the intake officer, today these decisions often require the approval of the prosecutor. The prosecutor’s approval of the probation officer’s decision to file a petition ensures that the

legal criteria exist for a properly authorized petition. The prosecutor checks the legal wording of the petition, determines that enough evidence is available for establishing the petition (finding the delinquent or status offender “guilty”), and makes sure that the offense occurred in the court’s jurisdiction and that the child was of proper age at the time of the offense.

Because of the importance of such legal criteria and because of the growing emphasis on more punitive juvenile models, some jurisdictions have turned away from the traditional probation officer model of intake to models in which the prosecutor is either the first or the sole intake decision maker. Such models are consistent with more legalistic views of juvenile court in which the state has abandoned the traditional *parens patriae* philosophy.

A further development is that the prosecutor is now taking on increased responsibility in juvenile cases as more and more states are allowing prosecutors to file cases directly in adult criminal court. In addition to the traditional waiver (transfer), several mechanisms allow prosecutors to proceed against juveniles in criminal court: concurrent jurisdiction; statutory exclusion; presumptive waiver; reverse waiver; and once an adult, always an adult statutes. Bishop (2000) estimates that approximately a quarter million youths under 18 were prosecuted as adults in 1996.

Research has shown some interesting results concerning the effectiveness of attorneys in juvenile court. Recent American Bar Association investigations of juvenile courts produced several disturbing findings. First, significant numbers of youths did not have representation, and many others had ineffective counsel due to lack of preparation or training. For many youths who have attorney representation, the quality of that representation is questionable. At detention hearings, attorneys often have little chance to confer with their juvenile clients and are not familiar with alternatives to detention. Most cases are resolved by pleas, and attorneys see many courts as simply interested in dispensing treatment or punishment. Probation officers also make disposition recommendations with little challenge from attorneys. At disposition, many attorneys simply do not act as advocates for their juvenile clients. Most cases are handled informally or by plea bargaining, and attorneys have little impact at disposition.

The situation in America’s juvenile courts appears to be that some attorneys are adversarial, some are still traditional and act as concerned adults, and some are in between the two extremes. Furthermore, in some states, many juveniles are not represented by attorneys. One frequent problem is simply that many juveniles waive their right to an attorney. This state of affairs raises the issue of which is the best approach: zealous advocate, concerned adult, or some compromise between the two alternatives.

The chief advantage of the zealous advocate model is that it is probably the best insurance that only truly guilty youths will come under court jurisdiction. Since the attorney does not pressure the child to admit to the petition (plead guilty), there is less danger that the court will attempt some type of

intervention program with youths who are not really guilty. An added advantage is that this approach may well generate the most respect from juveniles for the court system. Fewer youths will feel that they have been betrayed or tricked into something that some adult thought was best for them, despite their own wishes.

The biggest danger of the zealous advocate approach is that it may contribute to what Fabricant (1983) calls benign neglect. That is, since many youths appearing in juvenile court come from families wracked with problems, such as low income, public assistance, or broken homes, they need assistance. An adversarial approach may prevent these children from being railroaded into juvenile prisons or other types of intervention due to insufficient legal defense. That adversarial approach, however, does nothing about the real problems faced by these children in their homes and their neighborhoods.

The advantage of the concerned adult model is that it seeks to address the problems of the child that presumably led the child into delinquency. It also focuses on the needs of the individual child rather than applying a one-size-fits-all punishment based solely on the criminal act that took place. The problem is that this helping philosophy has been the rationale of the juvenile court since 1899, which unfortunately has not met with success.

Transfer/Waiver to Adult Court

The shift away from *parens patriae* and toward due process is evident in steps that emphasize punishment. Some states have adopted determinate sentencing statutes with an emphasis on penalties that are proportionate to the seriousness of the offense. Some states have enacted mandatory minimum provisions. This means that if the judge commits a child to the state youth authority, the law dictates that the youth must serve a certain minimum amount of time. Some states have adopted dispositional guidelines or suggested sentences for most adjudicated delinquents. Unless a case has some unusual factors, judges are supposed to sentence within the ranges stipulated in the guidelines.

Perhaps the ultimate example of this trend toward punitiveness is the move by many states to expand provisions for processing juveniles in adult criminal court rather than juvenile court. The decision to process a youth in adult court is a crucial one because it makes the juvenile subject to adult penalties such as lengthy incarceration in an adult prison and results in the creation of an adult criminal record, which is public and may hinder future opportunities for employment.

There are several methods that states use to place juveniles into adult court jurisdiction: transfer or waiver, statutory exclusion, prosecutorial waiver, and lowering the age of juvenile court jurisdiction. Traditionally, waiver or transfer was the primary method to place juveniles into adult criminal court. In 2004, a total of 46 states and the District of Columbia had statutes allowing judicial waiver

(Griffin, 2005). The waiver decision is made at a hearing, which is analogous to the preliminary hearing in adult court. At a waiver hearing, the prosecutor must show probable cause that an offense occurred and that the juvenile committed the offense. In addition, the prosecutor must establish that the juvenile is not amenable to juvenile court intervention or that the juvenile is a threat to public safety. An example of nonamenability would be the case of a youth who is already on parole from a state training school for an earlier delinquent act who then commits another serious offense (e.g., armed robbery). In 2000, approximately 5,600 juveniles were waived to adult criminal court. This was considerably below the peak number of 12,100 cases waived in 1994. Forty percent of waived cases in 2000 involved a personal offense, and 36% involved a property offense (Puzzanchera, Stahl, Finnegan, Tierney, & Snyder, 2004).

Statutory exclusion, also called *legislative waiver*, means that state legislatures rule that certain offenses, such as murder, automatically go to adult court. In 2004, a total of 29 states had exclusion laws (Griffin, 2005). The list of offenses that are excluded from juvenile court jurisdiction typically includes murder, aggravated sexual assault, robbery with a firearm, and gang-related felonies.

Prosecutorial waiver (direct file/concurrent jurisdiction) is another method for placing juveniles into adult criminal court. State law gives juvenile court and adult court concurrent jurisdiction over certain cases. Depending on the offense, the age of the offender, and the youth's prior record, the prosecutor decides whether to file the case in juvenile or adult court. In 2004, prosecutorial waiver (concurrent jurisdiction) was available in 15 states and the District of Columbia (Griffin, 2005). Another way to direct juveniles to adult court is for state legislatures to lower the maximum age of juvenile court jurisdiction.

It should be noted that 23 states allow for reverse waiver. This means that the criminal courts can return certain cases that they received due to mandatory judicial waiver, legislative exclusion, or prosecutorial waiver to juvenile court. It is also important to note that 31 states have "once an adult, always an adult" provisions. This means that all or certain categories of youths placed in criminal courts must automatically be processed in adult court for any subsequent offenses.

Still another development in this direction is blended sentencing. In blended sentencing, either the juvenile court or the adult court imposes a sentence, which can involve the juvenile or the adult correctional system or both correctional systems. The adult sentence may be suspended pending either a violation or the commission of a new crime. Fifteen states have juvenile blended sentencing schemes (the juvenile court imposes sentence), and 17 states have criminal blended sentencing laws (the criminal court imposes sentence) (Griffin, 2005).

These various transfer alternatives make it more and more likely that youthful offenders will be handled in the adult system. This action is counter to *parens patriae* but

very much in line with public sentiments for harsher punishments regardless of the age of the offender. The “get tough on crime” movement has greatly impacted the juvenile justice system.

The Case of Status Offenses

Nowhere is the *parens patriae* philosophy more evident than in the juvenile justice system’s intervention with status offenders (those who committed offenses that were only deemed crimes because of the offender’s age [status]). The rationale underlying this activity is to keep kids from progressing from these minor indiscretions to actual criminal behavior. While the juvenile justice system is no longer supposed to incarcerate youths for status offenses (although there are some exceptions to this fact), the system is still involved in working with these youths. Over the course of the past 40 years, there have been increasing calls for the juvenile justice system to completely divest itself of working with status offenders.

As states choose to shift more and more youths to adult court, should it continue to exercise control over disobedient, runaway, and truant adolescents? The state of Washington has opted to eliminate jurisdiction over status offenses. Maine has written full divestiture into law. Most states have retained jurisdiction over status offenses but implemented policies of deinstitutionalization (stopped confining status offenders in state institutions). In many places, private drug treatment and mental health facilities have stepped in to fill the void that juvenile court previously occupied.

Despite such efforts, status offenses and status offenders continue to take up a considerable portion of juvenile court time and effort. In 2005, juvenile courts handled an estimated 150,600 petitioned status offense cases, an increase of over 30% since 1995. Despite more than a decade of discussion about ending juvenile court jurisdiction over status offenses, approximately 11,000 youths were adjudicated status offenders and placed in out-of-home placements in 2005 (Puzzanchera & Sickmund, 2008). Concerns over intervening with status offenders have engendered a great deal of debate about whether the juvenile justice system should divest itself of jurisdiction or not.

There are several arguments in favor of complete divestiture. First, divestiture would allow the juvenile court more time and resources to deal with juvenile delinquents—especially violent and chronic delinquents. Since the court would not have to process or supervise status offenders, probation officers, prosecutors, public defenders, judges, and correctional program employees would be able to focus on more serious delinquents. Second, the elimination of status offense jurisdiction would prevent any possible violations of the due process rights of status offenders, such as being prosecuted for very vague charges. For example, how disobedient does a child have to be before he

or she is “incorrigible,” or how truant before he or she is eligible for a truancy petition? Status offense statutes typically are unclear and vague. Third, elimination of this jurisdiction would recognize the reality that juvenile courts are not adequately staffed and equipped to deal with status offenders. Most probation officers often have only bachelor’s degrees and are not qualified to do the social work and psychological counseling necessary to assist troubled teenagers and their families. Thus, status offenders should be diverted to private agencies with trained social workers and counselors who are better equipped to handle the complex problems of these youths and their families. Furthermore, eliminating juvenile court jurisdiction would force any intervention to be voluntary, which some argue is the proper way to deal with status offenders.

Another argument for elimination is that jurisdiction over status offenses has deteriorated the role of families, schools, and other agencies that traditionally handled, or should have handled, behaviors that fall under the rubric of status offense. Instead, status offense laws have allowed schools to run inadequate and boring programs that promote truancy and, in turn, blame parents and children for the problem. Instead of petitioning youths to juvenile court, schools should be improving instructional programs or offering innovative approaches such as alternative schools such as those where children attend school half a day and then work half a day for pay. In other words, prosecuting status offenders often is a blame-the-victim approach that ignores the real causes of the problems: inferior schools, ineffective parents, and insensitive communities.

Many commentators, however, believe that juvenile court jurisdiction over status offenses is both desirable and necessary. Proponents of continued jurisdiction contend that parents and schools need the court backing to impress adolescents with the need to obey their parents, attend school, and not run away from home. For example, repeal of status offense jurisdiction over truancy would remove the force of law behind compulsory education and allow youths to avoid school with no legal recourse by the schools or parents. Second, proponents of court jurisdiction argue that private agencies in the community will not handle (or will not be able to handle) all of the status offense cases if the juvenile court cannot intervene. Private agencies intervene only with willing clients, and many status offenders taken to such agencies simply refuse assistance. Moreover, some agencies do not provide the services they claim to provide.

Proponents also contend that status offenders often escalate into delinquent activity, and they note that truants are linked with the commission of a range of criminal offenses. Therefore, these proponents claim that early intervention can prevent current and future delinquency. This escalation hypothesis, however, is controversial. While some proportion of status offenders does indeed escalate or progress, most do not. Hence, it is questionable whether all status

offenders should be subject to juvenile court jurisdiction. A similar argument is that many status offenders become involved in very dangerous situations that can cause serious harm to the child. For example, runaways are often found to be heavily involved in drug offenses, property crimes, and acts of prostitution to support themselves. Proponents of court jurisdiction argue that it might prevent some children from running away and becoming involved in associated dangerous behaviors. A related argument is that since states intervene with adults to protect them from harmful behavior (such as drug use), the state should protect juveniles from the harmful consequences of their actions.

Another argument in favor of continued jurisdiction is that it prevents status offenders from being processed as delinquents. That is, where divestiture has occurred, there is some evidence that states have turned to treating status offenders as minor delinquents. There is concern that total removal of status offense jurisdiction from juvenile court may weaken the argument regarding why there should be a juvenile court at all. Instead, it may be possible to just move “delinquents” to the adult criminal court. The removal of status offense jurisdiction, with a concentration on delinquency only, may lead to a view of the juvenile court as concerned with crime only and, hence, a belief that adult criminal courts can exercise that function. Thus, removal of status offense jurisdiction may very well be the beginning of the end of the juvenile court.

Unlike a decade ago, the emphasis is not so much on the status offender as a distinct problem, but on those risk factors that can lead to serious, violent, or chronic delinquency. Attention to reducing risk factors and enhancing protective factors is considered to be the way to prevent such problematic delinquency. The juvenile justice system can play a strong role in addressing risk factors and encouraging activities that assist status offenders.

Proposals for Reforming Juvenile Court

The juvenile justice system continues to face calls to reform itself in light of significant levels of juvenile delinquency and its apparent failure to address youthful misbehavior. The reforms range from returning to the promise of *parens patriae*, to criminalizing the juvenile court, to abolishing the juvenile court altogether. These and other suggested reforms mean that the juvenile system is constantly buffeted by opposing forces.

Rehabilitating the Rehabilitative *Parens Patriae* Court

One approach to the problems of the juvenile court is to try to return to the rehabilitative and *parens patriae* roots of the court. Reformers who support this option think that the failures of juvenile court are failures of implementation: The juvenile court has not delivered the rehabilitation that

it initially promised. A major factor behind this failure of implementation is lack of funding. Legislators have not provided the money needed to help youths obtain education, counseling, family assistance, and vocational training. The assumption is that if juvenile courts received adequate funding and if they followed the advice of the research on effective rehabilitation programs, juvenile court could be the ideal youth court envisioned by the Progressives at the beginning of the 20th century. Juvenile court judges could act like concerned parents trying to help children.

Numerous commentators advocate both early intervention and the use of proven rehabilitation principles. They urge the use of verified risk assessment techniques so that the court can identify and focus on youth most likely to become serious, violent, and chronic offenders, rather than wasting efforts on the least serious offenders who will not offend again. In addition, they support efforts such as graduated sanctions, matching youths and interventions, gender-specific programming for girls, culturally appropriate programs for minority youths, family interventions, and the elimination of transfer to adult court.

Feld (1999) points out flaws with the argument that juvenile court failure is simply a failure of implementation and that all that is needed is a rededication to the original rehabilitative ideals of juvenile court. Feld agrees that adequate funds have not been devoted to juvenile court, but he argues that funds will always be inadequate. One reason is that there is “pervasive public antipathy” to helping the poor, disadvantaged, disproportionately minority youths who are the clients of juvenile court. Another reason is that since committing a crime is the condition for receiving “help” from juvenile court, there is a built-in punishment focus. Feld argues that providing for children is a societal responsibility, not just a responsibility of the juvenile justice system. In fact, the mere existence of the juvenile system is an excuse or alibi for not providing for poor, minority youths.

Feld (1999) also argues that juvenile court does not provide procedural fairness to children. Traditionally, some of the procedural protections of adult court, such as the right to a jury trial, have been denied children on the justification that the juvenile court was not a punitive court like adult court. Even worse than denying procedural protections, juvenile courts have treated children in similar circumstances who commit similar offenses in unequal and disparate fashion. This individualized handling was originally justified based on the supposed rehabilitative foundation of juvenile court. But since juvenile court is punitive and does not provide rehabilitation, this denial of due process safeguards makes juvenile court unfair and unjust. In summary, Feld thinks that efforts to return the juvenile court to its rehabilitative ideal are doomed to failure.

A Criminalized Juvenile Court

A second possible solution to the problems of the juvenile justice system is to “criminalize” the juvenile

court—to attempt to make it a scaled down version of adult criminal court. Two things need to be done to accomplish this. First, a criminalized juvenile court would entail providing juveniles with all the procedural protections of criminal court. Thus, children would have the right to a jury trial and would have fully adversarial defense attorneys, not attorneys who often slip into the role of a concerned parent trading off zealous advocacy for promises of treatment. A second action that needs to be taken to transform juvenile court into a criminal court for youths would be to scale down penalties out of concern for the reduced culpability of children. Sentences would be shorter in such a juvenile court compared to adult criminal court. This reform was suggested about 30 years ago by the American Bar Association and the Institute of Judicial Administration.

The major problem with the suggestion of a criminalized juvenile court is that it may not satisfy calls for a more punitive approach to juvenile offenders. Critics of the current juvenile justice system do not want reduced penalties; they want adult penalties for what they perceive as adult offenses. Such critics contend that violent offenses indicate culpability and should be punished with lengthy prison terms.

Abolishing Juvenile Court

Some critics feel that the problems of juvenile court are too extensive and too fundamental to be fixed and that it is time to abandon the sinking ship of juvenile court. Since juvenile court provides neither help nor crime control, it should be abolished. In its place, Feld (1999) proposes adult criminal court for all, both juveniles and adults.

Adult court would mean that juveniles would receive adult procedural protections. Juveniles would have the right to a jury trial, and defense attorneys would act as zealous adversaries. At the same time, Feld (1999) argues that juveniles should still get shorter sentences because shorter sentences have been a saving feature of the juvenile system and they allow youths who have made mistakes to still have a chance at a normal adult life. He fails to note that adult court sentencing for juveniles would also require some type of protection of the youth's record. In the juvenile justice system, adjudications and dispositions do not count against the individual. In other words, the youths can legally say that they have not been "arrested" or "convicted." Such legal protections against arrest and conviction records can be extremely important if one is applying for a job, college, or the military.

Opponents argue that many juveniles are now handled in adult court, and the results have been harmful for juveniles. They contend that juveniles actually receive fewer due process protections in adult court than they would in juvenile court. Instead, juveniles are simply getting punishment in adult court, not treatment.

Some critics have tried to deflect concerns about overly harsh sentences in the adult system by suggesting

that youthful offenders receive some form of reduced sentences. The problem with suggestions of discounted sentencing for youths in adult court is that even discounted sentences might not be much of a bargain. For example, if a life sentence is equivalent to a sentence of 50 years, a 16-year-old processed in adult court and receiving a 50% reduction of an adult sentence would still stay in prison until age 41. Thus, even with a youth "discount," youths processed in adult court would pay a heavy price to leave juvenile court where the maximum sentence is until age 21.

Creating a New Juvenile Court

Still another suggestion is to make a new juvenile court. Noriega (2000) suggests the creation of a new juvenile court that has two branches: one for children and one for adolescents. The children's court would be rehabilitative and would presume that children do not have criminal responsibility. The adolescent court would presume partial culpability and would be more punitive than the children's court. Waiver would be by judicial hearing only. There would be no prosecutorial or legislative waiver, and waiver would be only to the next step. Thus, children could only be waived to adolescent court, and only adolescents could be waived to adult court. Juveniles (children and adolescents) would not be allowed to waive their right to counsel. Noriega's reasoning for this is that children and adolescents are generally presumed not competent. Since they are not allowed to enter into contracts, cannot legally drink alcohol, and cannot vote or drive (until late adolescence), it is a logical extension that they be barred from making the decision on whether to waive their rights in court.

An attractive feature of this proposal is that it offers a more complex and more realistic view of child development. Instead of assuming that one day a juvenile is a child and the next day he or she is an adult, it recognizes the intermediate stage of adolescence. The impact of this approach is also probably more realistic than the results that would emerge from abolishing juvenile court and letting adult court handle juvenile matters. Adult courts are likely not going to be as caring and protective or concerned about youth discounts as advocates for that approach hope.

A Restorative Justice Juvenile Court

Some commentators suggest that now is the time to forge a new path for juvenile court. Namely, they propose adopting a restorative justice model in the juvenile justice system. This represents a radical rethinking of the role of juvenile court. Instead of sanctioning and supervising offenders, the role of the court would be to build community so that neighborhoods can better respond to and also prevent delinquency. Communities would be more involved in sentencing through community panels or conferences or

dispute resolution programs. Communities would return to their role of being responsible for youths.

Examples of this approach can be found in many communities. Young offenders are involved in service projects such as home repair for the elderly and voter registration drives. In many places, offenders are paying victim restitution out of wages from public service jobs. In Oregon, offender work crews cut firewood and deliver it to the elderly. More than 150 cities are utilizing victim–offender mediation. In Colorado and Florida, offenders work with Habitat for Humanity building homes for lower-income families. In Florida, probation officers are walking neighborhood beats to help promote local guardianship of communities. In Boston and Florida, probation officers are helping police monitor probationers at night.

A positive feature about this proposal is that many restorative justice programs are already in place. Thus, this is not a hypothetical proposal. As noted, numerous communities already are working at restorative justice. A major question, however, is how far restorative justice can go. How willing are citizens to assume the responsibilities that restorative justice would give them in deciding cases and monitoring sanctions such as community service? If people are not available to staff the restorative justice programs, they will not work. The answer to this question is that restorative justice programs are thriving in communities throughout the United States, and they are gaining momentum within both the juvenile and criminal justice systems.

Teen Courts

Another alternative to the traditional juvenile court is teen court. Here, the philosophy is based on restorative justice. Youths act as judges, attorneys (prosecutor and defense attorney), and jury members in cases involving status offenses, misdemeanors, and occasionally low-level felonies. The most common penalty is community service. Other sentences may include teen court jury duty, writing essays about offending, writing apologies to victims, community service, and monetary restitution. As of 2002, it was estimated that there were over 800 teen court programs in operation, handling over 100,000 cases per year, making them a primary diversion option (Butts, Buck, & Coggershall, 2002).

Teen court is not intended to deal with serious delinquency. Rather, it appears to be an alternative method for dealing with either status offenses or minor delinquent acts such as shoplifting or problems with alcohol or marijuana. Research has shown that these courts are capable of reducing recidivism when compared to normal court processing.

Drug Courts

Another option for reforming the juvenile court or diverting youths out of the justice system is the use of juvenile drug courts. In these courts, the judge, prosecutor,

and defense attorney collaborate as a team with drug treatment specialists. Like adult drug courts, juvenile drug courts attempt to intervene in both the criminal activity and the drug usage of clients. The courts use treatment, coordination, and extensive monitoring. The youths must appear in court frequently so that judges can monitor progress and offer encouragement or admonish the juveniles. There is frequent drug testing and there are penalties for failing to test negative. Sanctions for youths who are not following the rules can range from a warning; to an order to write a book report or paper; to doing household chores; to fines, community service hours, or even detention. There are also incentives such as the dismissal of charges and the termination of probation requirements upon graduation. Other rewards include verbal praise and various incentives such as gift certificates and tickets to local events. Drug courts usually celebrate completion with a graduation ceremony in the court that may include additional positive feedback such as providing graduation gifts to the youths.

One problem with drug courts is that they may be reaching the wrong population. If drug courts are actually intended for drug-dependent or addicted youths, they are not capturing many youths with severe drug problems. Much like the “war on drugs” in general, drug courts often paint a wide stroke that takes in more than is necessary. This means that the court is focusing on minor offenders who may be better left alone or handled in a less intrusive fashion. Society worries so much about adolescent drug use that the juvenile justice system overreacts and does too much. The “jury is still out” on the question of whether drug courts have positive effects such as reducing recidivism and drug usage. Although there are studies that claim to have had a positive result, the findings are not yet settled.

Conclusion

Juvenile justice faces an uncertain future. Despite this fact, it continues to operate (at least in part) under the *parens patriae* philosophy upon which it was built. The system now incorporates elements of due process and adapts to the changing demands placed on it. There is little doubt that this metamorphosis will continue in the future.

MASS MEDIA AND CRIME AND JUSTICE

KEVIN BUCKLER AND PATTI ROSS SALINAS

University of Texas at Brownsville

Crime and justice issues have been a stable fixture of mass media portrayal of American society. From the 1920s onward, crime appeared very frequently in tabloid journalism, especially in the context of photographic accounts of crime scenes. Since television became popularized in the United States in the 1940s and 1950s, crime has been featured extensively on television programming, including both entertainment and news programming. In terms of local television news, coverage of crime has intensified as local stations have shifted to “eyewitness” and “action news” formats (which rely on live, from-the-scene footage) beginning in the 1970s (Lipschultz, & Hilt, 2002). Crime also occupies a prominent position on many of the “infotainment”-oriented cable news network programs (on CNN, Fox, and MSNBC) that infuse entertainment elements with news elements.

This chapter focuses attention on mass media and crime and justice. This topic is very broad and encompasses too many multifaceted aspects to cover them all in the space that a book chapter provides. Media and crime studies have covered such diverse issues as the sheer volume of crime coverage by mass media (relative to other topics), the ideological content of mass media artifacts concerning crime and justice, how media organizations select certain crimes for coverage, the impact of media coverage on high-profile criminal trials, the impact of crime coverage on public opinion and public policy, and the impact of mass media consumption on how fearful a person is with respect to his

or her likelihood of victimization, to name a few. In addition, research has been done on news media and crime (relating to newspapers, national news programs, local television news programs), entertainment media and crime (relating to television programs, movies, songs, etc.), and “infotainment” media and crime.

This chapter will focus broadly on mass media and crime and justice. First, the chapter identifies a framework within which mass media behavior can be understood—from a market-oriented perspective. Distinctions between the market and public sphere models of mass media are noted. Justifications are next provided as to why it is logical to believe that market-oriented concerns have trumped public-sphere-oriented concerns in the production of mass media artifacts. This section of the chapter also illustrates how market-oriented concerns impact media decisions by discussing perspectives and research on “newsworthiness” criteria used by journalists. This section concludes with the application of the market model framework to research on entertainment media decision making.

Second, media decision making is assessed from the perspective of organizational imperatives of the mass media organization. This discussion is framed in the context of news organizations. This section focuses on how journalists create “news themes” in the reporting of news and how journalists are reliant on official sources of information. Third, research on the effects of media coverage of crime is discussed. Here, research on the concept of “moral

panics” is presented. Finally, research on the link between media consumption and fear of crime is discussed.

The Importance of Market Demands in Mass Media Production

The Market and Public Sphere Dichotomy

Personnel of mass media organizations face two overarching objectives in the production of mass media output. First, mass media organizations have an obligation to deliver information to the public in a thought-provoking manner that facilitates the further development of democracy. But even though mass media organizations have an obligation to the public they serve, in the United States these organizations are privately held companies. This fact creates a second, equally important role of media organizations—to earn profit for shareholders. In their book, *The Business of Media: Corporate Media and the Public Interest*, David Croteau and William Hoynes (2001) suggest that these two directives that media companies face often compete with one another over primacy when media personnel make decisions about what news items to cover and how to cover them.

Croteau and Hoynes (2001) call these two competing dynamics the market model and the public sphere model. In the *market model* of mass media, the media company is conceptualized as a private company that is selling a product. Based on this understanding of the role of the mass media organization, there is no real difference between media organizations and private retail companies (such as Wal-Mart or Target); both the retail organization and the media organization are manufacturing a product that they market to the public in hopes of maximizing profit. Since in the market model the primary purpose of the media is to generate profit for owners and shareholders of the company, the media company views the audience as consumers with tastes and preferences that need to be understood and addressed. The success of the media company is determined by the amount of profit that the company generates. In this model, the media company encourages “consumers” to enjoy themselves, view ads, and buy products. Information that is potentially presented to the public by the media company is deemed to be in the interest of the public only when the information is believed to be popular among citizens. Therefore, government attempts at regulating the mass media are viewed as interference with normal market processes involving supply and demand.

In contrast, Croteau and Hoynes point out that in the *public sphere model*, the media company is seen as a public resource that is supposed to serve the public. The main purpose of media in the public sphere model is to promote citizenship through information, education, and social integration. In this regard, the public sphere model of media addresses audiences as citizens who should be encouraged to

learn about their world in order to become actively involved. According to the public sphere model, when media companies are acting in the public’s best interest, it is because they are delivering diverse, substantive content, even when this type of content is not popular among citizens. Thus, in this model, the ultimate success of mass media organizations is not tied to profits generated for owners and shareholders, but instead is measured by whether the media organization is serving the interests of the public. In contrast to the market model, regulation of media organizations is viewed as a useful tool for protecting the public interest.

Market-Based Criteria and Media Assessments of “Newsworthiness”

Media scholars typically argue that media corporation personnel make decisions about media content on the basis of the market model. They suggest that mass media personnel perceive that the general public is interested in crime; thus, the topic of crime is used as a method of attaining ratings and high sales of their products. While the elements of this model are certainly applicable to various forms of entertainment media, the tendency by mass media to use market-based criteria in decision making is most clearly evident when *news reporting* of crime is considered. In this regard, mass media personnel make assessments as to the “newsworthiness” of potential news items, and newsworthiness assessment is a function of market-based criteria.

With respect to news reporting of crime, the concept of newsworthiness can be assessed in a variety of ways. Media researchers have consistently found that compared to other types of stories (e.g., business, foreign affairs, politics), crime stories occupy a prominent position in news reporting (Lipschultz & Hilt, 2002). Thus, one way of assessing newsworthiness is to compare media coverage of crime to media coverage of other topics of interest. Using this standard of newsworthiness, researchers generally conclude that journalists view crime events as quite newsworthy, in comparison to other story types.

But the main way that researchers assess the issue of newsworthiness is to compare the coverage of crimes with certain characteristics against coverage of crimes with other characteristics to determine whether there are differences across criminal events with respect to the intensity of coverage. In this respect, the notion of newsworthiness is synonymous with the intensity of the coverage. If a particular crime is covered more intensively than others, it can generally be said that the crime receiving more attention is deemed more newsworthy than the less covered story. Some researchers look at whether a particular crime receives any coverage as a way of understanding intensity of coverage. Others examine whether a story about a particular event was published on the first page of a newspaper or was the main story on a television news program. Some measure intensity of coverage by the number of words published or the amount of time devoted to a news item.

In terms of identification of the circumstances that would produce the most intense coverage, most commentators use the crime of murder to illustrate how market-based criteria impact journalistic decision making. Journalist Pat Doyle of the *New York Daily News* (1995) suggests that a murder incident makes for a good human interest story when the murder (1) involves a socially prominent or respectable citizen who is involved as either a victim or an offender in the story; (2) the victim is an overmatched and innocent target; (3) the method of murder is either shocking or brutal or involves multiple victims or offenders; and (4) the narrative generates mystery, suspense, or drama. In addition, Steve Chermak (1995) argues that the decision criteria used by journalists to assess the newsworthiness of crime stories include (1) the relative violent or heinous nature of the offense, (2) demographic characteristics of the victim and offender (age, gender, race, social status), (3) the uniqueness of the event, (4) characteristics of the incident producers (the news agency and staff), and (5) event salience (e.g., whether the offense is a local crime).

David Prichard and Karen Hughes (1997) looked to synthesize these various perspectives into a concise theory to explain journalistic newsworthiness assessments pertaining to crime. They establish four different “forms of deviance” that they argue lead journalists to intensively cover certain types of homicides. First, they argue that the greater the *statistical deviance* from the norm, the greater the likelihood that a homicide will receive intense media coverage. In essence, they theorize that there are typical crimes (like theft), and there are atypical crimes (like murder). Typical crimes are less likely than atypical crimes to be covered. Similarly, there are typical and atypical offenses within certain categories of crime, such as homicide. Based on the statistical deviance hypothesis, atypical homicides (for instance, a stranger homicide) will receive more coverage than more typical homicides (for instance, those involving acquaintances or family members).

Second, they theorize that the higher the degree of *status deviance*, the greater the likelihood that journalists will intensively cover a criminal event. They define status deviance as the extent to which a person or a group of persons is different based on established social benchmarks. For instance, Prichard and Hughes (1997) wrote that in society, wealthy white males have more status than poor African American women. Thus, a crime committed against a wealthy white man would violate the established social benchmarks more than a crime committed against a poor African American woman.

Third, they hypothesize that the higher the degree of *cultural deviance*, the greater the likelihood that the criminal event is intensively covered. A crime is considered to be culturally deviant when it is unclean, unhealthy, or perverted when measured against mainstream social norms. They suggest that crimes that are linked to involvement with drugs can be considered culturally deviant. In addition, they suggest that a crime committed against a particularly vulnerable victim (an elderly victim or a child, for instance) is the type

of crime that is most culturally deviant. The conceptualization of culture deviance by these two authors suggests that any crime involving certain circumstances that leads the average person to be repulsed to the point of experiencing negative emotional states (for example, anger, revenge, etc.) could be construed as culturally deviant.

Last, Prichard and Hughes (1997) identify the notion of *normative deviance* as a criterion that journalists use to assess the newsworthiness of a criminal event. Normative deviance is conceptualized as involving gradational levels of offense seriousness as determined by the level of punitive consequence dictated by statute. At its most basic level, the normative deviance hypothesis is an acknowledgment that society implements a gradational approach to sanctioning based on determinations of seriousness of the offense. Therefore, it is expected that crimes that are most serious (based on statute) will be judged by journalists to be the most serious; thus, the crimes and circumstances of crime that receive the most stringent punishments will be covered most intensively by news organizations. Even though Prichard and Hughes focus on the conceptual distinctions of these four types of deviance, they are not mutually exclusive. There can be overlap when applying these concepts to journalistic determinations of newsworthiness of crime events.

Croteau and Hoynes (2001) established the foundation for understanding what it means for a mass media organization to be what John H. McManus (1994) refers to as “market-driven.” The perspectives of Doyle, Chermak (1995), and Prichard and Hughes (1997) facilitate an understanding of the criteria that journalists use to make assessments about the newsworthiness of a particular criminal event. But it is important to keep in mind that the processes that each body of work identifies are intricately connected. Journalists use newsworthiness criteria as a method of making a judgment concerning the types of news items the general public is interested in consuming. In essence, the development of newsworthiness judgments is based on shared understandings of what is marketable to the general public.

The research of Prichard and Hughes (1997) most powerfully illustrates the importance of market-based criteria in journalistic decision making. In their qualitative interviews with journalists in Milwaukee, they quote one journalist as saying,

This is just a guess [but] I don't think we sell so many papers in the central city. But we do sell a lot of papers in the suburbs. So it is important that we give something to our readers that they can relate to as opposed to something that does not affect them. (p. 63)

The journalist was discussing why crime in the suburbs receives more coverage than crime in the central city, even though there is more crime in the central city. Another journalist stated, “In a mass-circulation paper, you need to consider what the reader wants” (p. 63). Another stated, “If the reader can say ‘that could have been me that was killed,’ then that has more news value” (p. 63).

While the connection between the market-based tendencies of journalism and use of newsworthiness criteria to cater to market demands is rather easily understood, precise propositions about what journalists and news editors view as a newsworthy crime story are not nearly this straightforward. Most of the perspectives about criteria of newsworthiness (for instance, the perspectives of Doyle, Chermak, and Prichard and Hughes discussed above) focus much attention on obvious factors about newsworthiness (heinous methods, multiple victims or offenders, well-respected people) and do not provide very specified direction about other factors (for instance, characteristics of the news producers and demographics of the victim/offender) that have been mentioned as those that influence news coverage of criminal events. In fact, the best-developed theoretical framework that has been set forth to date for understanding journalistic decision making (Prichard and Hughes's 1997 article on "Patterns of Deviance") makes competing predictions about newsworthiness criteria. For instance, the statistical deviance hypothesis predicts that homicides involving female victims will be most newsworthy, whereas the status deviance hypothesis predicts that crimes with male victims will be most newsworthy.

Sociologist Richard J. Lundman (2003) attempts to better understand how race and gender typification impacts journalistic assessment of newsworthiness. In his analysis of how gender and race affect newsworthiness of homicide cases, Lundman provides a framework for understanding the impact of demographic characteristics of the offender and victim on these decisions. He suggests that typification, or stereotypes, associated with gender and race provide journalists with templates, or "ready-made scripts," for potential stories. In other words, according to Lundman, the more closely a crime story fits existing stereotyped understandings of race and gender, the more likely the crime will be judged to be marketable.

With respect to race, Lundman (2003) argues that homicides that involve an African American offender and a white victim will be perceived by journalists as more newsworthy because such a crime can be framed in the context of white fear of minority offenders. He also suggests that crimes involving a male offender and a female victim will be viewed by journalists as being highly newsworthy because these crimes can be covered by using "male sexism" and "male aggression and female submission" frames of reference. The logic of this argument is that the common understandings about gender and race (e.g., the stereotypes) that exist in society are more acceptable and easily understood by the market audience. Likewise, audiences are viewed as likely to reject "confusing" stories that do not conform to the dominant, easily understood, gender and race typification. Journalists are not likely to devote time, energy, and attention to stories that they believe the market audience will reject.

Research on news media decision making in the reporting of homicide cases suggests that market concerns do

appear to impact the decisions of journalists and news editors in ways predicted by the literature on newsworthiness criteria. Prichard and Hughes (1997) examined newspaper coverage of 100 homicide cases in Milwaukee, Wisconsin, that occurred in 1994. They found that homicides involving white participants, female victims, and victims that were either children or elderly received the most attention in the *Milwaukee Sentinel* and *Milwaukee Journal*.

In an analysis of media coverage of 249 homicides committed in Houston, Texas, in 2001, Kevin Buckler and Lawrence Travis (2005) discovered that homicides that involve female victims received substantial coverage, and they found that crimes involving minority offenders and nonminority victims received more intense coverage. But they also determined that circumstance characteristics of the crime increase newsworthiness as well. They found that intensity of coverage increases if the crime involves multiple victims, if it is a stranger homicide, if it involves the use of an unusual weapon, and if there is a robbery motive.

Lundman's (2003) analysis of how gender and race impact media coverage of homicide in Columbus, Ohio, found that compared to the most common occurrence (black male offender, black male victim), situations involving a black male offender and a white female victim and situations involving a white male offender and a white female victim receive more intensive coverage.

The Market Model and Entertainment Media

While this discussion primarily focuses on mass media decision making in a news journalism context, it is not difficult to see the applicability of these theoretical perspectives to various forms of entertainment media. Indeed, an argument can be made that entertainment-oriented mass media companies that produce crime-related output are even more deeply entrenched in the market model. These companies may have less of an obligation than news media companies to inform audiences about their culture and society, and instead, conform to imperatives of the organization that are dictated by market concerns.

Television crime dramas have become increasingly popular with the general public. Crime shows like *The Avengers*; *Baretta*; *Cagney and Lacy*; *The Commish*; *Colombo*; *CSI*; *Dragnet*; *Hawaii Five-O*; *Hill Street Blues*; *In the Heat of the Night*; *Kojak*; *L.A. Law*; *Law & Order*; *Magnum, P.I.*; *Miami Vice*; *Mod Squad*; *Murder, She Wrote*; *NYPD Blue*; *The Practice*; *The Rockford Files*; *Simon and Simon*; *Starsky and Hutch*; and *T. J. Hooker* have proven to be immensely popular. Danielle Soulliere (2003) analyzed episodes from three of these shows (*Law & Order*, *NYPD Blue*, and *The Practice*) focusing on how the content of the episodes both diverges and converges with information on crime from official crime statistics. One of the most important conclusions from her research is that market factors may explain both divergence from the "reality" of crime and convergence with the "reality" of crime.

In terms of divergence, Soulliere (2003) found that these shows disproportionately focus attention on violent crime, and especially murder. Whereas murder makes up less than 1% of all crimes, in the episodes that were analyzed, murder was the focus in over 60% of the episodes. She concludes that this finding is attributable to the market demands of entertainment media organizations, noting that “violent crime, especially murder, strikes at the very core of our humanity and is therefore fascinating, dramatic, and entertaining. It is no surprise, then, that murder remains the most *marketable* crime in the entertainment television industry” (p. 30, emphasis added). In contrast, she found that there is convergence between official crime statistics and portrayal by these shows on the issue of victim–offender relationship (e.g., that most crimes are committed by acquaintances or family of the victim). She argues that this convergence may be “coincidental rather than intentional” (p. 31), noting that close relationships between the victim and the offender add drama to the plot and make it more marketable.

In addition, there is some evidence that entertainment-based media organizations also behave as Lundman (2003) suggests in that they organize content around a script that is known, widely accepted, and socially safe (in that it does not offend the market audience). Buckler’s (2008) analysis of the 2005 film *Crash* provides an illustration using the framework established by Lundman. The film won three Oscars, for Best Picture, Best Screenplay, and Best Editing. The film *Crash* follows a group of racially and ethnically diverse characters in Los Angeles as they interact with one another, often in criminal ways. In his analysis, the author notes how the film was promoted as one that tackled the issue of race in a unique way, but Buckler goes on to show how the film conformed to existing racial and ethnic scripts.

Buckler (2008) conducted a content analysis of 29 separate instances of verbal and nonverbal discourse in scenes where race- or ethnically based behavior and stereotypes are present in the film. He concludes that the film was able to successfully (in terms of monetary sales and awards) tackle a controversial social issue like race/ethnicity and crime because it presents the issues in ways that are socially safe for white viewing audiences, by using the following techniques: (a) contextualizing and explaining white prejudice while presenting prejudiced actions by minorities as arbitrary and devoid of context, (b) reaffirmation of minority stereotypes, (c) portraying minority characters in interactions with police as the instigator, and (d) showing white racist characters in positive ways that redeem their behavior in some respect.

Organizational Factors Intrinsic to Media Production

News Themes

Some research also implies that organizational factors that are intrinsic to the media production process impact

mass media organization coverage of crime. Research by Mark Fishman (2006) suggests that organizational imperatives of news media production can create perceptions of crime waves. To Fishman, a crime wave is nothing more than a sporadic “social awareness about crime” and is essentially a “thing of the mind” (p. 42). In essence, Fishman saw crime waves as nothing more than media waves of coverage on crime topics. Thus, it can be said that Fishman believes that crime waves do not represent an objective reality, but instead, a subjective reality created by mass media behavior.

Fishman (2006) arrives at these conclusions in a study of a “crime wave” against elderly victims in the 1970s in New York City. In 1976, three daily newspapers and five local television stations began to report heavily on crimes committed against the elderly. These reports focused mainly on incidents where young African American or Hispanic offenders were victimizing elderly white people in and around ghetto areas of the city. Fishman noticed that the trend in official police statistics concerning crime against the elderly did not match the trend in the media reports; official statistics suggested that some crimes against the elderly were decreasing and other crimes against the elderly matched the trends for crimes against the general population. But the media reports were suggesting that this type of crime was increasing.

What accounts for the massive disconnect between media reports and official statistics? Fishman (2006) suggests that the organizational realities of news production contribute substantially to this disconnect. He explains that when news organizations create the day’s news, media personnel have countless stories that can potentially be reported as news items. There are national, state, and local possibilities. They can retrieve stories from the Associated Press and Reuters news services. In addition, they have potential stories that local journalists have developed. There are also countless other types of stories that could be reported: arts and entertainment, business, crime, health related, politics, and sports, to name a few. Thus, the job of the news editor is to develop “news themes” around which potential news items and reports are organized. A *news theme* is simply a broad idea that a group of news items are associated with because of a commonality that runs through each of the stories. In other words, a news theme is a technique of packaging a group of stories, each as a single instance of something broader.

A news theme can be applied to (a) how the news organization organizes a single day’s coverage or (b) coverage over a longer time period (for instance, a week, a month, or even a year). The best illustration of the first scenario is a themed news package identified by Fishman (2006) that was developed by a television station in its coverage of elderly crime in New York City. He observed that the news station covered the following stories:

- Police apprehend juveniles who mugged an elderly couple in Queens.
- Police and citizens in Queens meet to discuss crimes against the elderly.

- Feature segment on Senior Citizens Robbery Unit.
- Police seize guns and drugs that were intended for warring gangs.
- Two members of a youth gang are arrested for robbery at knifepoint.
- ROTC cadet arrested in stabbing death of another cadet.
- NYC audit finds city police have been mishandling funds.
- NYC police union working on contract at the same time that laid-off firemen and subway cops will be rehired.

In this package, there are two broad themes: crime and budget issues. But there is also a more specified theme with respect to the coverage of crime: crime against elderly and crime committed by young people. In essence, the likelihood that a potential news item is covered often depends on whether the news item can be clearly connected to other marketable news items. Fishman (2006) concludes that the use of news themes produces a situation where a journalistic search for knowledge mutates into a process of not knowing. What he means is that the process of developing news packages strips the criminal event of its actual context and places the occurrence within a new symbolic context: the news theme itself.

In terms of the second scenario, Fishman (2006) suggests that news themes can also develop over a longer period of time. In his research, he noticed that when one news organization reports a story, other news organizations are apt to look for stories that tie into the previously covered story. Journalists get story ideas by watching or reading media reports from other news organizations. If journalists are able to find other instances that can be tied into the theme, the theme can be kept alive for weeks or months. Fishman found evidence of this in his study of media coverage of elderly crime in New York City. The majority of the coverage on crime against the elderly occurred over a 7-week time period. Prior to this massive media wave of coverage, news organizations had been covering crime against the elderly at a pace of one story every other week. In addition, the data indicated that the coverage that appeared in the news outlets that were examined did not coincide with actual events; instead, there was evidence that news organizations were responding to the coverage of other organizations.

The tendency to develop news themes is an organizational aspect of mass media production that influences media outcomes. News themes are functional for news organizations. On a daily basis, editors face a mountain of raw material in the form of information (press releases, news from the wires). They must sift through this mountain of material and produce a clear and concise plan to deliver information to the public. They have no limit to the information that is available, but they can only filter a limited amount of information to the public. News themes aid editors in the task of processing massive amounts of information down to a usable form; in essence, news themes facilitate efficiency.

Reliance on Official Sources of Information

Another important organizational tendency of news organizations that influences crime coverage is their reliance on official sources of information over unofficial sources. Kevin Buckler, Timothy Griffin, and Lawrence Travis (2008) note how research suggests that news media personnel and government agencies/agents are “coupled.” This means that both have an interest in the coproduction of crime information presented to the public. Whereas the news media’s interest is in the actual production of news as a tangible output, government agencies and agents have a public relations interest in mass media production. The clearest example of this is the relationship that has developed between public information officers in police departments and crime “beat” reporters. News reporters rely on official sources for information, and those official sources often filter the information released to the press in an attempt to manage public understanding about official agencies of social control. The reliance on official sources of information about crime thus places the news organization in quite a conundrum. News media are supposed to perform a “watchdog” function, but reliance on official sources of information limits the capacity to do so in the context of crime coverage.

The research by Buckler et al. (2008) documents the extent to which news organizations and official sources of information are coupled. They examined the use of sources in crime coverage in two major papers, the *New York Times* and the *Washington Post*. They found substantial use of official sources of information in quotations and references to persons in crime stories, whereas unofficial sources (professors, nonacademic researchers, etc.) were used much less frequently.

Other scholars focus on how news organization reliance on official sources of information can impact the content of news media coverage of crime and criminal justice. Katherine Beckett’s (1995) analysis of news organization coverage of the war on drugs focuses on how the use of different types of sources of information was related to how news organizations framed the war on drugs. She found that the news media heavily relied on official sources of information and that most often these official sources advocated a “get tough/law and order” approach to handling drug offenses.

Similarly, Michael Welch, Melissa Fenwick, and Meredith Roberts (1998) focus on the differential content between official sources (e.g., state managers) and professors/nonacademic researchers (e.g., intellectuals) in feature crime articles that were published in the *Chicago Tribune*, the *Los Angeles Times*, the *New York Times*, and the *Washington Post*. They examined quotations along two different topical dimensions: crime causation and crime control. They found that quotes used by journalists taken from state managers were more likely to focus on the potential solutions to crime (e.g., crime control), whereas quotes used by journalists that originated from professors

and nonacademic researchers were more likely to focus attention on the causes of crime (e.g., crime causation).

There were also notable differences between state managers and professors/nonacademic researchers within the “crime causation” and “crime control” categories of quotations. In terms of crime causation quotations, state managers were more likely to attribute the causes of crime to utilitarian explanations (individuals motivated by material and personal gain), whereas professors and nonacademic researchers were more likely to attribute crime causation to social conditions and personal pathology. With respect to crime control quotations, state managers were more likely to advocate for hard controls (e.g., expansion of enforcement, more incarceration), whereas professors and nonacademic researchers were more likely to advocate for soft control (e.g., rehabilitation, social reform, decriminalization).

Collectively, what this body of work suggests is that the ideas about crime and its control presented to the public may be slanted toward “crime as personal choice” understandings of the causes of crime and “get tough” solutions for the crime problem. But the influence of organizational factors of mass media production does not necessarily lead to a conclusion that such an outcome is purposeful or direct. The logic is not that mass media organizations are extensions of the government and look to force-feed the message of government officials to the general public in an effort to manipulate the public. Instead, the logic is that any bias or slanting of mass media content is more indirect and is the result of organizational imperatives to create news output in a fast, efficient, and cost-effective manner.

Effects of Media Coverage of Crime

Moral Panics

The work of Stanley Cohen (1972) suggests that one of the consequences of media attention to issues of crime and justice is the creation of moral panics. Cohen argues that a moral panic occurs when a “condition, episode, person, or group of persons emerges to become defined as a threat to societal values and interests” (p. 9). Russell E. Ward (2002) further describes moral panics as “rapid and intense emotional fervor toward an issue that media and other social control agents call to public attention” (p. 466). In addition, Cohen suggests that when a moral panic occurs, the media cover the event in a fundamentally inappropriate manner. In essence, Cohen describes the moral panic as occurring when there is a gap between the actual threat and the perceived threat that is created by the condition, episode, person, or group of persons. To Cohen, when there is a gap between the actual and the perceived threat, the gap needs to be explained.

Cohen (1972) developed this concept during a study of events that transpired in Canton, England, on Easter Sunday in 1964. On this date, adolescents and young adults were hanging out on the streets of the town. A rumor began

to circulate about a bartender who had refused to serve several young people. Eventually, a fight started and several youths on scooters and motorcycles started to race up and down the streets. Police arrested nearly 100 young people on various minor charges.

Cohen (1972) became very interested, not in the behavior of the young people involved, but in the media reaction to the events. The disturbance was covered by several prominent newspapers in England. In addition, the story was picked up by newspapers in the United States, Canada, Australia, South Africa, and the European continent. Youth fights and vandalism continued to be a news theme for news organizations in England for about 3 years following the original event. Cohen believed that much of the coverage was “fundamentally inappropriate” and was presented in a very stylized and sensationalized format. He noted that the press used loaded terms to describe what had transpired, such as “orgy of destruction,” “battle,” “smeared with blood and violence,” and “screaming mob.” One press report stated that *all* the dance halls in the city of Canton had windows broken out, distorting the reality that there was only one dance hall in Canton. Press reports also exaggerated the incidence of youth riding motorcycles and scooters, as most of the youth were on foot.

Cohen’s (1972) analysis of media coverage of the Canton incident led him to develop his theory of moral panic. In his theoretical framework, Cohen starts with the notion that a person or group emerges to be defined as a threat to societal values. The original behavior is sometimes a new phenomenon that suddenly emerges, but other times, the behavior has been in existence for a long period of time and has suddenly received more attention. He also argues that the nature of the act or action is presented in a very simplistic and stereotypical manner by the mass media. Next, he suggests that editors, special interest groups, and politicians begin to establish moral barricades. It is at this point that members of the media, politicians, and special interest groups can do and say things that either prevent the moral panic from resonating or enable the further development of it. If they contribute to the development of the panic, once the problem becomes clearly articulated, media, politicians, and special interest groups begin to promulgate diagnoses and solutions to the problem. Often, the solutions are a disproportionate or exaggerated response, or they reduce the civil rights of groups in society.

Cohen (1972) also argues that as time passes, the conditions (behavior) will disappear, deteriorate, or become more visible. A condition easily becomes more visible when there is other behavior that represents minor variations of the original behavior, which can be linked to the original behavior. In this respect, Cohen argues that once classes of people who engage in certain behaviors are designated as a social threat, small deviations from the norm are noticed, are commented on, and are judged by media, special interest groups, and politicians. Again, the main problem with situations where media, special interest groups, and politicians respond to behaviors in ways that are disproportionate to the actual threat is that often policy

becomes created that is illogical or does more harm than good in the long run.

Gary Potter and Victor Kappeler (2006) identify the drug panic (which began with the Nixon administration in the 1970s and gained tremendous strength in the Reagan, Bush Sr., and Clinton administrations) as one of the most powerful moral panics in the history of the United States. Dan Baum's book *Smoke and Mirrors: The War on Drugs and the Politics of Failure* (1996) provides a good review of the war on drugs in the context of moral panic. In a more narrow review, Ted Chiricos (1998) asserts that the crack cocaine "epidemic" that was widely reported in the mid-1990s constitutes a moral panic. He shows that media attention to crack cocaine escalated dramatically at a time when cocaine use was actually decreasing. He also shows that the main theme of the crack cocaine panic was that (a) cocaine use would spread to previously "safe" areas and (b) the spreading of the problem would increasingly impact children. Chiricos also notes the essential problem with the drug panics: "In an atmosphere of panic, building walls and stacking people behind them is faster and easier than doing the difficult work of restoring work and community to neighborhoods devastated by disinvestment and de-skilling" (p. 67).

Scholars suggest that moral panics can come in all different shapes and sizes, targeting the behavior of a wide range of social groups. Ronald Weitzer (2007) analyzed the discourse of leading activists and organizations that are opposed to prostitution and concludes that many of the assertions by these organizations are unsubstantiated. Burns and Crawford (1999) show how media and political attention to the issue of school shootings in the late 1990s led to widespread panic despite the fact that empirical evidence suggests that school violence was actually decreasing at the time of the panic. Barron and Lacombe (2005) argue that the heightened concerns about female violence can be characterized as a moral panic. Ward (2002) notes that some sociologists have described media attention to sports fan violence in terms of a moral panic; he argues that from a statistical standpoint, sports fan violence is not worthy of the attention it receives.

Fear of Crime

Research has also explored the impact of media coverage of crime on fear of crime. The "fear of crime" research is based on cultivation theory, which is credited to communication scholars George Gerbner and Larry Gross (1976). Cultivation theory suggests that exposure to the violence on television, over time, impacts viewers' perceptions of reality. In this regard, one of the findings from research based on the theory is that higher consumption of mass media impacts fear of crime. For instance, Romer, Jamieson, and Aday (2003) found that high levels of consumption of local news programming were related to fear of crime, using data from the General Social Survey over a 5-year period. But the research appears to be split on the issue of whether media consumption has a general impact on public fear of crime. In a sample of Washington, D.C., residents Kimberly Ann Gross and

Sean Aday (2003) found that mass media consumption did not cultivate fear of crime.

What appears to be a more promising area of research inquiry is the notion that the link between media consumption and fear of crime is not the same for all social groups and that some groups are impacted more than others. Chiricos, Eschholz, and Gertz (1997) found that consumption of radio and television news programs increases people's fear of crime; but this effect was only found for one social group that was part of the study—white females. They attribute this to an "affinity effect" in that white females are disproportionately portrayed in mass media as victims. Because of this, they perceive themselves as having a greater likelihood of victimization than they do in reality. In addition, Eschholz, Chiricos, and Gertz (2003) found that in a sample of 1,490 Leon County, Florida, residents, the link between media consumption and fear of crime was dependent upon racial composition of the neighborhood. Residents living in areas with a higher composition of African Americans that reported high levels of media consumption reported more fear of crime than other areas in the sample.

Future Directions

Based on the existing research on news media and crime, there are a number of areas of research that could be conducted in the future. First, research should continue to develop theory concerning how journalists and news editors construct news through selection processes. As it currently stands, there is no strong theoretical framework for understanding these selection processes. One of the main problems, in this regard, is that few studies have attempted to understand these processes through qualitative research techniques. A deeper understanding of these processes may potentially be gained by research studies that use field methods and qualitative interviews with journalists and editors. Second, with respect to journalistic decision making, future research should look to theoretically and empirically address the potential differences in the approach of journalists depending on location characteristics of the news organization. To date, most studies have mainly analyzed the decision making of journalists in major urban areas.

Third, future research should focus attention on local television news. Most of the existing research focuses on newspaper coverage of crime. Fourth, research should continue to apply the "moral panic" frame of reference to the construction of different social problems, particularly with respect to creation of policy. Fifth, research should continue to explore the specific conditions under which media consumption impacts fear of crime. Research should also focus on exploring these issues in the context of the emerging "infotainment" media market. News-oriented programs have become increasingly popular since the 1990s. Programs like *Hannity and Colmes*, *Hardball*, *Inside Edition*, and *The O'Reilly Factor* have become deeply entrenched in American culture. Methods used to construct communication delivered by these programs need to be explored.

Conclusion

The purpose of this chapter was to review concepts and research findings relevant to the topic of media as it relates to crime and justice. This topic is rather broad, so the chapter narrowly focused on (a) the market model as a framework for understanding mass media behavior, (b) organizational imperatives that influence mass media decision making, and (c) effects of mass media coverage of crime. The market model of media suggests that media organizations make decisions about what to cover and the content of media output on the basis of monetary gains that will be generated from the selling of media products. Mass media decisions in the presentation of crime are also governed by organizational concerns intrinsic to media production processes. The pursuit of market and organizational imperatives often results in crime coverage that is disproportionate to the reality of the crime problem.

THE POLICE

Historical and Contemporary Perspectives

GEOFFREY P. ALPERT

University of South Carolina

ROGER G. DUNHAM

University of Miami

The police have been a common feature in American society for more than a century. Today, police officers are seen patrolling streets, directing traffic, and serving the public in a multitude of ways. It has not always been so. Historically, the police were political assets for the power elites and had no pretence of treating everyone equally. The purpose of this chapter is to review briefly the history of the police, discuss the modern-day reality of police work, and assess the future of policing.

British Tradition

A great deal of U.S. policing heritage can be linked directly to its British roots. Policing in the community, crime prevention, and elected sheriffs all have origins in English law enforcement. The history of policing in England includes a variety of stories and scenarios that involve radically conservative interpretations of law enforcement and a liberal view of governmental intervention (Reith, 1938). Originally, all security in England was private. Those who could afford the luxury lived in well-built houses that were guarded by servants who acted as bodyguards. The remainder of the population merely hoped that their neighbors and those chosen as “watchmen” would protect them and chase away the criminal element. This system of shared and informal policing was referred to as “kin” policing (Reith, 1956) and the

“frankpledge system.” It was established to encourage citizens to act as the “eyes and ears” of the authorities, to protect their family and neighbors, and to deliver to the court any member of the group who committed a crime.

The pledge to protect others created a sense of security based on being protected by one’s family and neighbors. Communities were organized into *tythings*, or groups of 100 citizens, which were part of larger units called *shires* (similar to counties today). Shires were headed by *shire reeves* (later called “sheriffs”). Shire reeves were appointed by the king, and were primarily responsible for civil duties, such as collecting taxes and ensuring obedience to the authority of the king. From the frankpledge system came the *parish constable system*. In the 13th century, the position of the constable was formalized, thus permitting the appointment of watchmen to assist in their duties (Bayley, 1999). Watchmen had numerous responsibilities, from guarding the gates of town at night to watching for fires, crimes, and suspicious persons. This system of law enforcement continued without much change until the 18th century.

During the 18th century, there was unprecedented population growth and the population of London more than doubled. Accompanying the growth was a more complex and specialized society, resulting in law enforcement problems that challenged the control systems in existence. Rioting in the cities, which the existing system could not control, is one such example. As a result of the changing

social climate, a more formal and organized method of law enforcement became necessary. It was around this time that Henry Fielding (author of *Tom Jones*) and his brother, Sir John Fielding, helped improve policing in London and all over England by suggesting changes to the existing system of control that developed into what is known as the modern police department.

The First Modern Police: London

It was Sir Robert Peel, the British Home Secretary, who created a 3,000-strong police force. Peel drafted and then guided through Parliament the “Act for Improving the Police in and Near the Metropolis,” which is better known as the Metropolitan Police Act of 1829. Under the direction of Peel, the police were organized for crime prevention. By 1829, the entire city was patrolled by men assigned specific territories, or beats, on a 24-hour-a-day basis (Reith, 1956). The officers, or “bobbies,” wore blue uniforms so that they could be easily recognizable as public servants whose purpose was to deter crime. The leaders of the London police force provided a central administration, strict discipline, and close supervision of the officers. They eventually decided to introduce a military structure to what had been a rather loose organization. Peel and his bobbies were so successful that requests for help from outside areas were received and assistance was sent. This movement set the stage for modern police departments, which were developed according to the principles of what has become known as “the London model of policing.” Thus, the structure and function of current police agencies, as well as their overall mission, are heavily influenced by Sir Robert Peel.

The Modern Era

In fundamental ways, modern police departments remain slaves to their history. In the 1970s, Jonathan Rubinstein (1973) commented that understanding what police do is difficult because they have such a wide variety of tasks. Thirty-six years later, this statement remains as true as it did then. Citizens are split between viewing the police in positive terms, calling them brave “crime fighters” and heroes, and referring to them negatively, as corrupt, heartless, and brutal. Often, these different views are influenced by a citizen’s experiences with the police and whether it was a positive or a negative one. Partly because of severe criticisms of the police by citizens, policing has been forced to change and develop into what it is today.

Although much of policing has changed drastically since its initiation into American government, changes in the selection and training of officers have been among the most important. There were few standards when hiring officers during the early years of policing, and practically no training. In fact, positions on the police force often were

viewed as a reward for loyalty to political parties who were in power. Newly elected officials often fired existing officers and hired their political supporters. As a result, citizens thought of the police as nothing more than political “hacks,” enforcing the interests of those in power. This corrupt system of hiring officers has developed into the very elaborate and professional civil service hiring systems present in most departments today. Further, the practice of virtually no training of officers that existed earlier has progressed into the long and arduous training programs found in most departments today.

Recruitment and Selection of Officers

The importance of recruitment and selection cannot be emphasized enough. As police work is labor-intensive, and a large percentage of an agency’s budget is devoted to personnel issues, the officer is the most significant investment a police department can make. Police agencies are always looking for innovative ways to attract and retain good officers. Once an individual decides he or she wants to enter police work, the agency must screen the person for characteristics that make a good police officer. This is known as “selecting in,” a strategy that identifies those individuals best suited for police work. The agency must also eliminate or “screen out” those applicants who are unfit for police work. Many tests are available to evaluate someone’s psychological and physical characteristics to determine if success in police work is likely. There are multiple hurdles for recruits to pass. Unfortunately, there are no clear and accepted criteria to determine which candidates will make the best police officers. One reason for this uncertainty was suggested by Brenner (1989), who noted that an officer must be able to adapt to various situations and use a variety of styles and approaches, depending on the circumstances. He points out that officers must interact with violent criminals and distressed victims, perhaps during the same interaction, and it is unlikely that an officer’s behavior will satisfy all of the stakeholders all of the time. As it is extremely difficult to determine an applicant’s fitness for duty, officers must pass the many hurdles. Each decade or era has its own problems associated with the recruitment of police officers. The overall economy plays a role, as does the country’s involvement in war and the use of the military. In fact, these and other issues also impact trained police officers when they return from a leave or other assignment. There is enormous variance in the selection procedures and training among agencies, so the following discussion illustrate the options agencies have at their disposal to review and assess candidates.

Traditionally, police departments use standardized written tests to assess basic skills and attitudes. The use of traditional pen-and-pencil tests has been criticized for its lack of predictive ability, which has led many agencies to supplement these tests with a more comprehensive assessment procedure. Departments using this method process

applicants through a series of assessments, including simulated and role-play activities. The activities are developed to force a person to respond to situations and individuals who “test” the person’s character and ability to negotiate in a specific situation. Common examples of simulations used in assessment centers include a domestic altercation, a routine traffic stop, or a bar fight.

In addition, officers are given medical exams and physical agility tests that involve job task simulations, such as lifting weights through windows, carrying heavy objects, and other tasks that might confront a police officer on the job. Officer candidates are often given a polygraph test to determine if they have told the truth about their backgrounds or past experiences on their application forms and in their interviews. One area that is investigated is prior drug use history.

Further, applicants are often interviewed by an individual or a group of commanders. These interviews are designed to determine a candidate’s ability to communicate and to respond to difficult questions. Once an applicant has passed these initial hurdles, he or she is sent to training. This training varies from state to state and agency to agency, but all have some common elements, including preservice, field, and in-service training.

Academy Training

Police academies can be run by the department or by the state, and they can be independent or connected to community colleges or universities. The average length of academy training is approximately 600 hours, but varies from state to state. Regardless of the total number of hours required at the academy, the training and education is an experience that plays a significant role in shaping the officer’s attitudes about policing in general, including ways to address specific tasks, and the role of the police in society.

The building blocks of a good law enforcement training program are anchored to two issues: First, the programs should incorporate the proper statement of mission and ethical considerations, which should be taught in the context of what an officer will do on a daily basis. Second, there must be a balance of time spent on “high-frequency” versus “high-risk” activities in the required training. In the 21st century, it is also necessary to prepare police officers to think, make good decisions, and to respond to a variety of difficult situations.

Recruits must pass the requirements of the academy to graduate. Many academies insist that the recruit pass all courses the first time to graduate, while other academies have built-in provisions for remedial training to help marginal students pass. Academies use a variety of methods to evaluate and grade the progress of their recruits, such as multiple-choice tests, role-play exercises, written answer tests, and oral tests. Once graduated, with newly acquired attitudes and skills, the young officer is often required to enroll in departmental training or could be assigned street

work with a field training officer. Unfortunately, others are sent directly to the street, with gun, badge, and vehicle, with no further training.

Field Training

Most departments provide training after completion of the academy through a field training officer (FTO) model. Although recruits should have been exposed to a number of real-life experiences during academy training, those were created for training or role-play scenarios and are conducted in an artificial atmosphere. Field training is meant to bridge the gap between the protected environment of the academy and the isolated, open danger of the street. The new officer, or “rookie,” is paired with a more experienced police officer(s) for a period of time, usually several months.

It is the field training officer’s job to teach the young rookie how to survive and how to become a good police officer. Field training programs are often divided into several phases. Although agencies vary the length and scope of their field training, all programs should include introductory, training, and evaluation phases. The introductory phase is structured to teach the rookie officer about the agency’s policies, procedures, and local laws and ordinances. Departmental customs and practices are also communicated at this time. During the training and evaluation phases, the young officer is gradually introduced to complex tasks that require involved and complicated decisions. The young officer will have to interpret and translate into action what was learned in the academy and the field. The field training officer then evaluates the decisions and actions made by the recruit. Eventually, the successful trainee will be able to handle calls without assistance from the field training officer.

There exists a long-standing concern in policing that each rookie is told by an experienced officer to forget what was learned at the academy and to just watch and learn how things are done right. As Van Maanen (1978) described, “The newcomer is quickly bombarded with ‘street wise’ patrolmen assuring him that the police academy was simply an experience that all officers endure and has little, if anything, to do with real police work” (p. 300). This unfortunate message is that the formal training received at the academy is irrelevant or unrealistic. It is hoped that field training officers are selected and trained to make sure these types of counterproductive messages do not occur. After an officer has passed the probationary period, he or she may think training is over. However, most states and many departments require refresher courses, training on new issues, and other sorts of in-service training.

In-Service Training

Many states have now mandated in-service training for police in the same way lawyers and teachers must continue

their education. In-service training is designed to provide officers with new skills and changes in laws, policies, or procedures. Also, since many skills learned at the academy or while in field training are perishable, in-service training can restore an officer's skills. Some agencies send officers to lengthy management schools or specialized trainings. It is hard to believe that some agencies still do not train veteran officers aggressively. Police work is constantly changing, and remaining a good police officer is different from the process of becoming one.

If conducted properly, in-service training can provide a critical component to the agency's training scheme. There must be training for supervisors and managers, communication specialists and investigators, as well as street officers. In other words, patrol officers need certain skills and those on specialized assignments need others. Some skills, such as those used in the control of persons, emergency vehicle operations, and other high-risk activities, need more frequent and in-depth training than those engaged in more routine tasks. Officers must not only be provided with proper information, but they must also be given the opportunity to ask "What if" questions of the instructor. Further, officers must pass an examination before it can be assumed that they know the information and are competent to put it into practice in real-world situations.

The Internet is providing a new forum for training police officers. Many departments are creating home pages that provide information about the agency and the community served. There are also many police "chat rooms," which allow officers to share information and have discussions about many topics and issues. Innovative trainers can take advantage of these technological advancements for the improvement of their officers' knowledge and experience.

The expense of training is one of the important issues many departments must consider. Not only is it costly to evaluate needs, to plan and to provide for training, but it is also very expensive to remove officers from the streets to be trained. In the short term, the expenses are great, but in the long term, the training and its related costs will pay off.

Once selected and trained, there are many recruits who enter into police work only to realize that the work, schedule, and rewards are not what they anticipated. In addition, administrators will learn that some of the citizens they recruit and even train are not able to perform the required task appropriately. Other reasons officers do not make careers in policing include family influences, "burn out," and better-paying job offers.

After officers have negotiated successfully their initial training, most are assigned to the patrol function and, as a result, have the most contact with the public. There are multiple methods of patrol, including automobile, foot, horse, motorcycle, bicycle, and boat. Each type serves a different function, promotes different relationships, and creates different problems. In any case, these officers are now prepared to police independently and to interact with citizens on their own.

Police Operations

Police Patrol

Patrol has long been considered the "backbone" of policing, as this is where almost every police officer gets his or her "street experience." This experience on the street with citizens is vital in shaping the outlooks and views of the police officer. While many patrol officers will go on to supervisory or investigative positions, this starting point creates shared experiences and facilitates socialization with fellow officers. An important question is, what are the major factors that influence a patrol officer's behavior?

Although officers experience similar situations, their responses may differ due to the complexities and special circumstances of interactions. They soon learn that they cannot enforce all laws, and as Kenneth Culp Davis (1975) observed, the police must use discretion and selective enforcement.

Written guidelines or policies direct police officers' activities, reactions, and behavior. Policies are based on relevant laws and presumably best practices. They are directives that provide members of the organization with sufficient information so that they can successfully perform their day-to-day operations. Some agencies provide their officers with very detailed policies, while others have promulgated more general policies but have supplemented those with detailed in-service training. While officers are allowed discretion with specified boundaries, it is an important research question to determine what factors explain why police officers respond differently to the same conditions.

For example, the process of forming suspicion has been a topic that has received relatively little attention in the research literature. Jonathan Rubinstein (1973) was one of the first scholars to thoroughly discuss the formation of suspicion. He notes the following:

Many of the things the officer is looking for are a product of prior situations, a consequence of events about which he knows nothing, although he often makes assumptions about some of them. . . . While the patrolman is looking for substantive cues indicating flight, fear, concealment, and illegal possession, he is also making judgments based on his perception of the people and places he polices. (pp. 255, 257)

After an exhaustive review of the literature, the National Research Council (2003) concluded that a suspect's social class, gender, as well as other social factors do not explain variance in behavior in police-citizen interactions.

An important area of police behavior to address is the foot pursuit. Similar to vehicular pursuits, these activities were not regulated until the 1990s. Around that time, it became apparent that officers and suspects were unnecessarily injured or put in situations that resulted in unnecessary force and deadly force because they abandoned proper practices and went on foot pursuits alone, or were separated from

other officers in an attempt to corner or head off a fleeing suspect. Without proper communication, or a plan, officers put themselves in dangerous situations, which can result in crossfires and unnecessary force.

It appears that officers' beliefs and prior experiences strongly influence their responses to citizens. Perhaps the cognitive theorists are correct in arguing that officers learn by experience, and that the relative power of that learning is influenced by one's degree of familiarity and repeated associations in a fashion similar to the theory of differential association. In other words, these developed schemas form a mental model and illusory correlation that strongly influence a person's responses to people and places in future encounters (Alpert, MacDonald, & Dunham, 2005). This is all extremely important because officers' behavior creates an image for a police department, and supervisors must manage how the officers act and respond to situations. While the patrol function forms what has been called the backbone of policing, perhaps it is the first-line supervisors who form the nervous system of the agency. The patrol officers are the ones closest to the community and know the most about the people and places they police. It is they who are crime fighters, community policing officers, and problem solvers—all at the same time. It is the supervisor who directs and manages their activities.

The Crime Control Function

What are the major operations by which the police set out to control crime? The crime control function of the police relies on four primary tactics: (1) randomized and directed patrol (preventative patrol), (2) problem identification and solving, (3) response to calls for service by citizens, and (4) criminal investigation.

Preventive patrol is largely based on the assumption that it serves as a deterrent effect on crime. Although this assumption was questioned in the Kansas City Preventive Patrol Experiment, other studies have indicated that citizens' attitudes and beliefs are impacted by seeing officers on motorized and foot patrols. Problem identification involves the identification of specific locations and times wherein crime is most likely to occur or that are otherwise deemed most problematic.

The effectiveness of rapid responses to calls has been examined over the years. The initial rationale behind a speedy response is that it will improve the likelihood that police will apprehend a suspect. Unfortunately, citizens often report crimes after the fact, and a few seconds shaved by the police responding at breakneck speeds to a call for service does not make much difference in the officer's likelihood of affecting an arrest. Interestingly, whether or not the initial officer responding to a scene can identify a suspect may make a difference in whether the case is resolved, but the time differential is measured in minutes, not seconds.

Finally, the work of detectives and the criminal investigation process have been studied in a variety of ways. The

RAND Corporation study provides an important benchmark for establishing what is known about the effectiveness of retrospective investigation of crimes (Greenwood & Petersilia, 1975). There are several important findings in this report that merit discussion. First, detectives spend very little of their time (less than 10%) on activities that directly lead to solving crime. A large proportion of the time they do spend on casework is often used on cases after they have been solved (e.g., preparing a case for court). Second, solving crimes has little to do with any special activities performed by investigators. Instead, the most important factor affecting case clearance (e.g., whether a suspect can be identified) is the behavior of the initial responding officer and members of the public. As noted above, clearance rates are related to whether either the initial responding officer (or a victim or witness on the scene) was able to identify a suspect. It is usually a civilian and not the officer who can make an identification, thereby reducing the need for officers to risk the safety of civilians on the streets by driving at high speeds to get to a call.

While patrol is an important aspect of policing, police departments and their officers perform functions other than crime fighting. Order maintenance, rather than law enforcement, may be a better approach in certain places and with certain people. As police officers are available 24/7, they are called on to provide emergency aid, information, and animal control and to make referrals to other human welfare agencies, among other responsibilities. The time spent on these services can be significant and can be seen as taking away from routine crime-fighting activities. Even some terrorist threats that require attention can be seen as taking away resources from immediate community-level crimes and problems.

Several issues that require time and effort are gangs and weapons. Although these concerns are neither new nor novel, the police response must change continually to be effective. Taking guns off the street and reducing gang violence must be goals of every police department. As new strategies are developed, new techniques by gang members are discovered.

Important Influences on Officers' Behavior

A considerable amount of research has been conducted on the influences on officers' behavior while on the job. Policing is an occupation for which the behavior of the incumbent can have very serious implications for those they police. Few occupations give individuals as much power over others as the police position. In exercising their discretionary power over others, officers may severely injure citizens; end their lives; destroy their reputations; or send them to jail or prison, among many other very severe penalties. Thus, it is important to monitor how officers make such decisions and try to understand which factors influence them.

The Culture of the Police

The nature of police work is different from that of work performed in most other occupations. As has been noted, the police are among the few professionals that are required to be available 24 hours a day, 7 days a week, 52 weeks a year. Furthermore, the police deal with social problems and societal ills that extend beyond simply fighting crime. The police are also unique in terms of the persons with whom they most routinely interact. While police officers deal with the entire spectrum of humanity, they spend the majority of their time dealing with the seamier side of society. The central features of the police culture may be categorized according to the way officers relate to the unique nature of the job, the special category of persons with whom they come into contact, and the environment in which they work. In other words, the unique aspects of the police role, such as being given tremendous authority, and the corresponding right to use force on citizens; morality issues related to the police being the enforcers of right over wrong; and danger, or the threat of danger, shape the nature of the police and their work.

Research indicates that the environment in which police do their work is shaped by their isolation from citizens, their solidarity within the police subculture, their loyalty to each other, and their desire for autonomy in carrying out policing duties. These conditions all contribute to the character of the police subculture, which has been characterized by extreme loyalty to one's coworkers, particularly one's partner. However, the police operate in a bureaucracy that is based on a paramilitary model with many guidelines or policies, rigid lines of authority, and communication that is authoritative and clear. These also make important contributions to the police culture and have an important impact on how the police do their work.

Police Bureaucracy

Police departments are organized in a manner similar to the military, using ranks to designate authority (captain, lieutenant, sergeant, etc.). True to the bureaucratic form of organization, the larger police departments are divided into special divisions and units with lines of authority leading from the chief to the line officers. Police department hierarchies of authority vary in respect to how tasks are divided and which divisions report to which supervisors.

The traditional hierarchy is represented by a pyramid-type structure. On the top, to set and enforce policies and to provide overall leadership, is the chief. Other divisions include at least internal affairs, communication, and patrol. Smaller agencies may combine different elements into one division, but all agencies must perform the same basic duties.

For example, internal affairs or professional compliance bureaus investigate all allegations of police misconduct. These concerns can be initiated by civilian complaints or by

fellow police officers. This division or section is of paramount importance to the operations of any law enforcement agency and must receive support from the chief administrators. Most Internal Affairs Division managers report directly to the chief of police to avoid any question of prominence or importance.

One of the most critical elements of police work is its system of communication. It is this "heart line" that receives calls for service and forwards information to officers in the field. The communication process forms the link between the community and the police. The information provided to officers is the basis on which they prepare and respond. In other words, if the police department is told about a particular situation, officers and supervisors must recognize how many officers are needed, how quickly they need to respond, and where they need to be sent.

The degree of centralization in the organization is one of the most critical decisions an administrator must make. A centralized structure, with a dominant supervisor, will have strong controls and may be cost effective. A decentralized structure will have flexibility and will be cost efficient as it emphasizes team building as a mode of problem solving. As each structure has positive and negative characteristics, the goals of the organization, with input from the community, should serve to design the structure. Certainly, large departments can centralize administrative and certain investigative functions while they decentralize patrol and other activities. The trend has been to decentralize many police functions and to be more responsive to the unique characteristics of communities. Regardless of the type of organization, there are always going to be critical concerns and high-risk activities performed by the police. The next section looks at these activities and places them in their proper perspective.

Critical Issues and High-Risk Activities

Given the large number of issues that exist in policing today, this discussion must be limited to the most important ones. The approach here is therefore selective and focuses on a limited number of critical issues: minority hiring and promotion, women in policing, the use of force, and pursuit driving.

Minorities in Policing

Tremendous strides have been made in hiring minorities in recent years. Since the mid-1990s, police agencies have increased significantly the hiring and promoting of minority officers.

Advocates for the hiring and promoting of minorities argue that if minorities are adequately represented in police departments, departments become representative of the communities they serve. Police departments that reflect the racial and ethnic characteristics of the communities

they serve may increase the respect of community residents and thereby increase the flow of information concerning crime and the identification of criminals. Similar to ethnic minorities, females have not played an important role in law enforcement until relatively recently.

Until the early 1980s, the few females who were involved in police work were often assigned to clerical duties or restricted to work with either female or juvenile offenders. The reasons for this exclusion were many: First, male officers did not want to put up with the social inhibitions placed on them by the presence of women; second, they did not want to be overshadowed by or even to take orders from women; finally, most men did not want to be supported by a female in the performance of potentially dangerous work (Caiden, 1977; Martin, 2001). The common belief was that females would not function to the level of their male counterparts—specifically, that they would react improperly and would not be able to apprehend suspects in violent or dangerous situations. Recently, the myths about women in the police world have been debunked, and benefits connected with recruiting more female officers have been stressed. For example, female officers are often better than male officers at avoiding violence and de-escalating potentially violent situations. Moreover, while women currently represent approximately 13% of all sworn personnel, they are responsible for only 5% of citizen complaints, 2% of sustained allegations of excessive use of force, and 6% of the dollars paid out in judgments and settlements for excessive use of force (National Center for Women in Policing, 2002).

The next issue is the use of force by police officers, which often is handled more appropriately by female officers than by their male counterparts. The use of force is a highly controversial issue, and this examination will look at both the problems connected to it and some of the potential solutions that can prevent the abuse of this most necessary of police powers.

Use of Non-Deadly Force

The use of force, particularly deadly force, has traditionally been one of the most controversial aspects of police work. Clearly, a distinction must be made between appropriate police use of force and excessive force. While some level of force is legitimate and necessary to control suspects and protect innocent citizens, the use of excessive force is unacceptable and is one of the most troubling forms of police misconduct. New technologies, such as the Electronic Control Device or the Conducted Energy Device, provide police officers with alternatives to traditional batons, fists, and fights. While these technologies can lead to fewer injuries than traditional uses of force, they also create their own issues, such as device malfunctions that have been linked to several deaths. Although a disproportionate amount of media attention is given to the use of force by the

police, it is a rare event considering the numerous times police officers have encounters with citizens.

To understand police use of force, it is important to examine the sequence of events as they unfold in police–citizen interactions. The way to accomplish this task is to understand how the levels of force and resistance, and the sequence in which they take place, affect the outcome of the encounter. This effort requires using detailed information on the sequence of actions and reactions to make sense of the interaction process of the encounter (Alpert & Dunham, 2004).

Alpert and Dunham (2004) have formulated an interaction theory to help understand police use of force and the overall interaction processes between officers and citizens that lead to using force. The *authority maintenance theory* depicts the police–citizen encounter as an interaction process that is somewhat unique because authority dominates the process and it is more asymmetrical than in most other interactions. Another aspect of police–citizen interactions, according to the theory, is that the expectations and behaviors of these actors are more likely to violate the principle of reciprocity, an important function of human interactions. Officers are more likely to resort to using force when suspects block the officers from reaching their goals concerning the outcome of the encounter. Likewise, citizens respond to the blockage of their goals with varying degrees of resistance. The resistance/force sequence typically escalates until one party changes the other's expected goals voluntarily or involuntarily.

Use of Deadly Force

Since police use of force is often measured by its severity, deadly force is often analyzed as a separate category. It is estimated that each year, approximately 400 persons are killed by the police, and the issue becomes particularly problematic due to the widespread perception that minorities are more likely than white subjects to be killed by the police. Regardless of the research evidence that shows the threatening behavior of the suspect is the strongest indicator of police use of deadly force, the perception of racially biased or motivated killings by the police remains.

The authority to use deadly force can be traced to English common law, when police officers had the authority to use deadly force to apprehend any suspected fleeing felon (the “fleeing felon” doctrine). During this time period, the fleeing-felon doctrine was considered reasonable. First, all felonies were punishable by death in England, and second, defendants did not possess the rights or the presumption of innocence that they enjoy today. In 1985, the U.S. Supreme Court modified the fleeing-felon doctrine in the *Tennessee v. Garner* (1985) decision.

The landmark case of *Tennessee v. Garner* (1985) involved the use of deadly force against a fleeing felon: At approximately 10:45 on the night of October 3, 1974, a slightly built eighth grader, Edward Garner, unarmed and

alone, broke a window and entered an unoccupied house in suburban Memphis with the intent of stealing money and property. Two police officers, Elton Hymon and Leslie Wright, responded to a call from a neighbor concerning a prowler. While Wright radioed dispatch, Hymon intercepted the youth as he ran from the back of the house to a 6-foot cyclone fence. After shining a flashlight on the youth who was crouched by the fence, Hymon identified himself and yelled at Garner to stop. Hymon observed that the youth was unarmed. As the boy jumped to get over the fence, the officer fired his service revolver at the youth, as he was trained to do. Edward Garner was shot because the police officers had been trained under Tennessee law that it was proper to kill a fleeing felon rather than run the risk of allowing him to escape.

A lawsuit filed by the family ended up reaching the U.S. Supreme Court. The underlying issue being decided by the Court was when and under what circumstances police officers can use deadly force. The Court held that the Tennessee statute was “unconstitutional insofar as it authorizes the use of deadly force against . . . unarmed, nondangerous suspect[s]” (*Tennessee v. Garner*, 1985, p. 11). The Court cited with approval the Model Penal Code:

The use of deadly force is not justifiable . . . unless (i) the arrest is for a felony; and (ii) the person effecting the arrest is authorized to act as a police officer . . . ; and (iii) the actor believes that the force employed creates no substantial risk of injury to innocent persons; and (iv) the actor believes that (1) the crime for which the arrest is made involved conduct including the use or threatened use of deadly force; or (2) there is a substantial risk that a person to be arrested will cause death or serious bodily harm if his apprehension is delayed. (cited in *Tennessee v. Garner*, 1985, pp. 6–7, note 7)

In the final analysis, the Court ruled that “where the suspect poses no immediate threat to the officer and no threat to others, the harm resulting from failing to apprehend him does not justify the use of deadly force to do so” (*Tennessee v. Garner*, 1985, p. 11). The nature of this threat is also clear: “a significant threat of death or serious physical injury” (p. 11). In other words, the *Garner* decision created a modified “defense of life” standard. It is significant that this pronouncement can be reduced to a moral judgment. This was made clear when the Court noted, “It is not better that all felony suspects die than that they escape” (p. 11).

Police Pursuits

The use of deadly force by the police, involving the use and abuse of firearms, has been under scrutiny for a long time by police administrators, by the public, as well as by the courts. Another use of potentially deadly force that has only recently attracted significant attention is the police pursuit (see Alpert, Kenney, Dunham, & Smith, 2000). The purpose of a pursuit is to apprehend a suspect following a

refusal to stop. When an officer engages in a chase in a high-powered motor vehicle, that vehicle becomes a potentially dangerous weapon. As the training guide for the California Peace Officer Standards and Training (CPOST) explains, firearms and vehicles are instruments of deadly force and the kinetic energy or kill power of a vehicle is far greater than that of a firearm.

Considered in this light, it is not surprising that there is such great concern over police pursuits. Each year, the National Highway Traffic Safety Administration (NHTSA) collects data on police-pursuit-related fatalities. The data are collected as part of the Fatality Analysis Reporting System (FARS); however, they do not capture all of the pursuit-related deaths. For example, many law enforcement officers are not trained to check the “pursuit related” box when a fatality occurs. Similarly, if the police vehicle is not involved in the crash, officers don’t always report a death on the form. Nonetheless, the NHTSA data show that at least one person will die every day of the year in a police pursuit, with approximately one third of those deaths being innocent bystanders.

While the costs of pursuits are high, the benefits should not be discounted. On the one hand, it is the mission of the police to protect lives and, clearly, pursuits are inherently dangerous to all involved. On the other hand, there is an ongoing need to immediately apprehend some law violators. Determining how to balance these two competing goals will shape the future of police pursuits. Depending on the reason for the chase and the risk factor to the public, abandonment or termination of a pursuit may be the best choice in the interests of public safety. The critical question in a pursuit is what benefit will be derived from a chase compared to the risk of a crash, injury, or death, whether to officers, suspects, or the public. In other words, a pursuit must be evaluated by weighing the risk to the public against the need to immediately apprehend a suspect.

There are two myths that are commonly stated by proponents of aggressive pursuit policies. The first myth is that suspects who do not stop for the police “have a dead body in the trunk.” The thinking behind this statement is that people who flee from the police are serious criminals who have something to hide. While the empirical truth is that many who flee from the police are “guilty” of offenses other than the known reason for their flight, the offense is most often minor, such as a suspended driver’s license (Alpert et al., 2000). The second myth is that if the police restrict their pursuits, crime will increase and a significantly greater number of citizens will flee from the police. While this myth helps justify aggressive pursuit policies, it is not substantiated by empirical data. In fact, agencies that have restricted pursuits do not report any increase in fleeing suspects.

Police pursuits are dangerous activities involving risk to all persons involved, and even to those innocent bystanders who might be in harm’s way. Research shows that approximately 40% of pursuits result in a crash, 20% result in an injury, and 1% result in a death (Alpert & Dunham, 2004).

It is very difficult to force a vehicle to stop without the use of a deadly force tactic, such as ramming or shooting at a vehicle. As these tactics are also very dangerous, it becomes important to develop technologies to get vehicles to stop without risking lives. These technologies are being developed, and military technology is being declassified and used to assist law enforcement officers in stopping vehicles and avoiding unnecessary high-speed pursuits.

The Future of Policing

Although this chapter has presented only a snapshot of policing issues and research, a number of areas have had an increasing influence on policing and will guide policing in the future: (a) continued and concerted attempts by the police to be more attentive to the needs of citizens and solving the underlying problems that contribute to crime (e.g., community policing and problem-oriented policing); (b) responses by the police to demands for greater accountability from citizens, policymakers, and police administrators (e.g., Early Warning or Identification Systems, COMPSTAT, and citizen review boards); and (c) the application of new technologies to help officers and administrators accomplish these goals, including face recognition software and other computer applications.

Community and Problem-Solving Policing

One of the most important factors that moved policing strategies in new directions was the body of research indicating that traditional methods of policing (e.g., rapid response to citizen calls for service, preventive patrol, and the criminal investigation process) were not as efficient as expected in combating crime. The results of this research, and anecdotal information, highlighted the central role that the community played in the detection and prevention of crime. It is clear that without the cooperation of the community, very little crime would be solved at all, and public attitudes concerning the police would be very unfavorable. The argument that traditional policing is reactive rather than preventative, and treats the symptoms of crime rather than broaching the fundamental problems themselves, forced policing specialists to become proactive and to solve problems rather than simply respond to them after the fact. As these techniques improve and sufficient resources are allocated to proactive strategies, there may be a reduction in crime and a corresponding improvement in public perceptions of the police.

Responding to Demands for Greater Accountability

An integral part of community policing is greater accountability on the part of the police for their actions. In recent years, departments have adopted several strategies to facilitate an increase in officer accountability, both

internally to superiors and externally to the citizens they serve. In order to promote accountability within police departments, police organizations across the United States are experimenting with COMPSTAT and other programs that develop, gather, and disseminate information on crime problems and hold police managers accountable to reduce the problems. Another innovation in accountability is the early identification of potentially problem officers. The Early Identification System (EIS) includes three basic elements: identification and selection of officers, intervention, and post-intervention monitoring. Each element selects a variety of performance indicators that capture officers' behavior or compare officers in similar situations. The goal is to identify and intervene with officers whose behavior may be problematic.

New Technology

The improvement and application of technology is perhaps most likely to influence policing in the future. Implicit in this discussion of the implementation of community- or problem-oriented policing and the concomitant and innovative methods of enhancing police accountability has been the advent of technology. Perhaps the most important technological advancements inside a police department are crime analysis, computerized reports, GPS systems and car locators, and crime mapping. In the community, the use of cameras may result in crime deterrence or displacement and the enhanced ability to solve crimes.

Crime analysis has three primary functions. These include assessing the nature, extent, and distribution of crime for the purpose of allocating resources. The second primary function is to identify suspects to assist in investigations. The final function of crime analysis is to identify the conditions that facilitate crime and incivility and to direct approaches to crime prevention. The ability of law enforcement agencies to engage in crime analysis and fulfill these three primary functions has been greatly enhanced by advancements in information technology (IT). For example, computer-aided dispatch (CAD) systems have had a tremendous impact on the ability of the police to analyze and prioritize calls for service. CAD systems automatically collect and organize certain information from every call including the type of call, the location, the time, and the date. When these data sources are linked to others, crime analysts are capable of identifying "hot spots" of crime, detecting patterns of crime and disorder, and identifying factors or conditions that may be contributing to crime.

Most police officers complete handwritten reports on paper. New technology now permits many functions to be completed on computers in vehicles and automatically uploaded to agency computers as the vehicles drive by radio towers. Computerized reports can also permit key words, names, and specific information to be searched among all reports, and similarities can be flagged for further investigation of people and places.

New technologies installed in vehicles allow officers to access maps and allow managers to see where officers are located, at what speed they are driving, and where they have been. These new systems can assist the police function, protect officers, and serve as an accountability feature at the same time. In addition, experiments with license plate and face recognition software are taking place that allow officers while driving to be notified when a person or vehicle license of interest is observed.

The origin of crime mapping goes back to crude statistical analysis: a series of color-coded “push pins” in maps displayed on precinct station walls. Today, the police are able to use geographic information systems (GIS) technology to create maps that show the type of crime, victim information, location, time, and a variety of other criteria, all of which can be compared to census information or other databases containing what would otherwise be unconnected information. These data can be analyzed over time and space for trends or similarities, which can subsequently assist a department with crime detection, crime prediction, and resource analysis, among other things.

Conclusion

Increased interaction with the community, greater accountability within the police force and to the public, as well as technological advances will all increase and will ultimately have an effect on the police function and how it is carried out. As officers are provided with more time and resources, allowing them to interact more positively with citizens, the police will likely recognize the constructive results of these contacts. Innovative approaches to community mobilization should be designed to empower citizens and build trust in the government. Clearly, the application of technology will provide unique and innovative means of identifying, creating, and updating blueprints for resolving the many problems faced by the police.

PRISON

PETER B. WOOD

Eastern Michigan University

In 21st-century America, imprisonment has become a \$60+ billion per year industry, and will continue to increase in scope in the coming decades. The “prison industrial complex” includes not only those agencies directly involved in delivering punishment (courts, corrections, parole and probation agencies, etc), but also a widening array of vested interests that depend for their political and economic well-being on an ever-increasing supply of inmates. This new constellation of interests includes financial institutions that bankroll and finance construction and management of correctional institutions; political action committees that lobby for new prisons; politicians who run on law-and-order platforms that emphasize punishment for criminal offenders; local development authorities that compete for prisons, believing they will be economic development catalysts for their communities; the many for-profit firms engaged in prison privatization; architectural and construction firms that specialize in large institutions; and a broad range of service providers that seek to secure long-term contracts to provide telecommunications, transport, correctional technologies, food and beverage, clothing, computers, and personal hygiene products to the 2.4 million inmates that currently reside in American prisons and jails.

Beyond the tremendous recent growth in the number of inmates and facilities associated with imprisonment, several developments unique to this new era of punishment deserve notice. But before they are introduced, it is instructive to

provide some information about how the scope of imprisonment has changed in the last 30 years.

The Transition From 20th- to 21st-Century Imprisonment

For several decades prior to the 1970s, what was most notable was the remarkable stability of the incarceration rate, averaging about 110 per 100,000 (excluding jail populations). While there were minor fluctuations in this period, the rate remained very stable, which led some criminologists to hypothesize a “theory of the stability of punishment,” suggesting that a given society develops a certain culture regarding the level of punishment with which it is comfortable, and then, consciously or not, adjusts its policies and practices to meet this desired outcome. In 1972, federal and state prisons held 196,000 inmates for a prison incarceration rate of 93 per 100,000. In addition, about 130,000 inmates were held in jails, resulting in about 1 out of every 625 adults serving time in jails or prisons.

At the time, this level of imprisonment was viewed as egregiously high among those supporting a moratorium on prison construction, and in 1972, the National Council on Crime and Delinquency passed a policy statement calling for a halt to prison construction in the United States. In 1973, the National Advisory Commission on Criminal Justice Standards and Goals recommended that “no new

institutions for adults should be built and existing institutions for juveniles should be closed,” and concluded that “the prison, the reformatory, and the jail have achieved only a shocking record of failure. There is overwhelming evidence that these institutions create crime rather than prevent it” (National Advisory Commission on Criminal Justice Standards and Goals, 1973, p. 1).

Despite these sentiments, a prison expansion unprecedented in human history was about to take place. No one would have predicted that a large-scale imprisonment binge would characterize the next three decades. Many scholars point to the 1974 “Martinson report” (known for finding that “nothing works” to rehabilitate criminals) as signaling the death knell of the rehabilitation ideal in the United States, and since the late 1970s policy and public opinion has shifted toward more certain and severe punishment characterized by longer prison terms for an ever-increasing number of offense types.

The imprisonment binge over the past 30 years has resulted in a 700% increase in the U.S. incarceration rate to 762 per 100,000 and approximately 2.3 million in prisons (1.5 million) and jails (800,000) in 2007 (The Sentencing Project). With 1 out of every 100 adults incarcerated, the United States boasts the world’s highest incarceration rate (well ahead of the Russian rate of 635 per 100,000) and accounts for about 25% of the entire world’s imprisoned population. At present, this trend shows no sign of reversing. In addition, nearly 800,000 prisoners per year are now being released from prisons and jails into communities across the United States—the majority of whom will be readmitted within 3 years. The staggering growth in imprisonment in the United States and its scope compared to the past has generated several unique situations and circumstances not previously seen or anticipated. These include but are not limited to prison hosting, coercive mobility and its effects, issues associated with prisoner reentry, a host of “invisible punishments” and their consequences, and the impact of mass imprisonment on minority groups—particularly African Americans.

Prison Hosting in the 21st Century

In the past, prisons have been viewed as undesirable, and communities have traditionally lobbied against the placement of correctional facilities in their midst. Such institutions were regularly a focus of the NIMBY (Not In My Back Yard) and LULU (Locally Unwanted Land Uses) literatures, along with community mental health centers, mental institutions, free health and methadone clinics, homeless shelters, and other agencies or institutions that residents viewed with concern and even fear.

Such concerns have faded as communities now lobby fiercely for the opportunity to host prisons. Particularly for counties and communities that have fallen on hard economic times, a new prison offers the prospect of a new

industry, new jobs, and a potential economic catalyst that will spark community growth and development. Most new prisons in the past 20 years have been built in rural communities characterized by high unemployment and low wages, as local development agencies and authorities are lobbied by correctional firms and interests with the promise of higher wages, job opportunities, and so-called “multiplier effects” that are presumed to enhance quality of life for local residents (Wood & Dunaway, 2003).

Over 1,000 new correctional facilities were built in the United States in the last two decades of the 20th century—most in poor rural communities. Between 1980 and 2003, over 350 rural counties built prisons, and some counties boasted several. Nearly 250 prisons opened in 212 of the nation’s 2,290 rural counties in the 10-year period between 1991 and 2001 alone (Beale, 2001). In short, one (or more) prison(s) opened in approximately 10% of all rural counties in the United States in just those 10 years. Currently, nearly 60% of prisoners residing in prisons live in facilities built since 1980 in rural areas, and the average of 25 new rural prisons opening each year in the 1990s (in 1998, a total of 38 new rural prisons opened, the peak year for new rural prisons) is a significant departure from a yearly mean of 16 in the 1980s and 4 in the 1970s.

Correctional facilities are particularly attractive to local legislators and development authorities who seek to “bring home the bacon” to their constituents and hopefully promote economic development in their communities. In addition to the hope that jobs will be created during construction as well as service and supply jobs once the facility is in operation, counties typically charge the state for each inmate/day that a state inmate is housed at the county-level facility. Further, rural counties use minimum-security inmates for municipal and public works. For many rural counties, the majority of municipal and public work is conducted by state inmate road crews. The expense of local municipal services (trash and debris removal, construction work, road maintenance, etc.) is significant, and can be offset by requiring that inmates perform these services as part of their sentence—at no cost to the county. Thus, counties anticipate several payoffs; a new facility may serve as an economic catalyst, counties charge the state to house inmates, and counties use inmates to perform municipal services. In addition to publicly funded facilities, private prisons are increasingly likely to be located in economically distressed rural areas. Prison expansion has spawned a new and powerful coalition of vested interests with stakes in keeping prisons full and building more of them. The result has been a financial and political bazaar with prisoners as the prize.

Any new prison is likely to remain operating in place for at least 50 years, which appeals to communities as a secure source of employment. But there is little evidence that prison hosting stimulates economic development at the local level (Herival & Wright, 2007). Several national and regional studies have demonstrated that rural counties

that host prisons typically show no positive benefits in per capita income or reduced unemployment compared to non-prison areas. Why is this the case?

While prisons create jobs, they don't usually go to people in those communities, who don't have the skills or civil service rating to become a correctional officer. And in rural communities, people are used to commuting long distances to work, so guards at nearby prisons may choose to transfer to the new ones. Also, aggressive pursuit of new prisons can create an imbalance in a county's economic development strategy. Energies devoted to prison lobbying can detract from other pursuits that might create more jobs. In addition, there is a stigma attached to becoming viewed as a prison town. How many people think of a family trip to Attica as a summer vacation option?

The prison-building binge may have slowed in recent years, but given the projected increases in national prison populations, other states may soon follow the lead of California, which recently established a plan to add another 53,000 prison, jail, and juvenile detention beds for an estimated cost of \$7.9 billion. Though current economic woes have caused federal and state governments to reduce their investments in punishment, the expected future increase in the number of inmates, correctional institutions, and costs associated with the decades-long expansion has enough momentum to carry well into the mid-21st century.

Coercive Mobility in the 21st Century

The aim of get-tough sentencing policies was to reduce crime and improve community life, but neither policymakers nor the public anticipated how putting so many people in prison would damage the communities from which they were removed. While mass imprisonment has indeed incapacitated many who would otherwise have an overall negative effect on community life, it has also removed thousands of people who had a net positive effect on the economy, families, and the community as a whole. Many communities now face economic hardship, family disruption, and more crime due to high levels of incarceration.

A growing literature has begun to document the effects on community life of America's 30-year incarceration binge, but only a few studies have analyzed the complex relationship between incarceration and crime. Most scholarship that examines the incarceration-crime relationship has applied a social disorganization framework. In their seminal Chicago Area Project, Shaw and McKay (1942) found that the highest crime rates were in neighborhoods marked by social disorganization: dilapidated housing and infrastructure; unemployment; poverty; and most important, high residential mobility—people moving in and out of the neighborhood at a high rate. Much subsequent research confirms that crime is disproportionately concentrated in these types of neighborhoods. Because of conditions in these neighborhoods, those who "make it" move out, eroding a community's

ability to maintain primary institutions like schools, churches, and neighborhood associations. Social disorganization theorists argue that high residential mobility limits the formation of strong social networks essential in controlling crime, undermining the stability necessary to establish the elements of social capital (i.e., trust, empowerment, norms, and reciprocity) that serve as the backbone of effective mechanisms of informal social control.

Coercive mobility (incarceration and prisoner reentry) is concentrated in poor, urban, and predominantly minority neighborhoods and is an important source of residential mobility that leads to social disorganization and crime. But unlike voluntary mobility, coercive mobility has profound negative effects on other aspects of social life such as labor market participation, family functioning, and political participation. While not all coercive mobility results in social disorganization, at some level (a "tipping point") the benefit of removing those disruptive to the community (criminals) is outweighed by the costs of removing parents, workers, and family members who provide a net positive effect on social capital and informal social control. When the tipping point is reached, too much incarceration can weaken community economies, family relationships, and overall social capital and lead to higher crime rates.

Clear, Rose, Waring, and Scully (2003) collected community-level data regarding prison admission rates, prison release rates, and crime rates for several neighborhoods in Tallahassee, Florida, and Renauer, Cunningham, Feyerherm, O'Connor, and Bellatty (2006) collected similar data on 95 communities in the Portland, Oregon, area. Both research efforts found coercive mobility concentrated in poor communities with large minority populations, and communities with extremely high coercive mobility had higher subsequent crime rates even when controlling for other indicators of social disorganization. As expected, the relationship between coercive mobility and crime was curvilinear—incarceration reduced crime at moderate levels, but began to increase crime rates when they reached a tipping point of about 1.7 per 100 people in Tallahassee and about 2.75 per 100 in Portland.

High levels of incarceration may not lead to less crime because communities with the highest levels of incarceration (poor, predominantly minority ones) are actually weakened by the very thing that is supposed to make them safer. Research described above supports the idea that, at the community level, low and moderate levels of incarceration can reduce crime, but high levels of incarceration can increase it by reducing social and neighborhood capital.

Coercive Mobility and Counting Prisoners

In 21st-century America, imprisonment typically moves people out of large urban centers and into rural communities. This has major implications for electoral apportionment and financial distributions. The census general rule is to count people in their usual residence, "the place where they live and sleep most of the time." The usual residence need

not be the same as a person's legal or voting residence, and a person need not be there at the time of the literal census. The person can take a vacation and still count at home, or even work overseas and still count at home.

The Census Bureau counts prisoners as residents of the town that contains the prison in which they are housed. This practice reduces the population of communities where most prisoners originate (usually urban, low-income, minority communities) and swells the population of rural communities that host prisons. When prisoners are counted as residents of the prison town, it leads to misleading portrayals of which counties are growing or declining. Urban and black communities are the losers in the census count, since congressional apportionment of services, grants, funds, poverty relief, welfare, and so forth are based on census figures.

An accurate count of the population is used to apportion voting representation, draw political boundaries, and allocate state and federal funds among local and state governments. Mass incarceration distorts this fundamental tool of representative democracy. In the 1990s, 30% of new residents in upstate New York were prisoners. About 200 counties in the United States have more than 5% of the population in prison. Many have more than 20% of their population in prison. (In at least 21 Texas counties, inmates account for over 20% of the local population.) But when released, prisoners usually return to the community they call home. Whatever benefits accrue to a jurisdiction by virtue of its population, urban communities with high incarceration rates are losing. Conversely, rural counties with prisons are getting more than their fair share.

The official constitutional purpose of the census is political apportionment. About 12% of all African American men live in prison. Most of them are apportioned to districts that do not reflect the interests of their home communities or their personal political concerns. Significant densities of prisoners in state legislative districts are important because most criminal justice policy is made at the state level. Each free resident of a rural district with prisons gets a larger voice in the state capital than free residents in urban districts that have high numbers of residents in prisons. Prisons inflate the political clout of every real rural constituent. And at the state level, counting urban residents as rural residents dilutes urban voting strength and increases the weight of a vote in rural districts.

Larger places (those with larger populations) receive a correspondingly larger share of government resources. The primary measure of size for determining resource distribution is the official census count. The coercive mobility of offenders creates a consistent distortion in funding formulas such that rural counties come out ahead of urban counties that send them prisoners. For example, the U.S. Department of Agriculture (USDA) distributes some \$60–70 million annually to poor Appalachian communities via the Appalachian Regional Commission, and population is a distribution factor—so rural communities with prisons have an advantage over those without prisons. The USDA does not intend to reward prison construction, but that is the result.

It is estimated that the total cost of counting prisoners in their prison communities rather than their home communities runs between \$50 and \$250 per person, and averages about \$100 or more per prisoner for the local community where they are housed. When a jurisdiction plans to open a new 1,000-bed prison, it can generate at least \$100,000 in new “unearned” revenues that accrue simply from counting the prisoners. That \$100,000 doesn't sound like much, but it can mean a new fire truck, a renovation for a youth center, or a computer upgrade for a municipality. In sparsely populated areas, large prisons in small towns can result in significant distortions of the local population. A new 500-bed prison can yield \$50,000 in new revenue. The most dramatic impact can be seen in towns like Florence, Arizona, with a free population of about 5,000 and another 12,000 in at least three prisons. State and federal funds specifically linked to the prison population are estimated at \$4 million annually. This has tempted other towns to follow the path toward prison hosting.

Another effect of coercive mobility and counting prisoners where they are held is on the calculation of per capita income, which is figured by dividing the total community income by the total population. When prisoners account for a substantial proportion of the population, the apparently low per capita income makes that community more competitive for U.S. Housing and Urban Development (HUD) grants aimed at low-income areas. The appearance of greater need results in those communities getting more than their fair share. For example, in Virginia, distribution of K–12 education aid uses a formula based on county population. Several years ago, according to the Census Bureau, Rural Sussex County, which has a population that is 19% inmates, received \$115,000 extra as a result of the imprisoned population. Henrico County (Richmond) loses roughly \$200,000 as a result of the “exported” prisoner population. And because Latinos and blacks are imprisoned at 4–8 times the rate of whites, where incarcerated people are counted has significant implications for how black and Latino populations are reflected in the census.

Prison towns gain political clout through enhanced population, while the urban areas from which they come are further deprived through the loss of political influence and resources. When prison communities are credited with large, externally sourced populations of prisoners—who are not local residents—it turns the “one person, one vote” principle on its head. Prison towns do not share a “community of interest” with urban prisoners or their loved ones or neighborhoods. This phenomenon is unique to the new landscape of 21st-century corrections.

Prisoner Reentry in the 21st Century

Over the past 15 to 20 years, a significant body of scholarship has addressed the issue of prisoner reentry into society, a focus that evolved due to the rapidly increasing

number of prisoners being released—now nearly 800,000 per year—as well as the high rate of recidivism. (About two thirds of prisoners are readmitted to prison within 3 years of release.) This issue has become a major concern among those who study issues associated with reentry, deterrence, rehabilitation, and the possible criminogenic effects of imprisonment. Some scholars are convinced that the return of so many offenders—many who are committed to a criminal lifestyle—has a significant independent effect on crime rates.

In 2000, researchers at the Urban Institute launched an ongoing inquiry into prisoner reentry research to better understand the pathways to successful reintegration; the social and fiscal costs of current policies; and the impacts of incarceration and reentry on individuals, families, and communities. Their findings focus on several key dimensions of reentry.

Housing and Reentry

Perhaps the most immediate challenge facing returning prisoners is to secure housing. Many plan to stay with families, but those who don't face limited options. The process is complicated by scarcity of affordable and available housing, legal barriers and regulations, prejudices that restrict housing options, and strict eligibility requirements for federally subsidized housing. Research shows that those without stable housing are more likely to return to prison, and the majority of released prisoners themselves believe that having stable housing is important for successful reentry.

The majority of returning prisoners live with family members or intimate partners after release. Three months after release, 60% to 85% of returning prisoners live with families or partners. Many return home to living arrangements that are only temporary, and 6 to 8 months after release about one third had lived at more than one address. More than half of returning prisoners in Illinois thought they would not be staying in their current neighborhood for long, and in Maryland over half expected to be moving within weeks or months (Lynch & Sabol, 2001). Those who do not stay with family face limited options—many of which are unavailable to formerly incarcerated people. The shortage of affordable and available housing is a serious problem for returning prisoners.

Employment and Reentry

Finding and maintaining employment is critical to successful prisoner reentry. Employment is associated with lower rates of reoffending, and higher wages are associated with lower rates of criminal activity. But prisoners face enormous challenges in finding and maintaining legitimate job opportunities—including low levels of education, limited work experience, and limited vocational skills. This is further compounded by the incarceration period during

which they forfeit the opportunity to gain marketable work experience and sever professional connections and social contacts that might lead to employment on release. In addition, the general reluctance of employers to hire former prisoners serves as a barrier to job placement.

While prisoners believe that having a job would help them stay out of prison, on average only about 1 in 5 reported that they had a job lined up immediately after release. Moreover, despite the need for employment assistance, few prisoners receive employment-related training in prison. Even ex-cons who do find work do not necessarily have full-time or consistent work. At 4 to 8 months after release, 44% of Illinois respondents reported having worked for at least 1 week since their release. But less than one third were employed at the time of the interview, and only 24% of all respondents were employed full-time. At their first post-release interview, nearly 60% of ex-cons in Maryland were either unemployed or working less than 40 hours per week (Lynch & Sabol, 2001). Making things more difficult, transportation is a significant barrier to employment. More than one third of released prisoners had problems obtaining a car for work, and nearly one quarter reported problems accessing public transportation. It is widely accepted that finding and maintaining employment reduces recidivism, and an increase in levels of employment serves to reduce drug dealing, violent crime, and property crime.

Health and Reentry

Released prisoners have an extremely high prevalence of mental disorders and chronic and infectious diseases—much higher than in the general population. Ex-cons face limited and insufficient access to community-based health care upon release. Further, incarceration disqualifies inmates from Medicaid eligibility, and restoring eligibility can take several months—interrupting access to prescription drugs and health care. Between 30 and 40% of released prisoners reported having a chronic physical or mental health condition—most commonly depression, asthma, and high blood pressure. In New Jersey, one third of those released in 2002 had at least one chronic or communicable medical condition. Many more released offenders report being diagnosed with a medical condition compared to those who received medication or treatment for the condition while incarcerated. Only 12% report having taken medication regularly in prison. In Ohio, over half reported depression, but only 35% reported receiving treatment or medication. While 27% reported having asthma, less than 14% received treatment for it (Lynch & Sabol, 2001).

Corrections agencies often lack discharge planning and preparation for health care needs upon release. Less than 10% of Illinois ex-cons received referrals to services in the community. Securing health care is a major concern for many released prisoners. At least 75% of those interviewed said they needed help getting health care after release. As

might be expected, the vast majority of returning prisoners have no medical insurance—only 10% to 20% reported having private insurance.

Substance Use and Reentry

Research shows that while 83% of state prisoners have a history of drug use, only about 15% of this group receives treatment in prison, and even fewer continue to receive appropriate treatment once released. The majority of those released have extensive substance use histories. In Maryland, in the 6 months before entering prison, over 40% of offenders reported daily heroin use, while nearly 60% of returning prisoners in Texas reported daily cocaine use. Prisoners identify drug use as the primary cause of their past and current problems, but few prisoners receive drug treatment while incarcerated. In New Jersey, though 81% of inmates had drug or alcohol problems, program capacities were limited to only 6% of the state prison population. In Texas, substance abuse program capacity can only serve 5% of the potential population in need (Lynch & Sabol, 2001).

Researchers agree that in-prison treatment is much more likely to effectively sustain a decline in substance use if it is tailored to an individual's need and level of risk, and if it is linked to drug treatment aftercare in the community. Those with substance use histories and who engage in substance use after release are very likely to reoffend.

Families and Reentry

Well over half of U.S. prisoners are parents of minor children, and up to 75% of incarcerated women are mothers of minors. Nearly 3% of all minor children in the United States, and nearly 10% of children of color, have a parent in prison. When a parent is sent to prison, the family structure, financial responsibilities, emotional support systems, and living arrangements are all affected. Incarceration can drastically disrupt spousal relations, parent-child relations, and family networks. There are significant challenges to maintaining family contact while in prison, including visiting regulations, transportation costs to distant facilities, other financial barriers, and emotional strains. More than half of incarcerated parents report never having received a visit from their children.

Nearly 75% of returning prisoners in Illinois and Maryland felt that family support had been important in helping them to avoid prison after release, and strong family support before prison may also reduce likelihood of recidivism. Those who reported positive family relations were less likely to be reconvicted, while those who reported negative family relations were more likely to be reconvicted and reincarcerated. Those with closer family relations and strong family support were less likely to have used drugs since release. Most prisoners have contact with family and children, but it is usually through phone and

mail. In Illinois, only 13% of returning prisoners had had in-person contact with family members or children; 29% had visits from spouses/partners.

Distance to the correctional facility is one of the greatest challenges to maintaining contact. Three quarters of family members surveyed said the distance to the facility was the main problem with visitation. For the two thirds who did not visit family in prison, the median estimated travel time to the prison was 4 hours longer than those who did visit. This issue of distance and visitation is exacerbated in the context of coercive mobility. The 500 Hawaiian prisoners housed in Mississippi are unlikely to receive any visitation during their prison stay, and neither are the 1,500 Californian prisoners due there. States routinely exchange hundreds and thousands of prisoners in order to minimize the cost of housing them in-state.

Close family relationships can improve employment outcomes for returning prisoners, and closer family and partner relations and stronger family support result in more employment after release—likely because many releasees are hired by family members. But it has become increasingly common to export and import prisoners across state lines in order to save money, and more difficult for prisoners to maintain family ties and support systems while incarcerated.

Communities and Reentry

Released prisoners are returning in high concentrations to a small number of communities in urban areas—having a profound and disproportionate effect on community life, family networks, and social capital in these neighborhoods. These places are characterized by social and economic disadvantage, which compounds the problems associated with reentry. In addition, research shows that high rates of incarceration and reentry may destabilize these communities and result in higher crime rates.

A relatively large number of prisoners return to a small number of cities in each state. For example, recent data show that Chicago and Baltimore received more than half of all prisoners returning to Illinois and Maryland, respectively. Houston received one quarter of all prisoners returning to Texas. Two of New Jersey's 21 counties accounted for one third of all returning prisoners. Nearly 49% of prisoners returning to Massachusetts returned to just two counties. Five of Idaho's 44 counties accounted for three quarters of returning prisoners. Returning prisoners are often clustered in a few neighborhoods in these cities. For instance, 8% of Chicago communities accounted for over one third of all prisoners returning to Chicago; 7% of the zip codes in Wayne County, Michigan (8 of 115)—all of which are in Detroit—accounted for over 40% of all prisoners being released in that state.

High levels of social and economic disadvantage characterize communities to which prisoners return. These

communities have above-average rates of unemployment, female-headed households, and families living below the federal poverty level. Former prisoners who relocate tend to move to neighborhoods similar to the ones they left, with similar disadvantages, and prisoners returning to neighborhoods that are unsafe and lacking in social capital are at greater risk of recidivism and reincarceration.

Public Safety and Reentry

Over two thirds of released prisoners are arrested for a new crime within 3 years of release—many within the first year. Released prisoners make a substantial contribution to new crimes. Most returning prisoners have extensive criminal histories. Most returning prisoners (80%–90%) had at least one prior conviction, and at least two thirds have previously served time in prison. In Massachusetts, 99% of those released in 2002 had been previously incarcerated in a state or county facility. About 80% of those released from the Philadelphia prison system had been previously incarcerated there.

Many released prisoners are reconvicted or rearrested for new crimes—many within the first year of release. About one third are reconvicted or reincarcerated within 1 year. In Maryland, about one third had been rearrested for at least one new crime within 6 months of release, 10% had been reconvicted, and 16% had been returned to prison/jail for a new crime conviction or parole/probation violation. Releasees with substance use histories and who use substances after release are at high risk to recidivate.

Community Supervision and Reentry

The vast majority of released prisoners (over 80%) are subject to a period of community supervision. There are now over 800,000 parolees in the United States, up from about 200,000 in 1980. And there are many more offenders under probation or some other community-based sanction—of the 8 million under correctional supervision, about 70% are in the community. Resources have not kept up with the increase. Most probation and parole officers average 70 or more cases—about twice the recommended number. Persons on community supervision account for nearly 40% of new prison admissions nationally. Parole and probation violations have increased significantly over the past 25 years, and the number of persons returning to prison for a violation increased 1,000% between 1980 and 2000. About 40% of prisoners in state prison/jail are serving time for a probation and parole violation. Probation and parole officers appear to have little effect on rearrest rates of released prisoners. Findings show that prisoners who are released under supervision fare no better than those without supervision—their rearrest and reconviction rates are not significantly different.

What does all this tell us? Prisoner reentry is fraught with problems, the numbers are increasing rapidly, and not

enough resources are being put into the process—particularly given the increase in the number of returning prisoners. This is a growing and difficult problem that has no easy solution and that requires significant investment in time and energy to address.

Invisible Punishments in the 21st Century

Entering the 21st century, a new set of dynamics has come into play that calls for an understanding of the ways in which the effects of prison on society are both quantitatively and qualitatively different from previous times. These effects have been conceptualized as collateral consequences of imprisonment and have been dubbed “invisible punishments” by scholars (see Mauer & Chesney-Lind, 2002, for an overview). They are invisible in that they are rarely acknowledged in the courtroom when they are imposed, and equally rarely assessed in public policy discussions. These themes, and their impact on individuals and communities, should be the subject of careful scrutiny by those who study prison dynamics in the 21st century. While prison has always affected the individuals who are imprisoned and their families, the scale of imprisonment now magnifies these effects and expands their scope. Further, the racial dynamics of imprisonment have become a central component of this social policy.

Barriers to Reintegration Among Released Offenders

Once a prison term is completed, the transition back into the community is almost always difficult. Having limited connections with the world of work, for example, becomes even more problematic with the stigma of imprisonment attached to former offenders. In an economy increasingly characterized by a division between high skills/high technology and a low-skill service economy, few offenders have promising prospects for advancing up the job ladder—or even finding a spot at the bottom of it.

Over the past 30 years, policymakers have expanded the reach of punishments beyond sentencing enhancements, and have enacted a new generation of collateral sanctions that impose serious obstacles to a person’s life chances long after a sentence has been completed. Many of these obstacles are related to the war on drugs, and include a seemingly endless series of restrictions placed on those convicted of a drug offense. Depending on the state, an 18-year-old with a first-time conviction for felony drug possession now may be barred from receiving welfare benefits for life, prohibited from living in public housing, denied student loans to attend college, permanently excluded from voting, and may be deported if not a U.S. citizen. Ironically, many of these sanctions pertain only to drug offenders, not those convicted of murder, rape, and other serious violent offenses.

Impact on Families and Communities

A growing number of children have a parent in prison, and current estimates place this number at well over 1.5 million. But the racial dynamics of imprisonment produce a figure of between 7% and 10% or up to 1 in 10 for black children. Since this reflects a 1-day count, the proportion of black children who have experienced parental incarceration at some point in their childhood is considerably greater. Being the child of a criminal is not a status worth boasting about; shame and stigma are still the norm. One common consequence of this stigma is the severance of social ties to family and friends, which low-income families rely upon to cope with poverty and other hardships. The impact of parental incarceration will vary depending on which parent is imprisoned. Mothers in prison are far more likely to have been primary caretakers of children prior to imprisonment and were often single parents, and this dramatically impacts the children they leave behind.

In addition to the experience and stigma of parental incarceration, children in low-income minority communities now grow up with a strong likelihood of spending time in prison themselves. An estimated 1 in 3 black males born today can expect to go to prison. While they may not know these odds, their life experiences communicate this reality as they witness older brothers, cousins, parents, and neighbors cycling in and out of prison. Some contend that prison has become a “rite of passage” for young black men today and is almost welcomed as a badge of honor in certain communities. Prison is increasingly viewed as an inevitable part of the maturation process for many low-income minority children—in the same way that going to college is the norm in many middle- and upper-class communities. When there is little chance of traditional success (schools, college, jobs, marriage, etc), the often-taught value of hard work leading to success may seem unrealistic to many children in these communities.

Mass Imprisonment and Voter Disenfranchisement

When the nation was founded in the late 1700s, the vast majority of people in the United States were ineligible to participate in democratic life. Excluded were women, blacks, Native Americans, and other minorities, as well as illiterates, poor people, and felons. Only white males were “citizens” with the right to vote. Over the course of 200 years, restrictions for all these categories have been lifted—save for those with felony convictions.

Today, some 5 million Americans are ineligible to vote as a result of a felony conviction in the 48 states and D.C. that employ disenfranchisement policies for varying degrees of felons and ex-felons. If there was any doubt about the effect of these laws, consider the 2000 presidential election in Florida. That election was decided by less than 1,000 votes in favor of George W. Bush, while an

estimated 600,000 former offenders—people who had already completed their sentences—were ineligible to vote due to that state’s restrictive policies. One wonders who most former inmates would have supported.

While an estimated 2% to 3% of the national population is disenfranchised, the rate for black men is 13%, and in some states is well over 20%. When such high numbers of men in urban communities can’t vote, the voting power/efficacy of that whole community is reduced in relation to communities with low rates of incarceration. New evidence indicates that disenfranchisement effects go well beyond the legally disenfranchised population. Studies of voter turnout show that in the most restrictive states, voter turnout is lower, particularly among African Americans, and even among persons who themselves are not disenfranchised as a result of a felony conviction. Voting is a civic duty, and a process engaged in with families and communities. Family members talk about elections at home, drive to polls together, and see their neighbors there. When a substantial number of people in a community are legally unable to vote, it is likely to dampen enthusiasm and attention among others as well. Forty years after the Voting Rights Act was passed, mass imprisonment and disenfranchisement results in a greater proportion of African American and other minority communities losing the right to vote each year.

Mass Imprisonment and State Budgets

Regarding the impact of mass imprisonment on state economies, specifically higher education, a recent report by Grassroots Leadership shows how massive spending on Mississippi prisons has siphoned funds from classrooms and students, leaving higher education appropriations stagnant and African Americans shouldering the burden. The report documents a startling shift in Mississippi budget priorities. In 1992, the state spent most of the discretionary portion of its budget on higher education. By 2002, the majority of discretionary funds went to build and operate prisons. Between 1989 and 1999, Mississippi saw per capita state corrections appropriations rise by 115%, while per capita state higher education appropriations increased by less than 1%. Mississippi built 17 new prisons between 1997 and 2005, but not one new state college or university. And several more Mississippi prisons are under construction or consideration. There are now almost twice as many African American men in Mississippi prisons as in colleges and universities, and the state spends nearly twice as much to incarcerate an inmate as it takes to send someone to college. Moreover, due to new drug laws and a “truth-in-sentencing” bill passed in the mid-1990s, nearly 70% of those imprisoned in the state are nonviolent offenders. Mississippi is not unique in this situation—most states have followed this path and are facing serious budget shortages due to multiyear commitments to expand their correctional systems.

These and other dynamics of mass imprisonment make up what are called invisible punishments or collateral consequences. Changing the trends noted here are difficult for several reasons. First, it is very difficult to alter prevailing sentencing policies and practices, which can be legislated in a matter of hours but take years to undo. In a broader sense, the national commitment to mass imprisonment is deeply embedded in a punitive and individualistic approach to social policy. This has not always been the case in the United States, and is certainly not the style adopted in many other countries. Changing this political and social environment remains the real obstacle to a more effective and humane crime policy.

Race and Imprisonment in the 21st Century

In the 50-plus years since the historic *Brown v. Board of Education* decision that ordered desegregation of public education, no American institution has changed more than the criminal justice system, and in ways that have profound effects on the African American community. Mass imprisonment has produced record numbers of Americans in prison and jail (now approaching 2.5 million) and has had a disproportionate effect on African Americans. There are now about 10 times as many African Americans in prison/jail as on the day of the *Brown* decision (98,000 in 1954; nearly 1,000,000 in 2007).

Today, 1 out of every 21 black men is incarcerated on any given day. For black men in their twenties, the figure is 1 in 8. Given current trends, 1 of every 3 (32%) black males born today can expect to go to prison in his lifetime (U.S. Bureau of Justice Statistics [BJS] Web site). More than half of black men in their early 30s who are high school dropouts have a prison record. With regard to black women, 1 of every 18 black females born today can expect to go to prison—6 times the rate for white women. Moreover, black women born today are 5 times more likely to go to prison in their lifetimes than black women born 30 years ago.

Factors contributing to the dramatic increase in the number of African Americans in prison/jail are complex, and involve dynamics both within and outside the criminal justice system. Incarceration rates are about 8 times higher for blacks overall than for whites, and high school dropouts are more than twice as likely to end up in prison than are high school graduates. Consequently, much of the growth in imprisonment has been concentrated among minority young men with little education. By the late 1990s, two thirds of all prison inmates were black or Hispanic, and about half of all minority inmates had less than 12 years of schooling.

Imprisonment has become so pervasive among young black men that it is now viewed as a common stage in the life course by some researchers (Pettit & Western, 2004). Among all men born between 1965 and 1969, an

estimated 3% of whites and 20% of blacks had served time in prison by their early thirties. Among black men born during this period, 30% of those without a college education and nearly 60% of high school dropouts went to prison by 1999. For black men in their mid-30s at the start of the 21st century, prison records were nearly twice as common as bachelor's degrees, and imprisonment was more than twice as common as military service. Imprisonment has become a common life event for black men that sharply distinguishes their transition to adulthood from that of white men.

Black/white inequality is obscured by using employment and wage figures that fail to include inmates. From a life course perspective, the earnings of ex-convicts diverge from the earnings of non-convicts as men get older. By their late 20s, non-convicts have usually settled into a stable path of earnings growth, while ex-convicts follow an unstable trajectory of irregular/transitory employment and low earnings. Research notes that white offenders tend to age out of crime earlier than do black offenders, suggesting that employment and wage earning deficits experienced by black ex-convicts may endure for a longer period of time than for white ex-convicts.

Changes in the criminal justice system over the past 25 years have been wide-ranging, affecting policing, sentencing, prison construction, postrelease supervision, and a variety of other policy areas at the state and federal levels. The sheer magnitude of the commitment of public resources is comparable to that expended in the social welfare efforts of the 1960s and 1970s. Unlike antipoverty policy, however, the punitive trend in criminal justice policy serves to conceal and deepen economic inequality between blacks and whites. Whereas it has often been considered how welfare, employment, and education policy affects inequality, it is now known that criminal justice policy over the past 25 years has impacted racial economic inequality in a significant way, to the point where inequality can be seen as a product of the expansion of mass imprisonment.

Conclusion

Over the past 30 years, a complex set of social and political developments has produced a wave of building and filling prisons unprecedented in human history. Beginning with less than 200,000 in 1972, the number of inmates in U.S. prisons has increased to over 1.5 million today. Add to this the over 800,000 inmates in local and regional jails either awaiting trial or serving sentences, and a remarkable 2.4 million (and counting) Americans are behind bars as of 2008.

These figures take on more meaning in comparison with other nations. The United States locks up offenders at a rate 6 to 10 times that of other industrialized nations. The next-closest nation to ours in incarceration rates is Russia—which has been de-incarcerating for several years now. The nature and

meaning of incarceration in the United States have changed in a variety of profound ways with far-reaching implications.

Among these is the institutionalization of a societal commitment to the use and expansion of a massive prison system. Nearly two thirds of prisons today have been built in the past 20 years. These prisons are expected to hold offenders for at least the next 50 years, guaranteeing a national commitment to a high rate of incarceration. The growth of the system has spawned a set of vested interests and lobbying forces that perpetuate a societal commitment to imprisonment. The nearly 1,000,000 prison and jail guards, administrators, service workers, and other personnel represent a potentially powerful political opposition to any scaling down of the system.

The idea of prisons as sources of economic growth appeals to many communities that have lost jobs in recent years. Communities that once organized against the location of prisons now beg state officials and private prison companies to construct new prisons in their backyards. But the scarce research available questions the promise of prisons as economic development catalysts. There is also a rapidly expanding prison privatization movement focused on the bottom line of profiting from imprisonment. Privatization has produced a new dynamic in mass imprisonment that encourages the production of more inmates—which means more money and more profits.

The near permanent status of mass imprisonment is evidenced despite expressed concerns that often focus on the problem of funding for an expanding prison system that diverts resources from other public spending. Vast expenditures on corrections systems are now considered the norm, and represent the largest growth area in most state budgets. Virtually every state has engaged in a significant if not massive prison construction program over the past 20 years, financed through general funds; bonds; and more recently, public-private venture arrangements, which put communities into further long-term debt.

The impact of incarceration on individuals can be understood to some degree, but the effect of mass imprisonment on African American communities is a phenomenon that has only recently been investigated. Marc Mauer (Mauer & Chesney-Lind, 2002) of The Sentencing Project has asked what it means to a community to know that 4 out of 10 boys growing up will spend time in prison; what it does to family and community to have such a substantial proportion of its young men enmeshed in the criminal justice system; what images and values are communicated to young people who see the prisoner as the most prominent or pervasive role model in the community; and what the effect is on a community's political influence when one quarter of black men cannot vote as a result of a felony conviction.

New prison cells are increasingly being used for drug and nonviolent offenders. About 3 of every 5 (61%) new inmates added to the system in the 1990s were incarcerated for a nonviolent drug or property offense. In the federal system, three quarters (74%) of the increase in the inmate

population are attributed to drug offenses alone. Incarcerating ever-increasing numbers of nonviolent property and drug offenders is not the only option open to policymakers, nor is it the most cost-effective. A large proportion of these offenders would be appropriate candidates for diversion to community-based programs—if policy could be diverted away from imprisonment.

Direct consequences of the wars on drugs and crime include the imprisonment of literally millions of people, most of whom are guilty of relatively petty crimes; their lengthy and debilitating incarceration; and their ejection (reentry) back into society—ill-prepared and handicapped by their stigmatized social status. The direct financial cost of the imprisonment binge has been well publicized, and exceeds \$60 billion per year. What has not been emphasized enough are the invisible or collateral damages of mass imprisonment, including the harm done to other social programs because so much money has been siphoned off into corrections, the diminution of civil rights of many kinds, the erosion of traditional values of fairness and tolerance, the damage done to families and communities, and the creation of new and powerful lobbying groups with vested interests in more imprisonment. Imprisonment in the 21st century has generated far-reaching consequences that touch virtually every aspect of life, for prisoners and non-prisoners alike, and will continue to do so into the foreseeable future.

RACIAL PROFILING

MICHAEL E. BUERGER

Bowling Green State University

R*acial profiling* is a disputed term, embodying either a pernicious police practice or an intelligent application of police investigative skills, depending upon ideological perspective. It is most commonly understood in the former context, a shorthand for unfair police targeting of persons of minority groups for greater scrutiny and intervention, based solely upon the belief that members of their ethnic group are more inclined to engage in criminal activity. The contemporary term has a specific history anchored in drug interdiction efforts (Buerger & Farrell, 2002), but its informal synonym, “driving while black” (or brown), predates drug interdiction, stemming from the racial and ethnic animus of earlier eras.

The debate is defined at one pole by a belief that racial prejudice leads to disparate treatment of minority citizens. At the other pole, the fundamental belief is that disparate attention by the authorities is fully justified by the different patterns of conduct by different groups, specifically documented rates of criminality. A third, complicated rationale lies between the two: a legacy of belief, embedded in police socialization and reinforced by selective perception, that minority groups are more prone to criminality. That middle ground ignores class distinctions that are masked by visible racial or ethnic identity.

More recently, the concept of racial profiling (as either allegation or practice) has expanded beyond its original framework to include anti-terror activities and immigration law enforcement, as well as scrutiny by private security in

shopping malls and other venues. Scientific inquiry intended to confirm or refute the existence of bias has a wide range of methodological difficulties, and studies to date have produced mixed empirical evidence.

Two Perspectives

Police and their supporters assert that profiling represents a legitimate practice grounded in criminal behavior, to which race is incidental. Profiles arose from patterns of observable behavior, verified and sustained by convictions in courts of law. Successful searches based upon the profiles validate the general application of profiles as an investigative tool. The police continue to make periodic seizures of large quantities of uncut, bulk drugs during motor vehicle stops, which in their eyes is proof that the profile technique is a valid law enforcement tool.

Opponents tend to regard the successful interdictions as little more than the blind squirrel stumbling across an acorn by chance. While not rejecting the importance of drug interdiction, critics hold that the greater danger lies in rampant, unjustified, and unrestricted government intrusion into the lives of citizens. They note that the verification of the profiles’ accuracy has never been independently verified, and insist that the occasional triumphs must be judged in the context of the larger number of stops that yield no results whatsoever. Critics also point to

a growing body of testimonial evidence that police stop vehicles with none of the attributes of the operational profile save that of the driver's race. A more critical figure, the number of incidents based upon closer matches to the profile and still yielding no drugs or contraband, has not yet been quantified.

Disparity or Discrimination?

The central problem in racial profiling is whether disparity of treatment constitutes discrimination. In that respect, the issue mirrors many other debates in American life and jurisprudence.

Disparity can occur at multiple levels of police-initiated contact with citizens. The most basic level occurs in the act of being selected for police inquiry about a law violation. While motor vehicle stops are almost always supported legally by a threshold level of probable cause (a violation of the motor vehicle code, however minor), the greater issues hinges upon matters that occur after the stop.

Discrimination may be inferred from unequal numbers, but disparate treatment supports a stronger inference when persons of a minority class suffer a disproportionate burden than comparably situated majority citizens. In motor vehicle stops, requests for permission to search the vehicle in the absence of specific probable cause are the primary categories examined. In the absence of a search, police may more often issue tickets instead of warnings; written warnings (which may influence future actions) instead of verbal warnings, which simply address the immediate infraction; or conduct lengthier detentions for investigative purposes, including ordering the occupants out of the vehicle. For pedestrian stops, the length and character of the detention, and being frisked for weapons, are major categories of disparate actions.

For any type of police-initiated contact, both verbal and nonverbal police behaviors can carry suggestions of bias as well (language choice, tone of voice, even body language that conveys feelings of contempt). These attributes are not recorded in official reports of the contact, and are observed only rarely by independent researchers, but they can leave a lasting negative impression in the minds of the citizens. Those feelings can shape citizens' interpretation of official statistics and explanations.

A comparable set of behavioral cues is embedded in the police evaluation of the people they stop, however. Evasive answers, disrespectful language or gestures, even body postures elevate the initial level of suspicion, and can both prolong a contact and lead to a harsher outcome than was originally contemplated. Though defenders of the police point to these behavioral cues as indicative of criminal behavior, a rival hypothesis centers negative reactions to the police in a longer history of mistrust based upon mistreatment by the police in earlier contact. That history may be both personal and vicarious.

Profiling Generally

Profiling compiles behavioral attributes linked to specific criminal activities, creating a rudimentary sketch of as-yet-unknown persons who might be more likely than others to commit the crime. The serial killer profiling developed by the FBI makes use of crime scene evidence that suggests the personality of the perpetrator, and helps narrow the scope of inquiry. It was based upon extensive interviews with 33 convicted killers, a factual grounding comparable to the drug courier profile of Operation Pipeline (below).

Racial profiling results when a complex set of factors (which can include race) comprising a specific criminal profile are stripped away in practice, transformed into an unjustified oversimplification: "Minorities are more likely to have drugs [or commit other crimes] than are whites." That stereotype overwhelms the elements of individualized facts required for probable cause. While it is the police who have borne the brunt of the criticism, the practice also exists in the operations of private sector security and asset protection (Meeks, 2000).

Since the attacks of September 11, 2001, "racial profiling" has been extended to persons of Middle Eastern origin or descent. A single factor shared with the 19 hijackers of 9/11—their region of origin, or physical features that appear to be of that region—casts suspicion of terrorism upon thousands of law-abiding citizens and visitors. They are more likely to be pulled aside for more extensive inquiries at airport security checkpoints and other sensitive areas. The historical antecedent most familiar to Americans is the internment of Japanese Americans after the attack on Pearl Harbor, while members of the German Bund (a pro-Nazi organization) in America remained free and largely unmolested.

Basic Legal Foundations

The consent search is integral to the racial profiling controversy. The Fourth Amendment to the Constitution protects citizens from unreasonable search and seizure of their persons, property, and effects, but a large volume of case law continually refines the operational understanding of what constitutes an "unreasonable" search. As a result, a number of exceptions have been created, relaxing the general rule that the police must obtain a warrant before they search. Among them are searches incidental to a lawful arrest, exigent (emergency) circumstances, "hot pursuit," searches at ports of entry into the country, inventory searches of impounded vehicles, "inevitable discovery," and when the owner of a property gives voluntary consent to the search. Most challenges to consent searches center on whether the consent was in fact voluntary, or was influenced by coercive police tactics or deception.

American police have the power to detain citizens briefly, and to inquire of their actions, when the police

have reasonable, articulable suspicion that something may be wrong. Most motor vehicle stops are supported by some violation of a motor vehicle law, and court cases allow for brief detention to make further inquiries, such as to identify passengers, if the “articulable suspicion” threshold is met.

Police have the power to arrest citizens—a lengthier and more intrusive detention—only when they have probable cause. *Probable cause* constitutes a set of facts and circumstances that would lead a reasonably prudent person to believe that a crime has been, is being, or is about to be committed. For certain crimes, including drug dealing, the courts have acknowledged that a “reasonably prudent and experienced police officer” can detect criminal activity that might escape the notice of a citizen. This recognition of training and experience underlies the police assertion that their “sixth sense” understanding of crime should be respected by the public as well.

Although citizens have more limited expectations of privacy in their vehicles than in their homes, police do not have the authority to search a car based upon whim or mere suspicion. The line that separates suspicion from probable cause is constantly tested in court proceedings. Though the racial profiling debate centers on searches for drugs, “contraband” includes other categories of items that are illegal to possess or transport: smuggled cigarettes, loaded firearms, explosives or other controlled ordnance, child pornography, even illegal aliens.

If the police have probable cause that a crime is being committed in their presence—such as the smell of marijuana, or the existence of drugs, paraphernalia, or weapons in plain sight—they can arrest the occupants of a car and conduct a full search incidental to that arrest. They may also impound the vehicle and conduct an inventory search of all contents, for the mutual protection of the vehicle owner and the officers. In the absence of those circumstances, however, a police officer may only request permission from the driver or owner to search the car for contraband.

Consent is a recognized exception to the Fourth Amendment warrant requirement: Police need not obtain a search warrant if the rightful owner of a property gives free and informed consent to the search. In the context of racial profiling, the central issue is whether any such consent is voluntary under the circumstances of the stop. Police assert that all adult citizens of the United States know that they have the right to decline to give such permission, and so all consent is voluntary. They offer no explanation of why so many people who are carrying contraband voluntarily consent to having their vehicle searched—a statement contrary to interest—except to note that “we don’t catch the smart ones.”

Opponents assert that the nature of the stop and the inherently coercive presence of the police effectively eviscerate the right of refusal. The implied threat of further detention, coupled with vague suggestions of “consequences” for refusal,

coerce compliance. Opponents also point to instances where “probable cause” suddenly arose as soon as citizens declined to give consent; they consider such incidents further evidence that most “consent” claimed by the police is involuntary, a legal fiction.

Another objectionable category involves illegal police actions, searches conducted over the objections of the vehicle occupants. Though rare, such intrusions are insulated from sanction on two fronts. Searches that yield no evidence usually end with the release of the vehicle and driver. The ability of the aggrieved driver to seek redress is expensive, and often futile in the absence of independent evidence. When illegal searches are successful, the discovered contraband weights the case in favor of the police account of the incident (again in the absence of independent verification of the driver’s version of the event). As more and more police agencies adopt in-vehicle recording devices for vehicle stops, such incidents are fewer and farther between, but suspicion remains in the eyes of many citizens.

General History

The overall history of race relations in the United States remains pertinent to discussions of racial profiling. The second-class citizenship of black Americans was enforced by white police officers throughout the Jim Crow era, and extralegal suppression of the rights of citizenship continued well beyond the *Brown v. Board of Education of Topeka, Kansas* (1954) decision. Passage of the 1964 Civil Rights Act coincided with the rise of black militancy, and continued conflict between blacks and whites continued well into the decade of the 1970s.

While mainstream American culture has changed dramatically since the “long, hot summers” of racial conflict in the 1960s, police culture changes slowly. There is a lingering suspicion that both police training and the police socialization process subtly perpetuate outmoded racial attitudes from that era. When racial profiling first emerged as a public issue, this view was reinforced by revelations in the high-profile cases discussed below. Though America’s police forces are no longer a “white boys’ club,” that observation merely transfers animus—if any exists—from a white prejudice to a police prejudice.

Contemporary History

The U.S. Customs Service originally developed a profile of air travelers who had elevated probability of being a drug “mule.” Like their equine namesake, drug mules were not drug lords, but beasts of burden: persons unconnected with a drug cartel’s membership (and therefore relatively invisible to police narcotics intelligence) were paid on a one-time basis to carry drug packages in their

luggage on international flights, and deliver it to cartel personnel soon after their arrival in the United States. Specific conditions and behaviors were tip-offs to Customs personnel to inquire and examine carry-on luggage more closely: Lone travelers with luggage inappropriate to their itinerary, flying with tickets purchased with cash, and several other elements were central to the original airline passenger profile.

In 1984, Operation Pipeline adapted the practice to police highway drug interdiction, which sought to intercept bulk drugs in transit from southern points of entry. Seizing bulk drugs before they could be delivered, cut, and distributed in northern drug markets would reduce supplies for the street markets, deprive the drug syndicates of profits, and perhaps drive more addicts into treatment.

Operation Pipeline arose from police awareness that vehicle stops yielding large quantities of drugs shared certain characteristics. The vehicles were northbound at high rates of speed, usually occupied by two black or Latino males in their late teens or early twenties. Vehicle interiors contained fast-food wrappers and pillows and blankets (both indicative of nonstop travel), and detergent or other strong-smelling substances to mask the odor of drugs. The trunk might be locked, with only a valet key for the drivers; there might be tool or burn marks or other indications that drugs had been secreted in hidden compartments. Road maps might indicate places and timetables to call the drivers' monitor (Buerger & Farrell, 2002).

The profile alone did not constitute probable cause for the police to conduct a warrantless search. It was only a prompt for officers to pay closer attention to the vehicle, to develop probable cause if possible, or to obtain consent to search the car in the absence of specific probable cause.

The Flagship Cases

Three cases exposed the police application of the "drug courier profile" concept to scrutiny. In April 1998, two New Jersey State Troopers initiated a vehicle stop of a van on the New Jersey Turnpike that resulted in the shooting and wounding of three of four young minority men. The "profile" was cited as one reason for the stop, even though the vehicle was southbound. No drugs or other contraband were found in the van, and there were significant discrepancies between the official police report of the incident and other evidence.

The Turnpike shooting case revived scrutiny of New Jersey State Police practices that had languished since the 1996 case of *State of New Jersey v. Pedro Soto et al.* In that case, a New Jersey court overturned 17 drug possession cases brought by a state police drug interdiction team working another section of the New Jersey Turnpike. The defendants produced evidence that the team stopped and searched minorities, particularly African Americans, almost 5 times more frequently than they did white drivers.

Though black drivers were only 15% of the "violation" group (people driving at excessive speed, or committing other observable moving violations), vehicles driven by blacks comprised almost half of the stops made by the interdiction unit. By comparison, a state police unit doing speed enforcement in the same area of the New Jersey Turnpike stopped drivers at rates much closer to the observed proportion of highway use. The difference strongly suggested that the drug interdiction team equated racial identity with a greater likelihood of participation in illicit distribution of drugs.

A civil case, *Wilkins v. Maryland State Police* (2003), used the same analytical technique employed in the *Soto* case. Though whites comprised almost three quarters of drivers and speed violators, only 20% of the cars searched were driven by whites. Blacks made up 17% of the driving population, and slightly more of the violators, but were almost 73% of all persons searched. A total of 4 of every 5 drivers searched by the Maryland State Police interdiction team were of minority status.

If minority drivers were indeed more likely to have drugs than their white counterparts, a stronger argument might be made that the observed disparities were justified. However, the Maryland case revealed that the proportion of black and white drivers found to be carrying drugs was practically equal: 28.4% of blacks, and 28.8% of whites (other sources cite a slight difference: 34% of blacks and 32% of whites; the difference remains marginal). The New Jersey proportions were even lower: 13% of blacks, 10.5% of whites, and 8% of Latinos carried drugs. The New Jersey proportions are closer to the findings in other early studies; the Maryland hit rates are the highest in that first round of profiling inquiries.

More telling, none of the cases studied suggested that the drugs found in profile-based searches were pre-market bulk quantity (the quantum envisioned by the drug courier profile). New Jersey's post-*Soto* review explicitly noted that almost all seizures were of small amounts, consistent with post-market personal use (Verniero & Zoubeck, 1999); the conclusion is implicit in the absence of any discussion of the quantum of seizures in other studies. The inherent difference in the danger posed by market-quantity shipments, in contrast to personal-use quantities, is a potential limit on the latitude to be allowed government agents, and a fundamental problem with the game theory school of proof (discussed below).

Further inquiry into the New Jersey State Police practices in the wake of the April 1998 Turnpike shooting revealed that the state's training regimen included material that essentially equated minority citizens with greater criminality, effectively directing troopers to focus on minority motorists (Verniero & Zoubeck, 1999).

Both Maryland and New Jersey entered into consent decrees with the U.S. Department of Justice to amend their practices, monitor trooper performance, and revise training that had perpetuated the racial stereotype. Those findings

established racial profiling as a “fact,” but only in the two jurisdictions. In the public sphere, an ironic reversal of positions occurred. Where the police had tacitly assumed the actions of a small group of drug couriers were typical of the minority communities, the public now assumed that the practices of two agencies represented police practices everywhere. The distinction remains central to the debate over racial profiling in any guise: The generalizability of localized findings (or enterprise-specific profiles) to larger groups sharing only superficial aspects of the offending groups is limited.

The police insist that profiling is a legitimate tool of inquiry, well grounded in the experience of practice. The public points to the Maryland and New Jersey statistics, standing firm in their belief that it is merely a modern continuation of racial prejudice, now dressed up with pseudo-scientific prose. The scientific questions that have arisen in the wake of the *Soto* and *Wilkins* cases have examined a wider range of police activities and actions in numerous other venues. They embody an attempt to discern whether and where the “fact” of racial profiling by police exists beyond the specific milieu of the interstate highways in New Jersey and Maryland.

Overall, four issues are salient. The first is whether criminal propensity is more likely in one group than another, with a collateral question of what purported proofs should be considered valid. The second area involves the continuing refinement of methodology, and the factors to be considered when examining aggregate police data in vastly different locations for evidence of racial bias. A contemporary assertion, promulgated in different fashion by the police and by the econometric school of criminology, is that the “criminal propensity” point can be proven by a variation of game theory, based upon the results of consent searches without regard for any other considerations (including those of civil rights). The third is a legalistic consideration of whether elevated government intrusion justified against large-scale harm (proliferation of drug markets, or another 9/11-type attack) can be applied equally to smaller gains (seizure of personal-use drug amounts). A fourth operational issue rests upon the degree of precision with which the profile is applied by police officers and other agents of the state.

Four Salient Issues

1. The Legitimacy of Suspicion

For practitioners, the validity of the component of race rests upon personal experience and upon the evidence of aggregate crime statistics. The police arguments rest upon two separate but related features of police deployment. The first is accumulated personal and vicarious experience, in which minority offenders play major roles. The second is arrest statistics, the collective construct that is

the cumulative result of individual decisions by police across the nation, over time.

Experience

Officers assert a claim for a “police intuition”—essentially an accumulated knowledge of subtle behavioral cues that operates below the conscious threshold—that properly targets criminals. In this view, the fact that those who draw police attention are members of one or another minority is incidental to their demeanor and behavior, and irrelevant to the police decision to focus on them.

A second component of the argument is essentially defensive, made by officers who work in districts heavily populated by minority groups. Their point—which is valid at the individual level—is that the vast majority of individuals with whom they have contact during the day are residents and visitors who are minorities. To apply the template used in the highway studies to local police work, they argue, unfairly paints officers as racist because the “disproportionate” number of minorities they stop reflects the area rather than police decision making. Such comparisons are valid only in areas where there are significant opportunities to choose between minority and nonminority persons to stop. The argument is particularly acute in minority-populated areas, because minority-status victims are frequently the complainants in the cases police investigate: The police are incensed by accusations of racism when they are in fact defending the interests of law-abiding minority citizens.

A variant objection by the police is the “hours of darkness” defense. This assertion denies that officers can have knowledge of a driver’s race when they pull up behind a car during the nighttime. While intuitively logical, the defense has been countered on several levels. In the *Soto* case, a practice called “spotlighting” revealed the race of turnpike drivers: Parking a cruiser perpendicular to the road, with the high beams and spotlight on, created a zone of light that permitted the troopers to identify the race of the driver despite the brevity of illumination (the practice was independently examined by the New Jersey Attorney General’s office and was confirmed). On city streets, vehicles passing through intersections provide a comparable opportunity.

In the context of local policing, vehicle models, vehicle condition, and personal adornments (bumper and window stickers, certain styles of air fresheners, and other ephemera) are correlated strongly enough with specific groups to provide proxy identifications in lieu of visual confirmation. They provide no probable cause, but serve to draw the attention of officers; probable cause for a pretext stop likely would soon follow, given the many possible infractions of the expansive motor vehicle code.

Different sets of proxy identifications exist for pedestrian stops at night, where slower speed and ambient light allow for the observation of race, bearing, and other factors. This is especially salient when the police are looking for a suspect

who fits “The Description”—often an African American male of medium build, undetermined age, and dressed in a style common to hundreds of residents of the area.

Crime Statistics

Supporters of police profiling efforts point to the disproportionate presence of African American males in arrest, conviction, and imprisonment statistics. Those facts are presented as proof that the police properly focus their enforcement efforts on groups that demonstrate a greater propensity for crime. A corollary argument points to the racially homogeneous character of high-level drug gangs—from Jamaican posses to MS-13, from the Nicky Barnes organization to the Crips and Bloods—as a valid rationale for the police to focus on ethnicity or race in directing their drug- and crime-suppression efforts.

Opponents point to several flaws in the assertions that crime is a product of group characteristics. The history of racial prejudice created situations of real disadvantage: The arrest statistics and other perceptions of crime are more a reflection of class distinctions than group tendencies (see, e.g., Stark, 1987). Further, the fact that the upper echelons of a gang or criminal enterprise are of a common racial or ethnic heritage does not generalize their criminality to all who share their skin color or ethnicity.

In this view, both the police experiences and the criminal statistics reflect the impact of larger social forces rooted in America’s sordid history of slavery, Jim Crow laws, and racial segregation. Despite the tremendous gains made by the civil rights movement, race-based isolation continues to be a factor for substantial numbers of African Americans. Isolation by geography—whether based in Jim Crow segregation or the economic necessity of living in public housing—has had a negative influence on the employment and educational opportunities of the African American and Hispanic immigrant communities.

Economic necessity compels residents of many urban neighborhoods to participate in their area’s underground economy, even if they have a stable job and home life (Venkatesh, 2006); a large segment of that underground economy revolves around the drug trade. Street-level drug dealing has a relatively low capital entry threshold, and provides a reward structure far greater than comparable accessible legitimate employment. It is also a highly visible activity, more likely to come to police attention than corresponding drug trafficking in the suburbs.

2. Scientific Proof

Criminologists seek a scientific justification for police actions, in lieu of normative reliance upon unverifiable “sixth sense” justifications. The contemporary scholarly focus on racial profiling rests upon a debate regarding whether a variation on game theory can provide such a foundation.

One thrust of the early racial profiling research took up the question of whether disparity alone constituted *de facto* discrimination, or could occur innocuously. Various studies identified different uses of the highway for minority groups based on employment opportunities and recreational pursuits (Meehan & Ponder, 2002a). Another documented disproportionate representation of young minority males in the population of high-speed law violators on the New Jersey Turnpike, inferring the legitimacy of at least one assumption of the original profile (Lange, Johnson, & Voas, 2005).

The contemporary debate centers on a proposition by scholars drawing from the field of econometrics, asserting that the question of disparity or discrimination can be resolved by the application of a variation of game theory (Engel, 2008; Persico & Todd, 2008). This solution hinges on an examination of the “hit rate” (rate of discovery of contraband) of police searches, independent of any other concerns (Persico & Todd, 2008), treating the populations of white and non-white drivers as “urns” that can be sampled. This view posits that rational choice underlies the options of drivers to carry contraband (in the present discussion, drugs), and the choice of police officers to conduct investigations for drugs. Rational police officers would focus their efforts on groups most likely to carry drugs.

In essence, this econometric argument takes the side of the police, tacitly accepting the argument that group characteristics do exist, and can be inferred at the individual level. Furthermore, the acceptance of group-specific criminality (drug use, in this instance) assumes facts not in evidence. It is a hypothesis in the classic methodological sense, to be proved or disproved by scientific testing that cannot be conducted, and thus remains hypothetical.

Methodologically, the hit rate proposal encounters several difficulties. Police searches are conducted under a variety of situations, including searches incidental to arrest, inventory searches when a vehicle is towed, and in circumstances when probable cause is developed at the scene independent of the original reason for the stop. In addition, searches are conducted for a variety of motives, not just drugs (Engel & Tillyer, 2008). As a result, analyses based solely upon the hit rate for drugs must be able to discern those stops and searches motivated by an officer’s desire to “maximize the probability of a ‘hit’” (Persico & Todd, 2008). A further complication arises in the need to distinguish personal-use hits from the bulk drug seizures arising from the proper application of the drug courier profile, although the modern debate fails to pursue that distinction.

The proposition of hit-rate analysis has the advantage of being theoretical, unconnected from the larger concerns of the criminal justice system. The individuals who comprise the “urns” that police officers supposedly sample are not research subjects, but citizens of a country that presumes their innocence. They are defended by rules and expectations of conduct by agents of the state that do not allow

random selection for the purposes of testing. Basic civil rights preclude the use of the motoring public (or the ambulatory public) as a laboratory.

3. Balance of Harms

American law is more tolerant of intrusive state action when the harm to be averted is great. Lower-level violations of the law are tolerated, if tacitly, by the rules of criminal procedure that erect barriers to their discovery. Though the Supreme Court has expanded police powers in the cases of *Atwater v. Lago Vista* (2001) (permitting custodial arrest for conduct normally subject only to a citation) and *Whren et al. v. United States* (1996) (allowing the use of the pretext stop), the presumption of innocence remains a bedrock procedural right for American citizens.

Americans have a reduced expectation of privacy when driving a vehicle in public space, or when walking off their property. Nevertheless, a presumption of privacy remains, to be overcome only by an articulable danger to the public peace. Judicial tolerance of the consent search for drugs is one of the central questions in the racial profiling debate.

The original drug courier profile had a narrowly targeted objective: Intercept bulk shipments of illegal drugs in transit, before they could be cut and distributed to the public. That profile arose from a specific fact pattern, closely matching observable characteristics with searches that found bulk drugs.

Preventing illegal drugs from reaching the street has far more protective value to the public weal than a seizure of post-market, individual-use drugs. Post-market seizures occur only after the drugs have been distributed, and the profits returned to the middlepersons and the kingpins of the drug trade. The harm to the individual, and to society as a result of the individual's drug-induced actions, is much smaller than the aggregate of such harms embodied in the bulk shipment. They are also more hypothetical at the individual level, insofar as recreational drug use is not inevitably a cause of further criminality.

The contemporary debates embodying the "hit rate" hypothesis reflect an operational change from the bulk-drug courier profile to a broader "anyone carrying illegal drugs" foundation. That is a methodological convenience, in part: Many drivers and passengers carry small amounts of drugs for personal use; relatively few are involved in transporting pre-market bulk drugs. The numbers demanded by social science hypothesis testing can only be achieved by expanding the focus to personal-use quantities, at a sacrifice of the greater harms presented by drug couriers.

As profiling shifts to other areas of criminal conduct, the public interest in deterring harm also changes. Preventing mass casualty events like those of the September 11, 2001, attacks obviously meets the test of great social harm. However, when the harm remains hypothetical, unsupported by articulable facts and conditions, the "harm" argument

alone is insufficient to justify governmental intrusion. Advances in technology will continue to test the proposition, particularly as data-mining techniques draw conclusions from the electronic traces of everyday activity.

4. Precision of Application

More important to the populations at risk is the degree of precision with which police employ the drug courier profile. The epithet "racial profiling" embodies a belief that the profile itself is merely a sham, providing faux legitimacy for decisions that are actually based upon racial prejudice.

Profiles are like fingerprints: They are composites of particular characteristics which, taken collectively, provide enhanced confidence of an identification. For fingerprints, that identification is of a known individual matched to an unknown sample (the latent print). In criminal profiles, it is identification of the behaviors or characteristics as indicative of probable criminal behaviors. In both cases, the greater the number of matches, the greater confidence can be had in the identification.

The public outcry against racial profiling is embodied in numerous testimonial cases, in which the only characteristic the individual stopped by the police shared with the drug courier profile was that of race. Such evidence is not collected on a scientific basis, but its cumulative weight creates a viable presumption. Though there have been inquiries into public perceptions of racial profiling, a viable study of persons stopped and released as a result of profiling activities has yet to be published.

At least one court case examined the profile itself: the 1993 Colorado case of *Whitfield v. Board of County Commissioners of Eagle County*. In a case involving a highway vehicle stop based solely upon a drug courier profile, the court dissected the profile point by point, finding no correlation to criminality of the various components (rental car, out-of-state plates in an area heavily dependent upon tourism, radar detector, tinted windows, and so forth). The court then concluded that the only remaining variable was the driver's race, which was inadmissible. Examining each individual variable in the profile, rather than the collective weight of all the components, is an unusual approach, but the evidence of the resulting search was nevertheless suppressed.

Research on Racial Profiling

In the wake of the 1998 New Jersey Turnpike shooting, a fairly broad scholarly effort ensued to establish whether or not police engaged in racial profiling in other jurisdictions. In major cities, "stop and frisk" questioning of pedestrians also fell under the racial profiling umbrella. Dozens of studies have been conducted, yielding mixed results. In the earliest round of inquiry, most reputable studies indicated that minorities were stopped in numbers disproportionately

higher than their representation in population statistics (Engel, Calnon, & Bernard, 2002). Later studies have been mounted after the controversy spurred reform of practices and greater scrutiny; the results of emerging studies also document disparities, but generally are less inclined to conclude that discrimination drives them. However, the later studies also occur in a climate where police and civic officials are well aware of the racial profiling debate. Police agencies are more likely to have taken steps to minimize disparity, and are likely more politically astute in their interpretation of findings.

Whether such disparity represents police prejudice or is the by-product of patterns of civilian behavior has yet to be answered definitively. Because policing is locally based, practices differ by jurisdiction. One comprehensive study indicated wide diversity of practices across the 127 different jurisdictions in Massachusetts (Farrell, McDevitt, Bailey, Andresen, & Pierce, 2004). That study also uncovered evidence of a possible gender bias in some jurisdictions (i.e., the propensity of male officers to stop single, young, female drivers), an artifact not pursued in other studies.

Studying racial profiling has several methodological hurdles. First is establishing an appropriate population baseline against which to compare the proportion of minority stops. Second is the limited number of variables available in official records, the most common source of data for profiling studies. Because of these limitations, the most difficult task is determining whether any disparities are grounded in prejudice, or are a product of real (rather than presumed) criminal conduct.

The original New Jersey and Maryland turnpike cases were relatively easy: The proportions of drivers on the highway could be established by direct observation, as could the proportions of speeders and other motor vehicle code violators. Observable vehicle code violations constituted the sole basis for initiating a stop; the choice to request or initiate a search was less directly observable.

Away from limited-access highways, the question becomes more complex. Police officers working in neighborhoods populated by minorities rightly argue that most of the people they encounter will be of minority status, whether the officers are prejudiced or committed to equality. Furthermore, police investigative stops in cities and towns are often prompted by citizen complaints, providing specific descriptive information that is far more detailed than a profiling "hunch."

Studies note disparate patterns of highway use (both by time and route) by minority drivers, with differences linked to residential, employment, and recreational patterns (Meehan & Ponder, 2002a). Certain highways are transportation corridors from exurbs and suburbs into the core cities, and the commuting drivers may represent different ethnic proportions from the towns' resident populations. One post-shooting study in New Jersey suggested that young minority males comprised a much greater proportion of drivers using excessive speed (Lange et al., 2005).

It retroactively provided nominal support for the original profile, but remains untested against actual vehicle stop practices.

Another study found that even within a single jurisdiction, racial disparity in stops increased with distance from the city border. Minority drivers were far more likely to be stopped in homogeneous white suburban neighborhoods farthest from the city line, where black or brown faces stood out. Police activity was relatively race-neutral in areas abutting a core city, where a heterogeneous population mix was the norm (Meehan & Ponder, 2002b).

More critical to the interpretation of police stop data is the nature of formalized record keeping. Most police records systems were designed to facilitate case tracking and offender identification. Even in those jurisdictions that have adopted more rigorous tracking by race and ethnicity, either prospectively or in response to consent decrees or public criticism, few forms reveal the actual motivation of the officer. The Supreme Court decision of *Whren et al. v. United States* (1996) has legitimized the police use of the pretext stop, initiating action on the basis of a violation unrelated to the officers' real intent to conduct an investigation. Almost all vehicle stops meet the low threshold for probable cause (a moving violation or equipment defect), and are therefore legal.

Police records systems generally record only the fact of a stop, not its context. Computer analysis of aggregate stop data is insufficient to establish motivation because such information is not recorded. It remains difficult to determine whether disparate patterns represent overt bias, subtle bias, or a statistical artifact of police deployment based on crime and call patterns, or other localized phenomena.

Analyzing stop data at the aggregate level avoids any scrutiny of individual officers' work habits. Such techniques have political benefits, but if officers in small groups engage in prejudicial behaviors unrepresentative of the agency practices, the bias may be masked statistically in the larger agency patterns. The impact of their actions upon the minority citizens will remain vivid, however, and the gap between what is experienced by citizens and what can be demonstrated statistically will remain a cause of friction.

Conclusion

Central to the ongoing debate regarding racial profiling is the balance of the protection of public safety with the protection of individual liberty. In the original context, the potential gains in public safety to be realized by intercepting bulk drugs before they could be distributed might justify the tightly controlled use of an otherwise intrusive police tool. The contemporary focus of research ignores quantity, focusing instead on the appropriateness of a "hit rate" based on any quantity of drugs as a justification.

A decade after the New Jersey Turnpike shooting that revived the racial profiling controversy, the use of profiling

continues, and continues to be problematic. Questions of the accuracy and precision of application remain unanswered: Given the local control of police agencies, the questions are revisited on a case-by-case basis. Moreover, it is likely that the police have become more astute, both politically and scientifically, in their ability to articulate the reasoning processes of individual officers, and the patterns of agency-wide actions. While that possibility invites the reaction that “the police have become better liars,” it is equally possible that the police are becoming better at identifying and articulating the subtle behaviors that they observe, giving a more valid operational definition to the prized “sixth sense” of the street cop.

RESTORATIVE JUSTICE

Theory, Practice, and Evidence

GORDON BAZEMORE

Florida Atlantic University

Restorative justice is a “new” way of responding to crime and harm based on ancient practices. Criminal justice policy in much of the modern world, and in the United States in particular, views punishment as a primary response to crime. For advocates of restorative justice, however, crime is more than simply lawbreaking; rather, crime *harms* individual victims, communities, offenders, and relationships. “Justice,” therefore, cannot be achieved simply by punishing the offender, or even by only providing treatment and services. Justice must focus on *repairing the harm* crime causes, while ensuring accountability to those harmed by crime rather than to the state alone.

This chapter first provides a definition of restorative justice and discusses the differences and similarities between restorative and other models of justice. It then describes core value-based principles that should guide restorative intervention and policy development and discusses the varieties of restorative practice. In addition, research is summarized that generally demonstrates the effectiveness and adaptability of restorative justice. Following this is a discussion of how these principles relate to several criminological and social science theories that may help to explain *how* and *why* restorative practice “works” when it does. Finally, weaknesses of current policy and its implementation and threats or challenges to broader continuing application of restorative justice strategies are considered.

Background: A Brief History of Restorative Justice

If asked to define “justice,” most Americans use words such as fairness, similar or equal treatment, absence of discrimination, enlightenment, due process, and equal opportunity. Yet, when asked what is meant when someone has been “brought to justice,” Americans inevitably think first of punishment—often severe punishment—that must serve as retribution for wrongdoing. People know that justice is a larger concept than punishment, yet are mostly aware of a very limited set of choices about what justice means in response to crime.

Punishment, Settlement, and Exchange in Human History

Although most people are clearly taught, or *socialized*, to believe in the moral “rightness” of retribution, and to some degree in its effectiveness, there is no evidence to suggest that human beings are innately punitive. Indeed, most speculation is that in early human communal societies, when someone was harmed by another person(s), the response was typically some form of group dialogue. This deliberation included consideration of responsibility for the act, discussion of the nature of the harm, and consideration of “accountability” based on obligations for the offender (and often his or her family) to make amends to those harmed.

These so-called *ancephalous* (or headless) societies also preferred restitution and other reparative responses to crime that sought to restore community peace and harmony as an alternative to “blood feuds,” which generally had devastating consequences for community life. Moreover, the most highly developed ancient states—those in Egypt, Babylon, China, Persia, and Greece, as well as Hebrew and Anglo-Saxon societies—devised formal codes that specified monetary amounts, as well as goods and services, to be paid as restitution and offered as a means of “repairing the harm” caused by specific actions that would today be considered as crimes, including even serious and violent offenses.

In contrast to the view that punishment is an innately human trait, it seems more likely that humans are “hard-wired” for reciprocity and social exchange. When people use the phrase “I owe you one,” or “You owe me one,” it generally implies that there is an expectation to repay a debt or good deed that can “make things right” in a different way from individual revenge. While revenge may be part of the human condition, it may be more accurate to say that it was collective *state punishment*, rather than restorative responses that were “invented” (for Anglo-European cultures, at least) during the Middle Ages. Retributive punishment is therefore a more recent human “innovation” that essentially formalized the response to community and individual conflict resolution by designating theft and other offenses as “crimes” against the king (or the state). Although more commonly employed in some eras and cultures (e.g., forms of restorative justice never disappeared in many indigenous societies), reparation and informal settlement processes, as well as formal and informal restitution and other reparative sanctions (e.g., community service), have nonetheless persisted at some level alongside retributive punishment throughout Western history.

Punishment, Justice, and Restoration Today

Restorative justice advocates in the modern world, and in the United States in particular, are nonetheless up against a perception of “justice” as an offender “taking the punishment.” This narrow retributive perception of justice unfortunately continues to justify and support what much of the modern world increasingly recognizes as a uniquely American *addiction* to punishment. To a large extent, however, what has been a three-decade-long U.S. geometric increase in imprisonment is more accurately a function of *policymaker* addiction, which has in the past decade ushered in an era recently described as a condition of “mass incarceration.” This state of affairs permeates the existence and defines the future of affected populations, notably in this case African American males. Indeed, public opinion polls continue to suggest that, when given alternatives in specific case scenarios, most citizens appear to be less punitive than politicians and the legislation they develop. Specifically, for the vast majority of crimes, Americans responding to citizen surveys choose the option of a community-based alternative

sanction that might, in some research, include restitution, community service, apologies, and victim–offender meetings. While by no means soft on crime, restorative justice appears to fit well into this growing movement for reform, and with the emerging dissatisfaction with expanded punishment as the primary response.

What Is Restorative Justice?

In cities, towns, and rural areas in dozens of countries, victims, family members, and other citizens acquainted with a young offender or victim of a juvenile crime gather to determine what should be done to ensure accountability for the offense. Based on the centuries-old sanctioning and dispute resolution traditions of the Maori, an indigenous New Zealand aboriginal band, *family group conferences* (FGCs) were adopted into national juvenile justice legislation in 1989 as a dispositional requirement for all juvenile cases with the exception of murder and rape. FGC, or “conferencing,” is widely used in many countries as a police-initiated diversion alternative, a means of determining disposition (sentence) for juveniles and adults, and has been used for more than a decade in communities in Minnesota, Pennsylvania, Colorado, Illinois, and other U.S. states and much of Canada. Facilitated by a coordinator that may be a youth justice worker, volunteer, or police officer, FGCs are aimed at ensuring that offenders are made to face up to community disapproval of their behavior, that an agreement is developed for repairing the damage to victim and community, and that community members recognize the need for reintegrating the offender once he or she has made amends.

Item: In schools in Denver, Colorado; Chicago, Illinois; and many other U.S. cities and towns, middle and high school students in conflict with other youth, students being bullied or bullying others, and youth removed from the classroom for disciplinary violations meet with students, teachers, and staff they have harmed or who have harmed them, as well as parents and community members, in restorative peacemaking circles. These informal dialogues make use of a “talking piece” (an object held by the speaker) as a means of preventing interruption when a participant is speaking and regulating dialogue about the harm caused to victims, acceptance of responsibility and often apologies by offenders, and an agreement for offenders to accomplish various tasks aimed at making amends or repairing the harm they have caused.

Item: In Rwanda, formerly incarcerated members of one of two primary tribal groups, the Hutu, implicated in genocidal killings of the other primary tribal group, the Tutsi, participate in lengthy (sometimes multiple-day) “truth-telling” sessions in communal courts (known as *Gacaca*). Aimed at repentance, reparation, and eventually possible reconciliation

with surviving family members of their victims, participants in these sessions ultimately accept responsibility for murder and other crimes, apologize, and make commitments of extensive service or reparation (as money, goods or services) aimed at eventual healing and peace.

Item: In San Jose, California, and hundreds of other communities in the United States, youth arrested for crimes and considered for diversion from court or probation meet with citizen volunteers in Neighborhood Accountability Boards who, with youth and family input, develop a community- and victim-oriented restorative sentence as an alternative to a court order. When asked why they believe this approach “works” better than traditional juvenile justice intervention, they report that the program is effective because “we aren’t getting paid to do this”; “we can exercise the authority that parents have lost”; “we live in their (offender’s and victim’s) community”; “we give them input into the contract”; “we are a group of adult neighbors who care about them”; “they hear about the harm from real human beings”; and “we follow up.”

Item: In a prison in Texas, the mother of a daughter raped and murdered a decade before and her granddaughter, along with a trained facilitator, meet with the offender responsible for 3 days of dialogue after several months of preparation by the facilitator. The goal of this meeting is to provide the survivors with answers to their questions about how this young woman had died and hear the offender’s story. At the end of a 2-day session, the mother and granddaughter forgive the murderer.

Item: In residential facilities for youth convicted of serious and often violent crimes in Georgia, Tennessee, Illinois, Pennsylvania, and other states, staff and the youth they are responsible for are learning new methods of discipline based on restorative justice principles (versus standard reward/punishment models) aimed ultimately at changing the culture and organizational climate of their facility.

Item: In Northern Ireland, formerly incarcerated Republican (IRA) and Loyalist combatants in the decades-long conflict in the city of Belfast meet with young offenders in community restorative justice conferences. While only a few years before, youth like these caught stealing, joyriding, or committing other crimes were beaten and even shot (“knee-capped”) by these combatants (who assumed de facto responsibility for preserving order in communities where police were not welcome), today these youth are held accountable by meeting with their victims and community members and agreeing to make amends through reparation and service to the individuals and communities harmed by their actions.

Item: In inner-city Cleveland, Ohio, former incarcerated felons participate in civic community service projects that

typically involve providing assistance to the elderly, helping youth in trouble and those struggling in school, and rebuilding parks. For their efforts, the former inmates “earn their redemption” by making amends to the community they previously harmed, rebuilding trust, and making new, positive connections with community groups and prosocial community members.

Item: In Bucks County, Pennsylvania, neighbors in a primarily white, protestant, middle-class neighborhood in a Philadelphia suburb place a Star of David in their windows during the holiday season in solidarity with a Jewish family who the night before had been the victim of a group of skinheads who burned a cross in the family’s front yard. With input from the families and community members, the young men are diverted from the court with the understanding that they will meet with the victimized family and a rabbi who will also arrange community service and ongoing lessons in Jewish history for the boys.

What do these diverse brief portraits of restorative justice have in common? While involving different cultures and ethnic groups addressing a wide range of harm and conflict, these practices share a basic commitment. This commitment is to primary involvement of the true “stakeholders” in crime and conflict, in a very intentional effort to pursue a distinctive justice outcome. Aimed at achieving “accountability” by allowing offenders to actively repair harm to the individuals and communities they have injured, this outcome has been found to be more satisfying to both victims and offenders than those pursued in a court or other formal process. While the term *restorative justice* has in recent years entered popular discourse (after being featured on the *Oprah* show and in other popular media venues), restorative policy and practice is often widely misunderstood. It is important, therefore, to first be clear about what restorative justice is *not*.

Misunderstanding Restorative Justice

Restorative justice is not a single *program*, practice, or process. As indicated by the examples above—especially those involving serious and violent murders and reconciliation following genocide—it is also not an intervention meant only as an alternative response to minor crime, juvenile crime, or other misbehavior. And it is not limited to use in, or as an alternative to, one part of the criminal or juvenile justice process. Indeed, as illustrated in the last case above, restorative justice may occur spontaneously and completely outside and independent of any formal criminal justice context.

Restorative justice does not assume that the victim will or should *forgive* the offender. Although some victims—including those harmed by some of the most horrific crimes mentioned in the previous examples—choose in their own way and in their own time frame to forgive the offenders that harmed them, a successful restorative

intervention does not presume either forgiveness or reconciliation. Restorative justice is also not a “soft” option for offenders (many in fact view restorative justice as more demanding than traditional punishments), and restorative proponents do not suggest that more use of restorative justice implies that there is no need for secure facilities. Finally, restorative justice is not focused only on the offender—or on reducing recidivism—even though it has been effective in doing so. It is focused first on the needs of those victimized by crime and their families, and on the needs of other true “stakeholders” in crime and conflict: offenders and their families, communities, and supporters of offender and victim.

Defining Restorative Justice

Restorative justice is most accurately described as a model for “*doing* justice” by repairing the harm of crime. To the greatest extent possible, restorative intervention seeks to heal the wounds crime and conflict cause to victims, communities, families, and relationships. This approach provides a clear alternative to now-dominant retributive justice models that seek essentially to achieve “just deserts” by punishing offenders, but restorative justice is not simply a model of offender rehabilitation, or an easy community-based alternative to punishment.

Restorative justice is, however, generally compatible with many goals and assumptions of other approaches to criminal justice including crime control, rehabilitation, and libertarian/due process models. Restorative justice practices support rehabilitation and treatment, though this is not their only or primary goal, and according to research, restorative programs have been effective in reducing recidivism; restorative justice *is* an evidence-based practice. Advocates of restorative justice are also strong in their support of due process and limits on state intervention, and do not advocate restorative processes for offenders who have not admitted responsibility for the crime, or been found guilty in a fair adjudicatory process.

Regarding crime control, restorative justice advocates would support prevention efforts as well as public safety goals. But they would also argue that a society more focused on restorative practices at a community level (e.g., in schools, families) would be a safer society. Restorative justice proponents also recognize the need for secure facilities, and even incapacitation, for violent predatory offenders. Like many other critics of U.S. criminal justice policy, however, restorative justice proponents would argue that the incarceration binge of the past decade has resulted in more harm than good—for example, communities that are less safe, victims who have not healed, and offenders who are perhaps even more violent.

Restorative justice is perhaps most distinctive in its way of determining/measuring how much “justice” has been achieved in a given response to crime. Specifically, restorative justice advocates would gauge the success of

any response to crime by attention to the extent to which *harm is repaired*, rather than the degree to which “just deserts,” or fair punishment, is delivered.

Values and Principles

Underlying restorative intervention is a set of basic values, most notably “respect,” democratic decision making, fairness, and so on. Core *principles*, on the other hand, are value-based assumptions that express ideal goals and objectives to be achieved in a justice process. Such principles also provide general normative guidelines for gauging the strength and integrity (sometimes called the “restorativeness”) of any response to crime and harm. Broad core principles (as articulated by Van Ness & Strong, 1997) that guide restorative justice practice, and also suggest independent but mutually reinforcing justice goals, can be stated as follows:

- *The Principle of Repair*: Justice requires that healing be enabled for victims, offenders, and communities that have been injured by crime. The extent to which harm is repaired is assessed by the degree to which all parties identify the damage of a crime that needs to be addressed, and develop and carry out a plan to do so.

- *The Principle of Stakeholder Involvement*: Victims, offenders, and communities should have the opportunity for active involvement in the justice process as early and as fully as possible. The extent to which effective stakeholder involvement is achieved is assessed by the degree to which victims, offenders, and individuals from the community affected by a crime or harmful action are intentionally and actively engaged in decision making about how to accomplish this repair.

- *The Principle of Transformation in Community and Government Roles and Relationships*: The relative roles and responsibilities of government and community must be rethought. In promoting justice, government is responsible for preserving a just order, and community for establishing a just peace. The extent to which the community–government relationship is transformed in a restorative process is assessed by the degree to which a response to crime operationalizes a deliberate rethinking and reshaping of the role of the criminal justice system in relation to that of community members and groups.

While these core principles reflect normative values, they can also be linked to social theories that should guide practice, and in the long run help to *explain why* a given intervention, or a practice implemented over months or years, is successful or not. Later in this chapter, it will be demonstrated how each principle can be connected to causal theories drawn from criminological and other social science literature and intervention theories of crime and desistance.

Stakeholders: Who, What, and Where?

The problem of *crime* is of course much larger and more complex than the problem of the *offender*. Yet, criminal justice policy is in essence an offender-driven response, narrowly focused on arresting and processing lawbreakers. The principle of stakeholder involvement places a priority on engaging those most affected by crime—victim, community, and offender—in the justice process, and on the quality of this engagement. It also suggests an emphasis on the needs of key stakeholders and their obligations. Such needs are often different for each individual participant in the justice process and may vary in unpredictable ways—hence, the need for a meaningful, respectful engagement process that presumes multiple choices based on research and practice. Based on research and practice experience, it is possible, however, to describe *general* needs that have become quite common for each stakeholder in a crime or conflict.

Victim Needs

Many victims say that they often become most angry with the criminal justice system itself—with its delays, reluctance to share information, and often disrespectful treatment. Victims need first of all to be provided with information about their cases. They also may want, and demand, their “day in court” and to participate in their case, but many say that the adversarial process itself is a source of great trauma on some occasions. Indeed, as Judith Herman (2000) puts it, “If you set out to create a system to generate post-traumatic stress, you couldn’t do better than a court of law.” Thus, victims often prefer an informal process where their views count, such as the process offered by a range of restorative justice practices.

Victims also want more information about the processing and outcome of their cases, answers to their questions (e.g., about why they were chosen by the offender), “truth telling,” and vindication. Such vindication has nothing to do with “vindictiveness,” and the latter term, or terms such as “angry victims,” are often insulting to those harmed by crime. Rather, vindication is often about the need for the offender to express—to the victim and others—responsibility for the crime, and to make clear to everyone (and remove doubts that some victims have) that the crime was (if this is true) *not* a deliberate act by the offender toward this victim, and *not* the result of provocation or negligence on the victim’s part.

While all of us are likely to be angry when someone harms us, victim advocate Mary Achilles (Achilles & Zehr, 2001) notes that victim rage and demand for severe punishment are often a result of a lack of choices:

Victims frequently want longer time for offenders because we haven’t given them anything else. Or because we don’t ask, we don’t know what they want. So [the system] gives them door Number [1 or 2], when what they really want is behind Door Number 3, 4, [or] 5. (p. 12)

Indeed, if the choice behind “Door Number 1” is letting the offender off with no consequences, victims are unlikely to choose that. If “Door Number 2” is sending him to counseling or a wilderness program, the victim may approve of that but ask, “What’s in it for me—what about my needs as a victim?” When a prosecutor or other court official suggests jail time, on the other hand, it doesn’t take a vindictive or punitive person to choose “Door Number 3.” The lesson for restorative justice advocates, then, is to listen to victims and make new choices available that acknowledge the complexity of victims’ needs.

Offender Needs

Traditionally, offender needs when addressed at all in a nonpunitive way have focused primarily on treatment. While most citizens—including those who have been victims—support rehabilitation for offenders, the legitimate portion of public anger about the criminal justice system is based on the view that most offenders are *not* held accountable. Most offenders are never incarcerated, and thus are perceived as receiving a “slap on the wrist.” Moreover, serving time—taking one’s punishment—is in no real way related to being accountable, or taking *responsibility for*, the harm an offender causes to his or her victims (and in some cases, it may even encourage anger toward the victim). Greater understanding by the public and by victims, as well as justice itself, therefore requires that offenders be *meaningfully* held accountable for what they have done.

Rather than simply “taking their punishment” or completing treatment, offenders then *need* the opportunity to take *responsibility for* the harm caused by their behavior to victims. They need to take action to repair the harm and to have a voice in the decision-making process about how this is accomplished. Facing their victim(s) in a restorative justice process provides a rare opportunity to also develop empathy and remorse—two factors strongly related to a reduced probability of reoffending—while also having input into the process. Offenders then take action to repair harm by making amends through apologies, community or victim service, restitution, and so on. Offenders also need support for reintegration into their communities. Juvenile offenders in particular need opportunities to build a range of assets, skills, and competencies, and they need an opportunity to practice and demonstrate these. Young offenders need also to develop positive relationships with prosocial adults.

Community Needs

John McKnight, in his book *The Careless Society: Community and Its Counterparts* (1995), makes a convincing argument that Americans have in recent decades entrusted much of their traditional responsibility for raising children, helping the elderly, improving schools, and participating in civic life to experts. In doing so, Americans have handed over input into community life to

agencies focused on *problems* and deficits rather than assets that might enhance public life:

The service/medical establishment emphasizes the “half-empty” portion of communities and thereby thrives on disease and deficiency as its raw material. The raw material of community, on the other hand, is capacity. Communities are built utilizing the capacities and skills of needy, deficient people . . . [and] are built in spite of dilemmas, problems, and deficiencies. (p. 76)

Communities are also clearly imperfect. Yet, children grow up in communities, and not, if they are lucky, in service and juvenile justice *programs*. McKnight (1995), Robert Putnam (2000), and others who write about the decline in civic life and in the commitment to and reliance on neighbors and civic organizations, have in the past decade begun articulating the need to rebuild social capital as the “glue” that holds community life together.

Communities with high levels of connectedness or social capital typically have low crime rates because, as sociologist John Braithwaite (1989) suggests, in these communities, people “*don’t mind their own business.*” These are places active in maintaining informal social control and social support, especially for the young. Yet, as David Moore reminds us, the increasing reliance on the state, and especially on criminal justice and social service agencies, has in recent years “deprived people of opportunities to practice skills of apology and forgiveness, or reconciliation, restitution, and reparation . . . [and] appears to have deprived civil society of opportunities to learn important political and social skills” (Moore & McDonald, 2000, p. 30). As the state has taken on more responsibility for raising children, Americans have lost some of the basic wisdom and much of the competencies their parents and grandparents had (as well as their extended networks of support), and must literally relearn and practice these techniques. Rather than the typical focus of the past three decades on further expansion of the reach, responsibilities, and resources of the criminal and juvenile justice systems, restorative principles (especially the third principle described above, which addresses transformation of the community–government relationship) offer opportunities to strengthen and *resource communities* to allow them to reclaim responsibility for tasks they once performed *not perfectly*, but often better than criminal justice and social service agencies are capable of doing.

Restorative justice practice can and should therefore be viewed as a tool not simply to help individual victims and offenders, but also to help families, neighbors, schools, churches, networks of activities, and other foundations as communities begin to rekindle basic skills of social support and control that many believe are being lost. Examples of using restorative practice in these ways include cases in which community groups have stepped up to the plate to reclaim some of these responsibilities. In a city in the Minneapolis/St. Paul area, a case involving

serious vandalism in which a local teenager had ransacked an elaborately designed tree house that was open to and used by neighborhood youth, a group of community members took matters into their own hands, and with no professional help, organized their own neighborhood restorative conference. When police officers, who also ran their own highly effective restorative conferencing program, came to the neighborhood to inform residents that they had scheduled a conference for the youth and all families involved, they were told by several neighbors that one resident (a man whose own son had previously participated in one of the police program’s conferences with his own son) had “already handled the problem.” This community member had acted as a facilitator in a conference held in his own basement with the young perpetrator, his mother, several youth and their families, and other neighborhood residents. The conference resulted in restitution paid by the youth and his mother to rebuild the tree house; community service that involved neighbors working with the youth to repair damages; apologies from the youth and mother; and later, a neighborhood party to which the police officers were also invited.

Restorative Justice Practice

Responding to Harm Through Restorative Practice

Restorative justice does not require a program or a formal process. Indeed, some of the best examples of restorative justice occur serendipitously. The previously mentioned case of neighbors who reached out to the Jewish victims of skin-head hate crimes in a predominately white, Anglo-Saxon, Protestant neighborhood in a Philadelphia suburb was a restorative response that had no connection to a program, nor were the Denver faith community groups who provided assistance and support for victims of the Oklahoma City bombing, in town for the Timothy McVeigh trial, employed by a restorative program. In both cases, however, much restorative healing took place that did not require a formal program.

Yet, more organized, ongoing restorative practice can be divided into two primary programmatic categories:

1. *Restorative decision-making or “conferencing” models*—Designed to enable victims, offenders, their supporters, and affected community members to have maximum input into a plan to repair harm, these processes can assume many variations within four general structural models: (1) family group conferences, (2) victim–offender mediation/dialogue, (3) neighborhood accountability boards, and (4) peacemaking circles, all of which share a focus on decision making that seeks to maximize stakeholder involvement.
2. *Restorative sanctions or obligations*—These include restitution, community service, apologies, victim service, behavioral agreements, and other efforts to make amends

for harm caused by one's offense. Restorative obligations represent the concrete, behavioral aspect of holding offenders accountable by "righting the wrong," which provides evidence to the community and victim that the offender has earned redemption.

A Restorative Process and Outcome

Regarding decision-making processes, Howard Zehr (1990) notes that in the current criminal justice process, three questions are asked: Who did it, what laws were broken, and how will the offender be punished. The essence of a restorative process—focused on repairing the harm—is captured in three different questions: What is the harm, what needs to be done to repair it, and who is responsible for this repair.

To conduct a restorative process, stakeholders typically rely on one of the four general nonadversarial decision-making models listed above. This group of practices has in common a process whereby offender(s), victim(s)/victim rep(s), a facilitator, and other community members sit in a nonadversarial, face-to-face, informal meeting to consider the impact of a crime or harm on victims and communities and try to develop a plan to repair this harm that meets the needs of those most affected. Other common elements include adhering to a set of values and core principles, including different points of view, giving voice to various stakeholders, ensuring honest communication, respectfully acknowledging victims, expressing emotion, considering stakeholder needs, accountability, empathy and understanding, and creative problem solving.

The second category, restorative obligations, covers typical immediate products of the process that expect (and help) offenders to "make amends" for the crime or harm and demonstrate accountability through restitution, community service, apologies, victim service, behavioral agreements, and other means. While some would argue that a court order for restitution or service is generally more restorative than a traditional punitive sentence, most restorative justice advocates strongly prefer that these obligations come as directly as possible from the stakeholders themselves. Indeed, many regard the process itself as the essence of restorative justice, and some theoretical perspectives view the restorative dialogue as the fundamental means of *healing* in restorative practice, regardless of outcome.

Research and Effectiveness

There is now general agreement that restorative justice practice has shown positive impact on a variety of intermediate and long-term outcomes including victim satisfaction and healing, increased offender empathy, and procedural justice or fairness. In recent years, randomized trials, quasi-experiments, and meta-analyses have also consistently demonstrated positive impact on reoffending.

While research on restorative justice is in its early stages, relatively speaking, unlike studies of punitive programs and weak or counterproductive treatment models, no research shows that restorative justice practices make things worse (e.g., increase recidivism).

While only two models of restorative conferencing, FGC and victim-offender mediation, have received consistent and positive ongoing evaluation, other conferencing practices such as neighborhood accountability boards and peace-making circles have also shown promising early results. In addition, an older body of evaluation research on the aforementioned reparative practices—essentially, restorative obligations or sanctions such as restitution and community service—has consistently found positive impact. Moreover, unlike a wide range of punitive approaches, as well as a large number of treatment programs that consistently report negative outcomes in evaluations and meta-analyses, no studies of reparative practices (e.g., restitution, community service) report negative findings.

Regarding crime victim impact, researchers for more than a decade have been able to make the claim that crime victims who participate in face-to-face restorative justice dialogue processes with offenders experience greater satisfaction than those who participate in court or other adversarial processes. Though "selection effects" leave open the possibility that victims who choose to participate in these processes are predisposed to report greater satisfaction than those who do not, the consistency and strength of these results are nonetheless persuasive. In recent years, experimental research has also verified the effectiveness of restorative conferencing in reducing posttraumatic stress syndrome in crime victims.

Much uncertainty remains, however, about the primary causal factor or specific intervention most responsible for producing the typically higher levels of victim satisfaction in this research. For example, it could be argued that these results are due less to the fact that restorative processes are so effective than to the fact that the court and adversarial process is so harmful. Perhaps restorative dialogue processes simply take advantage of what is often called a "Hawthorne effect," whereby victims who are simply listened to, treated with dignity and respect, and given a wider array of choices are more satisfied than those who go through court, regardless of the effect of any special face-to-face dialogue with the offender. While this could mean that positive effects of a restorative process are actually a result of what is usually called procedural justice rather than some presumed restorative justice impact, authors of the bulk of restorative research publications tend to view greater satisfaction as itself a restorative justice benefit. Although early studies show independent positive impact of restorative obligations—for example, restitution, community service—unanswered questions remain about what additional positive impact might be attributed to the *purely restorative* features of the restorative process. Yet, evaluation studies in recent years have generally also shown significant reduction in recidivism—at least some of which

has been linked to unique features of the restorative process and its impact, for example, on offender remorse and empathy.

How and Why Does It Work? Better Theory for Better Practice

Despite this research progress and better outcomes for restorative programs relative to court and similar alternatives, there remains relatively little insight into *why* these programs appear to produce positive effects. Indeed, it is a legitimate question, whether it is a restorative justice process or some other set of intervention characteristics that accounts for the success of these practices. What is most needed at this time are clear and coherent theories that are consistent with restorative principles and assumptions that can account for *why* restorative justice works when it does, and *how* it works. Testing various theories may also reveal what aspects of restorative process and outcomes best explain why these practices reduce recidivism, improve victim outcomes, and seem to strengthen informal social control and social support.

Theories are not just for academics. Indeed, the best policies and practice are often guided by theories of change: in offenders, victims, other stakeholders, and communities. Theories should also guide practice and replication of successful projects by helping practitioners adapt general principles to diverse cultural and structural environments. As a collective encounter, restorative justice practice is naturally linked to a variety of social theories in criminology, sociology, psychology, and other disciplines.

Without a doubt, the most widely recognized theory associated with restorative justice is *reintegrative shaming theory* (RST). This theory emerged from sociologist John Braithwaite's (1989) comparative international work contrasting cultures and societies that tended to have low versus high crime rates. While Braithwaite concluded that generally low-crime cultures are those in which community members "do not mind their own business," he also emphasized the importance of informal sanctioning processes in which community members clearly denounced the crime or harmful act while also generally continuing to support the offender as a community member. This process, which he labeled "reintegrative shaming" (as the opposite of "disintegrative shaming"), has become the theory most associated internationally with the restorative justice process. While a powerful theory, reintegrative shaming practice does not receive absolute support among restorative justice advocates, many of whom prefer the emphasis on empathy and support rather than shame. In any case, even those who do use RST consistently now recognize it as only one of many theories that help to explain the impact of restorative justice.

In addition, a number of other theories appear to align directly with core values and principles of restorative justice, while at the same time providing practitioners with important immediate and intermediate outcomes that link

practice with long-term impacts and help to explain the success or failures of restorative interventions. Based on their fieldwork using interviews with staff and participants in restorative conferencing programs in several states and local communities, Bazemore and Schiff (2004) documented "grounded theories" in common use in restorative practice. These researchers also demonstrated how these theories tend to direct practice toward certain process approaches, and toward a focus on initial and intermediate outcomes believed to lead to positive long-term results (e.g., reduced recidivism, long-term victim healing). These theories and associated outcomes are discussed below as they relate to one of the three core principles of restorative justice.

Repairing Harm

The first core outcome is associated with the overarching goal/principle of repairing harm. In restorative practice, this principle gauges the extent to which the offender acknowledges responsibility for his or her actions, and is then held accountable to victim and community. The offender does this by "making amends" for the harm his or her crime has caused. This outcome dimension is grounded in *exchange theories* that emphasize the importance of reciprocity in human interaction. A second core outcome associated with the principle of repairing harm is the focus on rebuilding relationships damaged by crime, or helping offenders, victims, and families make new connections with positive individuals and support groups. This practice and outcome is grounded in Cullen's (1994) *social support theory*, which suggests that both emotional/affective support (e.g., from family and intimates) and more tangible instrumental assistance from prosocial community members enable offenders to desist from crime, and victims to recover from the trauma of crime.

Stakeholder Involvement

Theories surrounding the principle of stakeholder involvement emphasize different varieties, or tendencies, in the restorative decision-making or conferencing process. These theories give priority to different intermediate intervention objectives as most important in various theories of restorative decision making. For example, a theory of *healing dialogue*, which claims that the "victim-offender exchange" in the conference setting (with relevant input from others in the conference) is the most critical dimension (i.e., immediate outcome) of a successful conference, gives primary weight to the power of relatively unrestricted victim-offender discourse. Another perspective related to this principle is a theory of *common ground*, which suggests the importance of a kind of "mutual transformation" of victim and offender as an outcome central to the ultimate resolution of harm and conflict. This dimension gives priority to the power of conflict resolution processes that build upon what is at times a small overlap in the interests

of victim and offender, offender and community, and victim and community. Facilitators in a restorative process often find this overlap by close attention to change in group emotions, by respectful acknowledgement of the “other” (e.g., victim of the offender), and by recognizing and building on transition in subtle phases of the dialogue process. Also aligned with the stakeholder involvement principle is the previously discussed reintegrative shaming theory, which seeks a collective “respectful disapproval” of the offender’s behavior by those who acknowledge the harm caused, while distinguishing the behavior from the offender himself or herself.

Community/Government Role Transformation

The need for transformation of the community/government role and relationship in the response to crime suggested by the third restorative principle is consistent with more macro theories of *social capital* and informal social control. The theory and principle are best operationalized when participants in a restorative process (and their support groups, neighborhoods, and organizations) engage in “norm affirmation,” or values clarification and, in doing so, strengthen networks of support based on trust and reciprocity. These networks then form the basis for building common skills of informal social control and mutual support, and finally developing the commitment needed to exercise these skills as suggested by the theory of *collective efficacy*.

Another phase or dimension of community building noted in field observation of restorative processes, referred to as *collective ownership*, appears to emerge in restorative conferences when participants begin to take responsibility both for the case at hand, and for some of the larger local problems it exemplifies. This collective ownership may then impact willingness to take action in informal control and support based on a theory of *civic engagement*. The latter theory also suggests that offenders who make such a commitment, and follow through in the process of giving back by visibly making amends to their communities, are thereby able to demonstrate their value as productive citizens with something to offer to the well-being of others.

Practical Challenges to Restorative Policy and Practice

While restorative justice has demonstrated great success in some parts of the world, the restorative justice movement, especially in the United States, finds itself in something of a crisis due to a decline in resources to support new programs and initiatives, and continuing policymaker commitment to punitive and less effective alternative programs. Despite positive empirical impact and widespread support for restorative justice values, most problematic has been the

lack of broad application of restorative practices and policies beyond responses to low-level crimes. Also apparent is the failure to move beyond mostly small “boutique programs” disconnected from mainstream juvenile and criminal justice and from systemic change. For mainstream criminal and juvenile justice officials, these programs may seem worthy of support as one of many “alternatives” for low-level cases, but they also seem to be isolated from mainstream concerns. Most importantly, restorative justice advocates have often failed to explain to those criminal and juvenile justice professionals and the communities they serve *how restorative justice programs help them solve fundamental system and community problems*.

A focus on *programs* cannot provide the basis for a holistic approach to restorative justice in the absence of a systemic commitment to transform the focus and effectiveness of criminal and juvenile justice intervention. Indeed, the most successful case study of a comprehensive implementation of restorative justice began somewhat inadvertently in the late 1980s in New Zealand, as mentioned early in this chapter. This modern beginning of a systemwide restorative effort in juvenile justice produced national legislation mandating use of an ancient, nonadversarial decision-making model employed by Maori aboriginals for hundreds of years (now known widely as family group conferencing) to determine the disposition, or sentence, for all juvenile cases other than murder and rape. Family group conferences, rather than being presented as “alternative” or “add-on” programs, were meant to give parents, as well as extended family (or clan) and community members, primary input into decision making for these cases once guilt/responsibility for the crime was established. In doing so, this practice largely displaced or reduced the dispositional function of the court, while also addressing the solving of chronic system and community problems that were the primary concern of the national legislation: overuse of incarceration for juvenile offenders resulting in severe facility crowding, and the disproportionate confinement (DMC) of minority youth (i.e., Maoris).

While the New Zealand experience is unique as a case study in restorative justice implementation, there are many important lessons in that effort for the United States and other countries. Many countries, for example—including those in the United Kingdom and Europe, as well as Canada and Australian provinces and states—while not mandating use of restorative processes, specify *presumptive* use of restorative justice for many crimes; that is, use is expected in the absence of justification not to do so. Despite the fact that 25 U.S. states by the late 1990s had changed the purpose clauses of their juvenile codes to include restorative justice, and estimates in early 2000 that more than 700 restorative programs operated nationally, most states support only a handful of programs. Moreover, referral rates are miniscule relative to most programs and mainstream dispositions (e.g., probation), and most importantly, few of

these jurisdictions specify or even prioritize use of restorative practices.

Given the relative failure in the United States to make restorative justice part of the mainstream of criminal and juvenile justice, a checklist of do's and don'ts that should guide a new two-pronged strategy for expanding, sustaining, and maximizing the use and benefits of restorative policy and practice might have several key assumptions. In addition to the general emphasis on engaging system leaders by demonstrating how restorative justice could (as in the New Zealand and other experiences) resolve chronic system and community problems (i.e., by increasing public safety), additional specific recommendations for implementing and expanding use and impact of restorative justice policy and practice include the following: (1) De-emphasize programs and challenge the view that restorative justice is an "alternative" rather than a primary, even essential, feature of both decision making in criminal and juvenile justice and follow-up on meaningful obligations and sanctions assigned to offenders; (2) rather than supplement, or provide an "alternative" to, many mainstream, ineffective practices, restorative justice should be designated in statute or policy as the primary response to large groups of offenses; (3) because restorative justice is compatible with core justice functions in multiple settings, advocates should seek to develop a restorative "way" or approach to enhance and refocus core criminal justice functions—e.g., consider a restorative model of discipline and conflict resolution in correction facilities and in schools, and develop restorative models of diversion, probation, and reentry. In addition, restorative values and principles have been discussed and initially applied to staff discipline, court management, community policing, and other core criminal justice functions and could be further expanded as movement toward a systemic approach.

Conclusion

Restorative justice is a "new" approach based on ancient practices, unique justice values, and core principles. These justice principles guide a new justice process based on maximizing participation of core stakeholders—victim, offender, and community—and repairing the harm caused by crime. New outcomes emphasize accountability for the offender based on taking responsibility to make amends to victim and community and rebuilding or strengthening relationships of both offender and victim to their communities and supporters.

Challenges include moving beyond a programmatic approach to a holistic focus that seeks a restorative outcome in every case and uses restorative justice principles to solve major systemic problems in criminal justice and communities. Public opinion generally favors restorative justice practices, and prefers alternatives forms of accountability for most crimes. Yet, the continued commitment of U.S. policymakers

to retributive punishment and to an emerging prison industrial complex that appears to be creating the societal condition sociologist Bruce Western (2007) now calls "mass imprisonment" presents formidable challenges to any progressive reform. Optimism for greater use of restorative justice is based on strong research findings indicating its effectiveness in achieving multiple outcomes for multiple stakeholders, including reduced recidivism, and victim satisfaction and healing. Moreover, the connection between restorative justice principles and evidence-based theories of change at the social-psychological, peer support, and community-building levels of intervention provides further rationales for expanding these approaches. Finally, increasing recognition of a decline in and a need for revitalization of community skills in informal crime control and positive support for prosocial behavior also set the context for greater application of restorative justice solutions.

SENTENCING

BRIAN D. JOHNSON

University of Maryland

Few decisions in the criminal justice system exert as much influence over the life and liberty of criminal offenders as the final sentencing decision. Judges have a broad array of sentencing options, ranging from fines, restitution, and probation to incarceration in jail or prison. For much of the 20th century, criminal sentencing practices remained largely unchanged in the United States, but the past few decades have witnessed a virtual revolution in criminal punishment processes. A number of different sentencing reforms have been recently implemented or expanded, resulting in a variegated mix of different legal approaches to sentencing in the United States today. This chapter reviews the contemporary state of knowledge on U.S. criminal sentencing. It begins with a brief historical overview of sentencing philosophies, followed by a discussion of modern sentencing innovations. It then discusses research evidence regarding social inequalities in punishments before concluding with a discussion of unresolved issues in contemporary research on criminal punishment in the 21st century.

Historical Evolution of Modern Sentencing Systems

Criminal sentencing in America has long been guided by one of several different major philosophies of punishment, including retribution, deterrence, incapacitation, and rehabilitation (Spohn, 2000). Retributive sentences involve punishments designed to exact revenge, in line with the biblical

notion of “an eye for an eye.” This is based on the belief that some behaviors are categorically wrong and therefore deserving of punishment. From this perspective, sentences should be commensurate with the harm done to society in order to exact just punishment. Deterrence, on the other hand, involves a more utilitarian rationale for sentencing. It is based on the notion that crime is freely chosen as the result of a rational cost-benefit analysis. Individuals will engage in crime when the benefits outweigh the costs. The goal of sentencing, then, is to raise the costs of crime, in the form of punishment, to a level that will prevent future crime from occurring. In comparison, incapacitation argues that effective sentences should focus on removing serious offenders from society. Once isolated and secluded, criminal offenders will no longer be able to commit crimes against the public. Finally, rehabilitation as a philosophy of punishment emphasizes individual offender reform. According to this perspective, the goal of punishment should be to address the underlying causes of crime in order to reduce future offending. Although in practice these various sentencing rationales often coexist, throughout history major changes in sentencing have often followed paradigm shifts in predominant philosophies of punishment.

The Fall of the Rehabilitative Ideal

During colonial times, criminal sentencing in America was premised initially on retribution and then later on deterrence (Walker, 1998). By the late 1800s, however, sentencing

in America had become thoroughly dominated by rehabilitation. The goal of criminal punishment was to reform the offender by altering the underlying causes of crime. In order to accomplish this, criminal sentences had to be sufficiently flexible to be individually tailored to the unique needs of particular offenders. This led to a system of punishment known as “indeterminate sentencing,” so named because the exact term of punishment was often uncertain. Sentences often involved wide ranges, with minimum and maximum terms that could stretch from a single day to life imprisonment. These broad sentence ranges provided maximum flexibility for determining when an offender had been rehabilitated and when he or she was therefore ready to be released back into society. Judges at sentencing would determine the broad ranges of punishment, and then release decisions would be made by prison authorities or parole boards, who exercised considerable discretion in determining the actual amount of time served. Although indeterminate sentencing was based on a rehabilitative philosophy of punishment that emphasized the unique individual needs of different offenders, it is important to note that often the programs implemented in prison to target those needs were poorly funded and administered (MacKenzie, 2001).

Inherent in the rehabilitative philosophy of indeterminate sentencing was an implicit trust that criminal justice officials were able to reform criminal offenders. The 1960s was a period of important social change, though, and during this time trust in the justice system began to be questioned for a variety of reasons. A number of important social movements coincided that raised questions about the effectiveness and fairness of indeterminate sentencing. As part of the larger civil rights movement, a due process revolution swept through the criminal justice system that emphasized the fair and equal treatment of offenders. Prison conditions in particular came under attack following dozens of high-profile prison riots, like the one at Attica, New York, in 1971 that left 33 prisoners and 10 hostages dead after a 4-day standoff with prison officials. Race riots, such as the infamous Watts Riots in Los Angeles in 1965, were also breaking out in several cities; this, combined with the counterculture youth movement and anti-Vietnam War sentiments, helped fuel a growing mistrust of government (LaFree, 1999). Importantly, this period of social discord coincided with a precipitous rise in crime, which some commentators attributed to sentencing leniency associated with the rehabilitative focus of punishment. Over the next 25 years, violent crime would increase threefold, helping to further fan the flames of criminal justice reform while placing the get-tough sentencing movement at the forefront of political discourse in the United States.

Criminological scholarship also contributed to the dramatic changes in criminal sentencing that were about to take place. In 1974, a group of researchers published a comprehensive evaluation of 231 correctional treatment programs and concluded that with few and isolated exceptions, “nothing works” in corrections (Lipton, Martinson,

& Wilks, 1975). Known as the Martinson report, this study became a sounding board for criminal justice pundits and reform-minded politicians bent on change, despite the fact that its conclusions were taken out of context and heavily criticized by some. If rehabilitation was ineffective, something else was needed to take its place. Both conservative and liberal scholars lobbied for change, although for different reasons. Conservatives argued that rising crime rates were the product of undue sentencing leniency associated with the rehabilitative ideal of indeterminate sentencing. They argued for a return to more punitive times, limiting the ability of court and correctional agents to mitigate punishments, and placing greater emphasis on law and order. James Q. Wilson (1975), among others, argued for a shift in punitive philosophy toward a crime control model that would emphasize deterrence and incapacitation rather than rehabilitation. Liberal scholars, on the other hand, began questioning the unbridled discretion of judges in the sentencing process. They argued that inordinate discretion led to inequities in punishment, with preferential treatment reserved for higher-status offenders. Most famously, a Columbia law professor and federal judge named Marvin Frankel (1973) wrote a scathing critique of indeterminate sentencing in which he criticized the facts that judges were not required to provide any reasons or rationale for their sentences; their sentences were not subject to systematic oversight or review; and they lacked the training and guidance necessary to achieve uniform, fair, and just sentences. The unfettered discretion of judges under indeterminate sentencing, in his words, was “terrifying and intolerable for a society that professes devotion to the rule of law” (p. 5).

During the 1970s, then, bipartisan support emerged for wholesale change in criminal sentencing, with conservatives wanting to increase the severity of punishments and liberals wanting to curtail excessive judicial discretion. Coupled with rising crime rates and increasing distrust of government institutions, this unusual political alliance led to dramatic and unprecedented changes in criminal sentencing in America (MacKenzie, 2001).

The Determinate Sentencing Revolution

Although a number of states still operate under indeterminate sentencing systems, a distinct shift in sentencing has occurred that has fundamentally altered the modern landscape of criminal sentencing in America. The abandonment of rehabilitation as the core punishment rationale in sentencing left a sharp and unexpected void in terms of both punitive philosophy and public policy. The solution that emerged, in part, was reliance on a new “justice model” of punishment in which the goal of sentencing would be certain, severe, and proportional punishments rather than individual reformation. This was in effect a return to classical ideas rooted in the retributive ideal. The justification for sentencing under this new regime would

emphasize “just deserts”—or deserved justice—where the goal of sentencing was to fit the punishment to the offense rather than the offender. Under this new philosophy of punishment, uniformity would replace individualization in sentencing as the paradigm regnant. This philosophical change was at the heart of a larger structural shift toward determinate sentencing. Because rehabilitation was no longer the goal of punishment, there was no reason to sentence offenders to indefinite terms of incarceration; relatively fixed and equal sentences based on the severity of the crime and the prior criminal record of the offender became preferable.

Although determinate sentencing takes many forms, its core definitional requirement is the limiting of case-based discretion by judges and parole officials in sentencing. Under determinate sentencing, broad and uncertain sentencing ranges would be replaced by specific punishments that would be matched to specific crimes. Under this system, parole boards would no longer be necessary. Although determinate sentencing reforms have taken various forms, they all share a concern over replacing the rehabilitative ideal with a new set of sentencing considerations emphasizing greater uniformity, neutrality, certainty, predictability, and severity in punishment. The goal of uniformity in punishment arose out of concerns that unfettered judicial discretion was resulting in wildly disparate punishments for similar offenders. Reforms that emphasize uniformity attempt to ensure that similar cases committed by similar offenders receive equivalent punishments. Similarly, neutrality in punishment means that the law is applied in ways that are not systematically biased against particular classes of offender, such as racial minorities in society. Reforms targeting increased certainty and predictability in punishment place stricter constraints on the amount of time served by offenders. Under indeterminate sentencing, time served was typically much less than the nominal sentence because offenders were eligible for parole release after serving as little as one third of their sentence. The actual term of imprisonment was uncertain and unpredictable, and two sentences of equal length could result in different terms of actual incarceration. Finally, severity of punishment, as a goal of sentencing reform, emerged largely out of the law-and-order movement that attributed rising crime and societal discord to unwarranted leniency in sentencing. An important element in the shift to determinate punishments, then, was an increase in severity of sentences, at least for certain classes of crime like drug and violent offenses.

Modern Sentencing Innovations

Although determinate sentencing innovations all share at least some of these core concerns, they have taken various forms, leaving some commentators to note that sentencing philosophy today lacks a strong, unifying organizational or

policy-oriented goal structure (Tonry, 1996). Different jurisdictions have enacted different sentencing reforms, often without adequate concern for their overlap in application. A number of jurisdictions have abolished parole completely, while others have restricted its application in attempts to achieve greater predictability in punishment. Most jurisdictions have also established mechanisms for ensuring that offenders serve a fixed portion of their nominal sentence. Offenders can still earn “good time” credits, but this discount for good behavior is often capped at 15%, so offenders must serve at least 85% of their nominal sentence. These laws are referred to as “truth in sentencing” because they aim to increase the certainty and transparency of the actual time served by the offender. Both parole abolition and truth in sentencing were often enacted along with broader reform efforts designed to achieve additional goals of determinate sentencing. The three most prominent examples of these modern reforms are determinate sentencing laws, mandatory minimums, and sentencing guidelines.

Determinate Sentencing Laws

As early as the 1970s, a number of states, such as California, Illinois, Arizona, and Colorado, began experimenting with determinate sentencing systems based around statutorily defined penalties. These “determinate sentencing laws” shifted sentencing discretion from the judge to the state legislature. Rather than allow the judge to sentence offenders to broad, open-ended terms of incarceration, specific sentences or sometimes narrow sentence ranges were codified in the criminal statutes themselves. Although legal statutes already determined maximum penalties for most crimes, determinate sentencing laws narrowly focused the limits of judicial sentencing authority. In some states, like California, which still operates under this system, aggravating and mitigating sentences are also specified, but judges must provide explanation of the unusual circumstances that warrant these sentencing adjustments.

Determinate sentencing laws dramatically constrained the sentencing discretion of judges and shifted sentencing power to a new player in the justice system—the legislative body. Some of the complications and criticisms of this sentencing innovation revolve around the inherent complexity involved in determining fixed punishments for every possible crime. Because state punishment codes cover hundreds of different offenses, it can be very difficult to assign specific punishments to every offense. Moreover, determinate sentencing laws can make it difficult to account for the full range of offense characteristics that make some crimes more serious than others. Many judges felt disenfranchised after the enactment of determinate sentencing laws, and critics argue that these laws shift sentencing discretion to the prosecutor, who determines the charge of conviction in the case. Moreover, there is disagreement about the appropriateness of having politically elected

bodies like state legislatures determine the legal parameters of appropriate punishments. Because legislative bodies are publicly elected, they may be particularly prone to short-term political influences surrounding crime and punishment. They also are unlikely to have the specialized expertise or necessary legal resources to effectively gauge appropriateness and proportionality in punishment. Although determinate sentencing laws hold the potential to promote statewide uniformity in sentencing, for these and other reasons they have only been selectively implemented in a limited number of states. However, they did help pave the road of sentencing reform for other innovations like mandatory minimums and sentencing guidelines.

Mandatory Minimum Sentences

Mandatory minimums are similar to determinate sentencing laws in that they involve legislatures passing fixed penalties, but they differ in that these laws are applied selectively to specific offenses and offenders, and they only establish statutory minimums, not maximum penalties. For these cases, judges can sentence qualifying offenders above the required minimum but not below it.

The modern history of mandatory minimums is one of extremes. Although they have long existed in milder forms for most of U.S. history, mandatory minimums were categorically repealed by Congress in 1970 (Tonry, 1996). This was at the height of the indeterminate sentencing movement, and under the rehabilitative ideal it made little sense to have fixed minimum punishments that would result in some offenders remaining incarcerated after they were successfully rehabilitated. Sentence lengths needed to be flexible enough to account for individual differences in rehabilitative potential. Soon after, though, rehabilitation fell drastically out of favor, and between the mid-1970s and mid-1980s, every single state reenacted various mandatory minimum laws, making them the most prolific of the modern sentencing reforms. The federal system alone has more than 100 different mandatory minimum sentences.

Most mandatory minimums target drug, violent, or firearms offenses, or they are designed specifically to punish repeat offenders. Mandatory minimums that apply to repeat offenders are called *habitual offender laws* because they are triggered by the offender's prior criminal record rather than or in addition to the current offense. For instance, in Florida, two prior felony convictions or one prior violent felony makes an offender eligible for a habitual offender mandatory minimum enhancement (Crawford, Chiricos, & Kleck, 1998). When mandatory minimums are applied to a case, they can substantially increase the sentence, and they often require the offender to serve a more significant portion of his or her sentence before being eligible for release.

One particular type of habitual offender law that has been widely popularized is *three strikes and you're out*.

Drawing upon a baseball analogy, three-strikes mandatory minimums require that offenders convicted of a third serious felony serve 25 years to life imprisonment, often without possibility of parole. These laws rely on a philosophy of punishment known as *selective incapacitation* because they aim to selectively remove serious repeat offenders permanently from society (Wolfgang, Figlio, & Sellin, 1972). The first of these laws was passed in Washington State in 1993, but they have quickly spread; currently, just over half the states and the federal government have some form of three-strikes law. In most states, three-strikes laws apply to very few criminals, but in a few jurisdictions, like California, they have been broadly defined to apply to a wide spectrum of offenders (Zimring, Hawkins, & Kamin, 2003).

Some commentators point out that mandatory minimum sentences are important for the political and symbolic goals that they achieve. Politicians often favor mandatory sentences because they are perceived to be tough on crime, but once passed into law they can be difficult to amend or repeal because they require formal legislative action to do so. Perhaps the most infamous example of this is the 100:1 crack/cocaine ratio in federal sentencing. Five grams of crack cocaine are all that is needed to invoke a 5-year mandatory prison sentence in federal court, whereas 500 grams of powdered cocaine are required for the same minimum punishment. The tough mandatory minimum for crack cocaine was passed during the war on drugs in the 1980s when political hyperbole surrounding crack cocaine was rampant. Today, because minority offenders are disproportionately convicted of crack cocaine offenses, this mandatory minimum has been harshly criticized for contributing to racial injustices in sentencing (Tonry, 1995). Although the U.S. Sentencing Commission has encouraged that steps be taken to eliminate this disparity, and the Supreme Court recently affirmed the judge's authority to sentence offenders below the crack cocaine minimum (*Kimbrough v. United States*, 2007), these sentencing laws at present remain on the books. One solution that has been proposed is to include "sunset clauses" in the passage of mandatory minimums, which would mean that they would be automatically repealed if not renewed by the legislature (Tonry, 1996). Currently, though, this type of legal clause is rare in the policy world of mandatory minimum sentencing provisions.

Although public support for mandatory minimum sentences is often high, they have been repeatedly criticized for various other reasons as well. Academic research provides little evidence of their effectiveness as a crime deterrent, and prosecutors are known to selectively apply them in a limited subset of eligible cases. Some evidence suggests mandatory sentencing provisions target offenses disproportionately committed by minority offenders and are disproportionately applied to minority defendants. There are also dramatic geographic variations in the application of mandatory minimums such that the location of the court impacts the likelihood of receiving a mandatory sentence (Ulmer, Kurlychek, & Kramer, 2007). Moreover, dismissal rates for

some mandatory sentences have increased dramatically after their passage, suggesting prosecutors and judges take instrumental steps to selectively avoid application of these procrustean penalties. When mandatory minimums are invoked, they almost always result in sentences that are substantially more severe than they would be otherwise. In many jurisdictions, little effort has been made to adequately reconcile mandatory penalties with other structured sentencing approaches, such as sentencing guidelines, which have been a more popularly received sentencing innovation for a variety of reasons.

Sentencing Guidelines

Perhaps the most significant development in determinate sentencing has been the widespread implementation of sentencing guidelines, which have become a popular vehicle for enacting large-scale sentencing reform. Like other determinate sentencing reforms, sentencing guidelines constrain judicial sentencing discretion, but unlike other reforms, the creation of sentencing guidelines is typically delegated to a sentencing commission, or a specialized administrative body of judges, lawyers, politicians, and other legal specialists. Sentencing guidelines were first proposed by Judge Frankel (1973) as part of his eloquent diatribe against indeterminate sentencing in the 1970s. He argued that unlike the state legislature, an administrative commission of sentencing experts would be able to develop special competency regarding appropriate punishments while remaining isolated from short-term political pressures. He also argued that a standardized system of sentencing recommendations, or “guidelines,” were needed to provide uniform benchmarks for judges at sentencing in order to increase equality in punishment. Most sentencing guidelines today are set up as two-dimensional grids that include a measure of the seriousness of the current offense on one axis, and a measure of the prior criminal record of the offender on the other. Sentencing decisions are determined by the intersection of these two core sentencing criteria. More serious crimes and longer criminal histories result in more severe recommended punishments.

Although all sentencing guidelines are founded on similar core ideas, the way in which they have been implemented in different jurisdictions is extremely varied. Guideline systems differ in their complexity, in their sentencing ranges, in the amount of discretion they afford judges, in whether or not they retain discretionary parole release, in the types of crimes and sentencing options they cover as well as the philosophies of punishment they emphasize, and in the extent to which they deviate from past sentencing practices (Frase, 2005). Some guidelines, such as Minnesota’s, only govern prison sentences for felony offenses, whereas others, like Pennsylvania’s, cover a broad range of sentencing options, including jail, prison, and various intermediate sanctions, for both felony and misdemeanor offenses. A few states, like Delaware and

Ohio, have created narrative rather than grid-based guidelines, and other states like Maryland have developed separate sentencing matrices for different crime categories. There has been some discussion of creating three-dimensional guidelines that incorporate other factors like offender culpability or amenability to treatment, but no state has yet taken this approach.

Although there are a number of subtle differences in the types of guidelines currently in use, guidelines systems can be broadly categorized on a continuum between “presumptive guidelines” and “voluntary guidelines.” Presumptive guidelines legally mandate judges to sentence within prescribed sentence ranges that are presumed to be appropriate unless there are unusual circumstances in the case. Judges can still sentence offenders outside of presumptive ranges, but these “departure” sentences require explicit justification, and they are subject to appellate review by a higher court. Voluntary guidelines, on the other hand, provide sentencing recommendations that are not legally binding. Judges are encouraged to consult the guidelines, but they are not required to follow them. Presumptive guidelines place a higher level of control over judicial sentencing discretion than voluntary guidelines. Similarly, different guidelines systems can also be categorized on a continuum between “descriptive guidelines” and “prescriptive guidelines.” Descriptive guidelines are based on past sentencing practices. They are meant to codify and define existing sentencing behaviors, whereas prescriptive guidelines “prescribe” new sentencing patterns that differ from past practices in substantively important ways. The first presumptive sentencing guidelines were implemented in Minnesota in 1980, followed by Pennsylvania in 1982, and today, about half the states either currently have or have experimented with some form of sentencing guidelines.

The bulk of the research evidence on the performance of sentencing guidelines indicates that they are effective in altering the preexisting punishment patterns of sentencing judges. There is also evidence that guidelines have helped reduce unwarranted sentencing disparities associated with offender characteristics like race, class, and gender, although they have not eliminated these differences altogether. Some scholars maintain that they have been successful in creating greater proportionality in punishment. In some states, sentencing commissions have also been able to utilize guideline systems to achieve systemic goals, like effective management of growing correctional populations. Many states now routinely conduct computer projections on prison populations in order to evaluate the influence of potential changes to their sentencing guidelines or to better gauge the impact of other punishment policies such as the implementation of proposed mandatory minimums. These projection estimates can provide useful information on future offender populations that can be utilized to alter sentencing practices in necessary ways. In some cases, resource management concerns have been the primary motivating factor behind the establishment of

sentencing guidelines. Overall, then, commission-based regulation of sentencing guidelines has largely proven to be an effective mechanism for altering punishment patterns and implementing other policy initiatives such as correctional management goals.

For these reasons, state sentencing commissions and their guidelines have been a popular sentencing innovation. Although judges initially responded unfavorably to the curtailing of their sentencing discretion, many of them now openly embrace the idea of sentencing guidelines. In part, the relative success of guidelines stems from their broad appeal across multiple constituencies. Legal advocates, civil libertarians, and liberal scholars laud guidelines for encouraging greater consistency and uniformity in sentencing; crime control politicians, law enforcement agents, and conservative scholars support them for the certainty and severity of punishment they provide. Practitioners, including correctional officials, prosecutors, and even judges, often support sentencing guidelines because they reduce uncertainty in sentencing, increase predictability in corrections, and allow for improved resource management. Given the current breadth of their political support, the continued dissemination of state sentencing guidelines in the United States shows little sign of abating at this time, although this process is far from complete.

Not all sentencing guidelines have enjoyed unqualified success. Some states, like Wisconsin, have created sentencing commissions only to see them subsequently repealed, and other states have been unsuccessful in their attempts to promulgate guidelines altogether. The most controversial system of sentencing guidelines, though, is undoubtedly those created for the federal justice system. One prominent scholar has referred to them as the “most controversial and disliked sentencing reform initiative in U.S. history” (Tonry, 1996, p. 72). The federal guidelines have been repeatedly criticized for being overly rigid, harsh, and constraining, as well as too complex and mechanical in their application (Stith & Cabranes, 1998). Whereas most state guidelines systems have about 15 levels of offense severity, the federal guidelines have 43 levels. Moreover, their application involves the calculation of myriad offense-specific sentencing adjustments that complicate the calculation of guideline sentences. For instance, in the federal system, offenders can receive a two- or three-level discount in the severity of their offense for “acceptance of responsibility,” which means that they show remorse or take responsibility for their criminal behavior. In practice, this discount is routinely provided as a reward for pleading guilty. Some critics also maintain that the federal guidelines are routinely circumvented by court actors in attempts to achieve more just sentencing outcomes. Although the architects of the federal guidelines attempted to create a sentencing system that would account for all relevant contingencies in sentencing, judges retain the power to sentence offenders outside of the recommended guideline ranges; however, they are only allowed to do so when there are extreme sentencing considerations not adequately accounted for by the commission. These are rare because the

U.S. Sentencing Commission mandated that common mitigating factors like employment, mental health, and family consideration are “not ordinarily relevant” at sentencing. Unlike state systems, though, the federal guidelines also provide for departure sentences for “substantial assistance,” which means that an offender can receive a sentence below the guidelines recommendation for providing assistance in the prosecution of another federal criminal case. Research on federal departures shows that their use varies dramatically across federal districts and that the relative definition of what qualifies as “substantial assistance” is far from uniform (Johnson, Ulmer, & Kramer, 2008).

Since their inception in 1987, the federal sentencing guidelines have faced a number of important legal challenges. The guidelines were first criticized on grounds that they violated the “separation of powers” clause in the U.S. Constitution. The U.S. Sentencing Commission is lodged within the judicial branch of government, and critics maintained that because it was a bureaucratic administrative agency with the power to create laws, it was in fact performing legislative duties. In 1989, the Supreme Court ruled that the U.S. Sentencing Commission did not violate the separation of powers clause and that the federal guidelines were legally upheld (*Mistretta v. United States*). However, in a landmark case in 2005, the constitutionality of the federal guidelines was once again challenged, as described below.

One unique feature of the federal sentencing guidelines is that they are based on what is called “real-offense sentencing.” Rather than sentencing offenders based solely on the charges for which they are convicted, under the federal guidelines, offenders can be punished based on additional facts in the case. These elements can involve such things as magnitude of harm, motivation for the crime, and value of lost goods. The goal of real-offense sentencing is to limit the shift of sentencing discretion from the judge to the prosecutor, so that prosecutors could not determine the exact sentence by their choice of final charges of conviction. In particular, the federal guidelines provide for judicial consideration of “relevant conduct,” which means that the sentencing judge is required to factor any additional criminal behavior related to the offense into the final sentencing decision, including behaviors not formally charged or even those acquitted at trial. Importantly, the standard of evidence for determining relevant conduct of the offender is lower than it is for determining guilt at conviction. Offenders must be ruled guilty “beyond a reasonable doubt,” but a judge only needs a “preponderance of the evidence” (i.e., the judge only has to believe that the weight of the evidence supports the behavior) in order to apply relevant conduct enhancements at sentencing. In practice, what this means is that judges can enhance punishments for behaviors that are not subjected to the same standards of proof or the same constitutional right to have a jury decide the outcome. For these reasons, the Supreme Court in 2005 ruled 5 to 4 that the federal sentencing guidelines are in fact unconstitutional (*United States v. Booker*). At the same time, though, the Court determined that the guidelines could remain in effect, as long as they

were converted to “advisory” guidelines rather than presumptive guidelines.

The full impact of this landmark decision on federal sentencing has yet to be realized, but preliminary evidence suggests that federal sentencing has not been dramatically altered, although judges have begun to sentence offenders outside the sentencing guidelines with increasing frequency (Hofer, 2007). The experience of the federal sentencing guidelines is unique, but it highlights some of the potential pitfalls in guidelines implementation. Although the future path of sentencing guidelines in the United States remains unclear, for the most part they have been popularly received in policy arenas and political circles. The extent to which sentencing guidelines and other recent innovations have successfully achieved the goals of increased uniformity and equality in punishment, though, remains the fervent topic of considerable scholarly research.

Research on Criminal Sentencing

The vast majority of social research on criminal sentencing revolves around issues of sentencing disparity, or differences in the criminal punishments given to different types of offenders. Of particular concern is *unwarranted disparity*, or sentencing differentials that result from consideration of factors other than those that are deemed legally relevant at sentencing. Whether or not sentencing disparity is warranted inherently involves a value judgment, but the majority of research in the area focuses on the influences of offender race, gender, class status, and mode of conviction in the sentencing process. It is important to note then that disparity does not necessarily equate with discrimination. Discrimination in sentencing involves sentencing disparities that arise out of the prejudicial use of unwarranted considerations in punishment.

Research on Sentencing Disparity

Since at least the 1930s, criminologists have been enamored with the study of racial and ethnic disparities in sentencing. A voluminous body of research has developed in this area, and although the collective findings remain somewhat equivocal, the weight of the evidence suggests that minority defendants are often disadvantaged at sentencing, at least for some decisions and in some contexts (Spohn, 2000; Zatz, 2000). Racial disparities appear to be greatest for black and Hispanic offenders who are young, male, and unemployed (Spohn & Holleran, 2000; Steffensmeier, Ulmer, & Kramer, 1998). Typically, these offenders are more likely to be sentenced to incarceration and less likely to receive sentences that deviate below the recommended ranges of sentencing guidelines. These disparities have been shown to be particularly pronounced for minorities convicted of drug offenses in the federal justice system (Steffensmeier & Demuth, 2000). They also characterize earlier decisions in the punishment process such as the

determination of bail and pretrial release status (Demuth, 2003). Some evidence indicates that minority offenders are given higher bail amounts, which they are less able to pay, resulting in higher rates of detainment prior to trial. This fact is important because research shows that detainment is associated with greater severity in sentencing.

There is also evidence that the race of the victim influences sentencing, especially in combination with the race of the offender, and particularly for sexual assault and homicide cases. Several studies, for instance, demonstrate important racial disparities in the application of the death penalty, such that black offenders who target white victims are most likely to be sentenced to death (Baldus, Pulaski, & Woodworth, 1983). What this research suggests in sum, then, is that black and Hispanic offenders are often disadvantaged at sentencing, although racial disparity is not systemic. That is, it does not characterize every decision in every court, but rather isolated decisions for some minority offenders who commit particular offenses in certain contexts.

Although relatively less research examines the influence of gender, class, and mode of conviction on sentencing outcomes, conclusions regarding these factors are often less ambiguous. A number of studies investigate gender disparity in punishment and conclude that female offenders are treated with relative leniency at sentencing (Daly, 1995). While there are exceptions, most studies find that females are less likely to be incarcerated and that they are more likely to benefit from sentences that fall below the recommendations of sentencing guidelines. Some work also suggests that when incarcerated, they receive relatively shorter jail and prison terms compared to male offenders. Explanations for gender disparity in sentencing range from practical considerations of the differences in family roles, child rearing, and health care to arguments that male judges are likely to treat female offenders paternalistically or chivalrously. Relatively few studies actually investigate the intervening processes that account for leniency toward female offenders. Because male offenders are disproportionately involved in serious crime, judges may view them as more culpable or as greater risks for future offending.

Much less can be definitively concluded about social class in sentencing because offender socioeconomic status is typically unavailable or poorly measured (Zatz, 2000). This is an important limitation that characterizes the majority of research in this area. Some studies do find evidence that lower-class citizens are sentenced more harshly, but often these results are based on coarse proxies for socioeconomic status such as single indicators of education or employment status. It is also difficult to study these effects because offender samples often have limited variation on social class. Although sparse, this work suggests that class status is particularly likely to affect sentencing in conjunction with other factors such as the age, race, and gender of the offender. Future research is needed, however, before drawing more concrete conclusions regarding class disparities in sentencing.

Research on trial conviction is better developed and routinely finds that offenders who plead guilty receive more lenient sentences than those who exercise their right to trial. Trial conviction significantly increases the probability and length of incarceration, and it reduces the chances that an offender will receive a sentence that departs below the recommended punishment under sentencing guidelines. To some extent, though, this “trial penalty” is offset by the possibility of acquittal at trial. At least some offenders who go to trial are not convicted, so there is a tradeoff between the certainty of conviction that comes with pleading guilty and the reduced punishment that often accompanies it. For offenders who are convicted at trial, their sentences are routinely more severe than for similar offenders convicted through guilty pleas (LaFree, 1985).

Despite these generalizations, not all studies find significant offender disparities in sentencing. One explanation for this is that the subjective meaning and interpretation of offender characteristics may vary across different communities and courtroom social contexts. Although research in this area is still in its formative stages, preliminary evidence suggests that a number of sentencing considerations are conditioned by the larger social context of the sentencing court (Johnson 2005, 2006; Ulmer & Johnson, 2004). Factors such as the size and caseload of the court, the availability of local correctional resources, and the racial and ethnic composition of the community have been shown to influence individual sentencing decisions. Often, these context effects are subtle and indirect, influencing sentencing decisions in combination with specific offender and offense characteristics. Although on the surface, jurisdictional variations in sentencing suggest unwarranted sentencing disparity, it may be that regional variations in caseloads, public values and attitudes toward crime, or other locally determined considerations justify different punishment patterns across courts. Elected judges, for instance, may be sensitive to local punishment standards that are unique to their community environment. It is therefore possible that sentencing judges arrive at different punishments in different communities for valid reasons, although little research currently examines this type of explanation for interjurisdictional variations in sentencing.

The Future of Sentencing Research

Despite an abundance of studies examining unwarranted disparities in sentencing, a number of questions remain unanswered. Very little is known about racial and ethnic groups other than those that are most sizeable, such as Asians and Native Americans, and almost no research examines important differences within racial and ethnic groups. Hispanic ethnicity, for example, encompasses a multitude of nationalities, each with its own unique cultural heritage, but little is known about differences in sentencing among these different groups. Adequate measures of socioeconomic status remain elusive as well. In part, these and similar limitations reflect

the overreliance of sentencing research on official data sources (Wellford, 2007). The majority of modern studies of criminal sentencing have been limited to a handful of states where sentencing commissions collect and disseminate public data. Because these data are often limited in the details they provide, future work is needed that collects more detailed information on the full range of factors that collectively shape sentencing decisions across court contexts. These include information on victim characteristics like offender–victim relationship, offense details like weapon use, and additional offender information like substance abuse and family background histories.

In addition, research is needed that integrates the influence of additional court actors in the sentencing process along with additional decision-making points in the justice system. For instance, very little empirical research focuses on the role of the prosecutor in sentencing, despite qualitative and anecdotal evidence indicating this person’s importance. The analogy is sometimes given that discretion in the criminal justice system is like a balloon—if you squeeze one part of the balloon, it expands in another area. However, despite widespread acknowledgment that modern sentencing reforms “squeeze” judicial sentencing discretion, very little research systematically examines its expansion among other court actors. Studies that do investigate this issue have found only mixed and limited support for it, but these types of investigations are all too rare (Miethe, 1987). To adequately assess the role that unwarranted disparity plays in the punishment process, it is necessary to begin to examine the cumulative effects of race, ethnicity, gender, and other factors from the time an offender is arrested until he or she is rereleased into the community.

A broader approach is also necessary in terms of the larger societal consequences of sentencing decisions. How, for instance, might disparities in sentencing contribute to inequities in other social institutions, such as schooling, housing, or employment? Research on sentencing inequality also demands a larger comparative perspective. The vast majority of research on the topic has been conducted in only a handful of U.S. states. This dramatically limits the ability to generalize research findings, and it also precludes adequate tests of the global applicability of broad theoretical perspectives on sentencing and sentencing disparity.

Conclusion

When examined in historical perspective, the evolution of modern sentencing is in many ways cyclical. Recent years have seen evidence that the “tough on crime” movement in America is beginning to subside, in part because sustained growth in American corrections along the lines of past decades is no longer feasible, and in part because of growing evidence in support of rehabilitative correctional programs. One indelible consequence of modern sentencing reforms has been an unprecedented increase in the incarcerated population in America. Over the past 40 years, American prison

populations have quintupled, reaching new milestones, with more than 2 million offenders confined behind bars, and more than 1% of the total U.S. population incarcerated on any given day. Financially, socially, and morally, this rate of imprisonment cannot continue unabated. The pendulum of punishment is therefore showing signs of swinging away from the law-and-order crime control policies of the 1980s and 1990s, back toward more offender-based rehabilitative and restorative sentencing principles.

A number of jurisdictions have expanded their community punishment options and placed increasing emphasis on intermediate sanctions as alternatives to jail and prison. Although research evidence regarding their cost-effectiveness and crime-deterrent capabilities so far has been less than encouraging, intermediate punishments do provide for greater proportionality in punishment by offering a range of sanctions between probation and prison. A variety of restorative justice programs that emphasize the reparation of harm for the offender, victim, and society in sentencing have also emerged in recent years, as have specialized problem-solving courts that target the specific needs of particular offenders. For instance, specialized drug courts exist in all 50 states now, and although their details vary, they combine the efforts of justice and treatment professionals to provide more intensive treatment, management, and supervision for drug-addicted offenders. Similar specialized courts exist for teen offenders, mentally ill persons, and for family offenses among others.

As the 21st century continues, there will likely be an emerging public policy dilemma between well-established determinate sentencing structures that now exist in many states and the emerging social movement reemphasizing offender-based sentencing options, at least for some defendants and some crimes. If the progress of alternative and restorative sentencing options continues on its current path, the future will likely witness a growing disjuncture between existing determinate sentencing systems and increasingly individualized sentencing movements. It will therefore be the challenge of future generations to effectively balance the goals of equity and uniformity within structured sentencing frameworks with the emerging emphasis on individualized rehabilitative approaches to procedural and restorative justice in the United States. Successful integration of these alternatives will almost certainly require an expanded role for both social research and evidence-based sentencing policy to live up to the challenge of fair and effective sentencing in the 21st century.

PROBLEM-SOLVING COURTS

DAVID H. MARBLE

Collin College

JOHN L. WORRALL

University of Texas at Dallas

Problem-solving courts, also called specialty courts, are a fairly recent, but rapidly growing development in the American criminal court system. *Problem-solving courts* are specialized courts that develop expertise in particular social problems, such as addiction, domestic violence, or family dysfunction, because their caseloads consist primarily of these types of criminal cases (Dorf & Fagan, 2003). The first of them was a drug court created in Dade County, Florida, in 1989 (Jeffries, 2005). Besides drug courts, the most common types of problem-solving courts are domestic violence courts, mental health courts, and community courts (Casey & Rottman, 2005).

While not all problem-solving courts are the same, they share common elements that distinguish them from traditional courts. First, they use judicial authority to address chronic social problems. Second, they go beyond simple adjudication of cases and attempt to change the future behavior of defendants through judicial supervision of therapeutic treatment. Finally, they work collaboratively with other criminal justice agencies, community groups, and social service providers to accomplish particular social outcomes, such as low recidivism, safer family environment, and increased sobriety (Berman & Feinblatt, 2001).

The Problem-Solving Court Movement

History of Development

Most authorities identify the creation of the first drug court in 1989 in Dade County, Florida, as the start of the problem-solving court movement (Jeffries, 2005). However, others argue that the juvenile court, first created in Chicago in 1899, was the first problem-solving court (McCoy, 2003). Progressive reformers who advocated for the creation of a separate juvenile court believed that separate courts were needed to more effectively address the problem of juvenile crime. Parallels can be drawn between modern problem-solving courts and the juvenile court in that both shifted the focus away from just punishment to attempting to address the individual needs of the offender and that both relied on the services and expertise of social service agencies (Berman & Feinblatt, 2005).

Berman and Feinblatt (2005) have argued, instead, that problem-solving courts came about in a spontaneous manner, without any type of centralized planning or leadership. While they agree that problem-solving courts borrowed from the juvenile court, other disciplines and movements were tapped as well, including alternative dispute resolution,

the victims' movement, therapeutic jurisprudence, and the problem-solving and "broken windows" reforms in policing (Berman & Feinblatt, 2005).

Problem-solving courts have drawn from both the successes and the weaknesses of alternative dispute resolution programs. Interest in mediation and other alternative dispute resolution programs stemmed from a desire to remove low-level crimes and disputes from an overworked court system. Advocates also championed the informal aspects of mediation that generally led to an agreement favored by both parties. One weakness of mediation is that participation is usually voluntary and parties that are not satisfied with an outcome can continue the fight in a different forum. Thus, a key difference between problem-solving courts and mediation or other alternative dispute resolution programs is the reliance on formal court operations and systems to determine outcomes (Berman & Feinblatt, 2005).

Problem-solving justice has incorporated many of the successes and values of both the victims' rights movement and therapeutic justice. Domestic violence courts in particular focus on the needs of crime victims and involve victim advocacy organizations in decision making. The belief that particular communities can also be "victims" of criminal behavior was a major reason for the creation of community courts. Community courts ask for and receive much input from communities regarding the impact of public order crimes. While not a perfect example of therapeutic jurisprudence, problem-solving courts use the law and courts to address the physical and psychological needs of offenders through court-mandated and -monitored treatment (Berman & Feinblatt, 2005).

Other powerful influences over the creation of problem-solving courts were two recent reforms in policing, namely broken windows and problem-solving policing. *Broken windows* was a term introduced by J. Q. Wilson and Kelling in an article published in 1982 in *Atlantic Monthly*. Wilson and Kelling advocated changing the focus of policing from strict law enforcement to more order maintenance. They argued that overall crime levels could be decreased by concentrating on reducing low-level crimes such as vandalism and public intoxication.

Problem-solving policing was introduced by Goldstein in a 1979 article in *Crime & Delinquency*. Goldstein argued for a more deliberate inquiry into the underlying causes of and solutions to crime using resources within the community. Problem-solving courts also utilize community resources to identify and attempt to solve the underlying causes of crime. Community courts, in particular, also focus on combating low-level public order crimes with mostly community service sentences. Another link between problem-solving courts and recent reforms in policing is the focus on achieving real outcomes rather than simply case processing (Berman & Feinblatt, 2005).

A major impetus for the problem-solving court movement is dissatisfaction with the traditional criminal court.

This is particularly true with regards to the handling of low-level criminal offenders. While the public and the media focus more on the sensationalism of violent crimes, the criminal courts are bogged down with mostly misdemeanor crimes that rarely capture the attention of either the public or the media. Judges have expressed concern over the limited options available for the low-level drug user or public order offender (Berman & Feinblatt, 2005). Communities and victims are weary and frustrated over the apparent "revolving door" of justice through which minor criminal offenders are arrested, tried, sentenced to a few days or weeks in jail, and returned to the community to offend again.

Objectives of Problem-Solving Courts

A main objective of problem-solving courts is to go beyond mere case processing by attempting to address the needs of offenders, victims, and the community. The frustration with the state of misdemeanor justice in the traditional criminal courts and a desire to change the actions of criminals, improve the safety of victims, and enhance the quality of life in residential communities are the main forces behind problem-solving courts (Berman & Feinblatt, 2005).

Problem-solving courts attempt to change criminal behavior through court-ordered and -monitored treatment and more accountability in sentencing. Drug courts require substance abuse treatment as a condition of participation in the court. While drug treatment has long been used in sentencing by traditional criminal courts, the increased involvement by the judge in monitoring progress and compliance is a key component of drug treatment courts.

Community courts primarily deal with low-level public order offenders who have traditionally been sentenced to jail time or fines that seem to hold no deterrent effect. Judges in community courts are more likely now to sentence prostitutes, panhandlers, vandals, and other public order offenders to immediate sentences of visible community service (Berman & Feinblatt, 2005). In addition to these community service sentences, substance abuse treatment, employment counseling, housing assistance, and other services are typically available to assist the offender in overcoming some of the underlying causes of crime.

Addressing the needs of the victim is another objective of some problem-solving courts. This is particularly true with domestic violence courts. Ensuring the safety of victims of domestic violence is paramount in these courts. Judges presiding in domestic violence courts regularly issue restraining orders preventing offenders from having contact with their victims. Victims typically are brought to the court to make contact with victim services personnel so that they can receive other services such as counseling and safe shelter. In fact, some would argue that because domestic violence courts place the safety needs of the victim over the treatment needs of the offender, these courts are different from most

other problem-solving courts and probably should not be identified with them (Casey & Rottman, 2005).

Enhancing the quality of life in residential communities is a major objective of many problem-solving courts, in particular community courts. Considering that the community is the “victim” of many public order crimes, community courts draw from the resources in the community to identify and then address ways in which communities suffer from these crimes. Residents are surveyed to identify levels of fear and concern over community crime. With this information, community leaders including court personnel, law enforcement, and business owners can work with residents to combat crime and address other concerns. Much of the work to improve the appearance of the community is done either by volunteers or by offenders sentenced to community service (Berman & Fox, 2005).

Why Problem-Solving Courts Are Important

Problem-solving courts are important because they attempt to address the deficiencies of the traditional criminal courts. The traditional criminal court may do a good job handling more serious violent offenders where incarceration is the expected and usual outcome. However, the effective handling of minor offenders requires something more than short periods of incarceration. Other defendants, such as drug users and mentally ill offenders, would seem to benefit more in the long run from mandated treatment rather than punishment alone. The deficiencies of the traditional court in handling the specific needs of victims and particular communities give reason to expect more from the judicial system that some problem-solving courts are better suited to provide. Ultimately, the measured effectiveness of problem-solving courts to adequately address these needs will determine how important they are.

Problem-Solving Courts Compared With Traditional Courts

Collaboration

Judges and attorneys working in problem-solving courts invite in and are more likely to work with those not traditionally connected with the courtroom work group. Problem-solving judges and attorneys collaborate with social service workers such as treatment providers, victim advocates, or employment services personnel (Wolf, 2007). Officials in drug courts depend on drug treatment providers to provide treatment to their offenders as well as information on the progress of these participants. Court officials in domestic violence courts work closely with victim services providers as well as treatment providers, as they not only try to treat offenders, but also protect victims and provide them other needed services. Similarly, judges and attorneys in mental health courts work closely with service providers to ensure

mentally ill offenders receive the treatment they need. Officials in community courts likely share building space with a variety of service providers that assist offenders as well as community members in areas such as employment assistance, medical care, child care, counseling, and education (Berman & Fox, 2005).

Judges in traditional criminal courts usually turn over custody and supervision of offenders to community supervision or probation departments. These judges typically do not monitor supervision of sentenced offenders unless they are brought back to court for revocation proceedings. Judges in problem-solving courts more closely monitor the progress of offenders and thus have more contact and communication with other criminal justice officials such as probation or parole officers (Wolf, 2007).

Individualized Justice

Another key characteristic of problem-solving courts is the individualized or tailored approach to justice. Offenders are sent to these courts that have specialized caseloads based on the offense the person is charged with. Drug offenders make up the caseloads of drug courts. One of the main purposes for this specialization is to better ensure that offenders receive the treatment that will help them prevent future offending (Berman & Feinblatt, 2005). Another key purpose of this court specialization is to allow for more judicial monitoring of individual cases (Wolf, 2007).

Accountability

More complete judicial monitoring is a key component of problem-solving courts. Where judges in more traditional criminal courts can hand off cases to other criminal justice officials, problem-solving judges retain jurisdiction and monitor offender compliance throughout treatment, community service sentences, or other sanctions (Wolf, 2007). Judges not only monitor offender compliance through reports sent in by supervision or treatment officers, but they also can have one-on-one contact with offenders through additional court appearances (Berman & Feinblatt, 2005). Offenders who violate supervision or treatment orders are quickly brought back before the judge. Judges then have the opportunity to sternly lecture, counsel, or impose additional sanctions on the offender. Judges are then in a better position to ensure that sanctions are carried out or that offenders are following through with court-ordered treatment (Wolf, 2007).

Better Information

A key difference between problem-solving courts and traditional criminal courts is that problem-solving courts typically have access to more information so that decision makers can make more informed decisions. Problem-solving judges typically have more complete background

information on defendants, victims, and communities impacted by crime (Wolf, 2007). Judges as well as attorneys involved in problem-solving courts try to gain greater access to psychosocial information about defendants who are appearing in court (Berman & Feinblatt, 2005). Problem-solving judges also have more information about offender progress as they monitor defendants' compliance with treatment orders. Furthermore, because of the specialized caseloads characteristic of problem-solving courts, judges, attorneys, and other professionals working in these courts gain valuable expertise and receive specialized training in specific types of offending (Wolf, 2007).

Focus on Outcomes

Problem-solving courts have required more in the way of gathering data and conducting research to assess effectiveness. Not content with simply processing cases, problem-solving courts identify specific outcomes that are desired and then conduct research to test whether those outcomes are achieved (Wolf, 2007). Reduced recidivism is an important outcome that is measured in evaluations of problem-solving courts. Other outcomes measured include impact on victims and communities (Berman & Feinblatt, 2005) and cost-benefit analyses (Wolf, 2007).

More Community Involvement

One type of problem-solving court, the community court (described further below), is particularly focused on improving community engagement. For more than symbolic reasons, community courts are located in residential urban communities rather than in downtown, commercial districts. The goal is to bring the court closer to the community it serves. Besides physical closeness, the community court also attempts to bring itself closer to the community through increased communication and collaboration with community leaders and members (Wolf, 2007). Residents can serve on advisory boards that make suggestions to court officials for new programming ideas or to inform them of community concerns or conditions. Community members also serve as volunteers in various programs or services and provide a valuable service in offering feedback in evaluations (Berman & Fox, 2005).

Types of Problem-Solving Courts

Drug Courts

Drug courts are specialized courts designed to handle mostly adult felony drug cases of nonviolent offenders who have substance abuse problems. The first drug courts were not as concerned about treatment as they were about improving the efficiency and speed of processing drug

cases. These early courts were also more likely to handle less serious offenders and tended to be more like diversionary programs. Over the last decade, these courts evolved more into drug *treatment* courts that processed felony drug offenders and worked collaboratively with other agencies and treatment providers to ensure successful offender completion of drug treatment (Olson, Lurigio, & Albertson, 2001).

Specialized drug courts evolved from traditional courts that were unable to adjudicate and process drug offenders effectively. Traditional criminal courts failed to reduce drug offending. Traditional probation departments failed to identify and address the needs of supervised drug offenders. Drug treatment providers failed to effectively treat offenders under the traditional court referral processes (Goldkamp, 2000). Traditional sentencing practices led to the incarceration of hundreds of thousands of drug offenders on a yearly basis by 1998 (Hora, 2002).

Drug courts increased during the 1990s because of financial and political support from the federal government. Janet Reno, the U.S. Attorney General for most of the 1990s, was a key player in the formation of the first drug court in Miami in 1989. She and General Barry McCaffrey, former Director of the Office of National Drug Control Policy, supported specialized drug courts. Financial support from the Violent Crime Control and Law Enforcement Act of 1994 provided over \$50 million to expand drug courts around the nation (Olson et al., 2001).

Domestic Violence Courts

Domestic violence courts are similar to other problem-solving courts in that they have specialized dockets and trained judges, and they engage in collaboration between court officials and other agencies and organizations in the community. However, some people hesitate to classify domestic violence courts as problem-solving courts because there are some key differences between the two. Domestic violence courts generally consider the needs of the victim as more important than the needs of the offender. In contrast to other problem-solving courts, domestic violence courts do not express optimism for the ability to treat successfully domestic violence offenders. Domestic violence courts consider victim safety and offender accountability as more important than offender treatment (Berman, Rempel, & Wolf, 2007). Interestingly, participants in domestic violence courts typically take part in classes for substance abuse, parenting, and mental health counseling. However, these are not viewed as treatment classes; rather, they serve as a monitoring tool for the court (Gavin & Puffett, 2007).

The first recognized domestic violence court was created in Dade County, Florida, in 1992 (Casey & Rottman, 2005). Other jurisdictions over time created dedicated domestic violence courts. While no precise number is given here of how many domestic violence courts exist in

the United States, it is estimated that there are “many hundreds” (Gavin & Puffett, 2007).

An example of a domestic violence court is the one that was created in Salt Lake City, Utah, in February 1997. Court officials, along with police detectives, victims’ advocates, and domestic violence and battered women’s shelter counselors, worked in a collaborative effort to handle the 5,000 to 6,000 yearly domestic violence misdemeanor cases in Salt Lake County (Mirchandani, 2005).

Mental Health Courts

Mental health courts share characteristics of other problem-solving courts. The first such court appears to have originated in 1997 in Broward County, Florida (Boothroyd, Poythress, McGaha, & Petrila, 2003). These courts consist of specialized dockets of mentally ill offenders (Lushkin, 2001) where a team of court personnel and clinical specialists work collaboratively to address the problems of mostly nonviolent mentally ill offenders through court-ordered and -monitored treatment (Trupin & Richards, 2003).

While most mental health courts accept misdemeanor offenders only, the Brooklyn Mental Health Court, which opened in March 2002, also accepts felony offenders. Originally, this court limited participation to nonviolent felons, but later decided to accept violent felony offenders on a case-by-case basis. The Brooklyn Mental Health Court also limits participation to defendants who suffer from persistent and serious mental illness for which there is a known treatment. Participants in this court must agree to treatment mandates of 12 to 24 months depending upon prior criminal record and seriousness of offense (O’Keefe, 2007).

Community Courts

As mentioned above, community courts involve a collaborative effort among court officials, community leaders, and social service providers to combat social problems in a community (Casey & Rottman, 2005). However, rather than focus on one particular crime, community courts deal with a number of mostly misdemeanor public order offenses, such as prostitution, vandalism, minor assault, and criminal trespass (Malkin, 2005). Another defining characteristic is that many community courts tend to be located in residential urban communities rather than the commercial or downtown area of a city (Berman & Fox, 2005).

The first community court was the Midtown Community Court created in Manhattan, New York, in 1993. It handled minor public order offenses or “quality-of-life” crimes such as prostitution, shoplifting, drug possession, and vandalism. The main purpose of this court was to not only punish but also help the offender. Offenders were punished through visible community service or restitution sentences. They received

help through on-site social services such as drug treatment, job training, and counseling (Kralstein, 2007).

Other Specialty Courts

While drug, domestic violence, mental health, and community courts are the most recognized problem-solving courts, others involving specialized caseloads have been created in the United States and around the world. San Diego created a homeless court in 1989 (Davis, 2003). Some states operate teen or youth courts where juveniles act as the various court officials in cases involving other teens who have committed minor offenses (Acker, Hendrix, Hogan, & Kordzek, 2001). New York City created a gun court to deal with felony gun possession cases. Using a single judge and specially trained prosecutors, city officials hope that the gun court will “provide swift and certain justice to offenders who violate gun laws” (Berman & Feinblatt, 2005, p. 130). South Africa, reported to have the highest incidence of sexual assault in the world, created a sex offender court in 1993 (Walker & Louw, 2003).

Parole reentry courts are another emerging problem-solving court. A number of states have created them with the intent of addressing the problems of parolees returning to the community (Maruna & LeBel, 2003). The Harlem Parole Reentry Court was started in June 2001. This court supervises the returning parolees in Harlem, in New York City, who have served prison sentences for nonviolent drug felonies. This reentry court shares similar characteristics with other problem-solving courts. An administrative law judge monitors parolee compliance with parole conditions. The court implements a system of sanctions or rewards for violations or compliance. Court personnel work collaboratively with parole authorities and treatment or community service providers. These community and treatment providers assist in areas of substance abuse treatment, job training, employment, housing assistance, and family counseling (Farole, 2007).

Research on Problem-Solving Courts

Drug Court Evaluations

Evaluations done on drug courts have focused on both processes and outcomes. A number of process evaluations examined the characteristics of drug court programs. Goldkamp, White, and Robinson (2001b) identified two main ways defendants entered drug court programs. Participants in some programs entered the drug court after they were arrested but before they were officially charged. If they successfully completed the program, charges were not filed and some were able to get their arrests expunged. Other programs allowed defendants to enter the drug court program only after pleading guilty to criminal charges, and they worked through the program as convicted participants. Their successful completion yielded reduced sentences.

Another process evaluation by Belenko and Dembo (2003) examined juvenile drug courts and found that they were organized in the same manner as adult drug courts. They found that critical elements of juvenile drug courts included dedicated courtrooms, judicial supervision of treatment, judicial monitoring of participant progress and compliance, collaboration between court officers and community treatment providers, and sentence reduction or case dismissal for successful completion.

Outcome evaluations done on drug courts during the 1990s showed positive results. Most drug courts reported lower recidivism among drug court participants. However, these early evaluations were criticized for failing to use control or comparison groups (Berman et al., 2007). In a review of successful crime prevention policies operating before the year 2000, MacKenzie (2006) identified drug courts as a promising crime prevention policy, but also noted the need for more positive evaluations using more robust methodologies and statistical controls.

Evaluations of drug treatment courts since 2000 have been mostly positive. Goldkamp, White, and Robinson conducted evaluations of drug courts in Portland, Oregon, and Las Vegas, Nevada. Their first study (2001a) focused on outcomes and concluded that, in general, graduates of drug courts had substantially lower rearrest rates than non-graduates for up to 2 years after entering the program. However, when they used various statistical controls, they found that the positive results for graduates were not consistent from year to year and were impacted by outside factors such as changes in political leadership.

Roman and Harrell (2001) conducted a cost-benefit analysis of a Washington, D.C., drug court program. They found a statistically significant reduction in crimes committed by drug court participants compared to nonparticipants. They found that every dollar spent on drug court programs yielded 2 dollars in crime reduction savings.

A 2003 evaluation of six New York drug courts reported significant reductions in recidivism compared to control groups. This study tracked the arrest rates of the drug court participants and the control group members for 3 years. A randomized study of the Baltimore City Treatment Court also showed significant reductions in recidivism over a period of 3 years (Berman et al., 2007).

Galloway and Drapela (2006) conducted an evaluation of a drug court in a small nonmetropolitan county in northwest Washington. They found that graduates of the drug court, when matched with a comparison group of probationers, were less likely to be rearrested. The differences in the arrest rates between the two groups were statistically significant.

O'Keefe and Rempel (2007) conducted an evaluation of the Staten Island Treatment Court in New York. They used a one-to-one matching method of drug court participants with a comparison group of defendants who did not participate in the drug court. While selection for participation was not randomized, participants were closely matched with nonparticipants according to various demographic

and crime-related factors. O'Keefe and Rempel reported a 46% reduction in recidivism over 1 year for drug court participants compared to the comparison group. The 18-month rearrest rate for the participants was 25% less. The 18-month reconviction rate for the drug court participants was 44% less than that of the nonparticipants.

Recent review or meta-analysis studies have also shown reduced recidivism for drug court graduates. Belenko (2001) conducted a review of 37 published and unpublished evaluations of drug courts between 1999 and April 2001. Most of the studies reported lower recidivism for drug court participants. Three of the studies used random assignment between participation in the drug court and control groups and they all reported lower recidivism for drug court participants. D. Wilson, Mitchell, and MacKenzie (2002) conducted a review of 42 drug court evaluations and found that 37 reported lower recidivism rates for drug court participants compared to nonparticipating defendants in control groups.

A general consensus now exists that drug courts are an effective crime prevention policy. Berman et al. (2007) stated that drug courts "generally produce significant reductions in recidivism" (p. 20). Cissner and Rempel (2007) concluded that "adult drug courts significantly reduce recidivism, although the level of impact varies over time and by court" (p. 31).

Domestic Violence Court Evaluations

There have not been many rigorous evaluations of domestic violence courts. The evaluations that have been done demonstrate encouraging results for victims and mixed results for defendants. Victims of domestic violence are more likely to receive advocacy assistance and other services from domestic violence courts. Victims have expressed more satisfaction with domestic violence courts than with traditional criminal courts. Some studies of domestic violence courts found significant reductions in case dismissal rates, increases in the percentage of defendants ordered to participate in batterer programs, and increases in jail sentences for domestic violence offenders. There have been differing results on recidivism of offenders. Some studies found lower recidivism rates, while other studies found no reduction in recidivism (Gavin & Puffett, 2007).

Mirchandani (2006) conducted an extensive review of the Salt Lake City domestic violence court and identified three procedural innovations that helped encourage offender responsibility. The first innovation was a common plea agreement where defendants received suspended sentences in exchange for agreeing to a court order to complete 26 weekly sessions of counseling. The second innovation was a three-stage review system by the court that required offenders to provide proof of their compliance and progress in counseling. Offenders were required to provide evidence of their having made contact with the counseling agency within 10 days. Furthermore, they had to provide a 30-day progress report and a 6-month completion report to the court. The third innovation used by the Salt Lake domestic

violence court required that the same court personnel handle all domestic violence cases. Over time, these officials developed expertise and familiarity with all other stakeholders involved in trying to combat domestic violence in Salt Lake City.

Gover, Brank, and McDonald (2007) evaluated a domestic violence court in South Carolina. They found that compared with defendants processed in traditional courts, defendants processed in a domestic violence court were significantly less likely to be rearrested for domestic violence. Gover et al. conducted 50 victim and 50 defendant interviews of participants in the domestic violence court. Both groups expressed satisfaction with their experiences in the court and were generally satisfied with the outcomes of their cases.

Labriola, Rempel, and Davis (2007) conducted a randomized trial study of the different approaches used in domestic violence courts. Participant offenders were randomly assigned to different groups with some receiving batterer treatment, others receiving high levels of judicial monitoring, and others with less judicial monitoring. These various treatment groups were then matched with a comparison group of offenders who received neither batterer treatment nor judicial monitoring. The groups were tracked for 1 year after sentencing. Labriola et al. found no reduction in rearrests for those in batterer programs as well as no difference in recidivism based on the levels of judicial monitoring.

Cissner (2007) completed an evaluation of a teen domestic violence court in Brooklyn, New York. This court adjudicated domestic violence offenders who were between the ages of 16 and 19. The evaluation contained no measures of recidivism and primarily documented the challenges of implementing a teen domestic violence court. These challenges included having trouble identifying and flagging eligible cases to be referred to the teen domestic violence court, gaining full cooperation and maintaining communication with all court actors and team members, having uniform agreement on a set of clear goals and objectives, and establishing contact with teenage victims.

Mental Health Court Evaluations

Because these courts are relatively new, there have been few evaluations completed (Casey & Rottman, 2005). The evaluations available have mostly focused on characteristics of offenders (Steadman, Redlich, Griffin, Petrila, & Monahan, 2005). One such evaluation of the Brooklyn Mental Health Court showed that the participants were mostly male, African American, single, and had poor work histories and education. A majority of them had previously been hospitalized for psychiatric purposes at least once in their lives. At some point in the year prior to their arrests, 15% of them had been homeless. Most of the participants had been diagnosed with bipolar disorder, schizophrenia, or major depression. Almost half of them were diagnosed with co-occurring mental illness and substance abuse disorders

(O'Keefe, 2007). When asked in their 1-year interview, participants of the Brooklyn study indicated high levels of satisfaction with various aspects of their treatment. Outcome measures, done without a comparison group, showed mostly positive impacts of the court on measures of psychosocial functioning, homelessness, substance abuse, hospitalizations, service utilization, and recidivism (O'Keefe, 2007).

Community Court Evaluations

A few evaluations have been done of community courts. Kralstein (2007) conducted a review of seven evaluations done of four different community courts. The four courts were the Midtown Community Court in Manhattan, New York; the Red Hook Community Justice Center in Brooklyn, New York; the Hennepin County Community Court in Minneapolis, Minnesota; and the Hartford Community Court in Hartford, Connecticut. Kralstein reported that the evaluations consisted of surveys of community residents, offender interviews or focus groups, and larger-scale quantitative analysis using administrative court data.

Evaluations of both the Midtown and Hennepin courts showed that offenders were held more accountable in the community court compared to traditional courts. Offenders in the Midtown court were much more likely to receive community service or treatment sentences as compared to the more likely "time-served sentence" in the traditional Manhattan centralized court. The compliance rate for offenders was 75% in the Midtown court, which was 50% higher than the Manhattan court. Community surveys in Minneapolis showed that residents gave high marks for offender compliance with community service sentences from the Hennepin court. Community perceptions were high for both the Midtown and Hennepin courts in that majorities of citizens expressed willingness to pay more taxes to support their community courts. A high majority of residents in the Red Hook community reported positive views of their community court. Offender perceptions were mostly positive in studies done for the Midtown, Red Hook, and Hartford courts. Evaluations of the Midtown court found that prostitution arrests decreased 56% when processed through the community court. Midtown also reported a 24% reduction of illegal vending arrests and reduced arrests for offenders who had completed at least 90 days of court-mandated drug treatment.

Evaluations of Other Problem-Solving Courts

Many of the emerging problem-solving courts have not been around long enough for many evaluations to be completed. One exception is the evaluation of the Harlem Parole Reentry Court (Farole, 2007). Farole found that the use of caseworkers in the reentry court improved communication between parole and treatment or service providers. Parolees participating in the Harlem reentry court tended to have greater access to various services to assist them in their transition. The reentry court parolees were matched

with a comparison group of similar parolees who were not supervised by a reentry court. Regarding recidivism outcome measures, there was only one statistically significant difference between the two groups: The reentry court parolees had a reduced conviction rate on new nondrug offenses. However, there was no statistically significant difference between the two groups on new drug convictions or reincarceration rates.

Future Directions

The types and number of problem-solving courts will continue to increase. Officials are concerned with backlogs of court cases in the traditional criminal courts. This concern, combined with the generally accepted view that problem-solving courts are successful, will fuel the growth of problem-solving courts. Although relatively new in their appearance on the scene, problem-solving courts are now located in all 50 states (Berman & Feinblatt, 2005). The types of problem-solving courts will also continue to increase. If specialized courts can be created for drug, domestic violence, and mentally ill offenders, then they can also be created for the many other types of offenders. Victims' rights organizations, like MADD (Mothers Against Drunk Driving), are sure to call for the creation of specialized DWI or DUI courts. If society believes that specialized sex offender courts will be successful at improving public safety and increasing offender accountability, they will surely come to be created and operating in most states.

Continuing good research on problem-solving courts is needed. Drug courts have been around the longest and are the most numerous of the problem-solving courts. They are also the courts that have been researched the most. Evaluations conducted in the first decade of their existence rarely used control conditions. However, more recent evaluation research has included comparison or control groups. Because of this better research, a general consensus has formed that drug courts are successful crime prevention tools. This focus on good research needs to expand to the other established and emerging problem-solving courts. Domestic violence, mental health, and community courts need to be subject to repeated evaluations using rigorous methodologies, testing whether their objectives are being met. Decisions as to the continuation of these problem-solving courts should be primarily based on the effectiveness of these courts in actually accomplishing what they were intended to.

Conclusion

The last 20 years have seen the creation and proliferation of problem-solving courts. These courts are different from the traditional criminal court in that they have specialized dockets, create a collaborative relationship between traditional court actors and outside organizations, and attempt to solve social problems rather than focus only on adjudicating cases.

Evaluations of these courts are mostly positive, showing reduced recidivism among some types of offenders. Continued research is needed to justify the existence and growth of problem-solving courts.

VICTIM SERVICES

CATHERINE ELIZABETH KAUKINEN

University of Colorado at Colorado Springs

Violent victimization is often a traumatizing and life-changing event. Research has clearly identified a number of consequential social, behavioral, physical, and mental health outcomes associated with the trauma of violent crime and fear of revictimization. Researchers have also pointed out that violent crime victims are likely to suffer from depression, posttraumatic stress disorder, anxiety, negative self-perceptions, and other internalizing problems. Physical and sexual abuse in childhood, in particular, heightens the risk of suicidal thoughts and attempts, and increases the risk for a variety of antisocial behaviors, substance abuse, aggression, and violent offending in adulthood that may later impact adult well-being. It is therefore clear that the impact of violent crime, for the victims of crime, is a tremendous individual as well as social burden. An additional indicator of the injurious consequences of violence is the use of medical, gynecological, mental health, and social services by violent crime victims. Miller, Cohen, and Wiersema (1996) have estimated the cost of interpersonal crime to be \$105 billion annually in medical costs, lost earnings, and public programs dedicated to victim assistance.

While Miller et al. (1996) note the importance of these tangible economic losses, they point out that they do not address the full consequences of violent crime. They suggest that when pain and suffering and lost quality of life are taken into account, the “real cost of crime to victims” is an estimated \$450 billion annually. An analysis of mental health providers suggests that violent crime victims account

for approximately 25% of all psychologists’ client bases and upwards of 40% of all treatment hours (see Cohen & Miller, 1998). They also estimate the cost of providing psychological and mental health treatment to violent crime victims to be over \$9 billion. Appealing to various community sources of support after experiencing a violent victimization is suggested to be an important avenue for victims recovering from their trauma and dealing with the short- and long-term impact of violence. The utilization and receipt of network and community support, in the form of medical and emergency care, mental health services, counseling, and advocacy, may therefore assist in alleviating the negative effects of violent victimization, serving as a social safety net upon which victims may rely. Social and community support may also be considered an asset for victims dealing with the aftermath of violent crime to the extent that it promotes the preservation or recovery of valued resources. It is therefore evident that the directing of financial and personnel resources to the victim component of the crime problem and the provision of social and mental health services will assist victims in dealing with the short- and long-term consequences of crime and violence. The services currently available to victims address a number of tangible impacts of violent crime including victims’ rights within the criminal justice and medical systems; the physical and mental health outcomes; financial and legal costs; and the continued day-to-day impact some types of violence have on victims such as those who have experienced sexual assault, child abuse, and intimate partner violence.

A social and academic interest in the lives of violent crime victims reflects the changing role and importance of victims in the public imagination, public policy, lawmaking, criminal justice, and social service provision in recent decades. Prior to the 1960s, both the criminal justice system and the human and social service system largely ignored the plight of victims, instead focusing on the causes and nature of crime and the rehabilitation or punishment of offenders (see Wallace, 1998). The victims of crime have therefore gone largely unrecognized in public discourse and within the criminal justice system (see Elias, 1992). More importantly, until the last several decades, the impact of criminal victimization had not been a focus of public concern. Instead, the victims' role in crime was largely filtered through their role as witnesses within the criminal justice system. Beginning in the late 1960s and taking hold in the 1970s, academic research, the medical community, and law enforcement's concern and actions taken for victims of crime began to expand. The research, activism, and legislation helped to identify and highlight the toll of violent crime in terms of the social, physical, mental health, and financial consequences of victimization. This public concern owes much of its impetus to the actions and advocacy of grassroots organizations that organized and mobilized to offer victims the tangible assistance and support they needed in the way of shelters, crisis care, advocacy, and representation within the criminal justice system.

Services for and Rights of Violent Crime Victims

The creation and growth of the victims' rights movement, reflecting an expansion of the feminist and civil rights movements, led to the provision of services to victims and an extension of their rights within law and criminal justice (see Office for Victims of Crime, 2004). Changes within the criminal justice system and the wider collective experience of crime, which include a heightened fear of stranger crime, changes in the day-to-day activities of households, increasing evidence of public disorder, and increased media interest and dramatization of crime, have led to dramatic changes in the way victims of crime are responded to. These changes reflect and reinforce widespread concern about victims and public safety, the ineffectiveness of the criminal justice system, and the politicizing of crime issues and crime victims. The evolution and implementation of services for violent crime victims may therefore be viewed as reflecting the history of the victims' rights movement (see Office for Victims of Crime, 2004).

The victims' rights movement has shaped the definition of victimization and the types of crime events that warrant concern for those victims affected by crime and violence. An examination of victim services through the lens of the victims' rights movement over the last four decades provides a systematic view of how victims have evolved in the

public imagination and how victim services have developed and evolved. The evolution of social, mental health, and legal services, and the advocacy for victims over the last 40 years, may be seen as moving from financial compensation programs, to social service initiatives, to the development of federal legislation for the victims of violent crime that works to ensure stability of funding for services for victims and their rights within the criminal justice system.

1960s: Medical Definitions of Victimization and Law Enforcement Involvement

Some of the first concerns for the victims of crime focused on child victims. One of the earliest definitions of child abuse was suggested by physician C. Henry Kempe. In his benchmark paper, "Battered Child Syndrome" (Kempe, Silverman, Steele, Droegemuller, & Silver, 1962/1984), he defined child abuse as a clinical condition with medical injuries that resulted from a physical assault. As early as the 1960s, pediatric radiologists began exposing the injuries experienced by infants and children and subsequently reported these victimizations to law enforcement officials. After involvement by the medical community, laws were passed in 1962 prohibiting parents from abusing their children. During this same time, mandatory child maltreatment reporting laws were passed by every state. Today, every state has mandatory child maltreatment laws and in some states—North Carolina, for example—this extends to all citizens who have knowledge of abuse.

After the early 1960s, there was a dramatic increase in the demand for child protective services. Some of the services provided by these agencies included assistance for children and families, foster care placement for abused children, support for youth making the transition to adulthood while living in foster care, and placement of children in adoptive homes. Today, there are close to 3 million referrals made yearly to state-level protective service agencies, involving more than 4.5 million children. In dealing with the impact of child abuse, more than 350 communities have established children's advocacy center programs. These centers permit law enforcement officers, prosecutors, child protection workers, victim advocates, and therapists to interview children in a single, child-friendly location rather than in several intimidating environments. Child advocacy programs also provide holistic multidisciplinary case management to children during various stages of therapeutic treatment and criminal justice intervention.

1970s: Grassroots Advocacy and Victim Compensation Programs

The earliest assistance and services for the victims of violent crime came in the form of victim compensation programs. The first program of its kind was established in California in 1965 through that state's Victims of Violent Crime Act. This act provided for "reimbursement to persons who, as a result of a violent crime, have suffered a

monetary loss due to a physical or emotional injury not covered by another source” (California Attorney General’s Office, 1998, p. 21). In addition, the act allowed for the reimbursement of medical and hospital bills, loss of income, loss of support, funeral and burial expenses, rehabilitation or retraining costs, counseling and therapy, and attorney fees. It also required that members of law enforcement inform victims about the availability of state compensation funds and the location of the local victim/witness assistance center where they could file for a reimbursement. In outlining the need for such a service and provision to victims, California State Senator Eugene McAteer made a convincing case to then Governor Edmund G. Brown by stating the following:

The State of California spends millions of dollars for the maintenance of prisoners in penal institutions and the furnishing of dental and medical care, while the victimized persons and their families must bear any medical or dental expenses on their own and may suffer additional economic hardship from temporary or even permanent loss of employment. (McGagin, 2005, p. 2)

Similar victim compensation programs were subsequently adopted in New York and Massachusetts during the late 1960s. These programs were developed in recognition of the tremendous financial burden placed on the victims of violent crime. They included financial reimbursement for victims in which compensation administrators often became advocates for victims of violent crime. Today, every state has a victim compensation program, but California continues to be a leader in victim compensation, providing the largest outlays of awards.

It is important to note that to benefit from such programs, victims are required to make contact with the criminal justice system and report their victimization to the police. Given that the majority of victims, particularly victims of sexual violence and domestic assaults, do not report their victimization to the police, the receipt of compensation is often limited to a narrower group of violent crime victims. In addition, while many victims would benefit from these programs, they were not met without resistance given the potential cost of such programs. Today, the majority of the money for these programs comes from offenders via fees and fines charged against those convicted of crime, as opposed to public tax dollars.

The 1970s may be largely characterized as reflecting the hard work and dedication of grassroots organizers. Both rape survivors and battered women commonly founded programs, crisis centers, and shelters for victims; worked to organize coalitions; and provided opportunities for the growth of activism. The advocacy taken on the part of victims included the development of the first battered women’s shelter for female domestic violence victims, established in 1974. The network of shelters then spread across the United States. Today, there are over 2,000 shelters and direct services offered to women leaving violent and abusive intimate relationships.

Shelters most often offer temporary and transitional living programs for women and their children who have experienced family and intimate partner violence. Agencies may also offer women and their children an apartment for an extended period of time during which they receive counseling and assistance. Shelters often have programs designed specifically for children who have witnessed violence and abuse. This may include group and individual counseling, education and play-therapy services, along with case management services. It is important to note that roughly half of the residents in domestic violence shelters are children. Domestic violence agencies may also offer programming for batterers in the form of workshops and group therapy for both men and women. Some agencies offer outpatient services including support groups, vocational counseling and job training, outreach to high schools and the community, court advocacy, and mental health services or referrals. Finally, many agencies have funding for women dealing with the economic reality of leaving a violent relationship, including locating temporary shelter, if none other is available, and putting women and their children up at a hotel for a few days. While the operation of shelters initially was focused on (and continues to focus on) assisting women in leaving abusive relationships, it soon became part of the battered women’s movement, working to reduce the incidence of family violence. The actions taken by those involved in the shelter movement include educating the public and law enforcement officials, advocating for victims, and working for legislative change and funding of domestic violence programming.

During the 1970s, grassroots organizations also worked to assist sexual assault victims in dealing with the trauma of rape and drew public attention to the issue of violence against women more broadly. The work and actions taken by these small, grassroots feminist groups led to the development of the first rape crisis centers in 1972. The primary purpose of the centers was to counsel and assist women who had been raped, offering them assistance, information, and advocacy in medical settings, the criminal justice system, and court proceedings. As part of the feminist movement, rape crisis centers also served the purpose of empowering women and politicizing violence against women. The initial funding of rape crisis centers was largely erratic, but over time these centers have been funded by hospitals, universities, and local governments. Today, rape crisis centers across the United States offer comprehensive medical, mental health, and legal services to victims of sexual violence, as well as sexual assault awareness and prevention education, and advocacy. The actions taken during this time period helped to direct attention to rape survivors and led to the impetus to change the criminal justice system and laws to facilitate prosecution and encourage women to report their experience of sexual violence to the police.

By the 1970s, formal programs for crime victims also expanded to include a wider array of victim assistance programs, including the development of criminal-justice- and law-enforcement-based victim assistance programs. The

important role of law enforcement in the provision of services to victims is evident in the organization of the first “Victims’ Rights Week,” in 1975, by Philadelphia District Attorney F. Emmett Fitzpatrick. The National Organization for Victim Assistance, founded in 1975, is an organization of victim and witness assistance programs and practitioners, criminal justice agencies and professionals, mental health professionals, researchers, former victims, and survivors committed to the recognition and implementation of victim rights and services. Its primary mission is now to promote the rights of and services for victims of crime and crisis through national advocacy, direct services to victims, supporting the activities of victim service professionals, and forging relationships between members. With respect to the provision of services, the National Organization for Victim Assistance’s contact with victims, primarily via its national hotline, leads to service referral, counseling, and advocacy for the victims of crime.

During the 1970s, a number of coalitions formed to attend to the issue of violence against women. In 1978, as part of a United States Commission on Civil Rights, women’s advocates came together in Washington, D.C., to form the National Coalition Against Domestic Violence (NCADV). The primary mission of NCADV is to engage in leadership within communities to help bring an end to violence. To that end, NCADV engages in educational programming, policy development, and coalition building, and supports the provision of direct services for battered women and their children. During this same decade, the National Organization for Women (NOW) formed a task force to examine the problem of domestic violence and wife battering. These grassroots movements may be seen as the starting point for research, shelters, hotlines, abolishment of the marital rape exemption, and mandatory arrest policies. Minnesota led the way in criminal domestic violence interventions with the development of probable cause (warrantless) arrests for domestic assault.

Finally, the 1970s saw some of the first federal legislation related to victimization with the U.S. Congress passing the Child Abuse Prevention and Treatment Act. Through this act of Congress, federal funding went to states to support a variety of programs and criminal justice interventions including education and prevention, criminal justice interventions, and direct treatment and services for victims. As with other legislation, there was concern over its financial impact and some discussion over whether the funding would benefit offenders.

1980s: Medical, Legal, and Legislative Action

Whereas the provision of services to the victims of crime in the 1960s and 1970s reflected activism, the 1980s was a period of medical, legal, and legislative action to ensure the institutionalization of victim services and assistance. This includes the President’s Task Force on Victims of Crime, which recognized the plight of crime victims and placed a national focus on expanding crime victims’ rights

and services. During the 1980s, a growing interest in the trauma and mental health impact of violent victimization led to the development of innovative models of crisis intervention and community approaches to collective trauma experiences. The first Crisis Response Team was deployed by the National Organization for Victim Assistance to attend to a situation in Edmond, Oklahoma, in which a postal worker killed 14 fellow employees and himself. Within a day, experienced crisis interveners arrived to attend to the needs of the community as a whole, not just the individuals directly affected by the tragedy. Today, Crisis Response Teams are composed of mental health specialists, victim advocates, public safety professionals, and clergy members. Once these teams arrive at the site of a community crisis, the team engages in a variety of activities. These include assisting local decision makers in identifying the individuals and groups at greatest risk for experiencing trauma, the training of local service providers and caregivers to attend to the needs of traumatized victims after the Crisis Response Team has left the scene, and leading the group crisis intervention that assists victims in coping with their distress.

The 1980s also brought new legal services to the victims of crime. Through civil litigation, crime victims may be able to file lawsuits against perpetrators and responsible third parties for the damages the victims suffered as a result of the crime. The Victims’ Assistance Legal Organization and the National Crime Victim Bar Association are two such organizations dedicated to facilitating civil actions brought by crime victims. In a continued effort to protect child victims, legislation passed in 1984 included the Missing Children’s Assistance Act. After the act was passed, a clearinghouse and national resource center was established (National Center for Missing and Exploited Children). The primary purpose of the center is to assist in finding missing children and offer services to victimized and exploited youth. To date, the Center has handled more than 1 million calls.

During the 1980s, there began the first political and public discussion in favor of a federal “Crime Victims’ Bill of Rights.” This included a recommendation to amend the Sixth Amendment to guarantee that “the victim, in every criminal prosecution, shall have the right to be present and to be heard at all critical stages of judicial proceedings.” This would later, in 2004, become the Justice for All Act. Other major legislation and federal action included the Federal Victim and Witness Protection Act of 1982, which brought “fair treatment standards” to victims and witnesses in the federal criminal justice system; the United States Department of Justice creating the Office for Victims of Crime; and deposits into the Federal Crime Victims Fund totaling \$133 million. This was also a period of major reforms with respect to intimate partner violence.

Finally, the 1980s may be viewed as a turning point in the country’s focus on victims with respect to public policy, program implementation, and public awareness. An example of continued grassroots advocacy was the founding of

Mothers Against Drunk Driving (MADD) during the 1980s. The actions taken by MADD helped to create the impetus for impaired-driving laws across the United States and enhanced penalties for drunk drivers who kill children.

1990s: Continued Advocacy, Direct Service Provision, and Legislative Action

The actions taken in the name of victims in the 1990s continued to reflect advocacy and the direct provision of services to victims. The decade saw the inception of the National Domestic Violence Hotline, which attends to almost a quarter of a million phone calls each year from the victims and survivors of intimate partner violence, concerned family members and friends, and victims advocates. The anonymous and confidential calls are answered by advocates who offer support and assistance to those who have experienced violence in an intimate relationship. The services offered include crisis intervention, safety planning, information about domestic violence, and referrals to local service providers.

During this decade, researchers continued efforts to examine the plight of victims and evaluate social and criminal justice interventions and programs. This includes the implementation of mandatory arrest policies for domestic violence victims and the evaluation of their efficacy for protecting victims. The 1990s was also a decade of continued and more diverse legislation to change the circumstances faced by crime victims. There were a number of contributions of research to practice, as reflected in the work done by domestic violence researchers examining the efficacy of mandatory arrest policies, domestic violence courts, and batterer interventions. While the findings are often mixed on whether mandatory arrest policies reduce revictimization, most states have adopted either a mandatory or pro-arrest stance on domestic violence.

There were also a number of advances made in responding to the trauma experienced by crime victims, including the expansion and deepening of services to the varied victim populations. There continued to be a worldwide movement to articulate the rights of victims within the criminal justice system and attempts to develop interventions to enforce those rights. During this time period, for example, many states incorporated victims' rights into their state constitutions. There was also a growing sensitivity to the varied experience of crime victims and the extensive consequences of violence. For example, there was recognition of the lack of sensitivity to victims of sexual assault during medical evidentiary examinations. This led to the development of sexual assault nurse examiner (SANE) programs. The SANE programs addressed the waiting time for victims of sexual violence, and the lack of training and experience of those working with sexual assault victims during forensic examinations.

The increased sensitivity to the diversity and experiences of violent crime victims also led to important state and federal legislation expanding what had traditionally

been viewed as crime. Some examples include the Hate Crime Statistics Act, the Church Arson Prevention Act, and anti-stalking laws and legislation. The 1990s was also a decade of growing interest in the welfare of children as victims of crime. This led to a host of legislation meant to protect children including "Megan's Law," the National Child Sex Offender Registry, the Child Protection and Sexual Predator Punishment Act, and enhanced sentences for drunk drivers with child passengers.

In 1990, the Victims of Child Abuse Act established rights and services for child victims. The act was amended in 1993 to provide funding to support local children's advocacy centers and to set up regional training centers to assist communities in establishing interagency teams to respond to child abuse cases. Continued concern for the child victims of crime through the late 1990s included the adoption of the "Amber Alert" system. This system began in 1996 and was formalized in 2003 when television broadcasters teamed with local law enforcement to develop an early warning system to help find abducted children.

During the 1990s, presidential and congressional acts to address crime and victimization included the signing of the "Brady Bill" and the Violent Crime Control and Law Enforcement Act, which carried a number of provisions including one outlining the Violence Against Women Act (VAWA). This act would authorize more than \$1 billion in funding for programs to combat violence against women. By the end of the 1990s, the Federal Crime Victims Fund deposits totaled a record \$985 million.

2000s: Federal Legislation and the Diversification of Services

Whereas the 1990s reflected varied federal legislation addressing a number of diverse victim issues, the decade of the 2000s may be viewed as the consolidation of federal action for victims in the passing of the Justice for All Act in 2004 (a statutory alternative to the Federal Crime Victims' Rights Amendment), and the provision of financial resources to combat crime and help the victims of crime. The year 2000 saw the passing of the Violence Against Women Act (VAWA) and record funding for domestic violence and sexual assault victims. The passing of the VAWA authorized \$80 million annually for direct sexual assault prevention and education grants, \$875 million (over 5 years) for battered women's shelters, \$25 million for the one-time funding of transitional housing programs, and \$25 million to address violence against older women and women with disabilities. Finally, reflecting the expansion of technologies used by offenders to victimize their victim, the federal government also expanded federal stalking statutes to include stalking on the Internet.

The decade may also be seen as suffering from a failure to take federal action to recognize the rights of victims in the same way the U.S. Constitution protects the rights of the accused. With support from both Democrats and Republicans, the Senate Judiciary Committee passed the Federal Victims'

Rights Amendment to ensure basic rights to victims nationwide. However, the Congress failed to approve the amendment. As an alternative, the Justice for All Act was passed in 2004, providing substantive rights for crime victims and legal mechanisms to enforce those rights.

Victims and a Federal Constitutional Amendment

The move to enact federal legislation to protect the rights of violent crime victims and in particular an amendment to the United States Constitution has a long history and support from both liberals and conservatives. On June 25, 1996, President Bill Clinton voiced his position on such proposed legislation:

I have supported the goals of many constitutional amendments since I took office, but in each amendment that has been proposed during my tenure as President, I have opposed the amendment either because it was not appropriate or not necessary. But this is different. I want to balance the budget, for example, but the Constitution already gives us the power to do that. What we need is the will and to work together to do that. I want young people to be able to express their religious convictions in an appropriate manner wherever they are, even in a school, but the Constitution protects people's rights to express their faith.

Two hundred twenty years ago, our Founding Fathers were concerned, justifiably, that government never, never trample on the rights of people just because they are accused of a crime. Today, it's time for us to make sure that while we continue to protect the rights of the accused, government does not trample on the rights of the victims.

Until these rights are also enshrined in our Constitution, the people who have been hurt most by crime will continue to be denied equal justice under law. That's what this country is really all about—equal justice under law. And crime victims deserve that as much as any group of citizens in the United States ever will. (Office of the Press Secretary, the White House, 1996)

Almost 7 years later, on May 9, 2002, President George W. Bush voiced similar support for the victims of crime. In a speech at the Department of Justice, President Bush gave his support to a federal constitutional amendment for violent crime victims:

The victims' rights movement has touched the conscience of this country, and our criminal justice system has begun to respond, treating victims with greater respect. The states, as well as the federal government, have passed legal protections for victims. However, those laws are insufficient to fully recognize the rights of crime victims. Victims of violent crime have important rights that deserve protection in our Constitution. And so today, I announce my support for the bipartisan Crime Victims' Rights Amendment to the Constitution of the United States. As I mentioned, this amendment is sponsored by Senator Feinstein of California, Senator Kyl of Arizona—one a Democrat, one a Republican. Both great Americans.

This amendment makes some basic pledges to Americans. Victims of violent crime deserve the right to be notified of public proceedings involving the crime. They deserve to be heard at public proceedings regarding the criminal's sentence or potential release. They deserve to have their safety considered. They deserve consideration of their claims of restitution. We must guarantee these rights for all the victims of violent crime in America.

The Feinstein-Kyl Amendment was written with care, and strikes a proper balance. Our legal system properly protects the rights of the accused in the Constitution. But it does not provide similar protection for the rights of victims, and that must change.

The protection of victims' rights is one of those rare instances when amending the Constitution is the right thing to do. And the Feinstein-Kyl Crime Victims' Rights Amendment is the right way to do it. (Hearing Before the Subcommittee on the Constitution of the Committee on the Judiciary on the 2002 Victims' Rights Amendment, 2002)

Although the proposed amendment had 24 cosponsors, including a majority of the members of the subcommittee, and it had also been endorsed by President Bush and by Attorney General Ashcroft, it failed to pass. As a statutory alternative, as mentioned above, the Justice for All Act of 2004 was enacted to protect crime victims' rights.

The Justice for All Act accomplishes a number of major goals. As noted by the Office for Victims of Crime (2004),

The Act adds new victims' rights and modifies some of the existing rights. Most notable is the new right of victims to be reasonably heard at any public proceeding involving release, plea, or sentencing. The Act also requires prosecutors to advise victims that they can seek the advice of an attorney with respect to the rights established by the Act. Although the Act does not provide grounds for a new trial, it allows victims to file motions to reopen a plea or a sentence in certain circumstances.

For purposes of the Act, a victim is "a person directly and proximately harmed as a result of the commission of a federal offense or an offense in the District of Columbia." This language expands the definition of victim in the "Services to Victims" section of the Victims of Crime Act, which allows such services only for those who suffered "direct physical, emotional, or pecuniary harm."

Some of the specific elements of the Justice for All Act are to amend the federal criminal code to grant crime victims specified rights, including a number of rights that relate to victim compensation and the criminal justice process. The specific rights include (1) the right to be reasonably protected from the accused; (2) the right to reasonable, accurate, and timely notice of any public court proceeding or any parole proceeding involving the crime, or of any release or escape of the accused; (3) the right not to be excluded from any such public court proceeding, unless the court, after receiving clear and convincing evidence, determines that testimony by the victim would be materially altered if the victim heard other testimony at that proceeding; (4) the right to be reasonably heard at any public proceeding in the district court

involving release, plea, sentencing, or any parole proceeding; (5) the reasonable right to confer with the attorney for the government in the case; (6) the right to full and timely restitution as provided in law; (7) the right to proceedings free from unreasonable delay; and (8) the right to be treated with fairness and with respect for the victim's dignity and privacy (Office for Victims of Crime fact sheet, <http://www.ovc.gov/publications/factsheets/justforall/content.html#3>).

Financing Victim Services and Improving Service Delivery

While the stability and amount of funding for services for the victims of crime have changed over the past 40 years, the focus in terms of the "crime problem" continues to be on the punishment and treatment of offenders. Consider an example: Since 1982, there has been a 620% increase in the funding of jails, prisons, and offender treatment. In the year 2005, the United States spent over \$60 billion on the maintenance and operation of the correctional system (U.S. Department of Justice, <http://www.ojp.gov/bjs/glance/exptyp.htm>).

At the same time, programs designed to directly provide services and assistance to the victims of crime are highly underfunded, often grant-based, and frequently required to annually reapply for continued support (See Elias, 1992). Most often, the funding of services reflects federal distributions to states in the form of victim assistance grants. The magnitude of the funding of victim services is described as follows, by the U.S. Department of Justice:

During FYs 1999 and 2000, OVC [Office for Victims of Crime] distributed more than \$608 million to states through VOCA victim assistance grants (\$238 million in FY 1999; \$370 million in FY 2000). States sub-granted these funds to criminal justice agencies, social service agencies, private nonprofit agencies, and American Indian tribes to support direct services to victims of child abuse, domestic violence, sexual assault, drunk driving, elder abuse, and robbery; family members of homicide victims; and victims of other violent crimes. The services provided include crisis counseling, therapy, shelter, information and referral, help in filing compensation claims, and advocacy support. Between FY 1999 and 2000, VOCA funds supported some 4,000 programs across the country and reached more than 6.4 million crime victims. This represents a 15-percent increase in the number of victims served since the previous biennium. (<http://www.ojp.usdoj.gov/ovc/welcovc/reporttonation2001/chp2.html>)

While federal and state funding for victims has increased in recent decades, even those criminal justice initiatives that incorporate issues specific to victims' rights often depend for their funding on fines and victim surcharge fees collected from offenders.

In addition to increasing the funding of victim services, federal and state governments and social service providers have worked hard to improve the implementation and delivery of services. This has included significant changes

and improvements within the criminal justice system to better assist the victims of crime. A 2001 report by the Office for Victims of Crime notes the following:

States and sub-grantees have made and continue to make major strides in several key areas in working with crime victims. First, significant improvements are being made in the criminal justice system response to crime victims. Specialized domestic violence courts, community policing, automated notification systems, registries of protective and restraining orders and of sex offenders, and standardization of sexual assault evidence collection all support services to victims and increase offender accountability. Second, the need for and value of collaboration with other disciplines, agencies, and systems is recognized. Protocols are now in place for domestic violence and sexual assault cases and for criminal crisis response. Criminal justice officials and community-based advocates coordinate activities and, with increased training, both fields are more aware of the responsibilities of the other. Finally, states are increasingly expecting persons who serve crime victims to be trained and, in some instances, certified. Some states have developed standards for programs that receive VOCA funding. Several states have annual statewide conferences and others are implementing state victim assistance academies. (<http://www.ojp.usdoj.gov/ovc/welcovc/reporttonation2001/chp2.html>)

The area of domestic violence is an excellent example of the integration of service provision, increased training of criminal justice officials and social service providers, and coordination of justice officials and community-based organizations. For example, specialized domestic violence courts have served to integrate the screening, referral, and monitoring of criminal cases. These courts are dedicated to dealing with felony or misdemeanor domestic violence crimes, and they have been supported by federal STOP Violence Against Women funds. Some notable improvements in the treatment of domestic violence through the implementation of these courts include the training of court officials to promote the consistent and efficient handling of cases and on-site victim advocates. These victim advocates serve as the primary contact to victims, creating safety plans and coordinating housing, counseling, and other social services. They also provide victims with information about criminal proceedings and special conditions contained within their orders of protection. These courts have also employed resource coordinators and implemented technology that assists in maintaining links between service providers and court officials, providing information on the status of victims and offenders, and holding agencies accountable for accurate and prompt reporting.

Diversity of Services for the Diverse Population of Violent Crime Victims

Social services, victim programs, and crisis centers were largely devised to deal with female victims of intimate partner violence and sexual assault and as such may not

reflect the needs of all crime victims nor accommodate the types of coping strategies typical of male victims (see Wallace, 1998). Yet, over the last 40 years there has been increased public attention to the diversity of victims of crime, and this has translated into a number of services to attend to the needs of this population.

In the early part of 2000, the federal and state governments directed an initiative to attend to previously underserved victims of crime. Victim assistance programs received increased funding and began to direct resources to victims of elder abuse, child exploitation, child witnesses to domestic violence, cybercrime, hate crime, and stalking. Attention has also been directed to tailoring programs to previously underserved populations including immigrants, visible minorities, and rural and disabled victims. This includes improving programs to be more culturally relevant to the populations they serve, physically accessible, and in close geographic proximity to the victims of crime.

An example of the recognition of the diversity of victimization includes the legislation, advocacy, and services for the victims of hate/bias crimes, which have been important milestones within the evolution of victim services. The Hate Crimes Statistics Act of 1990 and the Local Law Enforcement Hate Crimes Prevention Act are notable in that they laid out the definition of bias crimes and extended federal law to allow state and local authorities to take advantage of federal investigative resources and personnel in bringing cases based on state law. Yet, it has been the advocacy of local service agencies that has most often assisted victims of crime motivated by bias, which less often comes to the attention of law enforcement. Since the late 1980s, local community organizations have run 24-hour crisis lines and have offered victims referrals to attorneys, counselors, and therapists. These agencies have also served as court advocates for victims who press criminal charges. Prevention and education are also at the forefront of victim services within the hate crime arena. Some of these projects include training residents how to protect themselves from the risk of violence and providing training for local law enforcement on how to respond to hate crime incidents.

OFFENDER CLASSIFICATION

PATRICIA M. HARRIS

University of Texas at San Antonio

Offender classification refers to a set of formal tools and practices used to establish supervision parameters and services for individuals under the control of correctional agencies. Of particular interest is the determination of the nature of risks posed by individual offenders and identification of their specific treatment needs.

The origins of classification, which is essentially the examination of how offenders differ from one another, can be traced to a typology presented by Cesare Lombroso in his 1876 work entitled *Criminal Man*. Development of structured instruments for ranking offenders according to risk began in the 1920s, when researchers such as Burgess (1928) explored the utility of statistical methods to distinguish between violators and non-violators among prisoners paroled from state prisons. Though numerous practitioners, criminologists, and forensic psychologists advanced classification research following this time, it was not until the 1980s that formal, structured classification became widespread practice in corrections. Three factors—the discovery that a relatively small proportion of offenders contributed disproportionately to the crime problem, successful inmate litigation calling for improved conditions of confinement in state prison systems, and heightened sensitivity of the public to new crimes committed by offenders released back into the community—accelerated the development and widespread adoption of objective instruments to classify offenders by risk and needs. Today, offender classification is practiced by local, state, and federal corrections

agencies throughout the United States. There are now many instruments available for the classification of adult and juvenile offenders, and work on improving prediction of recidivism via statistical methods continues as a focus of agency and university research.

Varieties of Offender Classification

Risk/Needs Assessment

The assessment of risk and needs is the most common form of offender classification. This form may entail separate instruments, one for risk and at least one for needs. Risk instruments, which resemble questionnaires, occur by interview or the offender's self-report, according to the design of the tool in question. Choice of risk instrument also depends upon the correctional setting in which it is to be administered. Risk assessment serves different purposes, depending upon the correctional context in which it takes place. Risk assessment tools used by probation and parole typically forecast the offender's risk of rearrest while under community supervision. Instruments employed by prison and jail authorities, on the other hand, predict a detainee's or inmate's adjustment to confinement. Jail risk assessment focuses on inmates' risk of harm to other detainees and need for protective custody, to guide housing decisions as well as to prevent harm to self, particularly suicide. The

objectives of prison classification differ depending upon whether external or internal classification is taking place. The purpose of *external classification* is to determine whether the inmate can be housed in a general population, and if so, at what level (minimum, medium, or maximum custody). The objective of *internal classification* is to assess the inmate's risk in the facility to which he or she has been assigned. This determination subsequently affects where the inmate will be housed, with whom, and with what privileges (programs, work assignments, etc.).

The evolution of formal instruments measuring offender risk and needs occurred over four "generations" (Andrews, Bonta, & Wormith, 2006). First-generation instruments were characterized by reliance on professional judgment and experience, also referred to as *clinical judgment*. Introduction of the salient factor score by the U.S. Parole Commission (Hoffman & Beck, 1974) and the Wisconsin Classification System (Baird, 1979) in the 1970s ushered in a second generation of risk assessments. Also known as actuarial tools, second-generation instruments are empirically derived tools whose items are chosen for their statistical correlations with recidivism.

Reliance on criminal history items (e.g., age at first adjudication, number of prior convictions, number of prior revocations of community supervision) and items assessing other static (i.e., unalterable) offender characteristics are distinguishing features of second-generation instruments. To the extent measures other than criminal history (e.g., drug or alcohol use and association with criminal companions) are used, such items capture historic data only. That is, second-generation tools may assess substance abuse and nature of associates up until the offender's encounter with the criminal justice system, but not the status of current use or associations.

Third-generation instruments preserve the evidence-based feature of second-generation tools, in that they rely on items exhibiting a statistical correlation with recidivism, but differ in the extent to which dynamic correlates of recidivism are used to assess offender risk. Examples of dynamic factors include use of leisure time, living arrangements, and ability to manage emotions. The use of dynamic measures allows instruments to be sensitive to changes in the offender circumstances, thus facilitating reassessments of risk at a later date. If all the information captured in a risk assessment tool consisted only of historical items, this would not be possible.

The Level of Service Inventory–Revised (LSI–R) is a third-generation risk assessment instrument. The LSI–R is a semistructured interview consisting of 54 items measuring criminal history, education and employment, financial status, family/marital relations, living accommodations, extent of criminal companions, alcohol/drug problems, mental health status, and attitudes toward correctional supervision (Andrews & Bonta, 2001). Thus, the LSI–R includes both risk and needs items within the same instrument, whereas the salient factor score and

Wisconsin models require administration of additional instruments for the assessment of those same offender needs. In contrast to stand-alone needs assessments, the LSI–R includes only those needs shown by research to influence criminal behavior.

Fourth-generation instruments are referred to as systematic and comprehensive because they measure factors important to treatment effectiveness. Fourth-generation tools embody all principles of effective correctional treatment by combining assessment of both static and dynamic predictors of risk with a case management component for setting treatment goals. The case management plan directs the officer's focus on the offender's criminogenic needs and responsivity factors (Andrews et al., 2006).

The evolution of risk/needs classification tools corresponds with research discoveries about the best predictors of offender recidivism (Gendreau, Little, & Goggin, 1996) as well as the nature of effective correctional treatments (Andrews, Zinger, et al., 1990). These include the principles of risk, needs, and responsivity. The principle of risk is that treatment is most effective on high-risk offenders. The needs principle holds that effective treatments will be those that take dynamic, criminogenic needs—those most likely to cause continued lawbreaking—into account. The responsivity principle indicates that interventions should take offender characteristics such as learning style, motivation, gender, and ethnicity into account when matching subjects to programs. According to a meta-analysis of 154 evaluations of adult and juvenile correctional treatments, Andrews, Bonta, and Hoge (1990) discovered that effective programs were those that practiced all three principles. Of much additional importance, failure to observe the principles of effective correctional treatment elevates the risks posed by low- and moderate-risk offenders. Using a sample of 7,366 offenders assigned to either community supervision or residential facilities, Lowenkamp and Latessa (2005) compared recidivism rates across different risk categories. They found that low- and low/moderate-risk offenders experienced higher recidivism rates when placed in residential treatment, compared to placement on community supervision alone.

While there is much empirical support for the supremacy of actuarial instruments over those favoring clinical or diagnostic judgment (see, e.g., Grove & Meehl, 1996; Monahan, 1981), the importance of *dynamic* variables for prediction accuracy is less certain. In a survey of meta-analytic studies of the capacity of instruments from each generation to predict general recidivism, Andrews et al. (2006) found that first-generation tools had an average predictive validity (r) estimate of .10; second-generation tools, .42; third-generation tools, between .33 and .40; and fourth-generation tools, .41. The larger the value of r , the greater the amount of error one would avoid in relying on the prediction instrument in question. Thus, best validity performances came from instruments that emphasized static factors. In fact, removal of dynamic variables such as

employment and living arrangements improved the predictive accuracy of the salient factor score, the assessment tool used by the U.S. Parole Commission (Hoffman, 1994). While the predictive accuracy of third- and fourth-generation tools does not yet outpace that of the second-generation tools, the later instruments are superior for their ability to enlighten the user about criminogenic needs and responsivity factors crucial for achieving successful case outcome.

Instruments such as the salient factor score, LSI-R, and the Wisconsin model were all designed to predict general recidivism. Also available are assessment tools that predict particular forms of recidivism such as the risk of new violence, or even more specifically, risk of new sexual or domestic violence. Examples include the Violence Risk Appraisal Guide (VRAG), the Static-99 (for sex offenders), the MSOST-R (for sex offenders), the Spousal Assault Risk Assessment (SARA), and the Domestic Violence Risk Appraisal Guide (DVRAG).

Diagnostic Instruments

Using diagnostic tools, personnel can verify or rule out various mental disorders, as defined and described in the *Diagnostic and Statistical Manual of Mental Disorders IV-Text Revision (DSM IV-TR)* (American Psychiatric Association, 2000). Though in some cases, forensic staff will rely on a structured interview to confirm or deny the presence of mental disorders as identified in the *DSM IV-TR*, more typically they will administer formal tests that assess subjects against *DSM* criteria. For example, the Minnesota Multiphasic Personality Inventory-2 (MMPI-2) is a commonly used mental health assessment for determining whether the subject harbors particular mood or personality disorders included in the *DSM IV-TR*. The MMPI-2 is a self-appraisal inventory that uses 567 true/false questions to measure subjects' scores on 10 scales (hypochondriasis, depression, paranoia, psychoasthenia, schizophrenia, masculinity/femininity, hysteria, psychopathic deviance, social introversion, and hypomania) (Butcher et al., 2001). Use of the MMPI-2 is common in the classification of inmates but is used more sparingly, such as to confirm mental illness where there are other indicators of the same, in populations of individuals under community supervision. Because the MMPI-2 must be scored by a clinician, it is too costly for broad application where the disorders being measured are not widespread.

Some mental disorders, such as alcohol and drug addiction, are common in offender populations. Instruments such as the Substance Abuse Subtle Screening Inventory (SASSI), Addiction Severity Index (ASI), and the Drug Abuse Screening Test (DAST) experience widespread use in both community and institutional corrections. In contrast with the MMPI-2, instruments for the measurement of substance abuse are easily administered and scored by nonclinical staff.

Personality Inventories

Unlike diagnostic tools, which were developed for the population as a whole, most personality inventories used in offender classification were designed solely for use with offenders. The presumption behind use of personality inventories in correctional contexts is that different personality types require diverse officer interaction styles, supervision intensity, and treatment. Though they are not intended to be risk assessment tools, some personality inventories provide useful predictions of recidivism and institutional adjustment. Because they tend to take longer to administer and score relative to risk/needs instruments, personality inventories are usually too costly for use with probation and parole populations. Typical applications include prisons and other residential settings.

Of the many personality inventories currently available for use in classification, commonly used instruments focus on measures of commitment to criminal values and lifestyle. The Psychopathy Checklist-Revised (PCL-R), for example, is a highly regarded instrument for identifying the most antisocial of offenders. Psychopathy is a formal construct consisting of 20 distinct interpersonal, affective, and behavioral characteristics, including glibness/superficial charm, grandiose sense of self-worth, need for stimulation, pathological lying, conning, lack of remorse or guilt, shallow affect, lack of empathy, parasitic lifestyle, poor behavioral controls, promiscuous sexual behavior, early behavioral problems, lack of realistic long-term goals, impulsivity, irresponsibility, failure to accept responsibility for one's own actions, many short-term marital relationships, juvenile delinquency, revocation of conditional release, and criminal versatility. Upon completion of a semi-structured 3-hour interview, a clinician assigns each item a score of 0, 1, or 2. A score of 0 means the factor is not present, and a score of 2 means the factor is strongly present. A total score of 25 to 30 indicates that the subject is a psychopath.

Though never intended as a risk assessment tool, the PCL-R is frequently used as one. Research finds that psychopaths are more likely to reoffend following release from prison than nonpsychopaths; that psychopathic sex offenders are far more likely to reoffend, including nonsexually, than nonpsychopathic sex offenders; and that treated psychopaths are more likely to reoffend than non-treated psychopaths (Hare, 2003).

The Psychological Inventory of Criminal Thinking Styles (PICTS) is an 80-item, self-report instrument that measures the offender on each of eight dimensions supportive of criminal lifestyles. These include mollification, cutoff, entitlement, power orientation, sentimentality, superoptimism, cognitive indolence, and discontinuity. The instrument, which can be easily scored by nonclinical staff, shows promise in predicting institutional adjustment, recidivism, and program completion. Because it measures dynamic factors, the PICTS can be used to measure change

in criminal attitudes over time, through repeated testing (Walters, 2002).

Typologies

Typologies, also referred to as taxonomies, sort offenders into mutually exclusive categories. Typology-based classification tools are available for both community-supervised and incarcerated populations. The value of typologies lies in their capacity to communicate information about responsivity, one of the principles of effective correctional treatment.

The Client Management Classification (CMC) component of the Wisconsin Classification System, used by numerous community corrections agencies, is an interview-based tool leading to the assignment of subjects into one of five “strategy groups” (casework control, environmental structure, limit setting, selective intervention–treatment, and selective intervention–situational). The strategy group serves as a guide to the offender’s criminogenic needs, motivation to change, amenability to supervision, treatment referrals, and recommended manner of interaction between officer and client (Lerner, Arling, & Baird, 1986). The Prisoner Management Classification System (PMC) is a prison/residential setting version of the CMC.

Quay’s Adult Internal Management System (AIMS) was designed to inform housing and program decisions in institutional settings. The AIMS consists of two assessments, the Life History Checklist and the Correctional Adjustment Checklist. The latter is completed by correctional staff after observing the inmate in custody for 2 to 4 weeks. Upon completion of the assessment, inmates are sorted by personality types and then placed into one of three categories: Heavies (prone to violence, manipulation, and predatory behavior), Lights (prone to anxiety and victimization), and Moderates (reliable and hardworking) (Levinson, 1988).

Edwin Megargee (Megargee, Carbonell, Bohn, & Sliger, 2001) employed the MMPI as the basis for a typology sorting offenders into 10 categories. The categories, whose names (e.g., Abel, Item, Delta, How) were assigned randomly and have no intuitive meaning, reflect patterns of MMPI scale responses. While Megargee’s typology has been subjected to extensive research regarding its ability to identify distinct groups of offenders with different behavioral characteristics, particularly with respect to prison adjustment, there is less evidence regarding its successful application to guiding treatment planning.

Classification of Juvenile Offenders

Classification is an important facet in the supervision of juvenile offenders, serving the same objectives—risk management and treatment planning—as it does for adult offenders. However, development of actuarial tools for juveniles has lagged behind evolution of classification

tools for adult offenders. There are fewer standardized instruments for the assessment of juvenile risk and needs, and less research affirming their reliability and validity, than exists to date for adults (Hoge, 2002). Promising tools include juvenile-oriented versions of the LSI and PCL, referred to respectively as the Youth Level of Service/Case Management Inventory (YLS/CMI) and the Psychopathy Checklist–Youth Version (PCL–YV). Also available are instruments that measure specific risks, though these should be used cautiously. For example, the creators of the Juvenile Sex Offender Protocol–II (J SOAP–II) warn that adolescent populations are inherently unstable and require frequent reassessment (Prentky & Righthand, 2003).

The Jesness Inventory–Revised (JI–R) is a widely used personality assessment tool for juvenile offenders. Introduced in the 1960s, the Jesness Inventory is a 160-item, self-report questionnaire that measures the offender on each of 11 personality, 9 subtype, and 2 *DSM IV–TR* subscales. Personality scales include social maladjustment, value orientation, immaturity, autism, alienation, manifest aggression, withdrawal–depression, social anxiety, repression, denial, and asocial index. Subtype scales are based on integration theory, formerly known as the I–Level system. Subtype scales reflect increasing levels of perceptual complexity (i.e., the extent to which the offender views the world as threatening or supportive) and interpersonal maturity. *DSM IV–TR* subscales facilitate diagnosis of juveniles with conduct disorder and oppositional defiant disorder. Preferably, the instrument is administered and scored by a clinician (Jesness, 2003).

Megargee’s MMPI-based typology is also available for juveniles, using a version of the MMPI that was normed on adolescents (MMPI–A). Also available is a version of the CMC for juveniles, called the Strategies for Juvenile Supervision (SJS).

Reliability and Validity of Classification Instruments

Before any classification instrument can be implemented, it is necessary to confirm its validity and reliability. Interview-based classification tools are deemed reliable if different raters assessing the same offender arrive at the same result. This is referred to as *interrater reliability*. Instruments based on self-reports are deemed reliable if the same offender offers similar answers if assessed more than once, barring the passage of time sufficient to cause legitimate changes in responses. This is called *test-retest reliability*.

An instrument is judged to be valid if it really measures what it purports to measure. There are numerous ways of assessing validity, depending upon the classification instrument in question. Personality inventories and typologies are typically examined for construct validity, which

uses quantitative means to measure the viability of their various scales or factors.

With respect to risk assessments, the question of predictive accuracy is a key concern. Different statistics are available for summarizing any one tool's accuracy; currently favored is the area under the curve (AUC) statistic. It is popular because its utility does not depend upon the base rate of the outcome in question (i.e., proportion of offenders who recidivate). That is, it is equally meaningful whether the behavior being predicted is rare or fairly common (Harris & Rice, 2007). The AUC communicates how well the assessment tool improves over a chance prediction (such as determined by the toss of a coin). Higher AUC values indicate greater prediction accuracy and improvement over chance. For example, a value of .50 would inform the user that the instrument does not predict better than chance, whereas a value of .80 indicates substantial improvement over chance.

Researchers can use the AUC not just to assess the performance of any one instrument but also to compare different instruments. The best comparisons are those that report results of administration of various tools on the same population of offenders, followed up for the same period of time. Such comparisons are not typical, however. One exception is a study by Barbaree, Seto, Langton, and Peacock (2001), who evaluated the accuracy of six assessment instruments designed for the prediction of general and/or sexual violence, using a sample of 215 sex offenders released from prison and followed up on community supervision for an average of 4.5 years. Outcomes of interest included any new recidivism (measured as either charges or convictions), any serious recidivism, and new sexual offense recidivism. Barbaree and colleagues found that some instruments were good at predicting all three outcomes; none was superior at predicting all three; and of much importance, instruments that were easy to use and score (such as the RRASOR and Static-99) provided good predictions of new sexual violence, the least frequent of the outcomes studied. This kind of information is extremely valuable to agencies seeking to invest in a specific kind of classification instrument when there are several or more to choose from.

Reliability and validity are necessary but not sufficient conditions in the selection of assessment tools. Agencies usually need to consider how much time they can devote to each offender, and the demands imposed by particular instruments on interviewers' skill sets. Thus while "multi-tasking" instruments such as the VRAG perform well with respect to the prediction of both new violence and new sexual violence, the high offender caseloads faced by community corrections agencies and baccalaureate status of the typical probation or parole officer make instruments such as the RRASOR and the Static-99, which have relatively few items and do not require much in the way of clinical skills to score, very attractive tools for assessing sex offender risk.

Issues in Classification Implementation and Practice

Classification Protocols

Protocols for offender classification depend upon choice of assessment instruments. Some tools involve interviews by staff, and others depend upon the offender's self-appraisal. In either case, the instrument will be scored by correctional personnel.

Training is usually required before an individual can administer and score a classification tool. Depending upon the instrument, training may be as brief as 1 or 2 days. Others may require a week-long training. Still others, and particularly most personality inventories, require that the interviewer have an advanced degree or prior experience leading to the accumulation of clinical skills and judgment, in addition to specific training in the application of the instrument itself.

The extent of training and experience an individual has had in the administration of particular tools can have a positive impact on their reliability and validity. For example, Flores, Lowencamp, Holsinger, and Latessa (2006) found that the relationship between LSI-R score and supervision outcome was strongest for agencies whose officers underwent training in the use of the instrument and in agencies that had used the LSI for 3 years or more.

Interpretation of Risk Scores

After a risk assessment has been completed, its administrator totals the scores for each risk item. Each risk total is associated with particular probability of failure among persons having the same or higher score; the score itself is not a probability. Thus, an offender whose risk score is twice as high as another offender's is not twice as likely to be rearrested. Increasing risk scores represent increasing probabilities of failure, and so should be used merely to rank clients as to risk of the outcome of interest. In order to determine the actual probability associated with a particular score, corrections managers must keep up with statistics regarding the failure rates of persons with each score.

Determination of Offender Risk Levels

Typically, ranges of risk assessment scores are combined into risk levels. For example, offenders scoring 0 to 10 might be placed in a low-risk category, those scoring 11 to 20 in a medium-risk category, and offenders scoring 21 to 30 in a high-risk category. The choice of which ranges of scores should be regarded as indicators of high, medium, and low risk classifications is an important one. Cutoffs delineating each group should take resources into account. In other words, what percentage of clients can an agency reasonably devote treatment and supervision

resources to? Not all offenders, or even a large minority, can be treated as high-risk offenders. Devoting more supervision resources to highest-risk cases, even if it is a minority of cases, will result in more crimes prevented than less supervision spread across many cases (Clear & Gallagher, 1985).

Misuse of Classification Information

Effective use of risk instruments requires users to exercise faith in the overall risk score rather than yield to the influence of explicit descriptions of the offender's prior criminal activities gleaned while carrying out the assessment interview. However, it can be difficult for classification personnel to ignore unsavory features of an offender's criminal or social history, even when the outcome of the risk assessment instrument indicates that the client is a low risk. Research indicates that these biases are common in risk decision making (see, e.g., Hilton, Harris, Rawson, & Beach, 2005), and so practitioners must make an overt choice to side with the recommendations indicated by the assessment results.

Overclassification

Overclassification refers to the channeling of relatively low-risk offenders to unnecessarily secure supervision levels or institutional placements. Overclassification can result from failure to administer reliable and valid risk assessment tools, but also from failure to base supervision decision making on the results of an instrument when a good one is administered. Overclassification has serious consequences, namely, increased risk by overclassified offenders. Overclassified offenders experience a greater likelihood of becoming higher-risk offenders for various reasons, not the least of which may be increased exposure to other true high-risk offenders and diminished opportunities, such as employment, as liberties are curtailed (Clements, 1982).

Agencies promote overclassification when their risk assessment instruments include items that lack predictive validity. The decision to rely solely on statistically justified assessment items is not always easy for an agency to accept when omitted factors exhibit strong face validity with the outcome in question. Items have *face validity* if it seems they should affect the behavior being predicted. For example, while it would appear that a history of past escapes and severity of current offense exert an influence on a prison inmate's risk of institutional misconduct, in fact, these characteristics are not valid predictors and including them will degrade the instrument's predictions of inmate behavior (Austin, 2003).

What happens when valid and reliable offender classification instruments are not used? Without classification, a greater number of mistakes are made in efforts to identify true high-risk offenders. There is an increased cost of corrections. Corrections becomes more expensive when decision

makers erroneously believe they need additional high-security prisons in the wake of overclassification of low-risk offenders, and when underclassified higher-risk offenders are mistakenly assigned to community supervision or other minimally secure settings.

Overclassification may be difficult to avoid with respect to prisons and jails. For example, the majority of jails in use today contain mainly maximum-security housing, which undermines meaningful custody classification. In many jails, inmate segregation according to gender, age (juvenile or adult), and detention status (sentenced or unsentenced) takes precedence over classification according to risk of violence or need for mental health care. As a result, jail administrators are unable to take advantage of many gains in offender classification that are available to other corrections agencies (Austin, 1998; Brennan & Austin, 1997).

Risk Prediction Errors

Risk prediction instruments, even those that are actuarial, are not perfect. One factor influencing the capacity to accurately predict behavior is called the *base rate*, the frequency of the outcome of interest (e.g., arrest, conviction, incarceration) in the sample being used to create the instrument. The more infrequent a behavior, the greater the difficulty in successfully predicting it. Thus, researchers are more successful predicting general recidivism than specific recidivism, such as particular violent acts.

All prediction tools produce both correct and incorrect predictions, also referred to as *prediction errors*. There are two possible kinds of errors: false positives and false negatives. False positives refer to incorrect predictions that offenders will commit new crimes. False positive errors are committed when individuals who would not have committed new crimes are subjected to secure settings or restrictive community supervision. False negatives refer to incorrect predictions that offenders will not commit new crimes. False negative errors occur when incarceration or restrictive conditions of supervision are not imposed on offenders who will commit new crimes. The terms *true* and *false* refer to the *accuracy* of the prediction. The terms *negative* and *positive* refer to the *content* of the prediction, that is, exhibiting a behavior (positive) or not exhibiting it (negative).

Because prediction errors with the current state of knowledge cannot be eliminated, the best to hope for is that their frequency can be reduced. With respect to any particular instrument, however, efforts to reduce one error type result in an increase in the other. To illustrate, suppose it is known from prior studies that 20% of felony offenders on community supervision can be expected to commit new felonies over the next 3 years. If there was a prediction instrument that was 100% accurate, identifying all of these recidivists-to-be would be very easy—the offenders could be rank-order classified by risk score and a cutoff established delineating the highest-scoring 20%. But when risk

instruments are imperfect, setting the cutoff at the 20th percentile of scores means that some of the offenders designated as high risk will be false positives, and that some of the offenders whose scores fell outside the 20th percentile will be false negatives. By setting a more inclusive cutoff—for example, at the 30th percentile—the instrument will capture more true positives while at the same time increasing false positives.

What kinds of incorrect predictions most likely to occur depend upon the values attached to each kind of error. If those conducting the assessment are risk averse, meaning that they emphasize public safety and strive to avoid new victimizations, they are likely to set low cutoffs delineating high- from low-risk offenders, resulting in a greater number of offenders (justly or unjustly) falling into the category judged high risk. If the assessors value justice for the individual being sanctioned in an effort to avoid unnecessarily restrictive supervision or confinement, they would establish more stringent cutoffs, resulting in fewer offenders judged threats to the community. Which type of error is worse? That depends upon policymakers' value frameworks.

Even though the best prediction instruments are subject to error, what is important to keep in mind is that good instruments yield predictions that improve upon chance or an officer's subjective judgment. Using a valid and reliable risk assessment tool helps to avoid the higher rate of error associated with using no actuarial instrument at all.

Overrides

On occasion, it may be necessary for officers and case-workers to disregard the risk score generated by even the highest-quality assessment instruments and process. For example, overrides may be appropriate when the subject of the assessment exhibits a lengthy history of serious criminal activity but encounters his first arrest relatively late in that career. The gainfully employed, vocationally skilled, drug- and alcohol-avoidant, married serial killer who commits several homicides before experiencing even one arrest will achieve a low risk score on most general risk instruments. Obviously, following the recommendation of the risk tool would be a very bad decision.

Positive institutional adjustment is a factor that might warrant a lower custody level. History of committing rape or membership in a gang might warrant higher custody levels (Austin, 1998). Whatever the reason for the override, the total rate of overrides should remain low. Frequent overrides are an indication that the classification system is not working or is not understood by users.

Situational and Environmental Influences on Offender Behaviors

Prediction accuracy is difficult to achieve in volatile environments. Prisons, for example, harbor a variety of environmental and situational features that can give rise to circumstances favorable to violence, independent of the

violence-proneness of any particular inmate. Encounters with gang members, sudden and unpopular decisions by prison administration, and even a facility's architecture create opportunities for misconduct above and beyond the prediction presented by the formal risk assessment process (Austin & McGinnis, 2004).

Neighborhoods are also important influences on an offender's risk. Neighborhoods vary widely with respect to the employment and housing opportunities they offer to reentering offenders, and they vary with respect to criminogenic influences such as crime rates, poverty, and residential instability. Using neighborhood-level census data in combination with data on a sample of offenders on community supervision in the Portland, Oregon, area, Kubrin and Stewart (2006) confirmed that recidivism rates were higher among offenders in disadvantaged neighborhoods, even after taking individual-level characteristics into account.

Controversies in Offender Classification

Universality of Risk Assessment Tools

An ongoing topic in classification research is the question of whether risk instruments developed in one jurisdiction or for a particular correctional setting are transferrable to other offender populations or contexts. When the Wisconsin model was first developed, it was rapidly adopted by probation agencies nationwide. Yet, a close look at the impact of applying the tool on a sample of probationers in New York City found that the instrument did not predict recidivism as capably as anticipated. Six of the items failed to exhibit any correlation with outcome, including drug and alcohol use, prior convictions, and prior revocations. Efforts to reweight instrument items to produce a better prediction were only marginally productive (K. N. Wright, Clear, & Dickson, 1984). Questions of transferability continue to haunt other risk assessment tools, such as the LSI-R, as well (see, e.g., Dowdy, Lacy, & Unnithan, 2002). While researchers have made great strides in producing more universally applicable classification tools, periodic evaluation of the impact of particular instruments on an agency's ability to successfully identify and supervise high-risk offenders is always a worthwhile endeavor.

Applicability Across Gender

Though it is the practice of most jurisdictions in the United States to use the same classification instruments on male and female offenders, researchers disagree about the applicability of "gender-neutral" tools to female offenders. Commonly used risk assessment tools are prone to overestimate the risks posed by female offenders, whose role in violent criminal activities is frequently limited to that of accomplices to male offenders. Where females take the lead in violent activity, their crimes tend to occur within

the context of long-term relationships and so do not present risks to the public. Factors such as seriousness of current offense, use of violence, and substance abuse do not predict adjustment of female offenders to custody settings, though these factors perform better for males (Brennan & Austin, 1997). Research indicates that because developmental pathways to crime are different for women, other variables better predict the behaviors of female inmates, among them, marital status, family structure of the childhood home, child abuse, and reliance on public assistance, to name a few (Bloom, Owen, & Covington, 2003; Hardyman & Van Voorhis, 2004).

Applicability to Different Cultures and Races

Ethnicity is a less well-understood variable in offender classification. On the one hand is the question of whether individual factors carry the same weight in prediction of new criminal behavior across different groups; on the other is the question of whether and to what extent assessment protocols should take culture into account to ensure a reliable and valid result. Whiteacre's (2006) research on the LSI-R, for example, revealed that the instrument led to a higher rate of classification errors for African Americans compared with whites and Hispanics when particular cut-off scores were used. Severson and Duclos (2005) point out that in the aggregate, American Indians are less open to interviewers' questions about mental and physical health, and use of alcohol and drugs, compared with other groups. The prominence of the narrative style in American Indian culture and its embrace of mental illness call for modification of both assessment items and protocols. Others indicate that the success of correctional practices, generally, relies on practitioners' appreciation for the role played by proximity, paralinguistic, density of language, history of discrimination, and other culture-specific variables (Umbreit & Coates, 2000).

Conclusion

Classification is the foundation of effective correctional supervision and treatment. Numerous tools are available for classification, such that it is possible for personnel of varying skill backgrounds to identify the risk and treatment needs of offenders in a wide variety of correctional settings. The most common form of assessment is classification for risk, possibly due to the stronger emphasis on crime control relative to rehabilitation aims of the criminal justice process. Risk assessment is also the most controversial form of classification, inasmuch as its errors are more visible and consequential to the public (in the case of false negatives) and the offender (in the case of false positives).

Many advances have taken place with respect to measuring offender risk and needs. Enhanced statistical methods and discoveries regarding the correlates of criminal offending have allowed researchers to make predictions that are

great improvements over clinical judgments. However, new arenas for prediction await these advances. For example, classification takes place after sentencing, not before, though clearly better sentencing decisions could be made in the presence of classification results. The determination of which sex offenders should be eligible for community notification takes place without the benefit of state-of-the-art prediction tools. Similarly, decision making regarding which sex offenders should be subjected to civil commitment resembles clinical judgments from an earlier era. There is a need for application of classification research beyond traditional contexts.

OFFENDER REENTRY

JEREMY TRAVIS AND ANNA CRAYTON

John Jay College of Criminal Justice

A defining characteristic of modern America is the nation's unprecedented level of imprisonment. For the 50-year period leading up to 1972, incarceration rates in America had remained remarkably constant, hovering around 110 per 100,000 population (Blumstein & Beck, 1999). Beginning in 1972, however, the nation has experienced a rise in its prison population every year. The prison population grew during times of war and times of peace, when crime rates rose and when they fell, in the midst of economic boom and economic recession. The increase that began in 1972 has been not only relentless but also substantial. Between 1973 and 2005, the number of people incarcerated in state and federal prisons increased by over 600%. There are now over 1.5 million people living in America's prisons, translating to an incarceration rate of 496 per 100,000 population (Sabol, Couture, & Harrison, 2007). If the jail population is included, the incarceration rate increases to 751 per 100,000 population and the number of people imprisoned in America totals over 2.3 million.

Viewing the state of imprisonment in America through different lenses underscores the scope and scale of this new reality. The growth of imprisonment has not been distributed evenly across the population; instead, the impact has been felt most acutely in poor urban communities, in particular, communities of color. Today, an African American man faces greater than a 30% probability that he will go to prison during his lifetime (Bonczar, 2003). For Hispanic men, the probability is 17%; for white men it is

6%. Although black men are disproportionately overrepresented in America's prisons, they are underrepresented in other, more prosocial systems. One such example is the American college system. In his recent book, Harvard sociologist Bruce Western (2007) calculated for specific groups the lifetime risk of incarceration compared with other life events, such as college, military service, and marriage. He found that black men born between 1965 and 1969 are seven times more likely than white men to have served time in prison by their 30s. On the other hand, white men are nearly three times as likely to have earned a bachelor's degree. Even more startling is the fact that in 2000 there were more black men incarcerated than there were enrolled in college (Schiraldi & Ziedenberg, 2002).

The American reliance on punishment as a response to crime also sets it apart from other countries. According to the International Centre for Prison Studies in London (n.d.), the United States, with 5% of the world's population, accounts for 25% of the world's prisoners. No other nation deprives such a high percentage of its citizens of their liberty. The incarceration rate in America is 6.2 times that of Canada, 7.8 times that of the United Kingdom, and 12.3 times that of France. Finally, in 2007, the nation passed another milestone: 1 in 100 adult Americans is now behind bars (Warren, 2008). America has entered a new, uncharted territory, without precedent in its own—or any country's—history. Our punishment policies constitute a new form of American exceptionalism, at dramatic variance with the philosophy and practice of the rest of the world.

Scholars have called this chapter of American history the *era of mass incarceration* (Drucker, 2002; Mauer & Chesney-Lind, 2002; Pattillo, Weiman, & Western, 2004) and have engaged in robust debate over the impact of high levels of incarceration on various dimensions of our society, including community well-being, family structures, poverty, race relations, labor markets, and voting patterns. One consequence of the era of mass incarceration is clear and inevitable: Many more people are leaving prison each year. The phenomenon of *prisoner reentry* reflects the “iron law of imprisonment”: With the exception of those who die in prison, from natural causes or execution, every person sentenced to prison comes home (Travis, 2005). The buildup in the prison population has inevitably led to an increase in the size of the reentry cohort. In 2007, an estimated 700,000 individuals left state and federal prisons, nearly five times the 150,000 who made similar journeys in the 1970s. Another 9 million individuals will leave local jails each year, constituting another version of the reentry phenomenon.

Prisoner reentry is not a new phenomenon. Clearly, people have been leaving prisons ever since prisons were first built. Neither is *reentry* a new phrase. The word *reentry* was used as early as 1967 in a report published by the federal Department of Health, Education and Welfare. John Irwin’s 1970 book *The Felon* contains a chapter titled “Reentry” that vividly describes the experience of leaving prison. However, beginning in the late 1990s, with support from the Department of Justice under then-Attorney General Janet Reno, the nation rediscovered prisoner reentry.

To address the unprecedented number of people being released from correctional facilities across the United States, the Justice Department launched a program sponsoring “reentry partnerships” among corrections agencies, police departments, and community organizations. These partnerships were designed to strengthen coordination of services to improve outcomes for people leaving prison. At the same time, the Justice Department spurred the creation of reentry courts around the country, applying lessons learned in other problem-solving courts, such as drug courts, to the unique experiences of formerly incarcerated individuals. The George W. Bush administration continued the federal role in reentry innovation, funding the Serious and Violent Offender Reentry Initiative, under which each state was invited to create gubernatorial-level reentry task forces to coordinate reentry services and test new reentry initiatives. A variety of criminal justice organizations undertook reentry programs; national associations of elected officials promoted reentry reform; prominent research institutions designed new studies of the reentry experience and tested the effectiveness of innovative programs; mayors designated staff with responsibility for local reentry initiatives; and national and local foundations awarded millions of dollars to support programs, research, demonstration projects, and policy advocacy in the reentry realm. Within the space of a decade, the nation was engaged in a robust policy conversation about prisoner reentry, and

some commentators concluded that this heightened era of interest and innovation constituted a “reentry movement.”

The challenge for scholars, students, policymakers, and practitioners is to link the realities of mass incarceration to the realities of prisoner reentry. Some of the linkages are obvious: A larger prison population translates into more people leaving prison. Some are less direct: The high level of imprisonment may have weakened the capacity of communities to reintegrate the large number of individuals, mostly men, returning home each year. Similarly, the same retributive impulse that led to higher rates of incarceration may pose barriers to successful reentry. Some linkages may be unexpected: The mere fact that so many people are now either imprisoned, under criminal justice supervision, or simply have felony records may create new alliances between social service providers and criminal justice practitioners. For example, the high rate of HIV–AIDS among the population under criminal justice supervision (either incarcerated or formerly incarcerated) means that public health providers working with the population living with HIV–AIDS would be strategically well advised to view the criminal justice population as offering an effective point of intervention.

The following sections of this chapter explore this intersection between the realities of mass incarceration and prisoner reentry. The first section examines the social and political forces that have produced our high level of incarceration. The next three sections highlight the impact of incarceration and reentry at the individual, family, and community levels. The final section provides an analysis of the current state of the reentry movement and some thoughts on the future.

How We Got Here

The extraordinary growth in the number of people incarcerated in America can be traced, on one level, to a series of public policy choices made by public officials: legislators who enacted sentencing reforms such as mandatory minimums, truth-in-sentencing laws, parole abolition, and three-strikes laws; prosecutors, judges, and parole board members who exercised their discretion in favor of more frequent and longer prison sentences; and parole and probation officers who were more likely to find violations of conditions of supervision and return parolees and probationers to prison. These shifts in public policy, in turn, reflected a political calculation that the public wanted its elected and appointed officials to be tough on crime.

According to an analysis by Blumstein and Beck (2005), the criminal justice system has indeed become more punitive over time. The probability that an arrest would result in imprisonment more than doubled, from 13% to 28%, between 1980 and 2001. This analysis also underscores an important point: The growth of the prison population between these years is not due to the increase in crime. In fact, the prison population continued to grow

throughout the 1990s despite a decrease in crime rates. In other words, America is placing more people in prison not because there is more crime but because America has chosen to rely on more imprisonment as a response to crime.

The nation's war on drugs has also been a major factor in the growth in imprisonment in America. Whereas the per capita rate of incarceration for most serious crimes increased significantly between 1980 and 2001—for murder (201%), sexual assault (361%), robbery (65%), and assault (306%)—the rate of incarceration for drug offenses increased by 930% (Travis, 2005). The level of punitiveness for drug offenses also increased during this time frame. In 1980, there were 2 prison admissions for every 100 drug arrests. By 1996, the rate had increased to 8 prison admissions for every 100 drug arrests. It is clear that the nation has decided that prison is the preferred response to drug crime and, as a result, 20% of the state prison population and over half of the federal prison population now comprises people convicted of drug crimes (Sabol et al., 2007), up from 6% and 25% in 1980.

There is a third factor contributing to the growth in incarceration: the fact that people in prison are serving more time than they did before. Between 1990 and 1999, the average time a person spent in prison increased 32% (Hughes, Wilson, & Beck, 2001). The increase in the amount of time being served by people in prison can be attributed to three developments. First, legislatures have increased the length of prison sentences overall by implementing mandatory minimums and truth-in-sentencing laws. Second, over the past quarter century, the nation has witnessed a significant shift in sentencing philosophy. For a 50-year period prior to the mid-1970s, every state in the nation, and the federal government, operated under a regime of indeterminate sentencing. Under this system, state legislatures would set broad ranges of possible sentences that could be imposed for various offenses; judges would impose sentences within those ranges; and parole boards would typically determine the actual date of the release from prison, weighing a variety of factors, including the prisoner's progress toward rehabilitation and his or her prospects for success upon return to the community. Beginning in 1976, a number of states passed legislation abolishing release by parole boards. In that year, about two thirds of prisoners were released by parole boards; by the end of the century, that level had declined to one quarter (Travis, 2005). Over roughly the same period of time, the nation increased the level of supervision—and the nature of supervision—of those released from prison. For four decades prior to 1970, about 2 of 5 prisoners released to the community were placed on parole supervision. As a result of the new legislation in the late 1970s, the number of individuals supervised by parole agencies ballooned from 220,000 in 1980 to 725,000 by the end of the century.

The third development is that simultaneously, the nature of supervision changed, evolving away from a services-and-supervision mission toward a surveillance and law enforcement mission (Petersilia, 2003). Under this new mind-set, which reflected the general national preference

for retribution over rehabilitation, parole agents were more inclined to find violations of the conditions of supervision and more likely to revoke supervision and return the parolee to prison. As a result, the number of parole revocations, including for violations of technical conditions of parole and for new crimes, increased sevenfold between 1980 and 2000. In 1980, only 17% of state prison admissions were parole violators; by 1999, that percentage had doubled, to 35% (Travis & Lawrence, 2002). Thus, this growth in the population under parole supervision, combined with the increased use of parole revocations, has resulted in an even larger prison population.

The reality that America now leads the world in its rate of incarceration, and has departed radically from its own history of low incarceration rates, can be traced to a variety of factors, but the predominant factor is the emergence of an unprecedented level of punitiveness toward people who violate the law. Running through this public posture is a powerful racial dimension. As was demonstrated by the infamous Willie Horton episode from the 1988 presidential campaign, racial stereotypes are often infused into public discussions about crime policy, and we face the undeniable truth that the impact of mass incarceration, and the unprecedented level of prisoner reentry, is felt most acutely in urban communities of color.

Impact on the Individual

The impact of the era of mass incarceration is experienced, of course, most directly by the millions of people in prison, who struggle to adapt to the conditions in prison, maintain contact with families, anticipate the day they will be released from confinement, and overcome the stigma associated with being an "ex-con." Over the past two decades, the length of prison stay has increased, the percentage of prisoners receiving services has declined, and the frequency of family visits has dropped, so the individual prison experience is demonstrably different than in years past.

Adapting a reentry perspective on the realities of imprisonment—in other words, realizing that everyone in prison ultimately returns home, and then asking whether they are ready for that journey—would call on prisons to take a more active role in preparing individuals for release. Through this lens, prisons can be viewed as an opportunity to engage incarcerated individuals in programs designed to help develop the skills needed to find employment upon release, maintain a substance-free lifestyle, and reestablish prosocial ties to the community.

The magnitude of this challenge is clear. The majority of men and women behind bars are from disadvantaged communities where there are limited opportunities and resources available. The incarcerated population is at a great disadvantage compared with the general population in terms of educational achievement, access to quality health care, and legitimate employment opportunities. For example, incarcerated individuals have lower levels of

literacy, lower high school completion rates, and more limited postsecondary educational experience than the general population (Crayton & Neusteter, 2008). Adequately addressing the needs of incarcerated people and individuals under supervision in the community has the potential to help increase public safety by decreasing the likelihood of the individual engaging in criminal activity or causing harm to those in the community upon his or her release. However, despite the skills and education the individual might obtain during his or her incarceration, upon release, a number of barriers stand in the way of his or her successful transition to free society.

The consequences of a criminal conviction are great and can be difficult to overcome. Many formerly incarcerated people are subject to a network of legislatively defined sanctions after release. These sanctions, known as *invisible punishments*, were not imposed by the judge at the time of the sentence and are poorly understood by the general public (Travis, 2002), but they pose significant barriers to the individual's efforts to achieve full reintegration. Also, consistent with the general trend toward greater punitiveness, the network of invisible punishment has also been expanded significantly over the past two decades. Individuals with felony convictions for drug offenses are now ineligible for public assistance and food stamps, can be excluded from public housing, and can be denied student loans. State legislatures and Congress have placed significant sectors of the labor market off limits to individuals with felony records. Most states bar individuals on parole or probation supervision from exercising the right to vote, and some states ban felons from voting for life (King, 2008).

The cumulative effect of these barriers to reintegration can have significant negative life consequences. As was mentioned earlier, the individuals returning from incarceration disproportionately come from, and return to, disadvantaged urban communities, typically communities of color. Prior to incarceration, many of these individuals relied on what limited governmental resources are available to them. However, after incarceration, many of these individuals will be unable to access the network of support that existed prior to their incarceration. For example, they might not be able to return to their families because of policies banning them from public housing. They might no longer be able to access the safety net of welfare benefits. Preventing people with criminal histories from accessing governmental assistance is not only a question of extended punishment but also an issue of public safety. Denying individuals access to services could increase the likelihood that the individual will return to criminal activities to support himself and his family.

One of the first priorities of an individual upon release is securing a place to live. Some have a home to return to and a family to welcome them back. For others, there is no family to return to, either because of broken family ties or an unwillingness on the part of family members to allow the individual to return home. People being released from prison without a place to live will face a number of challenges in

accessing housing, both in the public and private housing markets. The majority of housing available in the United States is found in the private housing market. The private market is generally beyond reach for most individuals being released from prison. Landlords often conduct credit checks, or criminal background checks, which would disqualify most individuals with felony records. Moreover, state legislatures have enacted legislation banning individuals convicted of certain offenses—sex crimes and some drug offenses—from living within designated geographic areas. Other laws require community notification whenever a person who has been convicted of a sex crime moves into their neighborhood, placing another formidable barrier to successful reintegration. The public housing market—both public housing developments and housing made available through Section 8 vouchers—is also off limits to some individuals returning from prison. Under federal legislation, public housing managers are authorized to deny public housing services to individuals convicted of designated offenses. Not only is the individual at risk, but his or her family may be evicted for continuing criminal activity, if it does occur. So, the network of support that in some instances may help with successful reentry is denied to some individuals coming home.

For some individuals leaving prison, the only housing option is a homeless shelter. Research on the connection between homelessness and prisoner reentry has demonstrated that a larger percentage of people living in homeless shelters were recently incarcerated, and many of them will return to jail or prison (Metraux & Culhane, 2004). Many jurisdictions around the United States have sought to interrupt this cycling in and out of prison and shelter, creating transitional housing options for people coming out of prison and supported housing options for people living in homeless shelters.

Contributing to the ex-con stigma are employment bans and hiring practices that prevent formerly incarcerated individuals from obtaining jobs. After housing, employment is one of the fundamental needs of an individual leaving prison. The existence of employment bans are understandable in certain situations. For example, many would agree that it would not be appropriate for a person convicted of a sex crime perpetrated against a child to have a job working at a child care facility. However, many employment bans are blanket policies that affect all people with criminal histories, regardless of their crimes. In the United States, people with felony convictions are denied employment or licenses in over 800 occupations (Cromwell, Alarid, & del Carmen, 2005). Such occupations include cosmetology, barber, emergency services, and practicing law.

Moreover, employers have virtually unlimited access to potential employees' criminal backgrounds. Employer discrimination against people with criminal histories is not a new phenomenon; however, the advent of online databases—many of which have been deemed inaccurate or as missing information—has increased opportunities for discrimination. In addition, it is customary for applicants to come

across a question on a job application or in an interview that inquires about a person's criminal history. For many formerly incarcerated people, the answer to the question "Have you ever been convicted of a felony?" will be the reason they do not get the job. For that reason, some jurisdictions have joined what is known as the "ban the box" campaign (Henry & Jacobs, 2007). In these jurisdictions, background checks are allowed only after the job applicant has been determined otherwise eligible for the position in question, and the final hiring decision will be made only after an assessment of the nexus between the behavior leading to the conviction and the requirements for the job.

The net effect of these barriers to employment is that individuals who have served time in prison face significantly diminished earnings prospects. According to analysis by labor market economists, individuals with prison records will experience a 10% diminution in earnings over their lifetimes (Western & Pettit, 2000). To interrupt this trajectory toward lower employment outcomes, and the economic marginalization that is implied, some jurisdictions around the country are experimenting with programs that offer transitional employment to individuals returning from prison, helping them get back on their feet until they can find permanent employment.

In addition to connecting with family, finding housing, and securing work, people coming home from prison often face significant challenges in connecting with health care services. The prison population presents health problems that are significantly higher than found in the general population. The prevalence of a variety of communicable diseases—including HIV–AIDS, hepatitis, tuberculosis, and sexually transmitted diseases—is between 4 to 10 times higher in prison than in the general population (National Commission on Correctional Health Care, 2002). The rates of mental illness are also higher. Three quarters of those currently incarcerated have histories of drug and/or alcohol addiction. Whatever the quality of health care in prison—and there is substantial variation in these services—the process of reentry poses a challenge in terms of connecting the returning prisoner to appropriate community-based services. In some instances, this is an acute need, as in the case of medication to treat an individual's mental illness or of continuing care for HIV–AIDS. In other instances, the period of reentry presents high probabilities of relapse to risky behavior, as in the case of someone with a history of addiction, or challenges to mental health when dealing with the stresses of a return to free society.

Finally, one of the greatest challenges facing individuals returning home is to avoid future criminal behavior. According to the Bureau of Justice Statistics, two thirds of returning prisoners are rearrested for one or more serious crimes within 3 years of their release from prison (Langan & Levin, 2002). Fifty percent of them are returned to prison, half of them for a new crime and half for a parole violation. This overwhelming reality of reentry means that the other efforts to secure reintegration—by getting a job,

reconnecting with family, securing housing, and accessing health care—can all be for naught if the formerly incarcerated man or woman is rearrested for a new crime. One aspiration of the reentry movement is that the innovations in reentry programs will result in reductions in the recidivism rates across the nation. Any significant progress in this direction could have beneficial effects in communities struggling with high crime rates. As the size of the reentry cohort has increased over the years, and rates of violent crime have decreased since the early 1990s, the share of arrests attributable to the reentry cohort has increased, meaning that any success in reducing criminal behavior among returning prisoners could yield measurable public safety benefits.

Impact on the Family

The effects of incarceration and reentry extend beyond individuals who have had direct experience with the criminal justice system. Family members of the incarcerated and formerly incarcerated also feel the harmful effects of the experience of their family members being arrested; removed to prison for, on average, nearly 3 years; and then returned to the home, placed on parole supervision, and in many cases cycling in and out of prison. Removing a parent from the home not only interrupts the function of the traditional family but also removes a source of income because one less adult is working. This loss often forces the remaining family members—usually the mother—to take on additional employment, thus reducing time for parenting. Furthermore, family members are often left to cover costs associated with incarceration itself: Providing money to the incarcerated family member, accepting collect phone calls, and traveling long distances for visitation are expenses that add up over years of incarceration.

Little is known about the effects of incarceration on children. It is clear, however, that the reach of imprisonment extends deeply into the population of minor children in America. The Bureau of Justice Statistics has reported that at least 1.5 million children have a parent who is currently incarcerated, and another 10 million have had at least one parent incarcerated at some point in their lives (Mumola, 2000). They represent 2% of all minor children in America. As with the incarcerated population generally, the racial profile of these children is revealing. A sobering 7% of all African American minor children in the United States currently have a parent in prison.

The separation of a parent from his or her child can have great consequences, both for the parent and for the child. The contacts between parent and child during incarceration are infrequent, strained, under artificial conditions, and costly. At the time of release, reestablishment of the parent–child relationship is enormously difficult, and sometimes impossible. The passage of time, the shame and stigma of the parental incarceration, and the absence of positive interactions all pose barriers to successful reconnection

between parent and child. Yet, notwithstanding these barriers, the parent–child bond is often powerful and resilient. For some individuals leaving prison, the opportunity to create, or reestablish, a positive relationship with their children provides strong motivation to succeed in the reentry process. However, the overwhelming reality remains, namely, that the era of mass incarceration has, in effect, cast a long shadow across the next generation as more and more young Americans are growing up having lost their parents to imprisonment. Little is known about the intergenerational consequences of this reality.

On a more macro level, the removal of larger numbers of men, sending them to prison, and returning them home with significant new social challenges in terms of participation in the world of work and other institutions of civil society, has created communities that are experiencing new realities in the relationships between men and women. In these communities the pool of marriageable men is significantly reduced, contributing to an increase in the number of single mothers (Braman, 2002). It is likely that the process of removing so many men from families and communities has a great impact on early childhood development of the community's children, the dating relationships of its teenagers, the family formation behaviors of its young adults, and the long-term shape of family life. However, research in this area is lacking, and it is impossible to fully understand the impacts of incarceration and reentry on children and families.

Impact on the Community

The effects of mass incarceration and prisoner reentry also extend beyond the formerly incarcerated individuals and their family members. In many ways, the most profound effects of these phenomena are experienced at the community level, because the ripple effects of imprisonment are felt in virtually every aspect of community life. In every city in America, the majority of individuals sent to prison come from a small number of neighborhoods. These are typically communities of color, which are already facing other challenges of low-performing schools, poor health care, weak labor markets, inadequate housing, and high rates of crime. In the era of mass incarceration these communities have been asked to take on an unprecedented social responsibility: the reintegration of record numbers of returning prisoners, mostly men, who have been taken out of the natural rhythms of community life and are now expected to regain their footing.

The costs of the high rates of incarceration can be calculated at a community level. Analysts have demonstrated that there are certain blocks in central urban neighborhoods with high rates of incarceration for which taxpayers pay over \$1 million a year to house, in prison or jail, the men and women from that block. According to one analysis, in Brooklyn, New York, there are 35 such “million dollar blocks” (Cadora, Swartz, & Gordon, 2003). This analysis provides the basis for a provocative policy exercise, namely, asking

whether the taxpayers could get better public safety results by investing a portion of the \$1 million in strategies other than high rates of imprisonment of the block's residents.

These communities bear another cost. The high levels of arrest activity, incarceration, reentry, and supervision have permeated community life and have weakened the social networks and relationships that provide the foundation for an orderly society. Some scholars have concluded that the high rates of incarceration have so weakened the forces that exert informal social control that the nation's prison policies have had the unintended and ironic effect of actually increasing crime rates, even though these policies were originally advanced as a way to reduce crime (Clear, Rose, Waring, & Scully, 2003).

The impact of incarceration on individuals can also translate into larger social problems. Computer software now allows researchers to create maps of communities based on traits such as crime rates; incarceration rates; and other social factors, such as poverty rates and rates of sexually transmitted infections (STIs). Using this technology, and looking at the reentry phenomenon through the lens of public health, one can see how a problem at the individual level quickly translates to a problem for the community. As previously mentioned, many individuals released from incarceration have little or no access to health care upon release. Like other communicable diseases, the rate of STIs among the incarcerated population is higher than that of the general population. Men and women returning from prison return to their partners, some to multiple partners, exposing them to diseases they might not even know they have. Mapping research conducted at the community level suggests a relationship between incarceration and communities with high rates of STIs (Thomas, Levandowski, Isler, Torrone, & Wilson, 2008).

Looking Toward the Future

The growth of incarceration in America has slowed down in recent years, but it has not abated. Some states have experienced declines in their prison population, but the overall trend remains a growth trend, even though the rates of violent crime are at the lowest level in a generation. There are some signs, however, that the policy environment is shifting. A number of states have eliminated mandatory minimum sentencing statutes, others have modified their truth-in-sentencing calculations to allow shorter sentences, and still others have adopted parole supervision reforms that have reduced the number of individuals sent back to prison for parole violations. Perhaps most noteworthy has been a campaign to return voting rights to hundreds of thousands of formerly incarcerated individuals who were denied the franchise.

The reentry movement has grown significantly in the decade following Attorney General Reno's call for proposals for reentry partnerships and reentry courts in 1999. Now, the terminology of reentry is well accepted, and the justice

reform community has embraced the challenge of improving reentry programs. Every state in the nation and many urban jurisdictions have established reentry task forces to bring together the public and private entities that work with individuals leaving prison. These coalitions now include active participation of other service sectors that were not always active in justice reform initiatives, such as public health professionals, groups working on low-income housing, organizations devoted to workforce development, and agencies advocating for child and family welfare. It is indeed ironic that these service and advocacy communities have found common cause with the justice agencies working on prisoner reentry. One unavoidable consequence of high rates of incarceration is the high rate of overlap between the population involved in the justice system and those seeking to improve public health, child and family well-being, employment rates, and adequate housing.

One of the most significant developments in this regard was the enactment of the Second Chance Act, which was signed into law by President George W. Bush on April 9, 2008. In his 2004 State of the Union Address, President Bush asked his audience to consider the challenges facing people leaving prison: “We know from long experience that if they can’t find work, or a home, or help, they are much more likely to commit crime and return to prison.” He then proposed a 4-year, \$300 million prisoner reentry initiative, saying that “America is the land of the second chance, and when the gates of prison open, the path ahead should lead to a better life.”

The Second Chance Act, taking its name from President Bush’s eloquent statement about the difficulties of prisoner reentry, signals an important moment in criminal justice policy in America, a time when the federal government exercised leadership in helping individuals, families, and communities deal with the realities of reentry. This remarkable bipartisan consensus leaves unaddressed, however, the fact that the country has chosen to place those individuals in prison in the first instance. Some advocates for policies that would reduce America’s reliance on incarceration have applauded this new national focus on prisoner reentry, believing that a pragmatic discussion of the impact of incarceration on individuals leaving prison will inevitably lead to questioning the sentencing policies that put them in prison. Proponents of this hopeful view can point to a range of sentencing reform initiatives to support their view that the reentry movement will soften the ground for broader reconsideration of the country’s punishment policies. Others argue, however, that the focus on prisoner reentry has been a distraction from the more difficult task of rolling back the nation’s imprisonment juggernaut. They point to the continuing rise in the rate of incarceration, even in a time of stable crime rates, as evidence of the intractable nature of America’s unprecedented reliance on prison as a response to crime. They ask a difficult rhetorical question: What if all the energy now devoted to prisoner reentry had been focused on sentencing reforms?

Only time will tell whether the rediscovery of prisoner reentry in the era of mass incarceration has any influence on the direction of crime policy in general, but even without an answer to that intriguing question there is no doubt that over the past 10 years the United States has, belatedly, recognized one of the inevitable consequences of the ramp-up of imprisonment, namely, the return home each year of hundreds of thousands of individuals, mostly men, who have been removed from their families and communities and held in the nation’s prisons. This overdue recognition, on its own terms, has the potential to restore a human dimension to our understanding of the consequences of our policy choices and to provide common ground for a movement that would ameliorate the negative effects of those policies. The reentry movement has been characterized by a burst of programmatic innovation; an array of federal, state, and foundation funding initiatives; unprecedented scholarly attention; the engagement of formerly incarcerated individuals; and a sense of optimism, all of which will serve the larger cause of justice.

JUVENILE COURTS

GEORGE W. BURRUSS

Southern Illinois University Carbondale

As therapeutic legal institution, the juvenile court balances rehabilitation and justice for America's youth who are at risk for harm or have violated the law. The juvenile court was founded in 1899 in Chicago with the goal of rehabilitating wayward youth. Although the methods of rehabilitation, or treatment, have changed over time, it is a goal that remains central to the function and legitimacy of the juvenile court. Treatment encompasses many different means of attending to the needs of delinquent or neglected youth: psychological supervision, medical services, behavioral management, educational needs, and restitution to victims or the community. Despite treatment being the fundamental goal, juvenile courts recently have become more criminalized because of concerns about fairness; that is, they are more like adult criminal courts. Examples of criminalization include an increased use of determinate outcomes and more adversarial proceedings.

The juvenile court is an important component of the American criminal justice system because it adjudicates wrongdoing by juveniles and attempts to prevent future crimes by addressing the root causes of problem youthful behavior. When parents fail to informally control their children and prevent wrongful behavior, society has an obligation to punish and correct delinquent youth. However, authorities must intervene in a way that acknowledges the limited rationality of immature minds. Juvenile court practitioners assume they can rehabilitate wayward youth through treatment. Consequently, the juvenile court prevents crimes

by treating the root causes in individual juveniles' lives—drug or alcohol dependence, criminal associations, poor parenting, and so on. Because young minds are impressionable, court caseworkers want to intervene early in a child's life to alter bad behavior and poor decision making. From its inception, the juvenile court has applied the best scientific methods from medicine, psychology, criminology, sociology, and social work to change antisocial behavior. Critics of the juvenile courts have noted a tendency toward punishment over treatment; thus, juveniles have due process rights in court procedures to ensure fair hearings.

Because of the juvenile court's rehabilitative orientation and legal authority, it has developed terminology that is analogous to criminal justice terms yet is slightly different. Some of the more common terms are defined here. When a juvenile commits a felony crime, it is called *delinquency*, meaning that a juvenile is delinquent in his or her obligation to society. Delinquency includes personal and property crimes, such as robbery and burglary. Behaviors that are prohibited only for youth are called *status offenses* (the age cutoff between youth and adulthood varies by state). Status offenses include truancy, drinking alcohol, breaking curfew, and incorrigibility (i.e., being uncontrollable). Cases in which juveniles need intervention because they are not being cared for by parents or guardians are called *abuse* (if done so maliciously) or *neglect* (if done so unintentionally). Although juvenile courts handle all kinds of family- and youth-related matters, such as adoption and guardianship, this chapter focuses on delinquency matters.

To emphasize the treatment goal, juvenile courts avoid the stigmatizing language used in the adult criminal courts. For instance, a juvenile is *referred* to the court rather than *arrested*. A formal written complaint against a juvenile is called a *petition* rather than a *charge*. The *trial* is called an *adjudication*, and the *sentence* is called a *disposition*. Finally, to be held in *custody* until the adjudication hearing is called *detention*.

Juvenile court professionals have designations similar to those of their counterparts in adult courts, but their roles differ slightly. A juvenile court judge is a magistrate who is responsible for adjudicating delinquency, status offenses, and abuse and neglect cases and other legal family matters. In most jurisdictions the judge also runs the juvenile court office, hiring personnel, setting office policies, and planning the budget. A chief juvenile office manager oversees daily functions, but the judge holds the ultimate authority over operations. This particular role for the judge differs from the adult system. If a felony court judge had the same responsibilities in the adult system, that judge would oversee probation and parole as well as sit on the bench. In urban courts with large dockets, several officers, known as *magistrates*, *referees*, or *masters*, may adjudicate cases. A chief judge authorizes these officers to adjudicate cases.

Juvenile court cases can involve attorneys acting as prosecutor and defense counsel. Most juvenile courts retain an attorney who acts as a prosecutor, employed by either the juvenile court or the county district attorney's office. In urban courts a prosecutor may sit in on all felony delinquency cases; in rural courts the prosecutor may only appear in only a few contested cases. The job of the juvenile court prosecutor is to plead the state's case against the juvenile; however, unlike in the adult criminal courts, the juvenile court prosecutor consults with the probation officers with regard to an outcome that is in the best interests of the juvenile (i.e., involves some kind of treatment plan). More recently, many prosecutors also invoke public safety as a concern in the state's case to justify secure confinement or waiver.

Although they do not routinely appear in juvenile court cases, defense counsel can be either a court-appointed public defender or a privately hired attorney. Most defense attorneys, however, do not specialize in juvenile court law. Even though criminal court judges appoint public defenders only to represent indigent adults, most juvenile court judges appoint a public defender if requested regardless of a family's means. In abuse and neglect cases, however, private attorneys, known as *guardians ad litem*, are routinely appointed by the judge to serve as legal guardians for the youth.

Juvenile court probation officers are central to realizing the juvenile court's treatment goal. Probation officers handle cases from the initial intake stage to postadjudication probation. In many rural jurisdictions the same person performs all these tasks. Much of what probation officers do is to gather information about the juvenile and the offense. For instance, probation officers write up predisposition

investigation reports for the judge to consult once the juvenile has been found delinquent. These reports make treatment recommendations that the judges use to determine disposition outcome. Thus, the juvenile officer must generate an individualized treatment plan that addresses the unique needs of the juvenile. In some jurisdictions, especially when the case is uncontested, the probation officer may present the state's case before the judge. Thus, the probation officer has much discretion and a wide range of responsibilities in the juvenile justice system.

Before discussing the juvenile court process, a brief history of the foundation of the juvenile court and attempts at reform will help highlight why these courts operate differently from the adult criminal justice system. Then a brief overview of the juvenile court process is discussed, along with current problems facing the institution today. Finally, the future direction of the juvenile court is discussed.

A Brief History of the Development of the Juvenile Court

In the century prior to the establishment of the juvenile court in 1899, a growing problem of delinquent and impoverished urban youth led states to respond by building houses of refuge. As American migrants and European immigrants began settling in cities to work in factories, they displaced their children from small homogeneous rural communities into densely populated and diverse urban neighborhoods. These new urban settlers found they had less ability to supervise their children while their children had more opportunity to commit crime. The only official methods of controlling delinquent youth were arrest and adult criminal prosecution. Because judges were unwilling to send children to jails or prison, they were let go with no corrective measures taken. Thus, there were only two formal options available: (1) let them go or (2) send them to adult prisons.

Because no state institution existed to handle delinquent youth, prominent Quaker reformers proposed the houses of refuge for the reeducation and rehabilitation of delinquents and impoverished youth. The Quakers reasoned that poor living conditions caused poor parenting and bad behavior by children; therefore, the way to reform delinquent youth was to remove them from the cities and place them in a rural institution. In the houses of refuge, idle youth would learn to behave through industry, basic education, and moral instruction until they became adults, typically their 21st birthday. It did not take long, however, before the need to control the committed youth overcame the reformers' good intentions. The houses of refuge became what sociologist Irving Goffman called a *total institution*—where custody became more important than treatment or education.

The legality of removing children from their parents' homes and placing them in institutions was tested in the case of Mary Ann Crouse in 1826, 1 year after the first house

of refuge opened. To prevent her child from becoming a pauper, Mary Ann Crouse's mother had her committed to the Philadelphia House of Refuge. Mary Ann's father, however, challenged the commitment and filed a writ of *habeus corpus*, demanding to know why she was held in custody, because she had committed no offense. The matter was finally settled by the Supreme Court of Pennsylvania in 1838. The court held that the house of refuge was helping Mary Ann Crouse and not punishing her; therefore, the state was acting on behalf of her interests with good intentions. This case established the legal doctrine of *parens patriae*, which, literally translated, means "parent of the country." This doctrine allowed the state to take custody of wayward and delinquent youth. The *parens patriae* doctrine came from English common law and applied to handling the estate of orphaned children. The Pennsylvania Supreme Court, however, applied *parens patriae* to the Crouse case and established that the state could act as legal guardian even when the parents did not relinquish their rights. The court reasoned that juveniles were being cared for and not punished, so due process rights were not necessary. Thus, Mary Ann Crouse, and juveniles like her who had committed no offense, could be placed legally in an institution along with delinquents.

By the end of the 19th century, the house-of-refuge movement had failed to maintain best interests over punishment. This became evident in the 1870 Illinois Supreme Court case of Daniel O'Connell, which highlighted the fact that poor juveniles were being punished rather than helped (the opposite finding of the *Crouse* case). In fact, the *O'Connell* decision outlawed the practice of sending poor youth who had not committed a felony crime to reform schools. Although the case did not overturn *Crouse*, it highlighted the Illinois Supreme Court's skepticism about the benign operation of the houses of refuge. The immediate result of the case was that poor youth could not be placed in a house of refuge simply for being poor.

At the beginning of the 20th century, new reformers, called the *Progressives* or *Child Savers*, took up the cause of reforming delinquent youth. The Progressive reformers, mostly wealthy Protestant women, had many of the same concerns as the Quaker reformers, but they tried to improve the condition of wayward youth through the latest scientific and professional means, namely, psychology and law. Although they attempted to improve the conditions in the houses of refuge, their enduring legacy would be to establish a legal institution: the juvenile court.

The first juvenile court was founded in Chicago in 1899, with the intent of extending the *parens patriae* doctrine for all youth in need of care or supervision—the poor, abused, neglected, orphans, delinquents, and the incorrigible. The need for a separate legal institution was due in part to the *O'Connell* decision that limited the state's custody to delinquency matters only. In addition, juveniles who did commit delinquency still had to appear before a criminal court judge, who was likely to dismiss the case. The Progressive reformers petitioned the Illinois legislature to

create a juvenile court that would have jurisdiction over all youth and could intervene on behalf of the child's best interests. Because the O'Connell decision had questioned the legitimacy of *parens patriae* for nondelinquency matters, the Progressives proposed the new court as a civil court rather than a criminal one. Thus, the court could intervene under *parens patriae* and do so without having to assure due process protections guaranteed in criminal matters. The Progressives envisioned the juvenile court as a social welfare institution rather than a criminal justice agency.

The early juvenile court hearings were less formal than adult criminal trials, to emphasize the treatment orientation over punishment. The judge or master sat at a conference table with the juvenile rather than sitting behind a bench. Caseworkers who investigated the social needs of the youth were also present at the conference and given wide discretion to help the judge decide how to rehabilitate the juvenile. Instead of providing the same treatment for similar petitions in the name of fairness, probation officers tailored outcomes to each juvenile's special needs. For example, two juveniles who committed the same act under the same circumstances could receive very different outcomes. As mentioned earlier, the founders of the juvenile court movement used terminology that suggested treatment over punishment; for example, they called the delinquency hearing an *adjudication* instead of *trial* and the outcome a *disposition* instead of a *sentence*. In the early courts, defense counsel and prosecutors were not necessary, because the hearings were not adversarial: The court was acting in the best interests of the child, so due process was unnecessary.

Due Process Reforms

Like the social movement that created the houses of refuge, the juvenile court as an institution generally failed to advance rehabilitation over punishment. By the 1960s, it had become clear that the juvenile court needed further reform, because many juveniles faced long durations in secure facilities without benefit of due process. The U.S. Supreme Court, led by Chief Justice Earl Warren, imposed important reforms on the juvenile court process.

In the 1960s, the Supreme Court began to hear appeals from juvenile court cases in an effort to settle the need for due process in the civil treatment-oriented juvenile courts. The *parens patriae* doctrine established in the *Crouse* case limited juveniles' due process rights in exchange for treating needs over punishing wrongdoing (known as *quid pro quo*). In addition to the Supreme Court action during this period, President Johnson's Commission of Law Enforcement and Administration of Justice criticized both the juvenile justice system and the adult criminal justice system and called for comprehensive reform. There are several important cases during this period that led to the criminalization of the juvenile justice system. Only three are discussed at length here to highlight the way juveniles

were being treated and how the Supreme Court decided the cases: (1) *Kent v. United States*, (2) *In re Gault*, and (3) *In re Winship*.

Kent v. United States

The first case that precipitated legal reform began in 1961, when Morris Kent, a 16-year-old boy, was charged with breaking and entering, robbery, and rape. Already on probation for breaking and entering and purse snatching when he was 14, Kent was arrested for breaking into a woman's apartment, taking her purse (robbery), and raping her. The police found that latent fingerprints at the crime scene matched Kent's prints taken during his previous arrest. While in custody, Kent's mother hired an attorney who anticipated that the judge would waive, or transfer, the case to the adult criminal court, which would most likely result in a longer sentence; thus, the attorney planned to contest the waiver. In planning the case, the attorney filed a motion to see Kent's social history. The judge, although he received the attorney's motion, ruled in favor of waiver without holding a hearing. The judge did indicate that he had made his decision after conducting an investigation but did not elaborate on his decision.

After the juvenile court waived its jurisdiction, Kent was indicted in adult criminal court and later tried in front of a jury. The jury found him guilty on six counts of house-breaking and robbery but not guilty of rape by reasons of insanity. The judge sentenced Kent to prison for a term between 30 to 90 years. Kent was committed to a mental hospital until his sanity restored, at which time he would serve the remainder of his sentence in prison.

The U.S. Supreme Court took up Kent's appeal, which argued that he was denied due process during arrest and during the waiver decision. The Supreme Court ruled that the juvenile court had denied Kent his due process rights in violation of the District of Columbia statutes. The court affirmed that Kent should have had attorney representation, access to his related juvenile court records, a hearing specifically on the waiver decision with due process, and a detailed explanation from the judge for the reasons behind the waiver decision. In an appendix to the decision, the justices listed guidelines for future waiver hearings. The guidelines included eight criteria judges must consider for waiver: (1) community protection, (2) premeditation or aggressiveness of the offense, (3) a crime against persons, (4) reliability of available evidence, (5) adult criminal associates, (6) the juvenile's sophistication and maturity, (7) prior offense record, and (8) amenability to treatment. Furthermore, the justices allowed that all factors need not be present to waive jurisdiction but said that the judge should address them in his or her final decision.

The *Kent* decision pertained only to the District of Columbia; however, juvenile courts across the country applied the criteria to their waiver decisions. Ironically, Kent was given a new hearing to reconsider the waiver decision after he had already been found guilty in adult

court. The new hearing found that the judge had adhered to the criteria set out in Kent's own appeal and thus the original waiver decision was valid. Kent therefore served the remainder of his sentence. The *Kent* decision had two important outcomes: (1) It signaled that *parens patriae* was no longer beyond due process considerations and (2) established that the Supreme Court would now hear juvenile appeals.

In re Gault

The case of Gerald Gault followed the *Kent* decision in 1967 and affirmed due process protections for juveniles throughout the entire juvenile justice system. In Arizona, in 1964, Gerald Francis Gault, age 15, and Ronald Lewis made an obscene phone call to a neighbor, Mrs. Cook. The obscene phone call included the following statements: "Do you give any?" "Do you have big bombers?" and "Are your cherries ripe today?" Incensed, Mrs. Cook called the sheriff, who arrested Gault and Lewis, placing them in a detention facility. Gault's parents were not informed that he had been detained; Gault's mother learned about the detention from the Lewis family.

Mrs. Cook did not attend the hearing the next day, so she did not identify the boys as the callers or offer any testimony. The judge claimed that Gault had admitted to making the lewd statements, but Gault denied making any such confession, claiming that he had only dialed the number. Gault was released to his parents until a second hearing that would decide the outcome.

At a second hearing, Gault's mother requested that Mrs. Cook be called as a witness to identify the voice of the caller, but the judge said that Mrs. Cook need not be in attendance. There was no transcript kept of the hearings. The judge found Gault delinquent and committed him to a state industrial school until his 21st birthday (a 6-year sentence). The judge later justified his disposition decision on the grounds that Gault had engaged in disturbing the peace and had a history of delinquent behavior (he was on probation for being in the company of another youth who had stolen a purse). Had Gault been an adult, the outcome could have been only a maximum of 18 months and a \$50 fine. Gault's parents hired an attorney who filed a writ of habeas corpus (Arizona did not allow appeals for juvenile cases). The writ was the basis of the U.S. Supreme Court decision.

Gault's attorney argued that the juvenile court had denied him six constitutional rights: (1) right to notice of charges, (2) right to counsel, (3) right to confront and cross-examine witnesses, (4) right against self-incrimination, (5) right to transcript of the proceedings, and (6) right to an appeal. The Supreme Court ruled in Gault's favor in four of the six points but did not rule on the right to a transcript or the right to an appeal because there is no constitutional guarantee of appeal and thus no need for a right to a transcript. In its reasoning, the majority argued that the juvenile court was punishing Gault rather than treating him, especially considering that he was at risk for a lengthy

commitment in a secure facility, a sentence that no adult would have faced. The justices also questioned the foundation of *parens patriae*, because the performance of the juvenile justice system seemed to have failed to live up to its intentions. The Supreme Court ultimately concluded that due process protections were necessary when juveniles were likely to face lengthy incarceration.

Because the *Gault* case had constitutional ramifications, it applied to the entire country, unlike *Kent v. United States*. The Supreme Court's affirmation of due process in the traditionally informal juvenile court attempted to reform the institution. After the *Gault* decision, juveniles had the rights to know the charges, to counsel, to confront witnesses, and to remain silent. The actual implementation of these legal reforms, however, remained limited. Juveniles were likely to have their constitutional rights explained to them by probation officers, much like the Miranda warning given by police, but most juveniles did not ask for legal representation, and most juveniles routinely confessed to the crimes. The implementation of the *Gault* reforms, although important, remains problematic today. This is discussed in more detail later in this chapter.

In re Winship

In 1970, the Supreme Court heard the case of 12-year-old Samuel Winship, who was charged with stealing \$112 dollars at a department store. At the adjudication hearing, Winship's attorney established that the key eyewitness was in a different part of the store at the time of the theft and thus could not have seen Winship steal the money. The judge ruled that Winship was delinquent based on a *preponderance of the evidence*—that the evidence was sufficient to establish that Winship had committed the theft. Winship's attorney questioned the judge about the evidentiary standard, because the eyewitness testimony failed to establish that Winship was guilty beyond a reasonable doubt. The judge ruled that the state's statute on juvenile justice calls for a preponderance of the evidence, a standard of evidence use in civil court.

The Supreme Court again ruled in favor of due process rights for juveniles given that Winship was likely to spend several years in a secure facility. As in *Gault*, the justices questioned the quid pro quo of the *parens patriae* doctrine. They ruled that in delinquency cases where a juvenile faced a sentence in a secure facility, the judge must use the reasonable doubt standard before finding juveniles delinquent. Moreover, they made the ruling retroactive so that juveniles who had been committed under the preponderance of the evidence standard prior to the *Winship* case had to be released or readjudicated. This ruling, like the ones in *Gault* and *Kent*, signaled the criminalization, or imposition of due process, in the treatment-oriented juvenile court.

Two more Supreme Court cases during this era affected juvenile courts: (1) *McKeiver v. Pennsylvania* and (2) *Breed v. Jones*. The *McKeiver* case centered on whether juveniles had the right to a jury trial. Unlike in the previous three

cases, the Supreme Court ruled that juveniles did not have a constitutional right to trial by jury. In the *Gault* and *Kent* cases, the Supreme Court had ruled on the fact-finding by judges and found that due process was necessary to curb abuse. The court stopped short of giving full due process rights to juveniles with *McKeiver* because they claimed the juvenile court was, in fact, different from the adult criminal courts and they wished to preserve its unique nature. A jury trial, they reasoned, would severely intrude on the informal nature of the juvenile court. The second case, *Breed v. Jones*, established that double jeopardy applied to adjudication hearings: Juveniles could not be tried twice for the same offense, once in juvenile court and again in adult court.

In the *Kent* decision the justices had called the juvenile court the "worst of both worlds," meaning that juveniles got neither the due process protection that adults enjoyed nor the rehabilitative treatment that the Progressives had promised. The total effect of the Supreme Court reforms was to ensure due process rights while retaining some of the informal and treatment orientation of the original system. *Breed v. Jones* was the last case in the historic Supreme Court restructuring of the juvenile court system. By the time of the *McKeiver* decision, the Warren Court had been replaced by the more conservative Berger Court (four conservative justices were appointed by President Nixon).

These Supreme Court cases were not the end of attempts to reform the juvenile court. Other Supreme Court cases, along with federal and state initiatives, have attempted to return the juvenile court to its original goal of rehabilitation even in a milieu of harsh punishment and individual responsibility. Criminologist Tom Bernard (1992) referred to this ongoing succession of reform as the *cycles of juvenile justice*. The reforms attempted to date have had unanticipated consequences. Other attempts at reform have included targeted strategies, such as reducing disproportionate minority confinement and individualized treatment courts such as drug and DWI courts.

Although juveniles are now able to assert their due process rights, the dilemma of *parens patriae* continues: informal justice to facilitate treatment versus formal processing to guarantee due process. For example, juvenile courts operating under a traditional treatment orientation tend to view legal representation as an impediment to rehabilitation; that is, juveniles who retain counsel may escape treatment on legal grounds. Thus, some judges and probation officers unofficially de-emphasize due process in their courts. For example, an intake officer may inform a juvenile of her right to counsel but tell her that confessing without counsel present will ensure she gets more favorable treatment by the judge.

Because the Supreme Court due process reforms have not been fully implemented in many jurisdictions, some critics have called for the abolition of the juvenile court for all delinquency matters. The critics propose that delinquency cases be heard in the adult criminal courts so juveniles are assured full due process. This does not mean juveniles will fail to get treatment; instead, they can still receive a sentence

for probation by a juvenile probation officer or placement in a residential treatment facility. Furthermore, the adult court judge would consider the youth and immaturity of the juveniles as a mitigating factor. To date, no state has considered abolishing the juvenile court.

The Juvenile Court Process

This section describes the juvenile court process. Although most states follow this same process, there is wide variation in daily practices and policies across states and even within states. Therefore, interested readers should consult practitioners at the local level to find out how they depart from the process described here. Because most referrals to the juvenile court come from the police (about 80%), many delinquency offenses are handled informally (i.e., not referred) before the juvenile court has an opportunity to process the matter. Police discretion in handling juvenile cases is an important consideration but is not discussed here. The first official step in the juvenile court process is called *intake*.

Intake

When the police, schools, social service agencies, or even parents refer a juvenile to the juvenile court, the matter is typically assigned to an intake officer. In smaller jurisdictions the same officer might handle intake and other functions, such as probation. In larger, urban courts an entire unit may be devoted only to intake. If the matter is serious enough, or the juvenile is deemed a threat to himself or herself or the community (e.g., an assault or suicide attempt), the juvenile likely will be sent directly to a detention facility; otherwise, intake is handled at the juvenile court office. In addition, serious offenses in some states, such as homicide or armed robbery, necessitate referral to the prosecutor's office, thus bypassing the intake stage.

The intake officer typically has wide discretion in how to handle the referred juvenile, especially for minor and first-time offenders. Again, jurisdictions vary on how much discretion the intake officer has—some mandate specific outcomes for specific offenses or specific personal characteristics, such as having a prior delinquency referral. In most jurisdictions the intake officer informs the juveniles of their constitutional rights, including the right against self-incrimination and the right to counsel.

At intake, there are three actions the juvenile court can take: (1) dismissal, (2) diversion, or (3) filing a petition. The first action, *dismissal*, means that the court takes no further action against the juvenile, although the intake office will collect information about the juvenile and the alleged offense. Although there is no formal (legal) record of the referral, the juvenile court will keep a file, which can influence its future decision making (several dismissals for status offense, for instance, may indicate the need for a filing a petition). The second action, *diversion*,

means that the court does not take formal legal action but does address the offense in some manner. Diversion can be as simple as an informal meeting with the juvenile and his or her parents or guardians, or it can be more comprehensive, such as a list of goals that the juvenile must reach in order to prevent the juvenile office from filing a formal petition. Such goals may include maintaining good grades, being home before curfew, or staying away from delinquent associates. The third action, *filing a petition*, is the beginning of the formal legal process in the juvenile court.

Filing a petition corresponds to filing charges in the adult criminal court. The *petition* is a formal legal document that lists the offenses allegedly committed by the juvenile. From its rehabilitative past, juvenile courts typically refer to the case as “in the matter of Gerald Gault” or “In re Gerald Gault” as opposed to criminal courts filing charges as “State of Illinois v. Gerald Gault.” The juvenile court office can file a petition for delinquency, a status offense, or a case of abuse and neglect. Once the petition has been filed, the juvenile must wait for a hearing date with the judge. In many cases, the juvenile court will suspend the petition if the juvenile agrees to adhere to a treatment plan through an informal probation period. This is in essence a plea agreement. This agreement gives juveniles an incentive to rehabilitate in exchange for keeping an official charge off the record, which could increase sanctions in later referrals. If the juvenile fails to meet the treatment goals, the court can reinstate the petition and seek a formal adjudication of the matter.

Transfer or Waiver

As mentioned previously, the juvenile court can transfer, or *waive*, its jurisdiction over a juvenile to the adult criminal courts. There are several different ways in which a juvenile may be waived to adult court. Many states now mandate waiver by statute for specific ages and certain serious offenses (called *statutory exclusion* or *automatic transfer*). For those offenses not covered by statutory exclusion, most juvenile court judges have the discretion regarding whether to waive the matter to adult court (a *discretionary waiver*). In such instances the judge must hold a hearing, called a *Kent* hearing, to establish two things: (1) that probable cause exists that the juvenile committed the delinquent act and (2) that the juvenile is no longer amenable to treatment by the juvenile court. Once these two elements are satisfied, the court may waive its jurisdiction. Some states require the juvenile office to demonstrate that juveniles are not amenable to treatment (called *regular judicial transfer*), whereas other states require that juveniles prove their amenability to treatment (called *presumptive transfer*). Finally, the prosecutor can request in which court, adult or juvenile, to try the offender (called *direct file*, *prosecutor discretion*, or *concurrent jurisdiction*).

Why transfer authority to adjudicate the juvenile in the first place? There are two main purposes. The first is that juveniles who have committed serious offenses or have

many delinquency referrals may simply be beyond rehabilitation and require secure custody. The second purpose is that because the sanctions are greater in the adult court, due process is more likely in the adversarial nature of the adult system. A juvenile transferred to the adult criminal courts is therefore likely to be more severely punished but also be afforded full due process protections.

There are two other issues with regard to waiver. First, 23 states have *reverse waiver*, whereby the juvenile can petition to have the case transferred to the juvenile court. Second, 31 states have enacted “once an adult, always an adult” provisions. In such a state, once a juvenile has been convicted of a crime as an adult, all further cases will be automatically tried in the criminal courts.

Detention

Juveniles may be detained in secure juvenile facilities for a short assessment period or until their adjudication hearing, which can be several weeks or even a few months. Most jurisdictions require a mandatory detention hearing, typically 24 to 72 hours, to justify the juvenile’s custody. Although most juveniles sent to detention facilities are quickly released to their parents or guardians, there are three reasons to prolong detention: (1) to prevent harm to the community, (2) to prevent harm to oneself, or (3) to ensure attendance at the hearing. Juveniles who commit a serious crime, such as armed robbery, are likely to be held until their hearing. Detention facilities typically have intake personnel who assess the juvenile’s needs, either informally or through a risk assessment instrument. If a juvenile meets one of the aforementioned criteria, then the judge must assess the matter in order to keep the juvenile in detention. Unlike in the adult system, juveniles do not have the right to post bail and gain an early release prior to the adjudication hearing (another right denied to juveniles).

Adjudication

In the adjudication hearing, the judge or master presides over the fact-finding inquiry. Delinquency adjudication hearings resemble criminal trials, whereas abuse and neglect or other family-related adjudications are more like a civil trial. Once the juvenile office files a petition, the court must notify the juvenile of the allegations in the petition and the time and place of the hearing. Most adjudication hearings are closed to the public and only the juvenile, parents, and counsel may attend. This practice, which dates from the early days of the court, ensures that the public’s learning of the proceedings does not harm the juvenile’s reputation. Furthermore, the juvenile’s records are to remain closed and then destroyed when the juvenile reaches the age of majority; however, this rule is often not followed. In fact, some states now allow juvenile court records to be admitted into adult criminal proceedings as evidence of prior criminal behavior.

Some jurisdictions hold the adjudication hearing informally: The judge sits at a conference table with the juvenile, the parents, and attorneys, if present, and the hearing seems more like a conference than a trial. Other jurisdictions hold a more formal, trial-like hearing in which the judge sits behind the bench and the defense and prosecution sit at separate tables. Larger courts may have a building dedicated to court proceedings, whereas smaller courts hold hearings in the county courthouse.

When a juvenile agrees to accept a ruling of delinquency and accept the treatment plan, the petition is considered *uncontested*. Accepting the judge’s decision is simply a formality. Often, the adjudication hearing is suspended if the juvenile agrees to the probation office’s treatment plan (similar to a plea agreement). If the juvenile violates the informal probation, the adjudication will resume. As in the adult criminal courts, most cases are handled informally, with juveniles agreeing to an informal probation in exchange for either dismissing the petition or suspending the adjudication hearing. Furthermore, some prosecutors and probation officers will bargain on the specific charges in the petition, hoping to name a less serious offense in exchange for the juvenile agreeing to the treatment plan.

In contested cases the hearing will be more formal, because the state must present its case before the judge. The juvenile has the right to counsel but may waive that right, and most do. If this is the case, the judge must determine whether the juvenile has made the decision freely, voluntarily, and intelligently. This means that the judge must determine whether the juvenile understands the risks of continuing without counsel or whether his or her waiver has been coerced. Thus, the judge will question the juvenile before proceeding. Once both sides have presented the facts and examined witnesses, the judge makes a determination of whether the juvenile is delinquent or in need of supervision in other matters.

Disposition

In the *disposition hearing*, like sentencing in the adult system, the judge decides case outcomes. Some states require separate adjudication and disposition hearings; in other states the disposition hearing immediately follows adjudication. Prior to pronouncing the disposition, the judge consults the *predisposition report*, prepared by a probation officer. The predisposition report is a presentence investigation that includes the social history of the juvenile. Many factors in the report are presented to the judge, including the nature of the offense, the delinquency record, school record, family history, and psychological evaluation, and the probation officer’s assessment of the juvenile’s amenability to treatment. The report can also include mitigating and aggravating factors, such as gang involvement or premeditation. Not surprisingly, there is wide variation in the amount of information and scope of such reports. Finally, the probation officer

makes a recommendation about the outcome and treatment plan. In most states, the judge is not supposed to see the predisposition report or know the probation officer's recommendation until the juvenile is found delinquent. Given the close relationship between the judge and juvenile court officers, however, the court officers often share this information informally.

Several dispositional outcomes are available to the juvenile court, but the resources for treatment vary by community (urban, suburban, or rural). Thus, depending on where the juvenile receives the disposition, two juveniles with similar backgrounds, offenses, and delinquency records may receive very different outcomes. This is referred to as *justice by geography*. In general, there is a continuum of dispositional outcomes, from informal probation to long-term secure custody. First-time offenders get less restrictive outcomes, unless the offense is particularly serious. As juveniles reoffend, extending their delinquency records, the dispositional options become more formal and punitive, especially if juveniles appear unwilling to accept treatment.

Probation can be informal (under no disposition order) or formal (decreed by disposition). *Informal probation* can be very simple, for example, no arrests or referrals for a set period. It can also be a more *formal probation*, in which the juvenile must meet several demands or risk continuing through the juvenile court process. Probation generally involves attending school, meeting curfews, making restitution to victims, performing community service, and undergoing behavioral or substance abuse therapy. The possible conditions are endless, but most juvenile courts have some kind of general probationary guidelines in place. Some probation officers use a certified risk assessment instrument to score the juvenile's needs and apply the appropriate probation plan. Many states now include intensive probation that uses global positioning system monitoring and frequent house visits by the probation officer. Should a juvenile violate the terms of the probation, the probation officer applies to revoke the probation and reinstitute the formal process.

If probation fails to reform, or the offense is serious enough, juveniles may face placement in an institutional setting, which can range from open residential facilities to secure confinement. At the soft end of confinement, juveniles may be sent to treatment programs that use the cottage-style residence. These are often located in rural settings, like the houses of refuge, and such places teach behavior modification, therapy, conflict resolution, and improving self-esteem. Many such programs are privately run and contracted by the state. If juveniles successfully complete the program, they are returned to their families and communities.

Juveniles who are considered beyond treatment or who commit serious crimes are sent to juvenile correctional facilities, which almost always are run by the state. These institutions do provide some treatment programs and education; however, they often resemble adult prisons in

physical arrangement and operation. Such facilities represent the most severe dispositional outcome.

Future Directions

As has been noted, the juvenile court has become more criminalized in an environment where public safety concerns have mixed with the rehabilitation goal. The result has been that the assertion of due process rights to protect juveniles from unfair treatment, along with public demands to get tough on violent juvenile offenders, has increased outcome severity. The future is likely to see such mixed practices continue. For example, mandatory transfer decisions will continue to be revised to include specific offenses or a combination of offense and prior record. Also, prosecutors are also likely to gain influence in transfer decisions. This is especially likely if juvenile crime rates increase again after a period of decline. On the other hand, adjustments such as reverse waiver allow juveniles the possibility of reprieve from mandatory guidelines. Like the adult criminal justice system, juvenile court judges will continue to lose discretion in their decision making for serious offenses.

The most prominent reform that will affect the juvenile justice system is *restorative justice*: the philosophy that informs practice, like the idea of "best interests" from the early days of the juvenile court. Restorative justice asserts that the offender has harmed individuals and the local community, not the state. The offender should therefore make restitution to the victims and community through mediation and community service. Although community service and monetary restitution have been common aspects in juvenile court sanctions, they must be connected to the offense in order to address the needs of restorative justice. Treatment for juvenile offenders (education, vocational skills, or anger management) is also an important component of restorative justice because it facilitates the juvenile's ability to complete the restorative process.

Restorative justice has received favorable assessment by agencies that have adopted it; however, researchers have not sufficiently supported it empirically. Although restorative justice attempts to reorient the juvenile justice system away from punishment, it does not expressly seek to reduce recidivism; thus, its future adoption across the United States is unlikely to be embraced beyond restorative justice advocates unless it also demonstrates practical utility, such as reducing crime. In addition, the promise of reforming the juvenile court in favor of benevolent treatment over punishment is no guarantee of success, as history has shown.

One final future trend that appears to be helpful is the implementation of empirically established practices and policies. Often called the "what works" paradigm, researchers and funding agencies collaborate to find out why some programs work while others, even promising ones, fail to be implemented successfully. For example, the Drug Abuse Resistance Education program (D.A.R.E.),

although wildly popular in many communities, has failed to reduce drug abuse among teens. On the other hand, a similar education program aimed at keeping kids out of gangs—Gang Resistance Education and Training (GREAT)—has had successful evaluations.

The history of the control and rehabilitation of juveniles in the United States has proven to be good intentions that have failed. Although the fundamental idea of treating juveniles rather than punishing them is appealing, only close attention to policy reforms will prevent future unanticipated consequences.

FELON DISENFRANCHISEMENT

J. EAGLE SHUTT AND GENNARO F. VITO

University of Louisville

In general usage, the term *felon disenfranchisement* refers to the restriction of voting rights for convicted felons. Broadly speaking, felon disenfranchisement is a part of a larger category of collateral civil consequences, both formal and informal, that affect the status of convicted offenders, including residential restrictions, gun ownership bans, financial benefit exclusions, lost employment opportunities, decreased status, and social stigma (LaFollette, 2005; see Uggen, Manza, & Thompson, 2006, p. 297). A *felon* is an individual convicted of an offense that typically carries a maximum penalty of at least 1 year in jail. Although almost all (48 out of 50) American states have felon disenfranchisement laws, these policies have become increasingly controversial in terms of their impact on elections. For example, Manza and Uggen (2006, p. 191) estimated that the exclusion of felons from voting provided “a small but clear advantage to Republican candidates in every presidential and senatorial election from 1972 to 2000” (p. 194). Specifically, they asserted that Democratic candidates would likely have prevailed in Texas (1978), Kentucky (1984 and 1992), Florida (1988 and 2004), and Georgia (1992; Uggen & Manza, 2006).

Proponents of felon disenfranchisement argue that such policies serve deterrence, retribution, and efficiency rationales (i.e., they deter future crime, punish offenders by excluding them from community political participation on moral grounds, and are necessary to ensure the proper functioning of democratic institutions). Critics, however,

contend that felon disenfranchisement does not deter crime; undermines postconviction integration into society; originates from racial discrimination; and disproportionately excludes particular demographic segments, such as African American males, from political participation.

Because felon disenfranchisement affects the civil rights of nearly 5 million voters (over 2% of the eligible voters), critically evaluating its rationales remains a significant criminal justice policy issue (Manza & Uggen, 2004). Compounding the problem is America’s unprecedented incarceration binge over the last quarter century, wherein prison populations quadrupled from 500,000 to 2,000,000 (Currie, 1998; Richards, Austin, & Jones, 2004). This chapter first traces felon disenfranchisement’s history to its modern forms and reviews its current legal status. Then rationales for and against felon disenfranchisement are presented and evaluated in light of criminology and criminal justice research. The chapter concludes with sociology of law explanations for felon disenfranchisement and American trends therein.

History

As a practice, felon disenfranchisement has ancient roots (“The Disenfranchisement of Ex-Felons,” 1989; Johnson-Parris, 2003; Manza & Uggen, 2004). In ancient Greece, offenders pronounced “infamous” were ineligible to vote,

appear in court, attend assemblies, or serve in the military. In ancient Rome, infamous Romans lost suffrage and military service rights. In Anglo-Saxon England, outlawed offenders lost all rights to legal protection for life and property. In post-Norman England, “attainted” offenders—those convicted without trial by the legislature under bills of attainder—lost their civil rights to own property. The English-derived felon disenfranchisement tradition is based on the feudal doctrine of *corruption of the blood*, a legal fiction wherein the disenfranchisee and his or her entire family are presumed unworthy of the body politic. Most colonial governments adopted British statutes and common law wholesale and therefore inherited felon disenfranchisement policies with neither debate nor explicit justification. Enfranchisement was typically limited to white male property holders. Typical statutes permanently forbade felons from voting and holding public office, although felons could testify and hold property.

Post-independence America’s felon disenfranchisement trends are unique in the modern world. The general trend worldwide has been to eliminate permanent voting restrictions (Manza & Uggen, 2004). Similarly, the general American trend has been toward increasing electoral enfranchisement, as evidenced by ratification of the Fifteenth (1870) and Nineteenth (1920) Amendments and passage of the Voting Rights (1965) and National Voter Registration (1993) Acts, passage of motor-voter laws, and the elimination of Jim Crow voting literacy tests. By contrast, there has been no clear trend toward inclusion in American felony disenfranchisement laws, in part because of the absence of any national standard allowing each state to establish its own policy. In general, prisoner disenfranchisement increased from 1860 to 1880 and remained steady thereafter. Likewise, probationer disenfranchisement spiked over roughly the same period and remained consistent for nearly a century.

After the Civil War, felon disenfranchisement became increasingly significant as a tool to marginalize African American political power, following voting privileges granted by the Fifteenth Amendment (Johnson-Parris, 2003). Felon disenfranchisement laws had originally emerged as artifacts of British law adopted by some colonial governments along with all British common law without recorded discussion. Unsurprisingly, colonial legislative records typically offered no clear rationale in favor of felon disenfranchisement. In 1790, just 3 of 13 states forbade non-white suffrage. By 1800, most states had restricted suffrage to white male property owners, and by 1840, 20 of 26 states had done so. In light of the possibility of slave uprisings and high proportions of slaves in the general population, antebellum slave states created explicit formal systems for slave restrictions, typically forbidding voting, mobility, property rights, and education. The infamous *Dred Scott* (1857) decision rubber-stamped the total disenfranchisement of African Americans by declaring them chattel without the possibility of citizenship.

However, in the post-Reconstruction South, southern whites faced the loss of political hegemony, which they countered by a matrix of formal and informal systems of social control, such as Jim Crow laws, voting literacy tests, interracial marriage bans, segregationist institutions, and racist norms. Because African American voting privileges could not be limited by explicit legislation, under the Fourteenth and Fifteenth Amendments southern whites fashioned facially neutral but racially pretextual legislation to reduce African American voting influence.

Many felon disenfranchisement laws were passed for the first time in the late 1860s and the 1870s, when African American suffrage first emerged (Behrens, Uggen, & Manza, 2003). Just as slaves had been, ex-slaves were perceived as both threats to white rule and potential resources (Adamson, 1983). Post-Reconstruction white supremacy advocates preyed on the prejudices and fears of their constituents to promote ideology and harsh treatment for ex-slaves:

Real or imaginary threats to community order will give rise, on the one hand, to harsher treatment of those individuals or groups singled out as threats, and, on the other hand, will increase group solidarity. One of the ideological techniques used by the Democrats to gain control over southern legislatures in the 1870s was to brand the radical Republicans as traitors. The Redeemers played on the fears of the southern white population, describing the alliance of carpetbaggers, scalawags, and blacks, who were exercising their newly acquired right to vote and thereby keeping the Republicans in power, as a corrupt plot. The very foundations of southern civilization were allegedly threatened by the radical Republican state governments. (Adamson, 1983, p. 563)

Legislative records frankly acknowledged the utility of felony disenfranchisement laws in restricting African American suffrage. For example, non-whites made up just 2% of Alabama’s system in 1850 but 74% by 1870 (Manza & Uggen, 2006, p. 57), allowing for a convenient tool for excluding minority voters. Independently, the passage of restrictive felon disenfranchisement laws has been correlated with the presence of minorities: Between 1850 and 2002, states with higher proportions of non-whites passed more restrictive felon disenfranchisement laws, even when controlling for potential confounds of time, region, interracial economic competition, and punitiveness (Manza & Uggen, 2004, p. 493). As a consequence of the package of civil rights restrictions, African American voting influence dropped dramatically nationwide: for example, from 70% eligibility in Mississippi in 1867 to 6% in 1890 (Johnson-Parris, 2003).

Felon disenfranchisement laws thus expanded contemporaneously with the Black Codes and may be accurately viewed as a package of formal social control measures aimed at perpetuating, or reinstating, the antebellum status quo. The Black Codes helped segregate ex-slaves, force them into hiring-out/sharecropping systems, and prosecute violators, who were often individuals who broke labor contracts. Particularly in areas with high concentrations of

ex-slaves—the legacy of intensive slavery in southern states—African American voters were potential threats, particularly if they organized to form an effective voting bloc. The effect of these new measures was to help keep ex-slaves in their preslavery status, that is, “propertyless rural laborer[s] under strict controls, without political rights, and with inferior legal rights” (Stampp, 1965, p. 79).

America’s century of rising incarceration rates has dramatically expanded felon disenfranchisement’s scope. Incarceration rates nearly doubled from 1925 to 1980 but quadrupled from 1980 to 2000 (Manza & Uggen, 2006). As a consequence, while 75 Americans per 100,000 were incarcerated in 1925, nearly 480 Americans per 100,000 were incarcerated in 2000. America’s incarceration rates lead the world and are quintuple those of England and Wales. The consequence of the increased use of incarceration is a corresponding linear increase in disenfranchisement rates. The increase becomes more disturbing when one considers that, in many states, felon disenfranchisement continued after release from criminal justice supervision.

Currently, America is among only a handful of countries worldwide that disenfranchise unincarcerated felons. Although the modern-day scope of American felon disenfranchisement is in flux, several clear trends have emerged since 1950 (Manza & Uggen, 2004, p. 493). First, nearly all American states continue to exclude prisoners from voting, a figure that has actually increased 10% to its current total of 48. Although the majority of states exclude active probationers and parolees from voting, state exclusion rates decreased substantially from 1950 to 2002 (from 84% to 58% and from 84% to 70%, respectively). Although 70% of states permanently disenfranchised felons in 1950, less than 30% did so by 2002. In sum, although prison disenfranchisement has remained nearly ubiquitous, felon disenfranchisement, in its other forms, has exhibited consistent decreases over time.

Perhaps the most startling fact of felon disenfranchisement has been its explosive growth. In lockstep with the burgeoning incarceration rates since 1980, the criminal justice system has cast an increasingly wide net:

All categories of correctional populations—prisoners, parolees, jail inmates, and probationers—have grown at astounding rates since the 1970s. . . . [A] total of 7.0 million people were under some form of correctional supervision in 2004, relative to 1.8 million as recently as 1980. Prisons and jails in the United States now house more than 2.2 million inmates, representing an overall incarceration rate of 726 per 100,000 population. . . . By comparison, approximately 210,000 were imprisoned in 1974, or 149 per 100,000 adult U.S. residents. In 1980, there were only 1.1 million probationers and 220,000 parolees, compared to more than 4.1 million probationers and 765,000 parolees in 2004. (Uggen et al., 2006, p. 285)

Thus there are now far more disenfranchised individuals than ever before.

Felon disenfranchisement affects over 5 million Americans (Manza & Uggen, 2004). Despite formal tallies, the actual

scope of felon disenfranchisement remains a dark figure. The nearly 300,000 inmates serving jail time for misdemeanors and over 300,000 unconvicted pretrial detainees typically cannot vote because of incarceration. Likewise, many otherwise eligible felons may be unaware, because of ignorance, of the restoration of their voting rights (Uggen & Manza, 2004a). Reflecting state variations in policy and demographics, some states disenfranchise far larger voting populations than others. Florida, for example, disenfranchises over 1 million people, whereas two states disenfranchise none.

The astounding increase in disenfranchisement has had a magnified effect on marginalized socioeconomic groups, such as African Americans, who are disproportionately marginalized. One in 6 African American men cannot vote (Manza & Uggen, 2004). Felon disenfranchisement effects go beyond this relatively high figure, however, if, as estimated, 1 in 3 African Americans will go to prison during their lifetimes (Bonczar, 2003).

Correctional surveys have consistently identified a Democratic skew in felon disenfranchisee preferences. According to the Survey of Inmates of State Correctional Facilities (U.S. Department of Justice, 2000), in every presidential election from 1972 to 2000 correctional populations favored Democratic candidates, with values ranging from 66.5% (President Jimmy Carter, in 1980) to 85.4% (President Bill Clinton, in 1992). In other words, at least two thirds of all prisoners favored Democratic candidates, with popular Democrats receiving support from 6 of 7 prisoners. Resolving how many disenfranchised voters would have actually voted was problematic, however, in several ways. First, almost every state disallowed prisoners from voting and, because many potential Democratic voters remained incarcerated, they would have been unable to vote. Second, it appears unlikely that America’s voter policy toward incarcerated individuals will change in the short term; in other words, incarcerated individuals will be unlikely to vote over the next generation. Further complicating voting estimation is the fact that disenfranchised felons may have been less likely to vote than general voters. Because disenfranchised felons comprise a unique segment of society, they could not be assumed to have mirrored national turnout rates.

Using a counterfactual research strategy, Manza and Uggen (2006) examined whether felon disenfranchisement affected past elections:

Would election outcomes have differed if the disenfranchised had been allowed to vote? To fully answer this counterfactual question, we must determine how many felons would have turned out to vote, how they would have voted, and whether those choices would have changed the electoral outcomes. If so, a closely related consideration is whether disenfranchisement has affected public policy through feedback processes tied to these electoral outcomes. (p. 782)

Manza and Uggen (2006) adopted a two-part strategy for estimating felon disenfranchisement voter turnout and

choice. First, they matched the felon population to similarly situated voters in the voting-age population and assumed that the felons would demonstrate similar voting characteristics, based on National Election Study data. Second, they estimated voting preferences using data from the Survey of Inmates of State Correctional Facilities Series (U.S. Department of Justice, 2000). They concluded that disenfranchisement policies altered the outcome of the 2000 election. In addition, controlling for changes in conviction rates over time, existing policies and demographics would have cost the Democrats the 1960 and, possibly, the 1976 presidential elections, which were relatively close. Of the over 400 senatorial elections from 1978 to 2002, Manza and Uggen found that seven outcomes would likely have been reversed if not for felon disenfranchisement. Although these outcomes represented a small minority of overall elections, they were significant overall considering the U.S. Senate's chronically narrow party margins.

There is a conspicuous absence of felon disenfranchisement research into voter preferences of probationers and parolees, who are more likely to be enfranchised in the future than prisoners. Instead, prisoner surveys have typically been used as a means of inferring probationer/parolee preferences. Such estimates suffer from an obvious confound in that probationer/parolee preferences may differ from prisoner preferences. Also, such estimates may be inaccurate because they fail to account for geographical diversity. Prisoners tend to be concentrated in various locales across states and often are housed outside their domiciles. Consequently, such surveys may not be predictive of disenfranchisement trends in particular counties, in particular those involving urban and rural contrasts. Surveys of probationer/parolee preferences, including voting preferences and turnout likelihood, would potentially provide more accurate measures of voting disenfranchisement effects. The importance of direct surveys is underscored by the quadrupling of probationers and parolees from 1980 to 2004 (Uggen et al., 2006).

Legal Status

There is no uniform federal standard for felon disenfranchisement; instead, such policies have been left to individual states to determine. Unsurprisingly, states now exhibit considerable variation in felon disenfranchisement laws, restricted in scope only by constitutional and federal statutory limitations. Although frequently challenged, felon disenfranchisement laws have been consistently upheld. Typical objections fall into three main categories: (1) the Eighth Amendment Cruel and Unusual Punishment Clause, (2) the Equal Protection Clause, and (3) the Voting Rights Act.

The U.S. Supreme Court has generally adopted a hands-off policy concerning disenfranchisement rationales. Eighth Amendment challenges have generally

been upheld when the punishment for the crime is disproportionate or excessive. Such considerations are contextual, based on evolving standards of decency in a community. In a non-felon disenfranchisement case, *Ewing v. California* (2003), the court ruled that, although punishment may have deterrence, retribution, incapacitation, and restoration rationales, the courts must generally defer to the legislature in choosing and justifying particular punishment. Relying on *Ewing*, modern courts typically will not question the utility of felon disenfranchisement policies.

In *Green v. Board of Elections* (1967), the 2nd Circuit Court of Appeals declared that felon disenfranchisement was not an Eighth Amendment violation because it was civil, and not penal, in nature. Moreover, even if penal, such a practice would not have qualified as cruel and unusual by the Constitution's framers because the practice was widespread at the time. Likewise, the court rejected an equal-protection argument, applying a reasonable justification test rather than a stronger test, such as strict scrutiny. The court also noted that the Fourteenth Amendment's Section 2 appeared to allow for felon disenfranchisement, observing that it acknowledged possible restrictions of voting rights for citizens who participate "in rebellion, or other crime[s]." In ruling, the court adumbrated a social contract rationale for felon disenfranchisement, reasoning that a felon has broken the social contract and may be disqualified from participation in the political franchise. This social contract reasoning became precedent for subsequent courts.

Green's Fourteenth Amendment analysis was endorsed by the U.S. Supreme Court in *Richardson v. Ramirez* (1974). The appellants argued that, under the Equal Protection Clause, felon disenfranchisement, as a practice, must be supported by more than reasonableness but by a compelling state interest. Moreover, such exclusion hindered felon rehabilitation. The court ruled that an equal-protection analysis was unwarranted because felon disenfranchisement was countenanced by Section 2 of the Fourteenth Amendment. The court avoided the rehabilitation issue altogether by deferring to the legislature.

However, in *Hunter v. Underwood* (1985), the Supreme Court showed a willingness to strike down a felon disenfranchisement policy that was originally intended to discriminate against a particular group on the basis of race. The plaintiff challenged the constitutionality of a state constitutional provision that denied voting privileges to individuals convicted of crimes of moral turpitude. After analyzing Alabama's constitutional convention of 1902, the court concluded that the moral turpitude ban was a product of racial discrimination. It also concluded that the Fourteenth Amendment's Section 2 was not intended to shield racial discrimination that was otherwise violative of the Equal Protection Clause.

The Voting Rights Act (1965), Section 2, created a new stumbling block for felon disenfranchisement by prohibiting voting practices or procedures that discriminate against a particular group of individuals on the basis of race or

color. Prior to the act, whites had often used literacy tests and poll taxes to exclude African American voters; however, there is convincing evidence that felon disenfranchisement was an extra tool of vote dilution that was calculated to diminish a minority group's voting power.

Thus far, no Voting Rights Act claim has resulted in a successful challenge to felon disenfranchisement. In *Hayden v. Pataki* (2006), a convicted New York prisoner claimed that felon disenfranchisement violated the Voting Rights Act's Section 2, arguing specifically that the historical nature of felon disenfranchisement and its disproportionate impact evidenced its intent to discriminate against a group of individuals on the basis of race. The Second Circuit Court of Appeals denied the petitioner's appeal, arguing that, in New York's case, there was no clear record of legislative intent to discriminate. In addition, Congress did not clearly intend to apply the Voting Rights Act to felon disenfranchisement policies but rather to other types of exclusionary devices, such as literacy tests. The appeals court noted, for example, that Congress had the opportunity to include felon disenfranchisement specifically but failed to do so. Likewise, they cited *Richardson's* analysis that felon disenfranchisement was constitutional under the Fourteenth Amendment, unless otherwise violative of equal protection.

To summarize these cases, courts have tended to defer to legislatures in setting felon disenfranchisement policies. Likewise, courts have been reluctant to infer discriminatory intent in disenfranchisement, even when there is clear evidence of discriminatory impact. At the same time, felon populations have little economic and political clout, as is discussed later. As a result, the utility and impact of felon disenfranchisements are virtually unregulated.

Policy Rationales and Their Empirical Assessment

Legalities aside, felon disenfranchisement's utility remains problematic. Modern proponents have marshaled numerous nondiscriminatory rationales in favor of felon disenfranchisement, some of which have been subject to empirical assessment. Standard rationales for continued disenfranchisement fall into three general categories: (1) crime reduction/deterrence, (2) retribution, and (3) system efficiency. In the sections that follow, each category is presented and critically evaluated.

Crime Reduction/Deterrence

Felon disenfranchisement has been rationalized as a crime prevention tool in that the threat of such a legal sanction serves as a deterrent to future crime. In other words, a rational actor would view the risk of disenfranchisement as a disincentive and therefore exhibit a decreased likelihood of committing crime. However, no extant research supports a deterrent effect. To establish a clear deterrent effect

would require a longitudinal data set with voting rights, conviction records, and postdisenfranchisement conviction records, as well as suitable control variables.

Critics counter that felon disenfranchisement is actually criminogenic (see, e.g., Cholbi, 2002). Viewed in the broader context of criminological and criminal justice theory and research, a deterrence rationale seems farfetched. Even extreme punishments such as the death penalty have exhibited no deterrent effects on crime. Moreover, offenders frequently exhibit low self-control, which may lead them to ignore long-term effects (e.g., disenfranchisement) in favor of short-term gratification. The assumption that all prospective offenders are even aware of the electoral consequences of criminal convictions is dubious. In any event, high-criminality offenders tend to have weak social bonds and may discount the value of enfranchisement. Similarly, felon disenfranchisement may increase criminality by impeding civic reintegration and thereby weakening social bonds. Using longitudinal data, for example, Uggen and Manza (2004b) found that individuals who voted were less likely to commit crimes. However, the finding was weakened by reliance on self-report voting and criminal behavior as controls to simulate the effect of enfranchisement on criminal behavior. In other words, the study did not actually test the effect of prospective disenfranchisement on future criminality; neither did it directly test the effect of past disenfranchisement on future criminality.

Retribution

Felon disenfranchisement is often justified as retribution, which is itself supported by normative discourse. Such rationales typically assert that felons have violated group norms and therefore deserve punishment (Altman, 2005) or at least are justifiably disenfranchised during imprisonment (Lippke, 2001). While ignoring deterrence considerations, modern retributive rationales typically do not support punishment as an end in itself but rather as an expression of group will, which itself serves a useful, integrative purpose by establishing clear boundaries of acceptable behavior and thereby fostering group cohesion. A retribution rationale implicitly assumes that there is widespread community support for felon disenfranchisement. Perhaps more important, retribution brings satisfaction to victims of crime, which is an underestimated purpose of criminal justice systems. Following this reasoning, felon disenfranchisement as retribution may strengthen group solidarity and norms while increasing victim satisfaction.

The broad scope of current felon disenfranchisement policies has received only mixed public support. In general, there is widespread support for felon disenfranchisement for felons serving active prison sentences (Cholbi, 2002). However, public support for felon disenfranchisement typically varies by offender status and conviction type. Although there is strong public support for felon disenfranchisement of prisoners and offenders who have

committed certain serious or violent felonies, 80% of the public favor reenfranchisement for felons after completing their criminal justice supervision (Manza, Brooks, & Uggen, 2004).

Unfortunately, no research has found benefits flowing from disenfranchisement. Proponents typically argue in philosophical or moral terms but lack any empirical basis to assert that disenfranchisement strengthens norms or group solidarity. By contrast, however, critics charge that such policies are unfair and immoral in that there is a clear disproportionate impact on minorities, specifically African Americans. In 1998 elections, for example, at least 10 states formally disenfranchised 20% of African American voters (“Felony Disenfranchisement,” 1999).

Proponents have argued that felon disenfranchisement is not a punishment at all but a civil action (Deigh, 1988), which may obviate the need for standard punishment justifications or legal analyses. Though effective in legal contexts, such arguments seem implausible and/or like splitting hairs in other normative contexts, because the loss of a right or privilege as the result of criminal behavior typically qualifies as punishment. In addition, felon disenfranchisement policies make no distinction for offense severity, counterintuitively treating minor and major felonies equally. Critics (see, e.g., Cholbi, 2002) have argued that felon disenfranchisement policies would be more rational if they accounted for offense severity, although justifying such distinctions or gradations among felonies would prove problematic.

System Efficiency

Harkening back to feudal doctrines, a common rationale for felon disenfranchisement is based on social contract and moral competence. The felon, it is argued, has violated the social contract and is thereby excluded from the privileges of the body politic (Johnson-Parris, 2003). A related argument is that such exclusion is necessary and justified to ensure the efficient working of the political system, or the purity of the ballot box (Manza & Uggen, 2006). Allowing felons to vote would presumably compromise the independence and integrity of the criminal justice system.

Proponents of ballot box purity appear to base their support of felon disenfranchisement on unproven assumptions. Even if felon disenfranchisement were allowed, it is by no means clear that previously disenfranchised felons would base their voting preferences on a candidate/party’s penal policy:

No evidence suggests that ex-felons would base their votes solely, or even partially, on a candidate’s positions on penal issues rather than other matters of policy and politics. Furthermore, even if ex-offenders were to base their votes on matters of criminal justice, it does not follow that their positions on these matters necessarily would be more permissive than those of the population as a whole. (“The Disenfranchisement of Ex-Felons,” 1989, p. 1303)

In other words, if the point of disenfranchisement is to protect the integrity of the criminal justice system, it is by no means clear that disenfranchisement would do so, casting doubt on the significance/utility of excluding felons from voting.

By contrast, critics have argued that excluding mass numbers of felons impairs, rather than promotes, system efficiency, in that the broad scope of felon disenfranchisement results in democratic contraction (Uggen & Manza, 2002). The exclusion of African American voters has impacted close election outcomes, such as the 2000 presidential election and Kentucky’s 1984, 1992, and 1998 senate races. In the last, Republican Jim Bunning defeated Democrat Scott Baesler by 7,000 votes; however, Kentucky’s felon disenfranchisement laws at that time permanently excluded felons from voting, eliminating 6,000 African American prisoners and 7,600 African American probationers and parolees, as well as thousands more permanently disenfranchised African American voters. In the election itself, the vast majority of African American voters voted Democratic (“Felony Disenfranchisement,” 1999). Afterward, Kentucky amended its policy to ease felon reintegration by allowing felons to apply for reenfranchisement. Unsurprisingly, however, Kentucky Republicans, such as Senator Mitch McConnell, have continued to support felon disenfranchisement (Manza & Uggen, 2006, p. 12). As a barrier to reenfranchisement, Republican Governor Ernie Fletcher ordered that felons be required to write an essay, which resulted in a slower rate of reenfranchisement and favored Republicans. His successor, Democratic Governor Steven Beshear, eliminated the essay requirement altogether, which favored Democrats.

Perhaps most disturbingly, the racial skew of felon disenfranchisement has only widened since President Ronald Reagan’s war on drugs. Drug incarceration rates increased faster than any other incarceration type during the past quarter century. Whereas drug crimes accounted for 10% of incarcerations in 1974, by 1997 they comprised 26% (Uggen et al., 2006). Much of the increase resulted from crack cocaine interdiction efforts, which disproportionately involved African Americans. African American incarceration rates, which were already higher than white rates, increased approximately 275% from 1980 to 2004, whereas white rates increased less than 100% over the same period.

Compounding system impairment are the formal and informal collateral consequences of felony convictions, which severely impact an offender’s life chances. Incarcerated felons typically leave prison with little or no money. While incarcerated, their families suffer economic hardships. Upon release, ex-felons face difficulties in securing employment, and certain professional jobs are forever closed to them. A felony record carries a permanent social stigma. Felon disenfranchisement provides yet another barrier to civic reintegration. Overall, an ex-felon’s

reduced opportunities have an intergenerational character that affects the life chances of their children, because being an ex-felon provides them with less social capital.

Sociology of Law Explanations

Sociology of law explanations of felon disenfranchisement are descriptive and not prescriptive in that they typically ignore the relative merits of felon disenfranchisement rationales while focusing on the underlying causes of the policies themselves. Functionalist theory, social distance theory, conflict theory, and culture of control theory provide four influential theoretical explanations for felon disenfranchisement, which are considered in order.

Talcott Parsons's (1951, 1952/1954, 1982) *functionalism*, the dominant American sociological perspective until the 1960s, analogizes any social system to an organism, which depends on specific organs to carry out specific functions necessary for the organism's survival. Under functionalism, any system, including the criminal justice system, can be divided into four interdependent subsystems corresponding to (1) economy, (2) policymaking, (3) policy enforcement, and (4) norm transmission/pattern reinforcement spheres. Should any subsystem's functions fail, all the subsystems would fail. For example, the failure of the economy would lead to the collapse of the other subsystems. Policymakers are individuals who have accepted the role of legislators. In playing their roles, the legislators employ means–end reasoning and rationality to devise policies to support the three subsystems. For example, a legislator may support a law in favor of felon disenfranchisement if the legislator decides, in his or her role as policymaker, that felon voting is bad policy that might adversely affect the independence of the policymaking subsystem or the efficacy of the policy enforcement subsystem. Functionalist analysis lends itself to consideration of the relative merits of felon disenfranchisement policies. The oft-criticized weakness of the functionalist approach, however, is that policymakers are not always disinterested, rational decision makers working in unison for the public good; instead, their decisions are inextricably bound with their personal interests and prejudices and often in direct conflict.

In *social distance theory*, Donald Black (1970, 1979, 1998, 2000) has argued that social distance between individuals increases the likelihood and extent of formal social control between them. Unlike physical distance in a multi-dimensional physical environment, social distance is socially constructed and corresponds to the perceived configurations of individuals in social space. For example, individuals of similar socioeconomic status and cultural backgrounds may perceive themselves as socially close, whereas individuals of divergent status and cultural backgrounds may perceive themselves as socially distant. Black predicted that social distance affects macrolevel behaviors, such as law making and law invoking. Unlike gravity, social repulsion actually increases with social distance.

Thus, Black predicted that the greater the social distance between two groups, the more likely that one group will create and invoke laws regulating the interaction between the two groups. Black (1998, p. 144) argued that *moralism* can be a consequence of extreme social distance:

[A] tendency to treat people as enemies . . . *Moralism is a direct function of social remoteness and superiority.* Those with the strongest partisans tend to be socially close and superior, while those with the greatest enemies tend to be socially remote and inferior. (p. 144)

In Blackian terms, felon disenfranchisement is the result of extreme social distance between felons and policymakers and their constituents, which in turn leads to feelings of moral superiority justifying exclusionary laws. In other words, the laws themselves are not necessarily justified by public policy rationales but exist because of social distance factors.

Although Karl Marx is famous for his thesis that economics drives political development (Tucker, 1978), modern Marxist thought has morphed into a more general tool of analysis, *conflict theory*, wherein individuals and institutions interact with each other on the basis of self-interest, often driven by an underlying process that is not necessarily apparent to observers (see, e.g., Adamson, 1983; Coker, 2003). Because rational, self-interested actors strive to maximize benefits, and such benefits may occur at the expense of others, individuals and institutions eventually will come into conflict, the end result of which is often conflict and coercion. The empowered will be able to actualize their interests, whereas the powerless will be coerced into accession. In conflict theory terms, felon disenfranchisement is predictable because the empowered legislators tend to be wealthy and supported by the wealthy and the middle class, both of whom disfavor felons as a class. Regardless of the theoretical explanation of felon disenfranchisement, an incontrovertible factor in America's felon disenfranchisement policies is that felons as a rule have relatively little influence in the political marketplace. As a class, felons are typically poor, and their legal status is associated with decreased economic opportunities for both them and their families. Support for felons may cause a politician to be perceived as "soft on crime" and is not politically expedient, especially considering that such felons cannot vote. Thus, regardless of the relative merits of rationales in favor or against felon disenfranchisement, the policies themselves are dictated by the calculi of self-interest.

Like Blackian theory, conflict theory itself lends itself to insidious interpretations of felon disenfranchisement. In arguably the most famous modern expression of conflict theory in criminal justice contexts, Michel Foucault argued that underlying the modern criminal justice system is a technology, discipline, aimed at the production of docile bodies, or mind control. Although the discipline's proponents assert that the technology itself is oriented toward public safety and treats everyone equally, the technology itself is focused on

what policymakers perceive as groups that threaten their power base, such as terrorists, felons, or potentially even minority groups. If certain elected officials predict that felons and African Americans would not support their reelection, these same officials would likely oppose felon enfranchisement, regardless of public policy justifications. The criminal justice system itself thus becomes a tool for the maintenance of one group's coercive power over another.

In *culture of control theory*, Garland (2002) elaborated on Foucault's arguments, asserting that, since 1970, America has entered into a new punitive phase, wherein policymakers and their public have largely rejected the rehabilitative ideal in favor of an actuarial model wherein offenders are viewed as risks to be guarded against via formal and informal social control measures. Individual safety is of paramount importance, while offender rights and life experiences are discounted. Incarceration and physical separation from offenders are viewed as desirable in that they reduce public risk. As a consequence of this new culture of control, Americans are resisting international trends toward felon enfranchisement.

Theoretical explanations are not justifications and typically contain no moral dimension of "oughtness." They suggest why felon disenfranchisement laws exist without justifying the latter's existence. Nevertheless, these theoretical perspectives provide useful frameworks for evaluating proposed rationales. Whereas a functionalist perspective might take a claimmaker's policy justifications at face value, other perspectives (see, e.g., Coker, 2003) would question the claimmaker's underlying motivations. For example, social distance and conflict theorists would agree that a claimmaker's policy justifications may serve as pretextual covers whereby a claimmaker can self-justify acting on his or her prejudices and self-interest. Consistent with social distance and conflict theories, early American felon disenfranchisement laws appear to have resulted from a conscious desire to oppress minorities, even though they were drafted as facially neutral, targeting no specific group other than felons.

Conclusion

Current felon disenfranchisement policies reflect punitive American attitudes and court deference to legislatures in punishment. Since the 1970s, the American criminal justice system has moved toward harsher punishments, in stark contrast to trends in Western industrialized nations. Thus, even as the world has moved toward increased electoral enfranchisement, felon disenfranchisement has remained relatively constant in America. Despite clear evidence that many disenfranchisement policies are artifacts of racial discrimination, only a handful of felon disenfranchisement challenges have been upheld. Courts have typically refused to subject felon disenfranchisement policies to strong constitutional tests, such as strict scrutiny. Likewise, they refuse to look for disparate impacts on populations alone, absent a clear discriminatory intent. Facially neutral disenfranchisement laws

have consistently been approved, despite the dilution of minority voting populations. As a consequence, courts have rubber-stamped pretextual tools of exclusion and allowed for the possibility of racial politics.

Although American felon disenfranchisement policies continue to receive broad political support, few criminologists, criminal justice researchers, and/or legal scholars support them, because little empirical evidence suggests that they are effective. Such policies serve as barriers to civic reintegration and are, at least in theory, criminogenic. There is a clear need for a nationwide, longitudinal study of the effects of felon disenfranchisement over time, which might help disentangle the effect of felon disenfranchisement on criminality. Nevertheless, the existing evidence suggests that felon disenfranchisement policies are counterproductive, irrational, and sometimes pretextually discriminatory. Unfortunately, these policy implications have been largely ignored by courts and lawmakers, in part because of the normative nature of discourse surrounding felon disenfranchisement.

Perhaps most disturbingly, felon disenfranchisement has disproportionately affected marginalized economic groups. Often, the parties opposing increased enfranchisement have been the same parties benefiting from disenfranchisement, suggesting that criminal justice policy is, at least partly, a Foucauldian political tool. The consequences of disenfranchisement on affected groups can be long lasting and harmful. If a key goal of effective criminal justice policy is reintegration, then disenfranchisement is pernicious thereto. Cohen (1985) theorized that the strength of social control is related to both formal and informal social control, which together can be conceptualized as an interlocking web. The strongest systems of social control result from effective formal social control measures, accompanied by effective informal social control, which itself may be affected by public perceptions of the legitimacy of formal social control measures. Merton (1936) argued that formal actions, such as laws, regulations, and policies, can have unintended consequences. Assuming, for purposes of argument, that both theorists are correct, felon disenfranchisement may be conceptualized as a purposive attempt at formal social control, accompanied by unintended negative consequences. The disenfranchisement of marginalized groups has disincentivized reintegration, which served no useful public purpose. Likewise, such disenfranchisement may have lowered the adversely affected groups' perceived legitimacy of the criminal justice and political systems, thereby reducing overall social control.

POLICE–COMMUNITY RELATIONS

JASON SCOTT

Rochester Institute of Technology

Police in any democratic society are faced with an inescapable dilemma: Their role requires that they adequately balance the legal authority they have been granted by the public (through government) with their responsibility to protect individual rights and contribute to public safety. Police officers are a walking symbol of government authority. They have the power to stop, detain, question, arrest, and even use deadly physical force when necessary. At the same time, police have to be responsive to the wishes of the public. They must carry out complex tasks while respecting important legal and constitutional protections. The police are occasionally called upon to enforce unpopular laws while attempting to foster or maintain public support. How the police balance these concerns often determines the quality of the relationship that they have with the public. The actions of individual police officers (e.g., the use of excessive force), or policies enacted by a department that emphasize the coercive legal authority of the police (e.g., zero-tolerance policing) may jeopardize public satisfaction. In addition, the quality of police–community relations often contributes to the ability of the police to accomplish goals of public safety. When the public is satisfied with and has confidence in the police, they are more likely to contribute information that may assist the police in solving crimes. When community residents trust the police, they are more willing to work collaboratively with the police to make improvements to neighborhoods. Therefore, there are very real and practical

concerns that should serve to encourage police departments to work on improving the relationships they have with local communities.

This chapter examines these police–community relations. It begins by examining police–community relations from a historical perspective. This discussion centers on an understanding of how the relationship between the police and the public has changed over time. Next, specific approaches that police departments have used to improve police–community relations are explored. Some of these approaches have included specialized police–community relations units, public relations campaigns, and community policing models. Finally, the chapter discusses what is currently known about the state of police–community relations in the United States with a particular focus on resident- and community-level surveys that examine public satisfaction with police service.

Modern Police History and Police–Community Relations

It is difficult to fully appreciate the modern challenges facing police–community relations without first understanding how the relationship between police and communities has evolved over time. At the same time, in many respects the relationship between police and communities is central to the history of policing. For this reason, this chapter begins

by examining how police–community relations have taken on a different meaning and significance over the past 150 years. Scholars have generally agreed that modern American policing can be divided into three distinct historical periods: (1) the political (mid-1800s–1930s), (2) the reform or professional (1930s–1980s), and (3) the community (1980s–present; Kelling & Moore, 1991). Although no specific event or date can be associated with the transition across these historical periods or eras, they do represent general shifts in the strategies and roles of the police. Consequently, these eras also signify changes in the way police relate to communities.

The Political Era (1840–1930s)

Beginning in the mid-1800s, there was an explosion of municipal police departments in the United States. These early police departments were organized around the neighborhood- or ward-based political systems that dominated this period. It was the local neighborhood politician who provided leadership and oversight over a substantially decentralized system of policing. Employment decisions within police departments were made at the ward level, and jobs were granted based on a system of political patronage. This system rewarded citizens with police work in exchange for their loyalty to the local ward politician who provided them with the job.

The localized nature of policing during this period had very profound consequences for police–community relations. First, it meant that police officers lived and worked in the same neighborhoods as civilians. Police officers and residents tended to share the same socioeconomic, religious, and ethnic backgrounds. As a result, police officers were well acquainted with the local customs, expectations, and values held by that community. Because of their familiarity with their neighborhood, officers were intimately aware of criminal as well as other social problems that plagued their communities. Officers were involved in foot patrol, crime prevention, and general order maintenance, and they also took on important social service activities during the political era. Because of rapid urbanization, officers frequently worked with ward politicians in assisting newly arriving European immigrants with housing, employment, and other social supports. This social service function contributed to the general satisfaction with and support of the police by the community. In fact, fostering a perception of police and political responsiveness among community residents was a goal central to policing during this period.

Although the political era is generally thought of as a period characterized by positive police–community relations, it was not without its problems. Two of the more significant problems during this period were (1) the involvement of police in corruption and (2) limited oversight and supervision of patrol officers. During this period, police involvement in corruption took on a number of different forms. First, because of their close relationship

with communities, officers were susceptible to involvement in criminal activity or the acceptance of bribes in return for the nonenforcement of laws. The later part of the political era coincided with Prohibition and created opportunities for officers to gain financially by protecting illegal drinking establishments or speakeasies. A system of political patronage and the close connection officers had to local ward politicians also made them highly vulnerable to political corruption. Because they provided oversight at neighborhood polling locations, it was not uncommon for officers to have undue influence over public voting decisions or in some instances to intentionally rig elections. The problem of corruption was complicated by the limited forms of managerial oversight and supervision of patrol officers. Unlike the historical periods that would follow, the availability of technologies to monitor and track the location and activities of officers was limited to nonexistent during this era. Patrol officers were afforded considerable discretion in their daily activities, and there was limited motivation to supervise and punish them for wrongdoing given the complicity of managers in political corruption as well. The inefficiency and disorganization that resulted comprised a direct target and impetus for the next historical period, the reform/professional era.

The Reform/Professional Era (1930s–1980s)

In 1931, the National Commission on Law Observance and Enforcement (known as the *Wickersham Commission*) presented its final report to President Herbert Hoover. Among the report's recommendations was a call for increased reliance on civil service to improve the credibility of police hiring and the integration of scientific evidence processing to assist law enforcement. The reform and professionalization movement that occurred during the 50-year period following the Wickersham Commission would profoundly change the face of policing in America. Three of the more significant changes included (1) a shift in the organizational structure of police departments, (2) a new role orientation of policing, and (3) changing demographic characteristics of large U.S. cities. All three of these changes produced new and unique challenges to police–community relations.

A struggle over the control of police departments characterized much of the early reform era. This struggle represented a tension between local ward politicians who wanted to maintain control of their neighborhood precincts and urban reformers who were trying to bring greater structure, organization, and efficiency to policing and government in general. These reforms were part of a larger Progressive movement in American politics that sought to wrestle control from ward-based political machines, centralize decision making at the city level, and eliminate police corruption that was perceived to be a result of political patronage. Although the impact of these reforms was not immediate, the result was a far more centralized, top-down bureaucratic organizational structure.

Within this environment decisions were increasingly made by professional administrators who were more distanced from the realities of the problems and concerns of local communities. In some cities, neighborhood precinct stations were closed in favor of more centralized downtown stations. In other locations, specific policies were developed in an attempt to completely isolate patrol officers from the negative threat of political and criminal influence that had previously existed. For example, during a period of time in Philadelphia it became illegal for patrol officers to live and work in the same beat (Kelling & Moore, 1991). Although many of these reforms laid the groundwork for increased professionalization within policing, these gains were frequently accomplished at the expense of police–community relations. The centralization of police departments created more isolation and social distance among police administrators, patrol officers, and residents of local communities.

During the political era, a central function of the police was the provision of social services. The professional era marked a transition to a period when the law enforcement functions of the police began to be paramount to what the police did and how police were viewed by the community. The shift to a law enforcement orientation was caused by an interaction between new organizational structures emphasizing professionalism and technological advancements. Some evidence of the emerging professionalism in law enforcement included the adoption of formal qualification standards and specialization. Civil service standards and an increased reliance on recruitment and training ensured that officers were hired not because they were integral members of a community but because they were the most technically qualified for the job. Prior to the professional era, police officers could be considered “generalists” who were required to perform a variety of tasks (e.g., solving interpersonal problems, enforcing laws, providing services). Professionalism, on the other hand, encouraged specialization around specific law enforcement tasks. It was now the function of patrol to respond to emergencies and engage in street-level enforcement of laws. It was the responsibility of investigative units to follow up and solve crimes through good detective work. Vice units now used undercover techniques to investigate illegal narcotics and gambling markets. Police officers were now hired and trained with the expectation that they would be “crime fighters.” The implication of this shift was the de-emphasis of the previously important community-service functions. For many new police recruits the service function was now cynically viewed as social work and as outside of the technical law enforcement responsibilities for which they had been trained and hired.

A number of technological innovations also contributed to the newly emerging and dominant law enforcement orientation of policing. The professional era marked the advent of the automobile, the two-way radio, centralized 911 dispatch, and investigative tools such as latent fingerprint technology. During the professional era the primary tool or mechanism for policing was preventive patrol in a

vehicle coinciding with the quick and rapid response of patrol to dispatched calls for service. An emphasis on efficiency over personal connections with communities signaled the rapid decline of foot patrol. The standardized reporting of crime represented another technological innovation that contributed to the increased law enforcement orientation of policing during the professional era. The Uniform Crime Reports, *clearance rates* (percentage of crimes resulting in arrest), and *response time* (the time it takes for officers to respond to the location of a call) were now the benchmarks by which police departments were to be evaluated.

This new law enforcement orientation had a profound impact on police–community relations. Police service was now delivered in a one-size-fits-all approach that emphasized efficiency and standardization of response. This changed the way officers viewed citizens and their problems. Police were no longer encouraged to develop intimate relationships with residents in an effort to help them solve individual or collective neighborhood problems. As crime control experts, police now began to simply view citizens as a means to information that would allow them to process criminal cases and return to service as quickly as possible. Outside of this passive role, police required very little of citizens and were provided little incentive to engage them. Some of the very technologies that made policing more efficient created a barrier to the continued development of positive police–community interaction. The vehicle represented a physical barrier to police–community interaction, making officers less approachable. Reliance on 911 dispatch meant that the limited interactions that citizens had with police tended to revolve around negative experiences such as criminal victimization or being the subject of a police investigation.

The reorganization of police departments and a changing role orientation emphasizing law enforcement took place during a time when American cities were experiencing significant demographic changes and American society in general was undergoing profound social transformations. The conflict and challenges that emerged in the face of these transformations would ultimately push police departments to reorient themselves once again.

One of the more significant transformations during this time was the emergence of a young counterculture brought on largely by the post–World War II “baby boom” generation. This generation posed a challenge to police on two fronts. First, the emergent young age structure of American society meant that crime rates began to increase in the 1960s and 1970s. Second, police were often called to regulate civil disobedience and protests associated with the civil rights movement and the Vietnam War. As symbols of government authority, police were naturally pitted against a generation that viewed them as part of the problem.

By the middle of the professional era, American cities and the relationship police had with communities looked substantially different than they had 50 to 100 years earlier. At the end of the 19th century, American cities were

characterized by increased urbanization, substantial European immigration, and concentrations of poverty and other social problems. Sixty years later, America was becoming increasingly urbanized; however, inner cities were beginning to lose population to burgeoning white middle-class suburban areas. These same inner-city communities were experiencing a new second wave of immigration represented largely by African Americans arriving from rural southern states and showed a continuation of concentrated poverty and social problems. The most substantial difference between these two periods was the role of the police in mediating these problems. During the political era, police came largely from poor working-class backgrounds, lived and worked in the same neighborhoods, and shared the same racial and ethnic characteristics as neighborhood residents. Because of changing urban demographics, by the 1960s police officers increasingly lived outside of the inner-city neighborhoods that were experiencing increases in crime and urban unrest. Because of professionalization, careers in policing were increasingly viewed as legitimate, middle-class professions. As a result, by the end of the professional era the increasing social, cultural, and racial distance between police and communities emerged as one of the most pressing issues facing the justice system. Public distrust of the police and allegations of racial discrimination and abuses of force were common. From the perspective of the police, an us-versus-them mentality was solidified during a period when officers felt underappreciated as they worked in regularly inhospitable environments. The tension between police and communities came to the forefront during a number of significant race riots in the mid- to late 1960s. As a result, the 1960s marked a period when police–community relations would become synonymous with race relations.

The challenge of race and policing was addressed in two important reports released in the late 1960s. The President's Commission on Law Enforcement and Administration of Justice (whose report was released in 1967) and the National Advisory Commission on Civil Disorders (commonly referred to as the *Kerner Commission*, whose report was released in 1968) both highlighted the need for police departments to bridge the widening gulf between officers and minority communities. Although some efforts to improve police–community relations were made toward the end of the professional era, it was only a signal of more significant changes on the horizon. As police departments moved into the 1980s, new organizational structures, questions about the efficacy of professional models of policing, and recommitments to communities represented a new orientation and a shift into the community era of policing.

The Community Era (1980s–Present)

The professional era successfully accomplished many of the reformers' concerns. Officers were now substantially

more removed from the influence of machine party politics and criminal corruption. Police department functions were more centralized, and they operated with greater efficiency. Recruitment standards and training ensured that officers were better equipped to deal with the technical and legal aspects of law enforcement activities. However, by the end of the professional era it was clear that there were limits associated with the professional model. Research and experiments with different forms of policing began to reveal some challenges to the common assumptions held by the professional model. First, it became clear that a concern for traditional crime (e.g., homicide, assault, robbery, burglary) during the professional era had come at the expense of attention to other problems that police considered less serious. Surveys of community residents revealed a deep concern for physical and social disorder within neighborhoods. Residents and community leaders expressed frustration over the inability of police to address problems such as graffiti, prostitution markets, and drunk and disorderly persons. Coupled with this was the realization that what made residents feel safer and more confident in the police was the more visible and interactive experience of having officers patrolling communities on foot (Wilson & Kelling, 1982). Second, the efficacy of the popularized law enforcement approach—random preventive patrol in a vehicle, rapid response, and follow-up investigation—began to be called into question. Research suggested that this strategy was unrelated to reductions in crime rates or improved apprehension of suspects. Furthermore, critics argued that this strategy limited the ability of officers and departments to appreciate the underlying problems connecting criminal incidents (Goldstein, 1979). Finally, it became apparent that the police were ill equipped to deal with crime and neighborhood disorder problems alone. The professional era encouraged the police to view themselves as experts over a narrow range of legal problems; however, it became readily apparent that the range of problems with which the police were dealing was neither narrow nor strictly legal. In addition, both police officers and police administrators began to realize that their efforts to address these problems were limited without the broad support of community members and other nongovernmental organizations. These recognitions culminated in the development of a new philosophy of policing that is reflected in the community era.

Since the 1980s, policing has been characterized by at least three broad changes: (1) organizational restructuring, (2) a broadening of the police role/function, and (3) greater collaboration with communities. In many respects, some of these developments reflected the ideals of policing that had existed during the political era but had since faded in light of the reform movement. Although the community era represents a new philosophy and way of thinking about policing, it is clear that many police departments continue to cling to remnants of the professional era. In this respect, some police departments have been more successful at

incorporating fragmented elements of community era reforms but less successful at adapting policies, practices, and coordinated strategies consistent with this new model (J. R. Greene & Mastrofski, 1991).

One of the most significant changes in the community era was a shift toward a more decentralized organizational structure of police departments. Decentralization has been accomplished in at least two different ways: (1) the physical restructuring of police departments and (2) the decentralization of decision making. In an effort to increase resident access to police, many departments have reversed the centralization trend popularized during the professional era. In some locations this has been accomplished by opening neighborhood-based storefront police stations. These locations provide a venue for residents to personally contact police officials with concerns or serve as a host location for police–community meetings. Some police departments have accomplished physical decentralization by restructuring police beats or areas of patrol responsibility so they more closely align with neighborhood boundaries. This, in conjunction with the permanent assignment of patrol officers to the same beats, has ensured that officers and communities become more familiar with one another. In the community era, not only are police departments more physically decentralized but also the organizations themselves have become more decentralized. This has meant that more discretion and decision making have been transferred from those at the top of the organization to those closer to the bottom. This change reflects recognition of the great variation in problems, needs, and assets experienced across urban neighborhoods. In the professional era, policies and decisions tended to be standardized and made by administrators who were too often removed from the unique challenges of individual communities. In an effort to be more responsive to the individual needs of communities, patrol officers and middle managers assigned to specific geographical areas have been given far more responsibility and discretion.

The community era has also forced police departments to broaden their focus and to elevate order-maintenance concerns as a priority activity. Police departments are increasingly recognizing that problems of order maintenance are often a precursor to more traditional crime and frequently create more fear and dissatisfaction within communities than do traditional crimes. Order-maintenance issues can include physical disorder such as abandoned buildings, graffiti, and landlords who ignore municipal housing codes. Order maintenance also includes social disorder such as loud parties, open-air drug markets, and teenagers who are skipping school and hanging out on the streets. An increased focus on order maintenance has required police departments to get far more creative in how they go about solving these problems. As discussed later in this chapter, oftentimes this requires the police to consult with residents and community groups in an effort to determine which disorderly problems are most troublesome and

what nontraditional responses might be best suited to addressing them. Alternatively, police have also been experimenting with more traditional law enforcement approaches to deal with order-maintenance issues. Zero-tolerance policing, which has also been referred to as *aggressive order maintenance*, is an approach that has been associated with some reductions in these problems but may also generate more complaints from the public (J. A. Greene, 1999). Therefore, how police departments go about addressing order-maintenance problems represents a critical determinant of police–community relations.

The final defining characteristic of the community era is increased attention to the relationship that the police have with communities. The urban unrest that emerged in the 1960s and 1970s provided dramatic evidence of the need for police departments to take more seriously the relationship they had with communities. With the focus on law enforcement during the professional era there was little incentive for police departments to be concerned with fostering a positive relationship with communities. As experts in crime control, police certainly did not view residents and community groups as equal partners in their fight against crime. An emphasis on order maintenance, the decentralization of police departments, and an increased appreciation for the complexity of crime and urban disorder encouraged police departments to challenge these patterns in the community era. Police are increasingly beginning to view community engagement as a central component of their mission. Within this framework, partnerships and collaboration between police and communities allow these two groups to jointly produce crime control and public safety. Some scholars have referred to this as the *coproduction of social control* (Scott, 2002). Instead of treating crime as isolated incidents, police in the community era have engaged residents and community-based organizations in long-term collaborative problem solving. In accomplishing this effort, police have turned to members of resident-based organizations, such as block clubs and neighborhood associations. Because of their central location within communities, and because they are frequently most vocal in expressing their concerns about neighborhood problems and the quality of police service, these resident-based organizations have been at the forefront of police–community partnerships. Also during the community era police have broadened their partnerships to increasingly include noncriminal justice government and nongovernment agencies. Examples of government agencies involved in these types of partnerships include school districts, municipal code enforcement, youth services bureaus, parks and recreation, and municipal waste management. In the community era police have also increased partnerships with nongovernment agencies that are working directly with local neighborhoods and communities. Examples of these agencies include community development corporations, private corporations, and nonprofit social service agencies.

Strategies to Address Police–Community Relations

Police–Community Relations Movement

Efforts to improve police–community relations have intensified during the community era, but attention to this challenge preceded this period by decades. As discussed earlier in this chapter, by the late 1960s American policing was facing a significant community relations crisis; however, the police–community relations movement got its start at least a decade earlier. In 1955, the National Institute on Police and Community Relations was held at Michigan State University. This 5-day conference was cosponsored by the National Conference of Christians and Jews and the Michigan State University School of Police Administration and Public Safety (Carter & Radelet, 1998). This conference, the discussions that it spawned, and the annual conferences that would follow moved the discussion of police–community relations to the forefront of the police agenda. Since the 1950s, a number of specific approaches have been taken in an attempt to address this problem and bring police and communities closer together. These strategies have been as simple as the development of police athletic leagues to support youth development and as complex as completely reorienting the philosophy of entire police departments. Taken as a whole, these strategies can be classified into three broad categories: (1) public relations efforts, (2) community service activities, and (3) community policing.

Public Relations

Some of the earliest efforts to improve police–community relations can be considered public relations efforts. Although public relations models differ in their scope and approach, they share a number of common characteristics. First, public relations approaches make a common assumption about the cause or origins of poor police–community relations. It is assumed that problems with this relationship exist because the public fails to fully understand the complexity and challenge associated with the job the police are trying to accomplish. Alternatively, poor police–community relations could simply be due to the fact that the public has an inaccurate or unfavorable perception of the police. This underlying assumption lays the foundation for the next characteristic of the public relations strategy. The second common element of the public relations approach reflects efforts to improve the public’s perception of the police. In some respects, this involves reeducating communities about what reasonable expectations they should hold of the police. This strategy has been carried out in a number of ways. Some police departments have created specialized police–community relations units to carry out these efforts. These units are composed of officers who have received special training in police–community relations, and their

focus, in part, is on developing and maintaining a more favorable public image of the police. Other police departments have engaged in media campaigns, hosted open houses at local police precincts, developed civilian ride-along programs, and operated citizen “police academies.” The shared purpose of these activities is to create an environment in which to play host to more positive interactions between police and residents and to assist the police in educating the public about police work. If the public perception of the police is to blame, public relations models simply try to modify these perceptions to ones that are more favorable of the police.

There are a number of problems or limitations associated with the public relations approach. Some critics have argued that the public relations approach simply represents one-way communication between police and communities (Carter & Radelet, 1998); in other words, the police explain to the public what they should expect or how the police can best realistically meet their needs. The trouble with this approach, it is argued, is that it fails to provide an opportunity for residents to voice their concerns to the police. It is important to note that what the police are telling residents they should be concerned with may be completely different from what residents are truly concerned about, or the expectations the police think a community should have of them may be inconsistent with what the community actually expects of the police. The problem with this limitation is that it usually fails to provide an avenue for discussion of the real issues that represent barriers to more positive police–community relations.

A second, but related criticism of some of the public relations strategies is that they may be most effective at reaching an audience that already shares a favorable opinion of the police. This criticism is commonly associated with evaluations of strategies like civilian ride-along programs and citizen police academies. These evaluations have found that civilian participants tend to be individuals who are already overwhelmingly supportive of the police. Also, civilian participants in these programs tend to come from neighborhoods where police–community relations are not serious or challenging issues. In this respect, the residents and communities that the police need to reach out to the most fail to be engaged in any meaningful interaction or dialogue with the police. As a result, the problems of poor police–community relations go unaddressed in the very communities where these issues are most pronounced.

Finally, some critics of the public relations model have observed that the officers who are most active in these efforts frequently are not representative of the typical officer on the police force. Officers selected for police–community relations units, or similar activities, typically receive special training, may already have a more positive rapport with citizens, and are less likely to have had civilian complaints filed against them in the past. This can be problematic for at least two reasons. First, it may encourage the average police

officer to be less motivated to develop positive police–community interactions in his or her day-to-day activities. After all, it can be argued, there are specific officers designed to deal with the hard work of developing these relationships. The second reason this is problematic is that it fails to address the conduct of specific officers who are arguably the target of most civilian complaints. In this respect, the officers engaged in the targeted interactions with citizens are not the officers on the force who are problematic from the police–community relations standpoint. This cosmetic approach frequently fails to deal with the small percentage of the police officers who are generating the majority of citizen complaints and therefore the biggest impediment to more positive police–community relations.

Community Service

A second strategy that has been used to address police–community relations is community service, which is similar to public relations but provides the addition of a more tangible public safety benefit for communities. Community service efforts recognize that a substantial obstacle to better police–community relations is the public’s perception that the police are not doing enough to address their public safety concerns. Community service has been especially pronounced in the community era as police departments have broadened their role in recognition of the significance of order-maintenance concerns. Community services that police provide are both directly and indirectly related to public safety. For example, police frequently engage in crime prevention activities by assisting residents in organizing neighborhood watch groups, attending community meetings to share crime statistics, providing tips to businesses in an effort to prevent theft, or establishing Drug Abuse Resistance Education (D.A.R.E.) programs in schools. In addition, it has also been common for the police to provide services that may be indirectly related to crime or public safety outcomes. Some of these services include activities for youth (e.g., police athletic leagues), general neighborhood improvements (e.g., working with residents to clean up a community park), or actively referring citizens to other public and private agencies that can address non-law enforcement problems.

The goal of community service activity is to increase the positive interactions that communities have with the police, to improve public perceptions of the police, and to meet real needs that are expressed by community members. The strength of the community service approach is that, unlike public relations models, community members receive a more tangible benefit from these interactions and the efforts by the police are more likely to reach a broader audience. There are a number of limitations associated with community service. First, some people have been concerned that the simple delivery of services to communities may not have the same effect as collaborating with community members to jointly make improvements. They

argue that there is value in having the police empower communities to work toward collaborative solutions; in other words, fostering dependence on the police is not as desirable as fostering opportunities for mutually beneficial police–community partnerships. Although this criticism is not true of all community service activities, it certainly applies to a large number of them. The second limitation is a criticism shared with public relations efforts: that officers assigned to community service are frequently not representative of the department as a whole. This is especially true in departments where a specialized community service unit is responsible for carrying out all community service activities. Community service activities have the biggest impact on police–community relations when the entire department adopts a community service orientation. One effort used to accomplish this department-wide orientation is community policing.

Community Policing

Community policing borrows many of the same ideas and concerns addressed by public relations and community service activities; however, community policing represents a far more comprehensive approach that demands some substantial changes to the organization, mission, and activities of entire departments. According to Cordner (1999), community policing contains three critical dimensions: (1) philosophical, (2) strategic, and (3) tactical. The philosophical dimension represents a new way of thinking about policing that is consistent with the community era as opposed to previous professional era models. The philosophy of community policing is characterized by a broad vision of the police function, increased attention to the unique needs of individual communities, and a recognition that communities should have input into the police services they are receiving. Community policing recognizes that there is more to policing than simply fighting crime. The police have recognized that they need to be involved in mediating conflicts, providing services, and helping communities solve a wide variety of problems. This philosophy also rests on the recognition that neighborhoods and communities are unique and require different strategies and approaches. Finally, a community policing philosophy has meant that police must consult with community members and draw on their knowledge and insight. The strategic dimension represents the means by which this philosophy is translated into practical operational concepts. For community policing this has meant a more proactive preventive approach rather than a reactive one. Police are more aggressive at identifying and addressing long-term community problems rather than simply responding to dispatched calls for service. Police departments have relied on foot patrol, permanent beat assignment, and regular community meetings as a means to increase the interactions they have with the public. Finally, the tactical dimension represents specific programs and actions that departments

take to meet the new demands of community policing. Two of the more common examples are (1) the development of strategic partnerships with other criminal justice agencies and community-based organizations and (2) the development of a problem-solving approach to public safety. These two activities help ensure that complex problems are addressed by a network of individuals and organizations that possess the knowledge and resources to tackle them.

Community policing, like other strategies to improve police–community relations, is not without limitations. First, community policing is very ambitious, because it requires that police departments completely reorient and reorganize themselves. For example, it is not easy for departments or individual officers to move away from a very reactive, 911-driven, law enforcement approach and adopt a more proactive, preventive, problem-solving model. The second challenge is that community policing is often most difficult to implement in the very neighborhoods that have the greatest need for improved police–community relations. Developing partnerships with community-based organizations and engaging residents can be very difficult in neighborhoods where there has been long-standing distrust and dissatisfaction with the police.

Conclusion: Public Opinion and the Police

As police–community relations have become more of a concern in recent decades, police departments and social scientists have become more systematic in measuring and assessing these relationships. These assessments have increasingly been made through public opinion polls in which residents are asked about their relationship with the police and their level of satisfaction with police service. Understanding public opinion concerning the police is important for at least two reasons. First, as an outcome, public opinion can help police departments gauge how they are doing in terms of police–community relations. Monitored over time, public opinion can be used to evaluate specific programs designed to improve police–community relations. Second, public opinion research can be used strategically by police departments to identify areas that are a direct impediment to better police–community relations. In this way, police departments can use this information to help inform the approaches they take and to better address the needs and concerns of communities. This research has explored a variety of dimensions of public support and satisfaction and has revealed a number of important characteristics and determinants associated with both positive and negative police–community relations.

Dimensions of Public Support

In general, public opinion research has distinguished between general or global attitudes towards the police and specific satisfaction with direct experiences and interactions

citizens have had with police officers. Surveys that have addressed the first outcome variable have asked residents to report general impressions of or attitudes toward the police. These surveys have measured citizen trust of the police, perceptions of police responsiveness, confidence in the police, general satisfaction with police service, and perceptions of police misconduct and other problems associated with abusive police behavior. Other public opinion surveys have assessed direct interactions that citizens have had with the police. These surveys have addressed interactions that citizens have initiated (e.g., crime victims who call the police) as well as interactions that the police have initiated (e.g., citizens who have been stopped for a traffic violation). This research has measured citizen satisfaction with the police response; citizen perceptions of police effectiveness in handling the situation and whether the police were fair, polite, and helpful in their interaction.

Individual-Level Factors

According to public opinion research, citizens are for the most part supportive of and satisfied with the police. However, this research has also revealed a number of individual citizen characteristics that have been shown to be related to differences in support and satisfaction with the police. Some of these factors are related to demographic characteristics, and others are related to the nature of the direct experiences citizens have had with the police. In addition, some research has demonstrated the importance of vicarious experiences reported by friends and family members who have interacted with the police. Some of the most important demographic characteristics that have consistently been shown to be related to public opinion of the police are age, socioeconomic status, and race. Older adults and senior citizens generally hold more favorable opinions of the police compared with young adults and teenagers. Individuals who earn more income, have higher levels of education, and who own their homes are generally more satisfied with the police. One of the most consistent findings is that an individual's race and ethnicity are strong predictors of his or her satisfaction with the police. White community members are generally more supportive and hold more favorable views of the police compared with African American and Hispanic community members. Some research has suggested that these race/ethnicity differences are due to differential experiences of minority members as well as differences in community-level characteristics. If minority citizens are more likely to have negative interactions with the police (e.g., the focus of a police-initiated stop or investigation), differences in their satisfaction with the police are only indirectly related to race and ethnicity. Likewise, if minority citizens are more likely to live in communities experiencing high levels of crime and disorder, differences in their confidence in the police are only indirectly related to race and ethnicity. These important community-level factors are discussed next.

Community-Level Factors

Much of the individual-level differences in citizen satisfaction with the police can be explained by community-level factors; in other words, where people live is a more powerful predictor of satisfaction than individual demographic characteristics and at least as important as direct experiences residents have with the police. Some of the community-level factors that appear to contribute to differences in public opinion include neighborhood-level poverty, perceived neighborhood disorder or incivilities, violent crime, and perceptions of social disorganization (e.g., willingness of neighbors to collectively address public safety concerns). Residents who live in neighborhoods experiencing high levels of poverty, neighborhood disorder, violence, and limited collaboration between residents generally report lower levels of satisfaction and attitudes less favorable to the police. This suggests that residents place a high degree of responsibility on the police for the physical and social conditions of their neighborhoods.

Implications for Police Service

The research reported in this chapter has a number of implications for police departments seeking to address and improve police–community relations. First, it suggests that an important first step is to decrease the number of negative interactions between police and community members and provide avenues for more positive interactions. This applies to both voluntary citizen-initiated interactions as well as involuntary interactions initiated by the police. Research suggests that the on-scene behavior of officers has an important influence on citizen perceptions of the police (Skogan, 2005). Ensuring that officers take steps to explain their actions, respond in a fair and polite manner, and provide opportunities for citizens to express themselves represent vital steps to improve citizen satisfaction. The second important implication of this research is that the police need to understand that the community context of these interactions matters greatly. Regardless of the demographic characteristics of communities, the presence of visible social and physical incivilities limits the quality of police–community relations. Police departments must address these concerns in ways that are visible and transparent to community members. In this way, police can improve public satisfaction to the extent that community members perceive the police to be seriously addressing these order maintenance problems. Increasingly, the real challenge for the police is to find ways to engage in aggressive order maintenance activities while not jeopardizing the quality of interactions they have with members of those communities.

CULTURAL ARTS AND DELINQUENCY REDUCTION PROGRAMMING

JERRY MILLER AND WILLIAM ROWE

University of South Florida

The first conference that looked at the use of arts in the criminal justice system was held in 2007. This is indicative of a young but growing movement that attempts to create positive intervention strategies using nontraditional methods. Foremost among these efforts is the utilization of visual, tactile, and performing arts as a means to reach and teach people who have either been arrested or incarcerated. These efforts have ample anecdotal evidence behind them but limited quantitative research to support their efficacy. This chapter describes the growth and development of the use of arts as an intervention strategy, what the research does and does not tell us, and where the next steps may be.

The chapter authors represent the research, training, and academic components of a program called Prodigy, which is funded by the Florida Department of Juvenile Justice. Prodigy serves as a diversion program for arrested youth. Instead of going to trial, the first-time offenders may opt for this arts program. Prodigy also serves as a prevention program in that it is open to all youth in the community. No distinction is made by the program or the instructors as to the reason for attending—the diversion and prevention participants are in the same classroom. In fact, the instructors may not know who the court-referred participants are. There were over 3,000 enrolled youth covering six counties in west central Florida in the most recent year ending in 2008.

One of the keys to the program is its placement in high-crime neighborhoods. On-site programming is managed through contracts with 15 neighborhood-based agencies.

This helps ensure that the program as implemented in the neighborhood has close ties with institutions—or *assets*, as they may more theoretically be called—that are connected (at least geographically) with the residents of that area. These partners include churches and community development corporations, as well as more traditional groups such as YMCAs and Boys and Girls Clubs.

The most critical measures from the program, from the funder's perspective, are the outcomes of completion and recidivism. Empirically, those who complete the program are significantly more likely not to recidivate. Prodigy currently operates with a nearly 85% completion rate and over a 90% 6-month nonrecidivism rate for the completers. Both of these outcomes far exceed the contracted goals of the program. Data are now being collected on individual-level outcomes such as mental and emotional health, academic efficacy, academic behaviors, and other variables that provide measures of the program's impacts.

History of Arts Programming

Purposeful arts programming, which also has links to the currently named *community arts movement*, has its modern roots in the Settlement House movement of the late 1800s and early 1900s, according to Grady Hillman, one of the leading practitioners of the use of art as an intervention strategy. Settlement houses originated to serve immigrants with educational programming, social services, and the arts as

part of the effort to acculturate residents and create upward mobility for them. Settlement houses are, not coincidentally, important also to the development of social work. It was a strategy to create and provide services to the general population with identified needs. Variations of this model of community intervention exist today in a range of environments, from neighborhood-based community organizations to a large federal Housing and Urban Development program called Creative Communities.

In the 1960s, the Arts in Education program greatly expanded the utilization of artists, with many schools around the United States hosting this program. This brought artists into the schools to work directly with youth and connected youth with art, culture, and the practitioners.

Later in that decade, the work and employment program Comprehensive Employment and Training Act was created, and many artists began working for that program. Hillman (in press) quoted a figure of \$200 million that was invested in hiring artists through that program. This work program was also used by schools to bring arts into the building.

Through the Arts in Education program and the Comprehensive Employment and Training Act, the expertise and the knowledge base for the use of arts as a model that can positively impact the life of youth began to develop. Interest in ways to expand this programming into other institutions was generated. The next step occurred when this programming began to be used in other institutions, in particular juvenile detention facilities and adult prisons. Again referring to Hillman's perspective, this drift toward those settings occurred intuitively, that is, without it being developed as a result of research or hard data. There was an underlying assumption that the process of viewing or creating art was inherently therapeutic or personally helpful. Identification of this assumption and how it impacted the prognosis of an individual in a positive manner was intuitively described and not clearly defined, at least from a research perspective. It was during this time that art intervention programs began receiving national (U.S.) recognition. One program, *StreetSmART*, was named a national model.

Up until this point, most of the reported positive aspects of arts programming were anecdotal. There had been little systematic evaluation or research of which these authors were aware. In general, the evaluations that had been conducted had methodological problems and were not very robust. There were many unaccounted-for variables that could skew the results. The studies, however, did tend to support the notion that there were indeed positive outcomes. This naturally led to an interest in developing more systematic evaluations of arts intervention programming.

Two projects in the 1990s attempted to address this issue and are particularly noteworthy. Neither can be said to provide definitive evidence supporting the value of the programming, but they represent important historical steps in furthering the research and practice of arts intervention programming. Both are still widely referenced in current work.

The Office of Juvenile Justice and Delinquency Prevention in the U.S. Department of Justice funded, in partnership with the National Endowment for the Arts, a pilot diversion project (for first-time offenders) and incarcerated youth. The YouthARTS project, evaluated by Clawson and Coolbaugh (2001), was a three-site program established as a demonstration project. This program was meant to serve as a formal evaluative process of what had been emerging independently and in piecemeal fashion throughout the country. It was designed to shed light on the question as to whether arts programming worked as intended.

At each of these sites, a cohort of youth was followed for a period of months, and assessments were conducted to evaluate the impact of the programming on the youth. Because of a number of problems, the evaluations were promising but inconclusive, a situation that frequently occurs when evaluating juvenile justice programs. The premise was that engaging youth in arts programming would result in their learning better ways to manage themselves and their lives. The youth generally lived in at-risk neighborhoods, which in these days current models describe as *communities with limited social capital or community assets*.

Many issues disrupted the quality of the data and the efficacy of the research. These included participant retention (high loss of participants), fidelity of implementation, quality of data collection, and similar issues. However, a pattern emerged that did indicate there was some promise to these programs. This was in line with previous evaluations that showed arts intervention as a promising practice.

The second noteworthy research project was a set of studies conducted by the RAND Corporation. These studies attempted to identify and codify characteristics and best practices of programs across the country and, more locally, in Los Angeles. These studies helped create the foundation for future research. They were systematic in their data collection and analysis and had a large enough sample size to have greater assurance in their findings, and they represented the most robust research concerning arts programming.

One of the RAND studies differentiated programs identified as developing "prosocial" behaviors from those that did not have that outcome. From this the researchers developed a set of best practices—or, more accurately, common practices—used by the programs associated with the positive prosocial outcomes. Some of these are described later in this chapter.

One of the most robust, long-term study of arts programs is commonly called the *McGill study*, because it was conducted by faculty from McGill University. Robin Wright and colleagues (Wright, Lindsay, Allaggia, & Sheel, 2006) conducted a 3-year quasi-experimental study across five sites in Canada to ascertain the impact on the psychosocial functioning of the participating youth.

Comparison with a matched sample from the Canadian National Longitudinal Survey of Children and Youth showed significant positive changes in some mental health measures, such as depression. Significant improvements were reported in social skills, communication, cooperation, teamwork, and conflict resolution. The data were inconclusive in regard to behavioral changes.

The RAND studies and Clawson and Coolbaugh's (2001) study foretold the interest in the impact of arts programming on juveniles and on criminal offenders. The McGill study was the one of the stronger examinations of the impact of the arts. Studies on the use of arts as an intervention, though still not conclusive, are now less inconclusive, and they show promising outcomes. These results are described later in this chapter, after some background about the philosophy and theoretical foundation of arts programming as an intervention program is discussed.

Theory

Conceptual Theory

The term *theory* has not been clearly defined when discussing arts as intervention. Excluding art therapy, in which trained counselors work clinically with the patients or clients, research on this programming is limited to mostly program or outcome evaluations and has not focused on developing a theoretical model for arts intervention.

Wright and her colleagues (2006) were an exception with their conceptual model related to learning skills that impact affective experience and behavioral aspects of

youth (see Figure 95.1). That model attempted to show the relationships to the program components and the outcomes.

Wright's approach, and in general most approaches to arts interventions programming, have either consciously or intuitively been shaped by the perspective of what is termed *positive youth development* (PYD). That model looks at the assets in the youth's life rather than looking at shortcomings, handicaps, and those things that are missing or destructive in the child's life (see Table 95.1). In such an approach the goal is to build and strengthen the assets in the youth's life. It is believed that doing so will increase the resilience of an individual who may be faced with dramatically difficult life events. For example, possessing certain social skills is believed to be associated with good social outcomes. If a person knows how to problem-solve, manage anger, or communicate effectively, then he or she is considered to have the skill sets to effectively resist the poor choices that may be available in his or her social environment and make constructive positive decisions. It logically follows that teaching youth these skills will build personal resources to manage a variety of situations. This also has an impact on youth's affective experience of self; they are postulated to show an increase in self-regard.

In contrast to PYD, a deficit-based approach attempts to find out what is wrong with the youth and then tries to fix it. However, there are limits to this approach. As Jeffrey Butts, Susan Mayer, and Gretchen Ruth (2005) discussed in their issue brief, keeping youth away from risky behaviors does not mean they will have a good future. Other elements—for example, assets,—need to be in place. Absence of the bad elements is not necessarily predictive of a productive future, but a youth who has many of the aforementioned important assets has a higher probability of having a productive life.

Figure 95.1 Conceptual Model for the Impact of Arts Programming

Program Theory

The PYD model operates in an arts intervention program as a contextual basis for a *program theory*. This is defined as a conceptual causal framework that explains what outcomes and results are expected in a program and the relationship of activities to those outcomes. Some people refer to program theory as a *model of change*; others state that program theory is an explanation of an underlying social model. This model may comprise other theories or models; youth development, attachment, or self-regulation theory are examples.

Although specific protocols are available for developing a program theory, for this chapter it is operationalized in the following way: There is a problem and an intervention, and activities are designed to solve the problem (based on the assumptions identified in the problem statement), outcomes are expected from these activities, and measures are defined that indicate success. The next section explicates these parts.

The Problem

Problem definition is a way of explicating the assumptions being made when the intervention program is being designed. In this sense, in order to understand the rationale in utilizing arts as an intervention strategy, it is important to define the problem one is trying to solve.

The history of dealing with “juvenile delinquents” is far too complex to discuss in any detail here; however, several generalizations will be made in an effort to develop a problem definition. Approaches to dealing with juvenile delinquent behaviors have changed over time and involve assumptions about environment and individual choice when looking at the perpetrator and about tolerance for behavior, or desire for retribution, when seen from the vantage of the victim or society. There appears to be one of two assumptions operating when punishment is

offered as the solution to the problem behaviors: Either (1) the youth is consciously choosing to be involved in criminal activity or, in a behaviorist framework, (2) there is sufficient reward for being involved in criminal activity and the behavior is reinforced. Either way, the punishment of locking up a youth is viewed as a method to interrupt those processes. When this view coincides with a low community tolerance for youth criminal activity, the approach can loosely be called a “lock ’em up” or “teach ’em a lesson” approach.

A second approach is evident in the rehabilitative movement or the utilization of a medical model. The youth have issues that need fixing in a manner analogous to having a chronic infection. However, these issues may be internal (developmental, mental or emotional capacity) or external. The latter refers to an environment that shapes and rewards negative behavior, which may include dysfunctional relationships with family, peers, and authority figures. In this model, youth are treated through therapeutic intervention. This is typically in the form of talk therapy. When viewed from the deficit model, this approach requires a focus on problems in the youth’s life and then actively determining ways to manage those problems.

Art as an intervention strategy is more aligned with the rehabilitative approach than with the punishment method of addressing youth crime. As such, it shares the assumption that the individual can be treated. However, it diverges from typical therapeutic intervention in two respects. First, the focus is not on the problems but on building the youth’s ability to make good choices. This is a way of building the individual’s assets. The assumption from this approach is the following: Given the skill sets needed to be able to evaluate situations and make good choices, people will generally do so. This eliminates the need for any in-depth diagnostic process to determine what is wrong with the youth. The focus is not on what is wrong but on the skills, knowledge, and experiences people need to manage life more effectively. In medical terms, it is a wellness approach instead of a disease-based approach to health.

Arts may offer therapeutic value similar to that of counseling, but without the counseling—and at a lower cost. The art environment, if managed effectively, has characteristics of traditional therapy in that self-exploration is a part of the process. Coupled with the building of the social skills, youth will have the capacity to make good decisions, which includes resisting criminal activity, *in vivo*, or in the present, rather than in reflection.

With that background, the problem statement could be phrased the following way:

In given environments, many youth engage in criminal activity for reasons that include the lack of skill sets needed to make good choices. With the right skills, youth can learn how to make good choices and will likely make them given the (structured) opportunity to explore their own place in the world and their sense of self. Therefore, the question becomes the following: how can we teach the skills in a framework that provides youth with productive self exploration in a manner that produces positive and constructive behaviors for the youth?

This is a very different problem definition than one that asks, “What is wrong with these kids? Or their families? Or their communities?” It also differs from a statement that asks “How can we make the streets safer?” The former is a typical rehabilitative approach, and the latter is associated with a desire for punishment.

Comparing Arts and Sport as Responses

As stated earlier, art is not the only possible response to the problem. Sport is a commonly expressed and funded answer. It is important to determine, therefore, the rationale for arts in contrast to sports or other programming. Without that rationale we are creating a solution that does not have a problem.

Because athletics is a primary approach to engaging youth in a positive manner, this section compares and contrasts arts intervention with sports as a way to explicate the rationale for utilization of arts programming. This is not meant to imply that there are not other ways to engage youth (e.g., scouting and recreational programs). The activities in those programs are somewhat more heterogeneous, making it more difficult to clearly distinguish between sports and arts.

Important areas of differentiation do exist between sports and the arts. One of the more prosaic differences is that not everybody likes sports. Alternatives and variety of choices are useful. This alone may be considered a valid argument for creating alternatives to sports programming. Why should people be forced into playing sports when they have no interest or limited ability? That generally can lead to frustration on the part of the participant or, worse, being the recipient of scorn and humiliation.

A more in-depth analysis, beyond choice, identifies several other core differences between sports participation and art. In general, youth do better in sports if they

are bigger, faster, stronger, or taller. Sports comprise a competitive situation in which physical attributes and the coordination of the senses play a strong role in performance. It is a team model with a hierarchical group structure in which the contributions of all the team members are not valued equally—there are bench-warmers, for instance. For the youth who do well in that kind of setting, sports may very well be an effective means to learn important skill sets related to social learning. For youth who do not do well, there may be a variety of responses, many of which are not necessarily positive for that child. This may be especially true if the youth is there involuntarily as an alternative to jail or being adjudicated.

Sports programs tend to value conformity to a high standard that is generally established by a coach or is intrinsic to the sport. Whereas at earlier ages youth are praised for their effort, as youth age performance becomes more central. Those who are perceived not to voluntarily conform may be labeled a “slacker,” “troublemaker,” or worse. Those who do not perform well based on the athletic criteria (hitting, running, blocking) may be called “dead weight” or “bench-warmers.” Those who are perceived to voluntarily perform are “team members,” and the ones who exhibit good athletic performance may be labeled “stars.”

Because sports is a goal-directed activity with a specific desired outcome (winning), these roles and expectations align very concretely and appropriately. Although process is important in sports—that is, being a good teammate is valued—outcome frequently overrides the process. Sports has many examples of players who were kept on the team for their ability to help achieve victory despite the fact that that individual could be blamed for an unhappy team environment.

The arts model takes an entirely different perspective to participation and performance. First, the arts values diversity or individuality, while conformity is eschewed. If instructions were given to participating youth to draw a picture of the self in school, there would be general surprise and disappointment if the entire class drew the same schoolhouse with the same teacher in the same colors with no variety in their expression. A variety of representations are expected. The expression of individuality is encouraged. Unlike sports, there are no external performance criteria that measure performance. In baseball, hits are hits. In an arts program, the criteria relate to learning how to express thoughts and emotions; there is no unitary standard.

An important distinction needs to be made between *arts intervention programming* and *art classes*. Art classes teach technique to the end of creating good, or at least skillful, art. Arts intervention programming, on the other hand, teaches expressiveness without concern for the quality of the product. The standards for the art product are relatively low and generally not a factor in its evaluation. The “performance standard,” or its equivalent, is the student’s interpretation of his or her artwork. Art is a vehicle to learn self-expression.

A second major difference between art and sports is the notion of *teamwork*. This generally is an entirely different experience in the arts than it is in sports. When the art project (e.g., a performing arts program) involves a group of people, there are generally enough tasks to include everybody in the process. Some tasks may have higher visibility, but all tasks are necessary for the successful completion of the art project. In drama, the person responsible for lighting may not be on stage, but that does not diminish the importance of the role. This again differs from sports, in which the weaker players are frequently seen as being carried by the stronger players. In the arts, everyone has their job and is expected to do it to the best of their ability.

A third area of distinction, one that has been too little researched, is the *variability in age* of the participants in the Prodigy program. Generally, there are two age groupings (7–12 and 13–17), a broader range than in activities that have a physical component central to it. This age mixture, if properly managed, creates an opportunity for the participants to learn more complex social skills. Dealing with youth who are at different developmental stages necessitates increased social skill sets to be an effective participant in this program. The issue of facilitating development of those skill sets is discussed later in this chapter.

Self-Exploration and Expression

Just as diversity is valued, also valued and encouraged are self-exploration of one's own emotional responses as well as one's standing in family, school, and community. This opportunity to self-reflect in a structured manner is also seen as one of the hallmarks of an effective youth arts program. This gives youth an opportunity to (a) explore individual emotional responses to various situations and (b) express emotions, including fear and anger, in a manner that is relatively constructive. This may be viewed as learning an alternative behavior, one that is more effective than behaviors that may lead to criminal charges.

Facilitating the expression of emotions is a common technique in therapeutic contexts. Labeling emotions seems to help with the management of them. Recent neuroimaging studies (Lieberman et al., 2006) showed a disruption in the negative emotional pathways when feelings were labeled. This type of coding of experience appears in the psychological as well as in the child development literature as being important in the emotional growth and in the regulation of negative emotions. Arts intervention programs encourage and support this type of coding.

Classroom Experience

To make all of these components work is, of course, a more complex matter. There are many side elements to creating a serviceable arts program, such as when and where to hold the program, but the focus for program effectiveness needs

to be on the classroom experience for the youth—the activity that engages the youth. Programmatically, most of the skill building takes place in the classroom, although some programs, including Prodigy, also hold separate life skills workshops. What the classroom looks like and how it is structured are the key questions to ask and manage in the expansion of the program.

One of the common elements among the programming across the country, and indeed, around the world, is the use of artists as instructors. Individuals trained as teachers are not excluded from being hired; they are just not recruited. The focus is on hiring working artists, for two primary reasons.

First, working artists serve as a role model for the youth. They are seeing an adult who is making a living in (and who has a commitment to) the expression of his or her own personal views in a creative manner, complete with emotional content. This can be powerful because it provides a role model of a decent human being (assuming a good staff selection process) who is introspective, expressive of individuality, and emotionally mature. Prior research has demonstrated that many acting-out behaviors relate to emotional immaturity. Art and artists provide a model for these emotions to be explored and expressed in a constructive manner. Greater value, in this model, is placed more on honest expression than in looking good for peers or gaining attention through destructive acts.

Second, because the artists are not recruited within the teacher framework, the relationship to a school classroom is minimized. Many of these youth have experienced failure in the schools and there is little justification for recreating that sort of environment in an arts program. The artist serves more in the role of journeyman who is working with apprentices rather than a teacher who is working with students. This becomes like a workshop and not a classroom. The artist becomes a resource, who is more in the role of a mentor—someone to share knowledge—not a didactic instructor. The youth is not in the role of a school-bound student but is viewed more collegially. This is a change in relationship between instructor and student and creates opportunities for trust building and additional social skill building.

What does the research say about these rationales? Not too much, it turns out. The best we can currently say, based on the RAND studies in the 1990s, is that artists may be a necessary, but insufficient, factor in the success of the arts programming; that is, both effective and ineffective programs have used working artists as instructors—so the artist alone will not produce the desired outcomes. As part of an evaluation, Prodigy has begun assessing different elements of the classroom that impact the experience for the youth.

Classroom Climate: Learning Skills

Again, little research has examined best practices in the classroom in the context of arts intervention programming. The evaluations that do exist report some common

elements, such as being supportive of youth taking (social) risks and having collaborative decision-making processes. These elements were associated with prosocial behaviors of participants.

As Prodigy began to focus on the content of the instructor training, the faculty researchers looked at the asset-based PYD model to determine the skill sets that related to positive outcomes for youth. Three skills were focused on as a result of this inquiry: (1) communication, (2) problem solving, and (3) anger management. These skills have been associated with positive youth outcomes and are teachable. The last is a critical component of any program.

In the ideal implementation, these skill sets are integrated into the class activities. If, for instance, while painting, one of the youth becomes frustrated, the instructor encourages the youth to find a way to work through the anger and find a way to resolve the issue that is creating the frustration. Integrating these social skills—in this case, both anger management and problem solving—is seen as important for two reasons: (1) It is a way to facilitate the teaching (and learning) of social skills, and (2) it helps create an environment in which social risks are encouraged.

The second point is an important one if the youth are to learn skill sets that will help them as they mature and the impact of peer pressure increases. *Positive social risk-taking* can be defined as the ability to express individuality in a peer or other group setting.

The opportunity for positive social risk-taking is influenced by the larger concept of *classroom climate*. This is broadly defined as the pattern of values within the classroom, as represented by the manner in which the content is taught, rewards and recognition are earned, and the interactions between the people in the class.

Classrooms can be a stressful, rigid, and competitive environment. By design, that is not the recommended experience for youth in an arts intervention program. Prodigy strives for an environment that is supportive of the youth in ways that can be measured and observed.

The few evaluative studies of art as intervention programming suggest that certain elements in the classroom are associated with producing positive outcomes, such as prosocial behavior:

1. *Encouragement for social risk-taking.* Youth are encouraged to speak their mind and present their work, questions, and critiques. Encouragement is an active, facilitated process, which is different from just allowing the risk-taking to occur.
2. *Facilitation of problem solving.* If a student presents a problem, whether it is a social issue (interaction with another youth) or technical problem (about the artwork), the instructor does not necessarily provide a solution but facilitates the youth in finding a solution.
3. *Rewards and recognition.* Participants need to receive recognition for their work as well as for positive risk taking.
4. *A caring instructor.* This was more frequently named as a more important part of an effective program than the fact artists were instructors.

5. *Instructor mentoring of participants and instructor facilitation of peer-to-peer mentoring.* These relationships seem to be important in the socialization of the participating youth. The adult–youth mentoring, as discussed previously, shifts the classroom from a traditional setting to a workshop format. The youth-to-youth mentoring creates opportunities for the participants to learn, with facilitation of the instructor as needed, targeted social skills.

These five points are not unique to an arts intervention program. In fact, other researchers, including Fixsen, Naom, Blasé, Friedman, and Wallace (2005) in their report on implementation practices and Weissberg, Kumpfer, and Seligman (2003) in their overview of prevention programs, have found similar associations between effective programs and some of these five points.

That refers us back to the previous questions about the differences between art programming and sports programming. If quality intervention programs have those five characteristics, does it matter which program a person is in? That is, does art programming offer anything that is unique relative to other intervention programming? Is there a rationale for arts programming that goes beyond choice and support of diversity and of expression?

Again, because the empirical literature related to arts intervention programming is thin at best on this question, we need to expand our view of arts programming to include research on the impact of arts on cognitive learning. That body of research is more extensive and more robust. From that research we can, through implication, develop some hypotheses about what associations can be expected about the relationship between art and the building of social skills.

Arts and Learning

The most centralized way to look at the research on arts and learning is to obtain a copy of a compendium of research on arts and learning entitled *Critical Links: Learning in the Arts and Student Academic and Social Development*. Edited by Richard Deasey (2002), this publication is a review of 62 studies that examined the impact of the arts on mostly academic outcomes, although some of the studies looked at social and behavioral outcomes. The research is not conclusive, because most of the studies were correlational; that is, they showed a relationship between the arts intervention or activity and an outcome, but did not ascertain whether there is a causal link between the activity and the outcome. Thus, it is inconclusive as to whether the arts program caused the outcome or there was some other factor that led to the outcome.

In brief, the research has found positive relationships between participation in arts and learning of spatial reasoning, verbal skills, writing, literacy, and math skills. Positive impact on the participant's self-perception and, in some cases, positive change in beneficial risk-taking were

also reported. More recent research is examining neural pathways to observe the relationship, but these studies are very early and also not conclusive.

These studies suggest that art benefits the development of intellect and cognitive abilities. This is in addition to the emotional development that programmatic use of art in an intervention program generally has as a focus.

Outcomes

The research on Prodigy has shown some exciting results. Program completion rates are high, over 85% on average, and recidivism is less than 10% after 6 months. Both are important outcomes to achieve. Incompletion is associated with a high recidivism rate, whereas completion is related to a low one. Although these outcome measures are the *raison d'être* for its existence, there are also some near-term results that may lead to a better understanding of the impact of the program.

Prodigy participants reported fewer mental health symptoms at the end of their program stay. This includes reduced measures of anger and depression. This is an important outcome, because mental health is strongly related to antisocial behavior among youth. The change was both statistically and clinically significant.

Gender differences were also reported. Females came into the program with a higher level of symptoms than did males, but at the end of the program there was no difference in symptomatology between males and females. Although females reported greater symptoms, their scores after the program showed no significant difference from the males, indicating a stronger program effect for females.

A behavior change is an observable change and so is easier to obtain views from others rather than relying solely on the youth's self-reported perception. The research indicates that both youth (who self-reported) and parents reported there was improved behavior of the youth at the end of the program compared with the beginning. This is an especially encouraging finding, because behavior change is generally considered one of the more intractable changes.

Another measure, in particular, had encouraging results. The youth reported improvement in their belief about their academic skills and ability to do well in the classroom. This academic self-efficacy may have an impact on student attitudes and even behaviors and performance in the classroom, an assessment Prodigy is just beginning to undertake. Doing well in school, in the PYD model, is an indicator of increased resilience on the part of the students. This relates to the previously discussed research on academic performance, cognitive development, and the arts.

Conclusion

Arts intervention is a strategy that has over 100 years of history in the United States. It has been reported to have a positive impact and to help keep youth out of trouble. It is a cognitive–emotional intervention. Students are asked to explore and understand their thinking and the relationship to their emotional state. They are asked to express themselves. They do this in the context of an environment that is supportive of risk taking.

A simplified version of the program model for the arts programming is shown in Figure 95.2.

However, research has been limited on its use and the implications of arts programming. Prodigy is undergoing a continuous evaluation, and the McGill study has shown positive results as has the research in education.

There are some next steps to take:

1. *A full program evaluation of an arts program.* This is under way at Prodigy and will provide more insight into the programmatic aspects. This has implications for all types of programming, not just arts. It is part of the effort to implement evidence-based programming.
2. *A theoretical examination and explication of the program components in an arts program that relate to the desired outcomes.* This will advance the science of intervention program and continue the research into PYD models.

Figure 95.2 Simplified Model for Arts Programming

3. *A cost analysis.* Early work indicates that arts programming can deliver effective diversion programs at a low cost per youth. This has important policy implications in terms of allocation of resources.

Over the next 5 years, the science on arts intervention programming should become reasonably robust, with more conclusive statements. Understanding this programming can lead to relatively low-cost programming that youth enjoy and that can be as effective as costlier options. The promise is that youth can improve their social skills, increase their ability to self-regulate, and learn how to express emotions in a constructive manner. They may also experience positive cognitive development benefits leading to improved school performance. If this type of programming holds up to scrutiny, it argues for a change in how we approach youth intervention from both a policy and programmatic standpoint.

WRONGFUL CONVICTIONS

MARVIN ZALMAN

Wayne State University

Wrongful convictions occur when innocent defendants are found guilty in criminal trials, or when defendants feel compelled to plead guilty to crimes they did not commit in order to avoid the death penalty or extremely long prison sentences. The term *wrongful conviction* can also refer to cases in which a jury erroneously finds a person with a good defense guilty (e.g., self-defense), or where an appellate court reverses a conviction (regardless of the defendant's factual guilt) obtained in violation of the defendant's constitutional rights. This chapter deals with the first type of wrongful convictions, or *wrong person convictions*. Note also that the verdict of acquittal in American law is "not guilty" rather than "innocent," meaning that an acquitted person might not be factually innocent. For the sake of clarity, the term *actual or factual innocence* is used to refer to persons who did not commit the crime. *Miscarriage of justice* (a legal term in England) is also used to describe wrongful convictions.

A wrongful conviction is a terrible injustice that is magnified when an actually innocent person spends years in prison or on death row. This has always been recognized by the U.S. legal system. The rising number of exonerations, however, and growing awareness that such injustices occur every day in American courts, raises profound doubts about the accuracy and fairness of the criminal justice system. This understanding is supported by considerable recent research. This surge in awareness and budding research has

motivated a growing number of innocence projects, which work to exonerate wrongly convicted prisoners, to also propose justice policy reforms designed to reduce the number of wrongful convictions or to alleviate their effects. This chapter explains why wrongful conviction has become a prominent issue, the scope of the problem, its causes, and reform proposals.

The injustice of being convicted and imprisoned for a crime one did not commit is intuitively apparent. Research and anecdotal evidence shows that a high proportion of wrongfully convicted prisoners suffer severe psychological consequences, including posttraumatic stress disorder and anxiety disorders, which is not typical among actually guilty prisoners in the absence of life-threatening experiences in prison. This complicates the ability of exonerated prisoners to return to a normal life after release.

More than half the states do not legally authorize financial compensation for persons who were victimized by the criminal justice system in this way, although the number of states with compensation laws has grown in recent years. Moreover, exonerated prisoners do not receive the services provided to prisoners released on parole. Newer compensation laws provide for health and restorative services, as well as financial compensation, to help exonerated prisoners. A person who has been exonerated does not have automatic grounds to sue and recover money damages against police or prosecutors. A number of such cases have been successful in recent years, but they are infrequent and successful

only when specific wrongdoing by criminal justice agencies can be proven and immunity defenses overcome.

The Rise of the Innocence Movement

Prior to 1990, wrongful convictions generated only slight interest. The famous writer of the “Perry Mason” legal thrillers, Erle Stanley Gardner, created an informal “court of last resort” in the 1950s to investigate and correct miscarriages of justice. For the most part, however, the public, as well as most judges and criminal lawyers, was convinced that very few innocent people were ever convicted. When the Supreme Court expanded defendants’ trial rights in the 1960s, for example, the reason given was not to make the criminal justice system more accurate in determining guilt and innocence but to prevent government oppression.

Some pre-1990 scholarship did raise issues of trial accuracy. First, a group of cognitive psychologists began to conduct eyewitness identification experiments in the 1970s. By 1990, they had amassed a wealth of information showing that eyewitnesses were often mistaken and that lineup and identification procedures could significantly increase or decrease eyewitness accuracy. Next, a survey of criminal justice officials by criminologists C. Ronald Huff, Arye Rattner, and Edward Sagarin in the 1980s estimated that thousands of wrongful convictions occurred every year (Huff, Rattner, & Sagarin, 1996). Finally, philosopher Hugo Adam Bedau and sociologist Michael Radelet published a survey in a prestigious law journal in 1988 asserting that 350 innocent persons were convicted of capital and potentially capital crimes in the 20th century and that 23 were executed. Although a handful of these 350 might have been factually guilty, the study’s overall correctness raised awareness in the legal community that an innocent person could be executed. This scholarship did not, despite occasional news stories about wrongful convictions, create widespread concern about miscarriages of justice.

It was DNA testing, used to prove guilt with near certainty and to absolutely exclude suspects or defendants, that caused a sea change in attitudes about wrongful convictions. Previously, blood testing based on group types and other blood factors could not exclude suspects whose blood factors matched the crime sample; even though a large percentage of the population also shared those factors, prosecutors placed these “matches” in evidence. In forensic DNA testing, 13 loci (sites) in a suspect’s DNA strand that vary among people are analyzed to create a distinct DNA profile (or *DNA fingerprint*). The profile is compared with that of the same 13 loci in the biological sample linked to the crime (e.g., semen or blood deposited during a rape or assault). If the profiles match, based on population genetics studies, the probability that the suspect was the source of the crime scene DNA is astronomically high. If only 1 of the loci does not match, the suspect is absolutely excluded.

The first DNA exoneration in the United States occurred in 1989 and showed how DNA transformed a confusing tale of innocence or guilt into one of absolute clarity. Gary Dotson was convicted of rape in Illinois on a teenage girl’s eyewitness identification. In fact, she made up the rape story to cover her fear and shame after consensual sex with a boyfriend. Six years later she was married, got religion, and recanted her story. The police and a judge refused to believe that the recantation was true, despite her pastor supporting her truthful state of mind and the former boyfriend admitting to the consensual sex. Dotson was released on parole by the governor of Illinois in 1985, who inconsistently said that he did not believe the recantation. Dotson was reimprisoned for a parole violation in 1987. Finally, with the support of journalists and a determined defense lawyer, a DNA test was performed on the semen in the rape kit. Dotson was absolutely cleared and formally exonerated. His case became a template for tens and then hundreds of thousands of police rape investigations, which exonerated suspects in the early stages of crime investigations. By the early 1990s, the FBI laboratory reported that one quarter of all rape kit samples from police around the country were exclusions. This meant that in thousands of cases, accusations based on eyewitness identifications were wrong.

Soon, prisoners who knew they were innocent and serving time or sitting on death row for crimes that did not happen or were committed by someone else began to petition for DNA testing. Most were denied testing because of prosecutors’ resistance based on legal technicalities. However, a sufficient number of exonerations occurred by the mid-1990s to generate significant happenings. Newspapers prominently reported DNA exonerations. In New York, two enterprising law school clinical professors, Barry Scheck and Peter Neufeld, started the first law school innocence project at Cardozo Law School to pursue cases of inmates claiming innocence. Janet Reno, then attorney general of the United States, commissioned a report highlighting the weakness of eyewitness identification. The report raised the profile of the wrongful convictions issue in criminal justice and legal circles. By the late 1990s, several powerful documentaries, such as Errol Morris’s *Thin Blue Line*, brought the issue to moviegoers and television audiences.

In 2001, Scheck and Neufeld, together with reporter Jim Dwyer, published *Actual Innocence*, recounting several of their exoneration cases in gripping detail. Each case listed a specific way in which the criminal justice system had failed. This list, along with previous studies, created catalogues of what are considered causes of wrongful convictions. Although the book was well received, the major event in 2000 that did more to put wrongful convictions on the map was Illinois Governor George Ryan’s moratorium on executions. Between 1990 and 2000, Illinois had executed 12 prisoners while 13 on death row had been exonerated and freed. This so shocked Ryan that he halted all executions and set up a commission to review capital

punishment in Illinois. The commission recommended many reforms, and several were enacted. Ryan's continuing concern with unreliable death sentences led him to commute the sentences of all 167 death row prisoners and pardon 4 on the grounds of actual innocence before he left office in 2003. This led other states to impose moratoria or to end the death penalty. Exonerations have weakened support for capital punishment and raised general public awareness about wrongful convictions.

Size and Scope of the Wrongful Conviction Problem

If wrongful convictions were rare, they could be downplayed as inevitable failings of a complex human system. If they are frequent and are linked to systemic problems, then they pose a challenge to the fairness and accuracy of the justice system that calls for a public response. The issue is controversial. Some prosecutors and judges believe the number of wrongful convictions to be vanishingly small and have offered an estimate of approximately 260 a year or an error rate of 0.027% (or 0.00027). This figure is a mistaken interpretation of a study conducted by Professor Samuel Gross and colleagues that counted 340 known exonerations between 1989 and 2003 (Gross, Jacoby, Matheson, Montgomery, & Patil, 2005). Critics fail to note that an *exoneration* is not the same as a *wrongful conviction* (although the terms are loosely used as equivalents). Gross et al. (2005) defined an exoneration as an official act declaring a previously convicted defendant not guilty, by means of (a) a governor's pardon on the basis of evidence of innocence; (b) a court dismissing criminal charges on the basis of new evidence of innocence (e.g., DNA); (c) a defendant being acquitted on retrial after an appeal, on evidence of factual innocence; or (d) a state's posthumous acknowledgment that a defendant who had died in prison was innocent. The study, however, demonstrated that the 340 exonerations it catalogued were the tip of an iceberg, with the number of wrongful convictions probably reaching into the thousands.

Most known exonerations have occurred in murder and rape cases rather than more numerous crimes, such as robbery, for which unreliable eyewitness identification is the only evidence. This is so partly because DNA evidence is available in most rape cases (although 60% of known exonerations were revealed by means other than DNA testing). High-stakes capital cases also generate greater assistance to avoid executions. It is likely that more errors occur in assault, robbery, and burglary convictions based on erroneous eyewitness identification and circumstantial evidence. Studies of wrongful convictions in death penalty cases since 1973 (when the modern era of capital punishment began), as to which careful statistics are kept by the government, have estimated "wrong person" wrongful convictions at 1% to 3.5%. In Illinois, of the 289 persons

sentenced to death between 1973 and 2003, 17 (or 5.9%) were exonerated and released.

Surveys of state judges, prosecutors, defense lawyers, and police officials have provided an alternate estimate of wrongful convictions—of about 1%. Although police and prosecutors give lower estimates than judges and defense lawyers, in light of what is now known about wrongful convictions a 1% felony error rate is plausible. On the basis of slightly more than 1 million state court adult felony convictions in 2004, and prison and jail rates of 40% and 30%, respectively, this rate translates to an estimated 10,790 adults wrongly convicted, of whom 4,316 were sent to prison and 3,237 wrongly jailed in 2004.

The number of wrongly convicted persons cannot be known with certainty, because no federal or state agency keeps track of exonerations, let alone wrongful convictions. Many news stories, reports, and books fairly describe wrongful convictions in detail, although not all of these wrongful convictions resulted in formal exonerations. In some of these cases, prosecutors insisted that the original verdict was accurate despite strong new evidence of factual innocence, further clouding an understanding of wrongful convictions.

Causes of Wrongful Convictions

Studies reveal several factors related to miscarriages of justice, labeled "causes," although they are not so in a scientific sense. Typically, more than one factor is found in each wrongful conviction. Although a few wrongful convictions are caused only by honest witness error, most involve some level of negligence or malfeasance by criminal justice officers or defense lawyers. A troubling minority of cases involve perjury or knowingly dishonest action by forensic examiners, prosecutors, and police. Brief descriptions of the major factors related to wrongful convictions follow. Note that the list that follows is not comprehensive.

Eyewitness Identification

Mistaken eyewitness identification is the leading cause of wrongful convictions. It was involved in 79% of the first 200 DNA exonerations. Although an overall error rate for eyewitnesses is not well established, some experts place it at about 25%. This figure is the same as the proportion of DNA tests in rape cases conducted by the Federal Bureau of Investigation laboratory in which the DNA did not match the mistakenly identified suspect. The human memory does not record all information like a video recorder; it drops most information out of short-term memory and stores the central, but not peripheral, elements of those events in long-term memory. This makes facial recall somewhat uncertain. Events during a crime, such as extreme stress or focus on a weapon, decreases facial recall by

victims and witnesses. In addition, *unconscious transference* can lead witnesses to superimpose the face of someone previously observed but not well-known onto the memory of the perpetrator. Memory is dynamic and can change during the recall stage from what was observed. Memory is also malleable and can change under the influence of suggestion. These and other factors show that eyewitness identification should be received with caution, and yet police, prosecutors, and especially jurors tend to rarely disbelieve eyewitness evidence.

Problems with eyewitness identification are made worse by flawed police procedures. Police have relied on “showups,” which is showing the suspect or the suspect’s photograph alone to the witness without a lineup. Courts rule that showups are suggestive and will exclude showup evidence unless one of several easy-to-produce factors is present. The showup exception factors are whether the witness paid attention, had a good opportunity to view the perpetrator, gave an accurate description, was certain, and viewed the showup shortly after the crime.

Even lineups are often flawed. Police are not always scrupulous in ensuring that the suspect does not stand out from the lineup fillers. Laboratory research shows that more errors occur when fillers are selected on the basis of their similarity to the suspect than on the basis of the victim’s description of the perpetrator. Police or prosecutors have at times suppressed the uncertain identification or nonidentification by one lineup witness while promoting the testimony of another. These and other elements often make lineups a less-than-optimal method of an accurate identification.

Forensic Science Error or Misconduct

Problems with expert evidence presented by forensic scientists or forensic examiners is the second leading cause of wrongful convictions; erroneous forensic evidence supported the convictions of 57% of the first 200 DNA exonerations. Forensic error and misconduct take a variety of forms, including problems inherent in the method, incompetent or untruthful experts, and substandard forensic laboratories.

Some expert evidence is based not on scientific testing but on comparisons that rely ultimately on the experts’ subjective evaluations. Some of these methods, such as fingerprints, bullet and tool mark examinations, and footprint and tire impressions, are relatively credible and accurate, but known errors have nevertheless occurred. If such expert evidence goes unchallenged by defense attorneys (by having other experts evaluate it), it is possible that honest but mistaken conclusions will lead to false convictions. Other kinds of expert comparison, such as handwriting analysis, are more subjective and require closer scrutiny. Even lower on the reliability scale are comparison methods that are so tentative that some label it “junk science.” Two such methods, microscopic hair analysis and bite mark impressions

on skin, have caused numerous wrongful convictions. Hair analysis has now been largely replaced by DNA analysis, and bite mark evidence, although accepted in courts, has been subject to strong criticism.

Examiners have been known to err even where evidence is based on forensic science, which includes blood analysis (serology, which has been replaced by DNA analysis), drug analysis, forensic toxicology (the science of poisons), and organic and inorganic analysis of crime scene trace evidence. Even worse, in a few notorious cases forensic examiners have been exposed as pathological liars who always testified to benefit the prosecution, even when no tests were conducted. In addition to outright falsification, forensic experts can mislead courts and juries by overstating the strength of their findings, reporting inconclusive reports as conclusive, failing to report conflicting results, and the like. When expert witness perjury has been exposed, state criminal justice systems have had to reopen hundreds of cases to ensure that they did not result in wrongful convictions. Some specialized arson investigators have relied on incorrect or outdated fire science to report that fire and burn patterns were evidence of arson when this was not true.

Finally, even the most reliable methods can produce incorrect results if the forensic laboratories are substandard. As DNA testing becomes more sensitive, the risks of contamination rises unless the laboratories are in pristine condition. Testing in some inferior laboratories has even led to several people being wrongly convicted on the basis of erroneous DNA analysis. Among the worst cases was the Houston, Texas, police laboratory. A few years ago conditions were so poor that the laboratory’s roof leaked, contaminating samples with excess moisture.

False Confessions

Most people cannot understand why innocent persons confess, especially as the “third degree” (beating and torture to get confessions) has mostly disappeared from American law enforcement. Yet, false confessions were obtained in about 20% of exonerations, and at least 125 false confessions have been documented. What people do not know is that police interrogation is a “guilt presumptive” process designed to extract a confession from the guilty person who is reluctant to confess. As such, it uses powerful psychological techniques to get suspects, even innocent suspects, to talk and to confess.

When police interrogate a suspect, they are usually not trying to solve a crime because they are already convinced that the suspect is guilty, even if the investigation has not been completed. Police conduct pre-interrogation interviews to ascertain whether a suspect is truthful, but the ability of police to detect lies is no better than chance. Despite Miranda warnings, most suspects waive their rights. Laboratory experiments and case studies have shown that innocent persons waive more frequently because they know they have nothing to hide.

The interrogation setting and process create psychological pressure designed to extract a confession. The suspect is isolated and confined in a small, uncomfortable space. The interrogator forcefully asserts the suspect's guilt and cuts off any denials or objections. In the United States police may lawfully lie to a suspect during interrogation, by, for example, falsely asserting that his or her fingerprint or DNA profile was found at the scene. The interrogation creates a sense of hopelessness in the suspect. The interrogator then develops themes, such as minimizing the seriousness of the crime, that make it psychologically easier for the suspect to admit guilt. Once an admission is made, the process moves on to generating detailed oral and written admissions or confessions.

Police interrogation produces incriminating statements or full confessions two thirds of the time. The techniques and subterfuges are so powerful that interrogation also induces innocent persons to confess. Research suggests that teens, mentally impaired individuals, and people with personality deficits are more likely to falsely confess than normal adults. *Compliant* false confessions are made in order to end the psychological pressure of interrogation. Some who confess naively believe that they will be released, led to that belief by subtle police statements that do not amount to the clear promises banned by the rule against coerced confessions. Others think that once they get out of the interrogation room they will be able to explain their case to a judge and have their case dismissed. Less frequently, cases of *internalized* false confessions occur, where the innocent suspect comes to doubt himself, after extensive and insistent police persuasion that includes false statements presented as fact, and admits that he "must have" committed the crime while in a blackout state. Even when such confessions are retracted, they play a strong role in convicting innocent suspects.

Perjury: Perpetrators, Informants, Jailhouse Snitches, and Criminal Justice Personnel

Perjury in various forms is common in wrongful convictions. Informant perjury was a factor in 49% of the first 111 death penalty exonerations. In capital cases the real perpetrator is often a suspect, and in several cases where police focused on an innocent person, the actual killers led investigators further astray with false testimony. Witnesses frequently lie to police for a number of reasons, and although police tend to believe that they are proficient at detecting witnesses' deception, scientific studies show that investigators do no better than chance at detecting liars. In laboratory studies, all groups (whether police or students) could identify falsehoods about half the time.

Miscarriages of justice happen often when police pay informants to supply incriminating information about suspects, which the informants then fabricate. Informants are often criminals and can be paid in many ways: money, dropped criminal charges, leniency when they are charged with serious crimes, or favors to friends or family. This

gives the most untrustworthy people incentives to lie, and police handlers often fail to properly screen their stories. A pernicious type of informant is the jailhouse snitch. Numerous false convictions are obtained in part on the testimony of jailed snitches who claim that the innocent suspect confessed the crime to them or made incriminating statements. It is not all that difficult for a clever snitch to get enough information about a case to make up a plausible story for the prosecution to use. In some jails the use of snitches has become so routine as to suggest willful blindness on the part of police and prosecutors.

Unfortunately, there are several recent notorious cases in which rogue police officers have framed innocent people for drug and weapons possession. Although this kind of corruption is rare, when it happens it requires officials to reinvestigate hundreds of convictions. Police and prosecutors have great discretion in conducting investigations and trying cases. Although the overwhelming majority are honest, their opportunity to cover the truth requires internal vigilance on the part of these agencies.

Ineffective Defense Counsel

Most defendants are poor (indigent) and rely on government-paid assigned counsel or public defenders rather than retained lawyers. Indigent defense is chronically underfunded, making it difficult for competent attorneys to routinely provide adequate defense. Studies in several states have shown a higher proportion of defense lawyers in exoneration cases with poorer disciplinary records than average, offering proof that substandard lawyering is a cause of wrongful convictions. The U.S. Constitution requires effective assistance of counsel for defendants, but the Supreme Court's standards for determining ineffective assistance are weak and require proof that attorney negligence caused a verdict. Only 38 of the first 200 (29%) DNA exonerees raised ineffective-assistance claims on appeal, reflecting the difficulty of making this kind of challenge, and only 4 received a reversal on ineffective-assistance grounds.

Egregious cases of defense attorney misconduct in court have ranged from sleeping or total unpreparedness to drunkenness and being high on drugs. Even ordinarily competent defense lawyers have failed to prevent the conviction of innocent clients in ways too numerous to catalogue. Among the most serious underlying problems are failures to adequately investigate case facts and failing to properly challenge prosecutors' witnesses, including forensic experts. Although the wrongful conviction literature does not list ineffective assistance as the highest cause, in a sense there is a failure by the defense in every wrongful conviction.

Prosecutorial Misconduct

Prosecutorial misconduct, whether or not it leads to wrongful convictions, is common. In-court misconduct

includes making inflammatory comments or mischaracterizing evidence to the jury, allowing witness perjury (suborning perjury), or permitting snitches to lie about their payoffs for testifying. Prosecutors have even been known to destroy evidence. The suppression of exculpatory evidence (that which points to innocence), in violation of Supreme Court rules, appears in many wrongful conviction cases. Suppressing exculpatory evidence is a cloudy issue because it is up to the prosecutor to determine in the first instance whether the evidence is exculpatory.

When DNA testing became standard in the 1990s, a large proportion of prosecutors, all of whom welcomed DNA as an investigation tool, strongly resisted postconviction, postappeal petitions by prisoners seeking to test DNA crime scene samples in storage. Such resistance added to the frustration and tragedy of actually innocent prisoners, and it delayed justice. In a few cases, any chance of getting to the truth was terminated when existing DNA samples in evidence lockers were deliberately destroyed after prisoners petitioned for testing.

Prosecutorial misconduct is especially significant because prosecutors are the most powerful figures in the criminal justice process, with great discretion as to whether to charge suspects or to dismiss cases. Before prosecutions are formally initiated, prosecutors have a judge-like role. They dismiss one quarter of all cases filed by police, often because they believe that the suspect is innocent. Two theories guide prosecutors in their discretionary decisions and in the way they prosecute their cases: the (1) adversary role and (2) the minister of justice role. In the *adversary role* a prosecutor can go forward with a case in which the evidence is equivocal, on the theory that it is up to the jury to decide whether a defendant is guilty beyond a reasonable doubt. As a *minister of justice* a prosecutor must be personally convinced that the defendant is guilty beyond a reasonable doubt. A problem with the adversary role is that prosecutors holding that view will tend to have a win-at-any-cost attitude, likely resulting in fewer dismissed cases, more aggressive trial tactics, more instances of misconduct, and greater opportunities of generating wrongful convictions. The minister of justice role requires the difficult human and institutional ability to balance vigorous prosecution with fairness and decency. This balance was captured in a 1940 speech to federal prosecutors made by Attorney General Robert Jackson, later a U.S. Supreme Court justice:

Your positions are of such independence and importance that while you are being diligent, strict, and vigorous in law enforcement you can also afford to be just. Although the government technically loses its case, it has really won if justice has been done.

Police Investigation

At its best, police investigation is the patient, systematic, and dispassionate search for, discovery of, and evaluation

of all relevant facts of a suspected crime. The goal is to establish whether a crime was committed and to identify and apprehend the perpetrator(s). This complex and sensitive task requires solid understanding of criminal law, extensive knowledge about criminal behavior and crime patterns, complete familiarity with the methods of evidence collection and analysis of forensic evidence, skill in interviewing witnesses, and good analytic and writing abilities.

Although it is inevitable that some crimes will not be solved and some innocent suspects will be mistakenly identified, several factors increase the probability of error. One is *tunnel vision*, which in fact affects all people and all criminal justice system participants. This term encompasses well-established psychological cognitive mechanisms such as *confirmation bias*, or the human tendency to seek and interpret new information in ways that confirm preconceptions and avoid information and interpretations that contradict prior beliefs. When applied to police investigation, tunnel vision is the tendency to focus on the first suspect and then to select and filter evidence that builds a case for guilt, while ignoring or suppressing exculpatory evidence. Tunnel vision is an unconscious or “natural” and entirely nonmalicious process. However, its worst effects are amplified by aspects of police investigation such as the nature of interrogation, discussed earlier.

Another problem is the nature of the police investigation report. This document is tremendously important, because in most cases there is limited or no investigation by the defense (in large part because of severely limited funds) and so the police case, found in the report, becomes the official facts in the case. The police report is relied on heavily by the prosecutor in deciding whether and what crimes to charge, by the magistrate in setting bail and ordering detention for psychological evaluation, and even by defense attorneys who do not independently investigate their client’s cases for plea bargaining and trial purposes. It is the basis on which an officer testifies at trial and can influence sentencing decisions.

In contrast to European countries, where police investigation is supervised by investigative magistrates who are well-trained judicial officers in national ministries (departments) of justice, American police investigation (aside from federal cases) is almost entirely under the control of local police departments. European police reports are highly detailed, part of the official dossier, and geared to ascertaining the truth; American reports are internal documents that serve functions other than informing the prosecution, such as evaluating personnel. Police are not specifically trained to include exculpatory information in reports, despite orders to include “all” information. Severe time pressure makes it difficult for police to write comprehensive reports, and police are trained to not report information that could lead to civil suits against themselves or their departments. Studies indicate that police reports do not normally contain exculpatory facts, and in fact are often deficient in reporting inculpatory facts, to the discomfit of prosecutors. A few cases have

uncovered deliberate fabrication and the exclusion of exculpatory evidence in police reports that framed innocent suspects. It is not known how pervasive these behaviors are. What is probably more common is for overworked police officers to focus on the initial suspect and enter facts in their field notes and follow-up reports that confirm their initial suspicion. Once written, there is no regular procedure to incorporate contradictory or exculpatory evidence in police reports.

Other Causes, Root Causes

This list of wrongful conviction causes is not comprehensive. Race may play a part, either by blatant discrimination, subtle bias, or as a result of the weaknesses of cross-racial identification. This last results not from bias but from familiarity that allows people to see subtle facial features among people with whom they are familiar. A disproportionate number of wrongful convictions have occurred against African American men convicted of raping white women.

The death penalty may also generate a higher proportion of wrongful convictions. Police, under extreme pressure to solve capital murders, rely on marginal evidence to fasten their attention on suspects. The American war on crime and its hyperimprisonment (at five to eight times the levels found in other advanced democracies with comparable crime levels except for homicide) has created a pro-prosecution atmosphere, leading police, prosecutors, judges, juries, and appellate courts away from balanced decision making, probably resulting in more miscarriages of justice.

In addition, pervasive root causes of wrongful convictions exist. One, discussed earlier, is tunnel vision. Another is the lack of resources for all actors (police, prosecutors, and courts, as well as defense lawyers). This creates extreme pressure to investigate cases within limited time periods. Overlapping with pressure is the system's normal bureaucratic functioning and production demands, which channel the work of justice officials into routines that make it difficult to slow case processing for more careful examination where called for. These bureaucratic imperatives are aggravated by structural factors that may be impossible to change. The American governmental and criminal justice system is the most fragmented of any modern nation. There are substantial differences in quality among the 16,000 local police departments and 3,000 prosecutors' offices in the nation. The election of prosecutors and judges, virtually unheard of anywhere else in the world, injects a level of partisanship into criminal justice that often undermines rational action. These factors may in turn create a culture of impunity among investigators and prosecutors in which errors are seldom restrained and misconduct rarely punished. The adversary system of trial, which imposes a large burden on the defense to counter the prosecution with its own evidence, is fatally flawed when

criminal defendants almost never have the ability to independently gather evidence.

Reforms: Reducing the Number of Wrongful Convictions

Research and systematic thinking about the proximate causes of wrongful convictions have suggested a number of feasible reforms likely to reduce miscarriages of justice. At this early stage in the innocence movement, no comparable thought has been given to dealing with the far more intractable root causes. The partial list and descriptions that follow do not explain the research bases for the proposed reforms, but there is good reason to believe that the widespread adoption and systematic application of these reforms will reduce the number of wrongful convictions.

Recommended lineup reforms are grounded in laboratory research findings that show they will reduce the number of false identifications without significantly reducing accurate identifications. Witnesses in all lineups (live and photo) should be instructed that the perpetrator may not be present, to reduce the tendency to pick anyone. All lineup fillers should be selected on the basis of the victim's verbal description, and not on similarity to the suspect. Lineups should contain only one suspect and should be fair in that there are similarities of race, height, general appearance, facial hair, photograph characteristics, and the like between the suspect and fillers. It is best that the lineup administrator not know who the suspect is (blind administration), to ensure that there is no unconscious influence on the witness (as is done for subjects in medical and pharmaceutical trials). If lineup administration is blind, the lineup participants (live or photo) should be presented one at a time (sequentially) rather than as a group (simultaneously). This helps to prevent the exercise of *relative judgment*, by which a witness picks a person out of the lineup who looks most like the memory of the perpetrator rather than recognizing the perpetrator. A witness should be asked for a confidence statement immediately after making an identification, to prevent his or her inflation of confidence as the case proceeds.

All crime laboratories should be accredited and their examiners certified and required to undergo periodic proficiency testing. Defense attorneys, as well as prosecutors and judges, should be educated in forensic testing techniques, and funding should be sufficient to have challenged forensic evidence retested. Defense attorneys should become aware that comparison testing methods, like fingerprinting, are not infallible. Where standards for comparison testing are weak or even suspect, as with bite mark evidence, special caution must be taken in allowing and weighing such evidence. Forensic science research is needed to ensure that methods and findings are valid. Substandard laboratories should be closed and not reopened until all problems are remedied.

The most widely recommended interrogation reform is to videotape entire interrogations, from initiation and before Miranda warnings to the conclusion, and not just the confessions. Videotaping allows pretrial judges to determine whether interrogation was coercive or likely to produce a false confession. Police benefit from videotaped interrogations, because confessions by guilty suspects provide powerful prosecution evidence. Interrogations should be time limited, especially for vulnerable suspects, such as teenagers, to 2 hours, because many false confessions are the product of protracted interrogation. Police in Canada and the United Kingdom are not allowed to use lies to get suspects to confess. This rule should be adopted even though the U.S. Supreme Court has held that lies do not violate a suspect's constitutional rights. Another valuable reform would require police to provide, before interrogating, stronger evidence of their belief that a suspect is guilty than is now the case. A judicial instruction that informs the jury about the risks associated with nonvideotaped station house confessions creates incentives for police and prosecutors to adopt electronic recording.

If the use of jailhouse snitches is to continue, prosecutors should carefully corroborate their stories and take into account snitches' characters and past experiences before using their claims that suspects confessed to them. Legal rules should allow defendants extensive discovery to explore the nature of deals made in return for their testimony. Judges should warn juries that jailhouse snitch evidence should be examined with greater care than that of other witnesses.

At present, many groups urge that compensation for indigent defense be raised to reasonable compensation, to allow competent assigned attorneys the time to better represent clients and bring public defenders' workloads into compliance with established standards. Changes in appellate rulings should allow findings of ineffective assistance without needing to prove that incompetence caused a verdict. Greater bar association scrutiny of appointed counsel and public defenders can enjoin attorneys to do their jobs properly. Defense attorneys should be expected to visit crime scenes and interview all prosecution and defense witnesses. Funding for investigators should increase.

Additional funding for prosecutors and their investigators, by reducing caseloads, will create better understanding of cases and may reduce wrongful convictions. Prosecutors should advise police and forensic laboratories to include exculpatory evidence in their reports. As the leading executive branch participants in the criminal justice system, prosecutors should promote laws and regulations to improve lineups and interrogations in accordance with best practices established by psychological research and should not resist reasonable postconviction requests for reinvestigation of evidence.

Police investigators also need greater resources to make work pressures more manageable. Standards should be rewritten and training revised to educate investigators in

wrongful conviction matters, to become aware of the effects of tunnel vision, and to include exculpatory evidence in their reports. This may be very hard to achieve, because it calls for a change in police culture away from pro-prosecution partisanship and more toward a neutral and scientific attitude toward cases.

Conclusion

In 20 years, wrongful conviction has gone from a little-noted phenomenon to an important topic within criminal justice. The number of innocence projects working to exonerate prisoners has grown from 1 or 2 in the early 1990s to about 50 today. Partly as a result of their policy advocacy, innocence reforms have been enacted. Congress passed the Innocence Protection Act in 2004, providing funding for state postconviction DNA testing, encouraging states to pass postconviction DNA testing laws, and raising the annual compensation for exonerated federal prisoners to \$50,000 for each year of imprisonment. More than 40 states have passed postconviction testing laws. Six states and hundreds of police departments have required videotaping of interrogations. Seven states and a growing number of police departments have established eyewitness identification reforms. North Carolina created the first innocence inquiry commission that reviews wrongful convictions claims and presents successful claims to a special court.

The investigation of wrongful convictions, which challenge the fairness and accuracy of the criminal justice system, are becoming a necessary feature of criminal justice analysis. The adoption of innocence reforms will not only reduce this kind of injustice but will also improve the quality and professionalism of criminal justice participants.

PUBLIC HEALTH AND CRIME

HAYDEN P. SMITH

University of South Carolina

During the decade of the 1980s, changes occurred in the field of public health that significantly impacted the field of criminology. At this time, public health professionals were evaluating a range of interventions and interventions that crossed the traditional boundaries of public health; for example, they worked on issues involving homelessness, teenage pregnancy, and violence prevention. The field of public health had even gained optimism in response to the HIV/AIDS pandemic. Starting with educational campaigns in the 1980s that addressed sexual behaviors and drug abuse and furthered by the development of antiviral medications in the 1990s, the HIV/AIDS pandemic was transformed from a death sentence into a manageable, chronic condition. Clearly public health and criminology were working side by side, if not together.

While some issues were gaining interest in both fields, three of the five leading causes of premature death—suicide, homicide, and injury—had received far less attention from public health researchers than criminologists (Rosenberg & Fenley, 1991). All three causes were strongly correlated with violence. In response, then-Surgeon General C. Everett Koop (1986) expanded the mission of public health and dedicated new resources toward the prevention and treatment of violence. By doing so, violence was now conceptualized as a public safety and community health issue, rather than principally a law enforcement matter. By 1991, the National Center for Injury Prevention and Control was housed within the

Centers for Disease Control and Prevention, and the American Medical Association had initiated practices designed to address family violence. Collaborative partnerships between criminal justice and public health increased, with the hope of pooling resources and creating synergy. In short, the field of criminal justice had experienced a paradigm shift and had incorporated the perspective of public health into everyday operations.

The inclusion of a new perspective was facilitated by the need for criminal justice to reach beyond its borders. The “nothing works” ideology had reached its peak following Martinson’s (1974) assessment of 231 rehabilitation programs, which found no significant changes in offender recidivism. Also, the Law Enforcement Assistance Administration had been dissolved and its models of operation criticized as ineffectual and obsolete. Thirty years later, former Law Enforcement Assistance Administration officials now involved in the Office of Justice Programs reflected that policies should always be “based on the knowledge that criminal justice agencies *alone* cannot solve crime problems” (U.S. Department of Justice, 1996, p. 1).

To address threats to public safety, practitioners and academicians who had previously embraced the traditional criminal justice models accommodated epidemiological models into the study of crime and deviancy. Today, the paradigm shift experienced by criminal justice is evident. Criminologists routinely conduct surveillance of geographical conditions to identify risk factors associated with criminality and devise population-based interventions

that prove to be evidence based. Practitioners now respond to “contagious” adverse events, and criminal justice syllabi include mental illness, drug abuse, and correctional health, among other public health topics. The purpose of this chapter is to link the fields of public health and criminology by showing their similar interests, methods, and goals.

The shift of the criminal justice system toward a public health perspective requires further explication. First, the notion of criminal justice as a public health issue is presented within the ecological context of mandatory sentencing, rapid incarceration, and the provision of services to an increasingly sicker and older U.S. population. Key stakeholders and administrators are cognizant that criminal justice institutions are responsible for providing interventions that directly impact neighboring communities. This includes addressing the chronic health needs of recidivists and tracking their migration among the criminal justice, public health, and community systems. Also included is the adoption of central epidemiological tenets that include surveillance, screening and testing, therapy, medication, and education.

Second, this chapter introduces readers to several classic public health experiments that have documented the social determinants of health (Marmot & Wilkinson, 1999). Specifically, the Alameda Study, the Whitehall Studies, and the Black Report highlight the relationship between the lived environment and trajectories of health.

Third, the concept of health is discussed using the accepted World Health Organization definition of “physical, mental and social well-being and not merely the absence of disease or infirmity” (World Health Organization, 1946). This broad definition includes a range of diseases, conditions, and behaviors that threaten public safety. This section is divided into the tripartite scheme of physical health, mental health, and social health, and their relevancy to the criminal justice system is explained. The Chicago Safe Start project is presented as an example of a synergistic partnership between criminal justice and public health designed to address community violence. Last, the paradigm shift within criminal justice is discussed and future directions are summarized.

The Need for Collaboration

No single actor, public or private, has the all-encompassing knowledge, overview, information or resources to solve complex and diversified problems.

—The Copenhagen Center (Schested, 2003, p. 89)

Criminal justice issues resonate beyond the domains of the police, court, and corrections and threaten the integrity of our society. In fact, disorganized communities experience the cumulative effects of socioeconomic disparities whereby layers of risk factors are nested within larger

ecological systems of additional risk factors (M. Lynch & Cicchetti, 1998). Within a nested model, citizens are more or less likely to encounter individual-level risk factors (e.g., poor prenatal care), group-level risk factors (e.g., gang membership), and institutional/social level risk factors (e.g., political and racial oppression). Prolonged exposure to risk factors reduces what sociologist Max Weber (1922/1968) termed *life chances*, or the opportunities provided to improve one’s quality of life. In addition to the relative deprivation that fuels this phenomenon, there is a loss of cohesiveness in the social relations within these communities (Sampson, 2003). This builds a cyclical pattern in which collective efficacy cannot be realized and the community maintains the “bad part of town” label. Such a despairing portrayal can only reinforce the need for community empowerment through integrating diverse scientific disciplines, agencies, and programs.

Public health has been an appropriate perspective adopted by criminology because crime is “a mirror of the quality of the social environment” (Kawachi, Kennedy, & Wilkinson, 1999, p. 719). Crime and poor health are endemic in low socioeconomic communities and are thought to originate from the same ecological sources. This suggests that criminologists provide an important role in public health by participating in collaborative endeavors and by recognizing crime as a harbinger of community health. To supporters like Moore (1995), the public health and criminal justice systems can maximize outcomes by assuming a complementary rather than substituting role. Here, key stakeholders utilize the specialized training of their respective disciplines but also work with partners outside of the discipline to promote synergy and address gaps in service delivery. Differences between the criminal justice and public health systems are typically found in the following five dimensions: (1) how each views the problem, (2) what particular components of the problem warrant more attention, (3) the analytic framework selected that is based on assumptions rooted in professional experience, (4) the available resources, and (5) divergences of ethical values (Moore, 1995). However these challenges are typically minimized by the collaboration between public health and criminology. An important reconceptualization of crime and delinquency is the role of the criminal justice system as an intervention point that can promote health.

Criminal Justice as an Intervention

The United States incarcerates more of its citizens than any other country, and most of these incarcerated citizens will return to mainstream society. In fact, there are currently 500,000 inmates per year who are released from prison alone, a three-fold increase from the 170,000 inmates released in 1980 (Travis & Waul, 2004). Never before has the U.S. criminal justice system been responsible for the personal safety and health care needs of such a large portion

of society. To present further challenges, many incarcerated persons are marginal members of society who have had minimal exposure to traditional health care resources. Further subsets of recidivist criminals have typically experienced serious trauma, drug/alcohol abuse, and mental illness over the life course and enter the criminal justice system with deteriorating health conditions. In response, the criminal justice system now functions as an intervention point whereby chronic conditions are evaluated and treated, with the distal goal of promoting compliance with medical directives following release.

This paradigm shift is predicated on the notion that criminal justice institutions are inextricably linked to the broader society. Lessons from the past teach that a dysfunctional correctional system acts as an incubator for communicable disease and violence that permeate neighborhoods. These adverse health outcomes are particularly salient for the children of individuals under correctional supervision, a population that currently numbers in excess of 3.2 million (Travis & Waul, 2004). The policies of mass incarceration have also reduced structural resources (i.e., housing and employment), emotional support, and hope for the future in low socioeconomic and minority communities.

Efficacious policies have been demonstrated through the adoption of the public health perspective. A public health approach includes the epidemiological tenets of surveillance, screening and testing, therapy, medication, and education. Therapy and education are promoted through a range of programs that are ideally linked to meet the needs of the individual. In addition to addressing individual-level behaviors, the field of public health seeks to understand the social determinants of health that occur at the ecological level (Marmot & Wilkinson, 1999). The antecedents of poor community health include economic inequality, fear of crime, education attrition, unsafe schools and housing, demographic vulnerabilities, environmental pollution, and racial/social oppression. These causal factors require the collaboration of several agencies to establish population-level interventions.

Another component of the public health perspective is the move from fragmented “silo” databases toward the construction of an integrated data warehouse. Here, data are collected from various agencies and standardized for researchers and policymakers. The integration of data systems enables the identification of at-risk populations. For example, Crandall and colleagues (Crandall, Nathens, & Rivera, 2004) found that 44% of women who were murdered by a spouse had gone to the emergency room within the previous 2 years. This represents a missed opportunity to screen and report intimate partner violence from within the safe confines of a medical setting. These victims fell between the gaps of the criminal justice and public health systems and highlight the need for suggested collaborations. With this in mind, this chapter now introduces readers to several classic public health studies and highlights their significance to the field of criminal justice.

Important Public Health Studies

The following seminal public health studies reveal the impact that ecological variables have on community health and have significant implications for criminal justice. Ecological variables include such environmental factors as where one works or how much money one makes. These studies focus on the hierarchical nature of social conditions that constitute fundamental causes of poor health and posit that higher socioeconomic groups are more favorably situated to know about health risks and to possess the resources that allow them to engage in protective behaviors to avoid those risks (Link & Phelan, 1995). The findings of the Alameda Study and Whitehall Studies are synthesized in the influential Black Report.

Alameda Study

In 1962, academics at the University of California at Berkeley allocated funds to initiate a large ecological study of community health. The Alameda Study, which had a longitudinal, cohort design, examined the causative agents of morbidity and mortality within selected residents during the years 1965, 1974, 1983, 1994, and 1995. Researchers found that, over time, living in an impoverished area was associated with a 50% increased risk in death for all sources of mortality, even after controlling for individual-level variables (Haan, Kaplan, & Camacho, 1987). In fact, the location of where one lived was far more important than personal lifestyle choices such as diet, smoking, and exercise. This research has since been replicated, with successive research documenting a positive, linear relationship between socioeconomic status and premature mortality (J. W. Lynch et al., 2004).

Whitehall Studies

The Whitehall Studies, Whitehall I and Whitehall II, were pioneered by Sir Michael Marmot and examined a particular work group: civil servants working in one area of London. Whitehall I and Whitehall II observed a large number of workers over time in order to quantify the presence of a social gradient of poor health. Civil servants were selected because this work group had nonsignificant differences in race and ethnicity, work environment, and medical benefits. However, the English civil servants could be categorized as belonging to one of five distinct work grades, which enabled researchers to collect data on social class while holding the aforementioned variables constant.

The Whitehall I study was conducted in 1967 and included 19,019 male civil servants. Whitehall I found that individuals with high employment grades were much less likely to die prematurely than men in the lowest ranks—in fact, after a 10-year period the low-ranked workers had three times the mortality rate of high-ranking workers (Ebi-Kryston, 1989). Low-grade workers also faced increased

risk for coronary heart disease, cancer, accidents, homicides, and suicides when compared with high-grade workers (Marmot, 1986). In 1985, the Whitehall II study examined a new cohort of 10,314 civil servants and included female civil servants. Whitehall II reaffirmed the presence of a social gradient of health, with lower occupational rankings correlated with an increased risk of premature mortality while controlling for individual-level risk factors. Analyses of Whitehall I and Whitehall II reveal that low occupation ranking was associated with low control of work, which promotes feelings of helplessness and stress. Social gradients of health have since been confirmed in almost the entire developed world with virtually every studied disease and condition (Marmot & Wilkinson, 1999).

The Black Report

In 1977, *The Black Report* (Black, Davidson, Townsend, & Whitehead, 1993) was commissioned by English medical sociologists to report on the rising health disparities that continued in light of a socialized medical system. The working group identified four models that explain health inequalities: (1) artifact, (2) selection, (3) behaviorist, and (4) materialist/structural (MacIntyre, 1997). The artifact model suggests that the relationship between ecology and community health is primarily a product of measurement error, whereas the selection model assumes that biologically determined natural abilities lead to the allocation of social position and health. The behaviorist model argued that habits, customs, and practices of low-socioeconomic individuals produced poor health, with foremost importance placed on instances of maternal mismanagement (e.g., smoking while pregnant, inadequate prenatal care) that produce infant mortality or unhealthy offspring. The behaviorist model placed emphasis on the disease pathways of personal ignorance and irresponsible lifestyles. The materialist/structural viewpoint argues that ecological factors influence health, “independent of inherited constitution” (Szreter, 1984, p. 528). Of particular significance was the finding of *The Black Report* that the materialist/structuralism model possessed the greatest explanatory power in terms of health disparity. This means that, despite the contribution of genetic, behavioral, and cultural factors, the governing explanation for health inequality was material deprivation and economic stratification. No other model could justify why mortality rates in higher social classes had steadily declined while those at lower levels had stagnated or even increased.

The Black Report Committee concluded that “the availability of health care did not overcome social and economic differences,” which “were central to the explanation for the existence of health disparities” (Bundrys, 2003, p. 171). *The Black Report* recommended the inclusion of a comprehensive anti-poverty strategy, educational development, and equity in the distribution of resources. It is important to note that materialist/structuralism theorists

would support structural changes that eliminate inequality rather than just providing interventions that ameliorate the effects. The Alameda and Whitehall Studies, coupled with *The Black Report*, provide valuable direction; the next section examines the contemporary state of affairs for public health and crime.

Defining Public Health

The World Health Organization’s (1946) broad definition of *health*, given earlier in this chapter, extends beyond individual risk factors and biological markers to include an assessment of ecological variables that lead to poor community health. The intersection of the criminal justice and public health domains can be explicated through the tripartite scheme of physical health, mental health, and social health.

Physical Health

Citizens who regularly interact with the criminal justice system disproportionately share the burden of infectious disease and poor health. Recent evidence identified the presence of an extensive criminal history as a strong predictor of physical illness (Mateyoke-Scrivner, Webster, Hiller, Staton, & Leukefeld, 2003). Furthermore, citizens positioned in the lower socioeconomic strata are more likely to enter the criminal justice process with limited health service utilization and with significant prior exposure to risk factors. As a result, an estimated 44% of state inmates and 39% of federal inmates at any given time have a medical problem other than a cold or virus (Maruschak, 2008). Paradoxically, many inmates discover that the medical services available in prison or jail are superior to the health resources available in the community. This is evident in research that found 80% of all state inmates received medical screening when admitted to prison, with 91% of state inmates seeking further professional care for health problems (Maruschak & Beck, 2001). Addressing physical health through the criminal justice system raises a host of complex issues; therefore, this discussion is limited to two key areas: (1) infectious disease and (2) specialized health needs.

Infectious Disease

Criminal populations account for a disproportionately large share of the total population of infectious diseases, in particular HIV/AIDS, sexually transmitted diseases (STDs), hepatitis, and tuberculosis. Infectious disease rates are even higher among incarcerated populations, with state and federal inmates approximately 2.7 times more likely than the mainstream population to have confirmed AIDS status (Maruschak, 2006). Almost all of these inmates will return to the community, and many

will continue to engage in high-risk activities. This represents a public health emergency when one considers that prison and jails annually release 25% of *all* HIV/AIDS cases, 30% of *all* hepatitis C cases, and 30% of *all* tuberculosis cases (Hammett, Harmon, & Rhodes, 2002). Despite limitations in resources and the presence of rigid security requirements, the correctional system functions as a crucial intervention point for the identification and treatment of infectious disease.

Sentinel health events highlight that inefficient correctional systems can act as disease incubators that threaten public safety. Sentinel events are preventable and/or treatable diseases that act as a measure of unnecessary disease, disability, and death at the community level. For example, during the early 1990s a combination of prison overcrowding, poor ventilation, inmate predispositions, and minimal health care resources led to an outbreak of drug-resistant tuberculosis in New York City (Schmalleger & Smykla, 2008). Approximately 80% of the confirmed cases were traced back to inmates released from New York jails and prisons. Such lessons reinforce the notion that correctional institutions are not isolated components of society, and infectious diseases left undiagnosed and untreated can generate dangerous contagion effects that resonate to the broader community.

The antecedents of infectious disease within corrections are well known and typically include unsafe sexual behavior, intravenous drug use, and tattooing, yet currently less than 1% of all U.S. correctional facilities provide condoms to inmates, and none distribute clean needles (May & Williams, 2002). These limitations are counterbalanced by the passing of the Prison Rape Elimination Act of 2003 by the U.S. Congress, which aims to reduce rates of sexual violence within prisons and jails. The Prison Rape Elimination Act follows an epidemiological method of surveillance, collection of confidential data, sexual health education, and the development of a risk-assessment model for the early identification of prison rapists. These efforts are supported by innovative collaborations at the state level that rely on both the criminal justice and public health systems to address infectious disease.

Specialized Health Needs

The shift experienced by the criminal justice system has been facilitated by the specific health needs of vulnerable populations. In this section, the discussion of health needs is limited to three groups: (1) children/youth, (2) women, and (3) the elderly.

Children/Youth. Recent evidence from clinical neuroscience demonstrates that the human brain experiences significant development throughout childhood and adolescence. Using a brain imaging technique known as *magnetic resonance imaging*, neurologists have found that components of the human brain, the frontal and temporal lobes,

are less developed in an adolescent brain when compared with an adult brain. As a result, youth in general are less likely than other age groups to govern impulse control. Criminologists have long known early delinquency to be highly correlated with other risk-taking behaviors, such as underage drinking and binge drinking, drug abuse, unsafe sex, and a propensity for violence. (Violence includes physical fighting, gang membership, bullying, and the use of weapons.)

These behaviors present as a constellation of risk and ultimately lead to *comorbidity*, or a state in which the individual suffers from multiple chronic diseases or conditions. The Youth Risk Behavior Surveillance System (YRBSS) created by the Centers for Disease Control is a longitudinal data source used to monitor priority health-risk behaviors in youth. Results from the 2007 YRBSS found that 72% of all deaths among persons aged 10 to 24 years result from four causes: (1) motor vehicle crashes (30%), (2) other unintentional injuries (15%), (3) homicide (15%), and (4) suicide (12%; Centers for Disease Control and Prevention, 2008). Alcohol and drug abuse are strongly associated with this early mortality and represent an early intervention point that the fields of criminal justice and public health have yet to adequately address. The YRBSS also revealed substantial youth morbidity due to teenage pregnancy, STDs, and HIV/AIDS. In addition to these risky behaviors, the majority of youthful offenders who enter the criminal justice system are less likely to have access to preventive medical care, educational programs, and supportive family units. Moreover, adolescence is a period of significant changes, with youth moving from strict attachment to parental figures toward the attainment of social status in accordance with peer standards. These at-risk youth are susceptible to victimization, homelessness, and drug abuse that further deteriorate health status.

Women. The sevenfold increase in female incarceration rates between 1980 and 2000 means that there are now over 950,000 women in the United States under some form of criminal justice supervision (Chesney-Lind & Pasko, 2004). The majority of these incarcerated women (55% in state facilities and 63% in federal facilities) report having a child under the age of 18, which equates to 1,498,800 children who are directly impacted by incarceration (Mumola, 2000). The effect of the mass incarceration of women has been disproportionately experienced by communities of color and in low socioeconomic areas.

Women who interact with the criminal justice system have discrete needs that differ from male populations. First, typical female offenders are more likely than their male counterparts to be convicted of a crime involving alcohol, drugs, or property, and they are more likely to have histories of sexual victimization. Typical juvenile female offenders are between 14 and 16 years of age, of a racial or ethnic minority, and likely to have significant academic problems (Boyd, 2008). These deficiencies are further compounded

by a history of negative interactions with social institutions, such as the family, school, and work, that promote non-compliance with health directives.

Second, higher rates of HIV/AIDs and STDs are reported in women who interact with the criminal justice system on a regular basis. The sequelae of HIV/AIDs include victimization due to intimate partner violence and/or a history of sex work. As such, at-risk women may draw the attention of law enforcement systems that can intervene to address public health issues. Within incarcerated populations female inmates are more likely than their male counterparts to request medical services; however, gynecological examinations are frequently conducted by nonspecialized providers, and preventive services, such as Pap smears and breast examinations, are not routinely provided in many institutions. This represents an underutilized intervention that could be altered to improve the sexual health of female offenders, most of whom are returning to families and children.

The third relevant need of female inmates relates to maternity and jail/prison visitation. Approximately 3% to 4% of female inmates enter the criminal justice system pregnant, and many will give birth while under correctional supervision (Maruschak, 2006). A lack of prenatal care places many of these women at increased risk for a complicated and/or high-risk pregnancy, which in turn increases the cost of health care for the institution and, eventually, the broader society. In general, women experience more guilt, anxiety, and worry about their children when compared with men. Jail visitation policies that balance the needs of incarcerated mothers with the need for institutional security will greatly benefit the emotional health of these women.

Fourth, women who interact with the criminal justice system are at increased risk of intimate partner violence. Feminist scholars posit that patriarchal societies relegate women and girls to subordinate social positions in order to maximize the power and status of men. As such, the often-cyclical pattern of partner violence continues over the life course and requires gender-based programming to restore self-efficacy and address issues of drug dependency and learned helplessness. Interestingly, the classic Minneapolis Domestic Violence Experiment conducted by criminologists Lawrence Sherman and Richard Berk (1984) addressed the health needs of women by using a medical model. This research viewed law enforcement as an intervention and randomized the treatment effect in order to identify an evidence-based policy outcome that supported mandatory arrest protocols in cases of domestic violence.

The Elderly. The term *baby boomer* signifies the rapid increase of birth rates following the second world war. In the year 2000, this boomer generation constituted between 22% to 32% of state populations, with the 50-to-54 age group exhibiting a 55% growth rate between 1990 and 2000 (Meyer, 2001). In addition, the national life expectancy of the elderly increased in part because of medical developments

but also because the notion of “age” was reconceptualized and a greater proportion of elderly people have benefited from active and healthy lifestyles. These demographic changes have impacted the country’s social structure and the criminal justice system.

Studies routinely demonstrate that elderly populations fear crime more than other groups despite the fact that they have a lower risk of being victimized. In San Francisco, a survey of elderly people residing in a crime-ridden area found that fear of crime was the most important health problem in their lives, supporting an association between low self-perceptions of public safety and reduced physical activity (Robert, 1999). Stated differently, fear of crime directly impacts the health of the elderly as they are forced to restrict daily activities, and fear of crime indirectly harms the community by reducing the level of collective efficacy its citizens can muster.

The health needs of an increasingly graying population have also impacted correctional facilities, where it is estimated that 83% of elderly prisoners have a long-standing disability and an average of three chronic illnesses (Fazel, Hope, O’Donnell, Piper, & Jacoby, 2001; McCarthy, 1983). Elderly health concerns can be separated into topics of morbidity and mortality. Elderly inmates experience morbidity due to incontinence; arthritis; and the potential need for corrective aids and prosthetic devices, including eyeglasses, dentures, hearing aids, ambulatory equipment, and special shoes. Early mortality, or early death, is usually the result of advanced medical conditions such as dementia and kidney, liver, or prostate disease. The resources needed to provide specialized health services to the elderly can overwhelm correctional facilities. Small jails have experienced difficulties in meeting the expense of constructing disability-friendly facilities, which is a component of the Americans with Disabilities Act. One cost-saving measure involves compassionate release of the sick. Elderly inmates who are terminally ill are provided palliative care services and can apply for a compassionate release; however, this is granted on the basis of poor physical health rather than consideration of age.

Mental Health

Mental health is defined as “a state of successful performance of mental function, resulting in productive activities, fulfilling relationships with other people, and the ability to adapt to change and to cope with adversity” (Satcher, 1999, p. 4). Conversely, mental illness is associated with interpersonal dysfunction and increased risk of homelessness and drug/alcohol abuse. Mental illness can also lead to abnormal social behaviors that draw the attention of law enforcement. Even though the appropriateness of criminalizing and incarcerating mentally ill persons remains a controversial ethical debate, the criminal justice system remains the primary form of mental health care for a sizeable portion of society. The criminal justice system is now responsible for the provision of mental health services

through the identification of evidence-based interventions. To be considered successful, these interventions must improve the mental health of individuals while also justifying distal goals such as lowering recidivism, maintaining fiscal responsibility, and reinforcing public safety.

In 1939, Penrose wrote that “criminality, insanity and mental deficiency are, all three, relative terms, for the difference between normal and abnormal implied in each of them is a matter of degree” (p. 2). Penrose identified a population whose aberrant behavior was labeled either criminal or mentally ill in relation to the parameters of social standards. The presence of a marginalized group that migrates between the mental health and criminal justice systems is still evident. The most noteworthy example of this migration centers on the deinstitutionalization of state mental institution patients that began in 1955. Deinstitutionalization involved the reassignment of patients out of state mental institutions and into community mental health centers. Deinstitutionalization was stimulated by advancements in psychotropic medication (e.g., Thorazine) that enabled better control of patients’ symptoms. Despite having earnest goals, the proponents of deinstitutionalization inadvertently shifted the burden of care of the mentally ill to the criminal justice system.

Studies estimate that the prevalence rate of psychiatric morbidity is now 10 times greater in prison samples when compared with the community (Brugha et al., 2005). Incarcerated populations are also estimated to contain between two and five times the rate of individuals with severe and persistent mental illnesses, such as schizophrenia/psychosis, major depression, bipolar disorder, and post-traumatic stress disorder, when compared with mainstream society (Lamberti & Weisman, 2004). The association between mental illness and substance abuse compounds problems. One study found that the preponderance of offenders were under the influence of substances at the time of arrest and estimated that 90% of inmates with severe mental illness experienced a substance use disorder during the life course (Abram & Teplin, 1991). Current practices of mental health by the criminal justice system include treatment in the form of psychotropic medications and/or therapeutic interventions.

Changes in practices are also evident in the accommodation of the mentally ill by the criminal justice system. The war on drugs carried harsh and punitive sentencing that resulted in the mass incarceration of mentally ill and/or substance-addicted people. As a result, the criminal justice system devotes significant institutional resources to an increasingly sick population. A case in point is the Los Angeles County Jail, where a daily population of 3,300 severely mentally ill inmates constitutes the largest de facto mental institution in the United States (The Sentencing Project, 2002). Furthermore, the state of California now treats more mentally ill people in prison and jails than all hospitals and residential treatment centers combined (12.5% vs. 10%, respectively; Beck & Maruschak, 2001). The adoption of a public health perspective has allowed for

the inclusion of programs that can direct suitable mentally ill individuals into more appropriate avenues of care. These initiatives include jail diversion programs and drug courts that redirect suitable mentally ill offenders away from the criminal justice system.

Jail Diversion Programs

The traditional models of law enforcement provided minimal guidance regarding how to respond to mentally ill people. As a result, police officers used rigid techniques that promoted the warehousing of the mentally ill within correctional facilities. Inadequate training on the etiology and manifestation of specific mental disorders were also associated with police officer injuries. In response, jail diversion programs were created as an interface between the criminal justice and mental health systems. According to Steadman (2002), mentally ill misdemeanants should be diverted into community mental health facilities that provide services in an appropriate and fiscally responsible manner. Not eligible for diversion are mentally ill offenders who commit violent and serious crimes, because these felonies constitute a threat to public safety.

Diversion programs can be separated into prebooking or postbooking depending on the time point of the criminal justice system intervention. The Crisis Intervention Team (CIT) within the Memphis (Tennessee) Police Department is the most publicized form of prebooking jail diversion in the United States. The CIT program was devised to offer law enforcement personnel specialized training and resources in order to divert suitable mentally ill offenders into community health facilities. This diversion occurs in lieu of the alternatives: release or arrest of the offender. This program provides 40 hours of training in psychiatric and substance use disorders, including use of crisis de-escalation techniques. Prebooking programs require the commitment of police officers, and discretionary decisions are conducted at the street level. Postbooking programs, on the other hand, target the intervention within the court or correctional milieu. During these processes a mental health professional identifies misdemeanor offenders who are eligible for transfer to a facility for the provision of psychiatric services. Jail diversion programs are ideally coupled with the defragmentation of social services, which can allow for streamlined reintegration back into the community. The Memphis CIT program is still in need of a public health/criminal justice program evaluation in order to test its efficacy, yet it is included here as an example of innovation and synergy.

Drug Courts

In recent years, the field of criminal justice has become reluctant to employ strictly *punitive* responses to drug and alcohol addiction and has moved toward an acceptance of *treatment-oriented* responses. Drug courts are based on the recognition of comorbidity between mental illness and

drug/alcohol addiction. They afford the offender the opportunity to meet treatment, screening, and technical mandates in order to have charges dropped. Failure to meet these requirements can lead to criminal sanctions, including incarceration and restitution. There are currently 2,000 drug courts in the United States, and research supports a 10% to 20% reduction in recidivism among participants (Draine, Wilson, & Pogorzelski, 2007).

The adoption of the public health perspective by courts can enable mentally ill/drug-addicted offenders the opportunity to reframe their interaction with the criminal justice system. Few would argue that punitive criminal justice policies in the area of drug abuse have maintained community health or reduced recidivism. Instead, these punitive responses have overwhelmed the criminal justice system and alienated communities (Bobo & Thompson, 2006). Conversely, efficacious drug courts link vulnerable populations with much-needed community services. The offender faces the decision of whether to address health deficits through these services or risk incarceration. Beyond these issues that bring the fields of public health and criminal justice together is the social health of citizens.

Social Health

Crime represents a serious threat to neighborhood stability that can affect the residents' health directly through violent acts, substance abuse, and financial loss. Crime directly impacts neighborhoods when residents decrease outdoor activity to avoid exposure to unsafe conditions (Ross, 1993). Fear of crime is also associated with prolonged stimulation of the fight-or-flight response, which in turn is linked to reduced resistance to infection and cancer as well as the exacerbation of chronic health conditions (Fremont & Bird, 2000). Crime influences health indirectly because the presence of recognizable cues sends a message that social cohesion is weak. Even low-level property crimes such as littering, vandalism, and graffiti are signs of a disorganized community, the implication being that social cohesion has been replaced by individualism and alienation. An organizing framework that distinguishes social health in a neighborhood includes the following: (a) physical features of the environment shared by all residents in a locality; (b) availability of health environments at home, work, and play; (c) services provided, publicly or privately, to support people in their daily lives; (d) sociocultural features of a neighborhood; and (e) the reputation of an area (MacIntyre, Ellaway, & Cummins, 2002). This chapter now presents these components with reference to an existing public health and criminal justice collaboration: the Chicago Smart Start project.

The Chicago Smart Start project is budgeted for \$3,350,000 over a 5½-year period and is cofunded by the city of Chicago and the U.S. Department of Justice, Office of Juvenile Justice and Delinquency Prevention (Chicago Safe Start, 2008). The mission of Chicago Safe Start is to prevent and reduce the impact of exposure to violence on children ages 5 and younger. The project is a true reflection of the

adoption of a public health perspective by the criminal justice system. With an emphasis on quantifiable outcomes, Chicago Safe Start categorizes social health into risk factors, protective factors, and treatment (Chicago Safe Start, 2008).

Risk factors are characteristics, variables, and/or conditions present in individuals or groups that increase the likelihood of that individual or group developing a disorder or adverse outcome (National Center for Children Exposed to Violence, 2008). Chicago Safe Start subdivides risk factors into four categories: (1) biological (e.g., prenatal exposure to drugs and/or alcohol), (2) individual (e.g., low academic achievement, including poor reading skills or a weak commitment to education), (3) family (e.g., exposure to and reinforcement of violence in the home), and (4) community (e.g., presence of gangs and drug dealing, which provide violent role models and rewards for violent behavior).

Protective factors are characteristics, variables, and/or conditions present in individuals or groups that enhance resiliency, increase resistance to risk, and fortify against the development of a disorder or adverse outcome (National Center for Children Exposed to Violence, 2008). Chicago Safe Start subdivides protective factors into three categories: (1) individual (e.g., capacity for empathy and respect for all people and their values), (2) family (e.g., positive, sustained attachments with at least one adult family member, teacher, or other adult), and (3) community (e.g., schools, families, and peer groups that teach children healthy beliefs and set clear standards).

The accumulation of protective factors can theoretically offset the accumulation of risk factors, leading to a promotion of social health; however, when communities disproportionately experience the burden of risk factors, then efficacious treatments must be developed. Public health officials define *treatment* as a form of intervention that is typically long term and characterized by an ongoing relationship with a particular type of service provider. The goal of treatment is to provide long-term support and remediation of symptoms (National Center for Children Exposed to Violence, 2007). The Chicago Safe Start project addresses physical health by linking Medicaid to clinical services. Services include, but are not limited to, screening, diagnosis and assessment, testing, psychotherapy, prescriptions and medication monitoring, emergency care, and health education. Mental health treatments are provided by linking separate funding sources, such as the Committee on Women's Treatment and the Domestic Violence and Substance Abuse Initiative. Community health targets high-risk teen parents, by providing home visits, screening and assessment, and parent group services.

Conclusion

The paradigm shift toward public health is expected to evolve as criminologists seek interdisciplinary perspectives to reduce social problems. Both the criminal justice system and public health systems share commonality in the population

they regularly serve. Criminogenic populations are more likely to have weathered lives of early trauma, adolescent delinquency, and adulthood addiction. Over the life course, these risk factors increase rates of physical, mental, and social abnormalities. By the time these individuals commit infractions serious enough to warrant the attention of the criminal justice system, they present with a constellation of chronic disease and egocentric behaviors. Certainly, ill health and high crime are disproportionately experienced by urban, poor populations in which people of color reside.

The social gradient of health demonstrates the extent to which environmental variables impact rates of mortality and morbidity. With time, the burden of disease manifests in crime, delinquency, drug and alcohol addiction, and criminogenic behavior. Furthermore, social inequalities promote abuse, victimization, and fear of crime that can restrict daily activities. The inclusion of a public health perspective enables criminology the opportunity to extend its mission beyond issues of crime and deviance in order to address public safety, public health, and social justice. This involves the adoption of epidemiology tenets of screening and testing, surveillance, data consolidation, and educational campaigns and programs. The public health perspective favors prevention strategies rather than treatment or response strategies and population-level interventions rather than individual-level interventions. Meeting these objectives will require the synergy of collaborative partnerships that involve criminal justice agencies and public health agencies.

The policies of the U.S. criminal justice system have led to the mass incarceration of groups that disproportionately experience the burden of physical, mental, and social pathologies. Paradoxically, criminologists have adopted the public health perspective in order to direct citizens into more appropriate avenues of care and away from the criminal justice system. A shift in perspective inherently carries conflicts in methodology and ethics; however, the potential efficacy offered through interdisciplinary partnerships outweighs these concerns. This chapter leaves readers a final quote that highlights the disastrous state of affairs in the California criminal justice system and the need for new perspectives to address crime and delinquency:

It has been projected that over the next five years, the state's budget for locking up people will rise by 9 percent annually, compared with its spending on higher education, which will rise only by 5 percent. By the 2012–2013 fiscal year, \$15.4 billion will be spent on incarcerating Californians, as compared with \$15.3 billion spent on educating them. (Harris, 2007)

CRIMINAL JUSTICE ETHICS

ROBERT M. WORLEY AND VIDISHA BARUA
Pennsylvania State University Altoona

Ethics is the study of morality, which prescribes what comprises good and bad conduct. Ethics and morality evolve out of the human experience, beginning in childhood at home and in places of worship and religious gatherings, and advancing to more pronounced rules, regulations, and laws that one needs to abide by as he or she grows into an adult. The study of ethics comprises three branches: (1) *metaethics*, which involves the interpretation of ethical terms; (2) *normative ethics*, which determines what people ought to do; and (3) *applied ethics*, which is concerned with the practical application of ethical principles, especially in professions such as medicine and law (Pollock, 2007).

Criminal justice and ethics are closely related. According to *social contract theory*, the denizens of a country give up certain liberties to be protected by the government, and criminal justice professionals are agents of the government. Justice practitioners are expected to have a higher moral character, so that the common man can feel confident about the agents of the government that are affording them protections. Virtually all criminal justice professionals, be they police officers, judges, prosecutors, defense lawyers, correctional officers, probation officers, or parole officers, need to exercise the use of their discretion at some point or another during the course of their careers. Usually this occurs when practitioners are faced with specific ethical dilemmas, as opposed to taking a stand in matters involving broad ethical issues (Pollock, 2007). When discretionary decisions are guided by ethics,

decisions can be said to be fair and just, because there are always shades of moral obligations that are higher than others (Souryal, 2006).

The awareness and importance of ethics in the field of criminal justice are increasing at a fast pace. This is because, as in virtually every other occupation, criminal justice officials also engage in unethical behaviors during the course of their 8-hour shifts. Every year there are practitioners who end their careers in disgrace by engaging in unscrupulous activities. This includes behaviors that are outright illegal, as well as those that have not been labeled as being criminal in nature. It is noteworthy that not every type of unethical behavior is necessarily illegal. In fact, criminal justice practitioners engage in many types of unethical behaviors that are not governed by the legislature and the court system.

Ethical Systems

Plato argued that the idea of “goodness,” or the *summum bonum* of values, is a virtue even higher than justice (Souryal, 2006). This goodness lights up the minds of human beings and helps them make moral judgments. The idea of *natural law*, or self-preservation, appealed to both Plato and his student Aristotle, who sought universal qualities in human nature (Souryal, 2006). Originating from the Stoics, natural law signifies a search for moral absolutes that is identified as natural (Pollock, 2007).

Aristotle, in the *Nicomachean Ethics*, “provided the first systematic study of ethics in the history of the Western world” (Albanese, 2008, p. 15). In this book, Aristotle proposed the ethics of virtue that is concerned with cultivating virtuous habits. Aristotle suggested the intermediate path, or the *golden mean*, which strikes a balance between extreme behaviors. He prescribed 10 moral virtues or excellences that are to be cultivated: (1) courage, (2) temperance, (3) prudence, (4) justice, (5) pride, (6) ambition, (7) having a good temper, (8) being a good friend, (9) truthfulness, and (10) wittiness (Albanese, 2008). Because Aristotle’s ethics of virtue was based on the cultivation of habits over time, it did not address the specific issue of ethical dilemmas and moral judgments (Pollock, 2007). There are several ethical systems that explain the ethicality of a moral judgment. Broadly put, the ethical systems can be *deontological* (nonconsequentialism) or *teleological* (consequentialism). A deontological ethical system is concerned with the inherent nature of an act, whereas a teleological ethical system is concerned with the consequences of an act (Pollock, 2007).

Deontological Systems

The most prominent deontologist is Immanuel Kant (1724–1804), who propounded *ethical formalism*. Kant proposed the rational basis of moral decisions and identified that an act based on duty was truly moral. He called this the *categorical imperative* or the *supreme principle of morality*, something that one must do, a duty (Close & Meier, 2003; Pollock, 2007). The next is the *Golden Rule*. This system, found in diverse cultures, proposes the common principle “Do unto others as you would have them do unto you.” Although the reason for this behavior might be based on the consequences of the action, this system is often treated as deontological because it sets forth a fundamental moral principle (Close & Meier, 2003). Religious ethics or the *Divine Command Theory* believe that God’s word is perfect and that morality is derived from the words of God, whatever the religion of an individual might be (Close & Meier, 2003; Pollock, 2007). The emphasis is on following God’s commands rather than focusing on the consequences of the actions.

Teleological Systems

The most common teleological ethical system is *utilitarianism*, founded by Jeremy Bentham (1748–1832). This concept was also found in the works of Cesare Beccaria (1738–1794) and John Stuart Mill (1806–1873; Albanese, 2008). Utilitarianism focuses on the good or happiness of the majority. Happiness is measured by Bentham’s *pleasure–pain principle* or the *hedonistic calculus*, whereby pleasure is sought and pain avoided (Albanese, 2008; Pollock, 2007). An action will be judged by the total amount of pleasure or happiness that will be created as opposed to the

total amount of pain or unhappiness that will be created (Close & Meier, 2003). Because the emphasis is on the consequences of an act, utilitarianism justifies bad actions as long as the result is good; in other words, the end justifies the means. Determining whether a specific act is morally right or wrong constitutes *act utilitarianism* (Pollock, 2007). *Rule utilitarianism* proposes that an act is morally right if it can be universally applied as a rule that is morally right.

Another teleological system is *ethical egoism*, which proposes that an action be judged by the greatest good that is produced for the person taking the action. The sole consideration is for the benefit to the egoist. *Ethics of care*, a feminine ethical system discussed in the works of Carol Gilligan, has found application in restorative justice and rehabilitation of offenders (Pollock, 2007). The focus is on relationships, the needs of the victims, and on reintegrating offenders into society after they have accepted responsibility for their actions. This can be said to be a teleological system, because it is concerned about the consequences of the actions, whether it would serve the needs of those affected by the decision.

Ethics and the Police

There are two paradigms of policing: (1) the traditional crime fighter role and (2) the more recent public service or community policing role (Pollock, 2007). In the United States, although crime control is the major role of policing, both paradigms can be seen. The public service paradigm is predominant in Europe. The public service paradigm can be identified with community policing, where the police are people’s friends, mingling with them in the community and aiming at social peace. The spirit of service is primary. The goal is to abide by the code of police ethics and be ideal protectors of the people, as expected by social contract theory. Under this paradigm, a criminal is viewed not as a member of a distinct group but as somebody from the neighborhood who has gone astray (Pollock, 2007).

Whereas the public service paradigm is more rights based and duty oriented, as prescribed by ethical formalism, the crime control paradigm is less formal and subscribes to utilitarianism. Under the crime control paradigm the police are seen as an army to fight crime and catch criminals by whatever means necessary (Kleinig, 2008; Pollock, 2007). With the September 11, 2001, attacks on the World Trade Center and the Pentagon, the crime control paradigm has gained prominence. Criminals are viewed as enemies, and the police consider themselves as distinct from the people they serve. This gives rise to the police subculture in which loyalty is the code of honor and the “blue wall of secrecy” is maintained. “Noble cause” corruption is tolerated within the departments, thus allowing police use of excessive force, as in the film *Dirty Harry* (Pollock, 2007). The police subculture also allows

officers to carry out unethical behavior at the individual level. Increasing diversity in the police force, police unions, and civil litigation are causing police subcultures to weaken (Pollock, 2007).

The Police Subculture

It should be mentioned that subcultures are prevalent in some form in almost every police agency in the world, ranging from the United States to the United Kingdom. It is important to note that police subcultures may directly contribute to unethical employee behaviors. Unlike probation and parole officers, who may work alone, police officers are heavily influenced by their peers. Walker and Katz (2008) contended that the police subculture provides officers with rationalizations and motivations that allow them to engage in unprofessional behaviors. Some scholars have argued that there is a profound need to eliminate the negative effects associated with the police subculture (Souryal, 2006).

It is also possible that the police subculture allows law enforcement officials to commit unethical acts in the presence of other officers. Ward and McCormack (1987) stated, for example, that there are some citizens who strongly feel that “the great esprit de corps in the police force inhibits officers from investigating suspected corruption of fellow officers” (p. 21). Other scholars have noticed the lack of cooperation between officers of different ranks (Toch, 2002). Souryal (2006) argued that this builds a sense of unity among low-ranking patrolmen who may be tempted to isolate themselves from senior officers or cover up each other’s mistakes. Pollock (2007) also contended that there is an enormous amount of discord between police administrators and their underlings. Some scholars also argue that the police subculture inadvertently excludes certain types of police officers (Holdaway, 1996; Miller, Forest, & Jurick et al., 2003). In the United Kingdom, discrimination has been said to exist toward other officers as an indirect result of police activities that occur outside of work, such as shift parties and get-togethers (Holdaway, 1996). According to Holdaway (1996), certain officers, usually women and members of minority groups, are excluded from these events. This is consistent with Miller et al.’s (2003) contention that homosexual police officers also have limited access to the police subculture. Even though some officers are more entrenched in the police subculture than others, much of the current literature contends that it promotes attitudes that lead to cynicism and unethical behaviors among police.

Police Corruption

In 1972, the Knapp Commission exposed unethical behavior and police corruption at virtually every level within the New York City Police Department (NYPD). During these official proceedings, corrupt officers were

considered to be either “grass eaters” or “meat eaters” (Pollock, 2007). Grass eaters were officers who accepted gratuities yet did not demand any of the services they received (Souryal, 2006). Meat eaters, on the other hand, aggressively demanded bribes in exchange for specific types of favors. The Knapp Commission discovered that both of these types of police officers permeated the entire police department.

In the Knapp Commission inquiry, two police officers, Frank Serpico and David Durk, of the NYPD, went public with allegations of corruption and graft (Maas, 1973). During this formal investigation Serpico testified against many of his fellow police officers and helped to expose the ineffectiveness of the NYPD’s internal investigation department (Maas, 1973). Not long after his testimony, Serpico was shot in the face during a routine drug bust; although his coworkers did not come to his immediate aid, Serpico survived the attack (Maas, 1973). After the Knapp Commission, the NYPD pledged to eliminate officer misconduct and corruption (Pollock, 2007).

In addition to accepting bribes or engaging in organized corruption, police officers may engage in other types of unethical behaviors during the course of their 8-hour shift. Some research, for example, has shown that police officers engage in unscrupulous sexual acts while on duty (Barker & Carter, 1994). Souryal (2006) contended that this is because police officers have a high degree of power and are relatively isolated from their supervisors. It has been well documented that some police officers have had sex while on duty (Barker & Carter, 1994; Souryal, 2006). There have even been instances in which sheriffs and chiefs of police have partaken in unethical acts. In one recent case, for example, a high-ranking police executive of Wallkill County, New York, was allegedly caught having an intimate encounter in a patrol vehicle (Souryal, 2006). In other instances, however, the acts may be much more serious and are often motivated by greed and self-interest (Pollock, 2007).

Additional Types of Unethical Police Behaviors

There are many types of unethical behaviors in which police officers engage besides sexual deviance. These acts can range from abusing sick time to brutality (Barker & Carter, 1994). Some law enforcement employees may also sleep on duty, even in instances when they are expected to be vigilant and alert (Souryal, 2006). There are also officers who may expect businesses to provide them with special perks, such as free meals and coffee (Souryal, 2006). Police officers may also be tempted to falsify reports and even commit perjury (Barker & Carter, 1994; Pollock, 2007).

It is important to note that many countries besides the United States have police officers who have acted unethically. In fact, virtually every country has had at least one type of instance in which police officers have acted unprofessionally (Reichel, 2002). Mexican law enforcement

officials, for example, are perceived by many scholars to be notoriously corrupt. In Peru, it has been said that corruption is so rampant that police officers may overlook traffic violations for bribes as small as candy bars (Reichel, 2002). In other countries, unethical police behaviors are equally as serious, if not more so, and may range from torturing pretrial detainees in Egypt to trafficking child pornography in Australia (Reichel, 2002). These examples illustrate that unethical employee behaviors exist in virtually every type of police organization on a worldwide scale.

Ethics and the Courts

Although police officers certainly engage in unethical behaviors, practitioners who work in the court also have the potential to act in an inappropriate or unscrupulous manner. This is because, to varying degrees, court personnel such as prosecutors, defense attorneys, and judges have discretionary powers. When faced with ethical dilemmas, they can take decisions one way or the other, because moral obligations have finer shades (Souryal, 2006).

Prosecutors and Ethics

Some prosecutors, for example, may behave unethically. Prosecutors exercise a great deal of discretion as they decide which cases should go to trial and which should be dismissed. In theory, they must try to seek justice and not merely a conviction. However, on occasion they are driven by personal ambitions rather than justice. Some prosecutors treat their current jobs as stepping-stones to other lucrative jobs (Kleinig, 2008; Pollock, 2007). This might compromise their undivided service to the public. They also are greatly involved in the process of plea bargaining, where the presumption of innocence is compromised and the defendant pleads guilty in exchange for a promise of lesser charges or less sentencing. At times, another ethical issue arises when the defendant refuses to accept a plea bargain and the prosecutor acts in a retaliatory manner during the trial.

In addition to the ethical issues inherent in the plea bargaining process, prosecutors may also intentionally attempt to compromise the trial process (Kleinig, 2008). This can be done by a practice known as *jury skewing* (Kleinig, 2008, p. 126).

According to Kleinig (2008), jury skewing occurs when prosecutors seek out jurors who are partial or biased in their favor. It should be noted that although some scholars consider this practice to be unethical, it is nevertheless perfectly legal, unless a prosecutor discriminates on the basis of race, ethnicity, or gender as per *Batson v. Kentucky* (1986).

In addition to engaging in jury skewing, prosecutors may also behave unethically by withholding exculpatory information that may affect the outcome of a criminal case in favor of the defendant (Kleinig, 2008). In *Brady*

v. Maryland (1863), the U.S. Supreme Court held that the suppression of exculpatory information is a violation of the due process rights of criminal defendants. Prosecutors are also likely to use questionable expertise because of the relationship the government has with forensic laboratories. Kleinig (2008) identified other examples of prosecutorial misconduct, such as coaching witnesses, overstatement about the evidence in the opening and closing statements, and zealous resistance to appeals that may reflect poorly on their work. Prosecutorial misconduct can be explained by utilitarianism and egoism, focusing on the consequences of their wrong actions, but such actions are definitely not justified by any deontological ethical system that recognizes that the inherent nature of the act must be good.

Unethical Behaviors and Defense Attorneys

Like prosecutors, defense attorneys also have the potential to behave unethically. The job of a defense attorney is to ensure that defendants are not deprived of their due process rights. Their loyalty lies solely to their clients and not to the public. At times, however, defense attorneys pursue this goal too zealously to prove their defendants' innocence. At such a time, they should be careful not to encourage or allow perjury by their clients (Kleinig, 2008). The attorney–client privilege is a very important aspect of the representation of a client. This confidential and loyal relationship is important to ensure proper representation of a defendant, which is possible only after a complete knowledge of the facts of the case. A defense attorney's job is not to judge whether the client is guilty or innocent but to ensure that the client gets a fair representation and that all due process rights are protected (Pollock, 2007). This confidentiality can be broken only under four circumstances: (1) The defendant can waive it, (2) by court order, (3) if the defendant expresses his intent to commit a future crime or fraud, and (4) if the defendant tries to implicate the attorney in some criminal enterprise (Pollock, 2007).

There are times when the defense attorney fails to represent his or her client effectively. Several cases alleging ineffective assistance of counsel have been filed, but this has been a ground hard to prove. In *United States v. Cronin* (1984), the U.S. Supreme Court held that a claim of ineffective assistance of counsel can be made only by pointing out specific errors made by the trial counsel. It cannot be based on an inference drawn from the defense counsel's inexperience or lack of time to prepare, the gravity of the charges, the complexity of the defense, or the accessibility of witness to counsel. In *Strickland v. Washington* (1984), the court ruled that an accused who claims ineffective counsel must show deficient performance by counsel and a reasonable probability that but for such deficiency the result of the proceeding would have been different.

There have been cases in which the defense attorney was found silent and even sleeping during the proceedings

in court. In *Burdine v. Johnson* (2001), a defense lawyer for a capital offense defendant kept falling asleep during the trial. Convicted and sentenced to death, the defendant appealed, claiming he was denied the constitutional right to effective counsel. The Fifth Circuit concluded that Burdine did not have the benefit of effective counsel and therefore ordered a new trial. The U.S. Supreme Court refused to hear the case on appeal; thus, the decision to give Burdine a new trial was upheld. In *Ex parte McFarland* (2005), the court of criminal appeals held that although the lead defense attorney had slept through portions of the trial, the defendant was not deprived of assistance of counsel because his second attorney was present and an active advocate at all times.

In *Bell v. Cone* (2002), the court allowed a death sentence to stand even though the defendant's lawyer failed to make an argument to the jury to save his life. In this case, Cone was tried and found guilty of capital murder. During the sentencing stage, the sequence was for the prosecution to argue first, then the defense lawyer, and then the prosecutor again. A junior prosecutor argued first for the prosecution. The defense lawyer then decided to waive his argument, because under court rules the prosecutor could not argue a second time if the defense lawyer waived the argument. This was done by the defense lawyer as a strategy so that the senior prosecutor, who was a highly effective lawyer and who was going to give the second prosecution argument, could not say a word. The jury gave the defendant the death penalty anyway. Cone appealed, claiming ineffective counsel. The court upheld the sentence, saying that Cone's constitutional right had not been violated because what the defense lawyer used as a strategy was reasonable.

In *Mickens v. Taylor* (2002), Mickens was convicted of murder and sentenced to death. He claimed ineffective assistance of counsel because he discovered, after the trial, that his attorney had represented the victim on unrelated charges. This was never revealed to Mickens. The U.S. Supreme Court rejected his claim, saying that a defendant who claims that the right to counsel was violated because of a conflict of interest must show that the conflict had a negative effect on the attorney's representation and that there was a reasonable probability that the result would have been different. The court concluded that "dual representation" in and of itself merely represents a "theoretical division of loyalties" and did not require a reversal of the results.

Ethical Issues Involving Judges

Just as both prosecutors and defense attorneys have the potential to behave unethically, judges are also not immune to engaging in inappropriate behaviors. The most important ethical responsibility of a judge is to be impartial. For this, judicial independence and integrity are vital. Judicial independence could mean both the independence of the

judiciary from the other branches of the government and the personal independence and integrity of the judges so that they are not influenced by other considerations in their function as judges (Kleinig, 2008). The Code of Judicial Conduct Canon 2 (1990) says that a judge shall avoid impropriety and the appearance of impropriety in all of the judge's activities. Also, as per the Code of Judicial Conduct Canon 2 (C) (1990), a judge should not hold membership in any organization that discriminates on the basis of race, religion, gender, or national origin.

Judicial accountability is yet another aspect that holds judges responsible for their actions. Judges are to disqualify themselves from cases in which their impartiality might be questioned, as in cases in which they might have a financial or other interest (Barua, in press). This was reinforced by the approval of the Judicial Conference Policy for Mandatory Conflict Screening on September 19, 2006. This policy mandated an automated conflict screening to identify any financial conflict that federal judges might have in cases that come before them. Besides this, judges are often invited to attend educational trips sponsored by certain organizations. This sometimes gives rise to an ethical issue that judges would be biased toward the sponsors of these programs or toward corporations in which they might have a financial interest.

It is more the appearance of impropriety than an actual unethical action of a judge that creates concerns (Barua, in press). On September 19, 2006, the Judicial Conference Policy on Judges' Attendance at Privately Funded Educational Programs was released. It mandated that a federal judge should not accept travel, food, lodging, reimbursement, or anything that would be considered a gift under the Judicial Conference Ethics Reform Act Gift Regulations for attending a private educational seminar, unless its sponsor has filed a public disclosure statement on the content of the program and all sources of funding for the judges' expenses. These two policies were aimed to allay the fears of unethical behaviors that the public might have about federal judges (Barua, in press).

The two areas where judges exercise their discretion are (1) interpretation of the law and (2) sentencing (Pollock, 2007). While interpreting laws, judges can get caught up in hypertechnical application of laws at the cost of equity and fairness (Pollock, 2007). Before the federal sentencing guidelines, sentencing disparities existed because of different sentencing patterns of individual judges (Hofer, Blackwell, & Ruback, 1999). Whatever may be the situation and the case, judges are expected to be fair, just, and impartial and to mete out equal treatment to all and sundry, upholding the neutral position of the judge and behaving in a manner that behooves a judge and the pristine judicial office. As this section of the chapter has shown, however, some judges may behave unethically. Like other practitioners who work in the court, judges also have the potential to behave irresponsibly or in an unprofessional manner.

Ethics and Correctional Officers

Although very little literature has systematically addressed the types of unethical behaviors in which correctional officers engage, at least a few studies have addressed these issues. One of the most common areas of ethical concern pertains to excessive uses of force that occur in penal facilities. Morris (1988) portrayed a classic depiction of abuse as he described the events that led up to the infamous 1980 New Mexico prison uprising. Morris gave a detailed account of the “goon squads” that were led by guards and designed to systematically abuse offenders as a means of achieving control. Ultimately, it was this informal control mechanism that was one of the major factors that led to one of the most devastating riots in American prison history.

It has been almost 30 years since the New Mexico prison uprising, yet there is still reason to believe that correctional officers use excessive force against inmates. In August 2005, for example, two female jail employees were arrested for conspiring with an offender to assault another inmate (Hales, 2005). In this incident, the guards were apprehended for utilizing offenders to punish a female inmate who was incarcerated for committing sex crimes against her son. The mistreatment of offenders by prison employees may occur in institutional settings besides state and local correctional facilities. For example, similar acts of brutality have been committed against Iraqi detainees by U.S. military prison personnel. In recent memoranda to the Armed Service Committee, one military employee stated, “We would give them [prisoners] blows to the head, chest, legs and stomach, pull them down, kick dirt on them. This happened every day” (Serrano, 2005, p. A-1).

In addition to physical brutality that is directed toward inmates, there have been cases in which male and female guards have acted unethically by sexually assaulting the inmates they are paid to protect. Welch (2004) described a well-documented 1998 incident in which three female prisoners were sold as “sex slaves” to male inmates at a federal penitentiary in Pleasanton, California. Ultimately, this led to a federal lawsuit, and the Federal Bureau of Prisons settled the suit for \$500,000 (*Lucas v. White*, 1999). The prison agency also agreed to drastic changes in order to curtail the sexual abuse of female inmates.

While the preceding case represents one of the most horrific examples of sexual abuse directed at female inmates, there have been other examples in which it may seem less obvious as to whether a sexual assault even occurred. In *State v. Cardus* (1997), a male prison guard developed a rapport with a female inmate for whom he was performing favors. This led to a friendship, followed by a physical relationship. Sexual contact occurred, but only on one occasion, and was limited to oral sex. To complicate matters even further, court documents indicate that there were strong feelings of attraction on the part of the inmate (*State v. Cardus*, 1997). She later admitted in an official proceeding that her actions were

voluntary. The inmate gave the following testimony: “I wanted to do it being incarcerated for about a month then, and prior to being incarcerated, I wasn’t having sex . . . I did want it” (*State v. Cardus*, 1997, p. 429). Despite this testimony, the Intermediate Court of Appeals ruled that the “consent” of an incarcerated person was “ineffective consent,” and it affirmed the defendant’s conviction of second-degree sexual assault. In the *Cardus* case, the correctional officer was behaving in both a criminal and an unethical manner.

Inappropriate Relationships With Prison Inmates

Some of the more recent literature on unethical behaviors that occur in prison settings relate to the inappropriate relationships that can develop between inmates and staff members. Few studies have been conducted in this area, and this is still largely uncharted territory. An incident that one scholar might call an “inappropriate relationship” may be labeled by others as a form of economic exploitation, or even sexual abuse. One thing is certain, however: These behaviors are certainly unethical and should not be tolerated in a correctional environment. Worley, Marquart, and Mullings (2003) provided a definition of inappropriate relationships:

Personal relationships between employees and inmates/clients or with family members of inmates/clients. This behavior is usually sexual or economic in nature and has the potential to jeopardize the security of a prison institution or compromise the integrity of a correctional employee. (p. 179)

Although some research on the forbidden relationships between correctional staff and inmates focuses disproportionately on sexual situations involving male officers and female offenders, the majority of inappropriate relationships occur between male inmates and female correctional officers (Worley et al., 2003; Worley & Cheeseman, 2006). This makes sense when one considers that female inmates make up only 7.3% of the state prison population and 7.5% of the federal prison population (Clear, Cole, & Reisig, 2009).

There may be a perception that only low-ranking correctional employees are likely to have inappropriate relationships, but even prison administrators are not immune from behaving unscrupulously with inmates. Recently, for example, Christine Achenbach, an executive assistant and fourth in command at a federal prison in Colorado, was convicted of having sexual relations with a prison inmate (Hughes, 2002). During the course of her sexual relationship with two offenders, Achenbach was even believed to have warned her inmate “boyfriends” when their cells would be searched (Hughes, 2002). Both of these offenders were members of the infamous Crips gang (Hughes, 2002). One of Achenbach’s inmate lovers, during the trial, described how he wooed her into having a relationship and said: “I felt that [Achenbach] was vulnerable and that she

could be compromised if a person were to be sensitive and take time with her” (Hughes, 2002). In 2002, a judge sentenced Achenbach to 4 years of probation; she was also required to register as a sex offender for life (Abbott, 2002). It is clear from this example that even upper echelon correctional administrators have the potential to engage in unethical behavior.

Contraband and the Prison Economy

It is important to note that in addition to having sex with inmates, correctional officers can also act unethically by providing offenders with contraband. According to some scholars, the recent anti-tobacco policies of many prison agencies have contributed to correctional officer misconduct (Silverman, 2001). Some employees may see nothing wrong with smuggling in tobacco, because it is not a mind-altering substance and has only recently become restricted, but Silverman (2001) argued this point:

Since the ban in Texas, tobacco has become the number one contraband item. Moreover, many [correctional officers] and other staff members are smokers, and some do not feel that bringing tobacco in is “really a violation,” because they disagree with the ban. For some, throwing a carton of cigarettes over the wall to make an extra \$100 is more of a game than a law violation. It presents staff with an easy way to supplement their income without really feeling guilty that they are violating the law. (p. 240)

As this quote illustrates, some correctional officers may see an enormous opportunity to conspire with inmates in order to provide a much-needed commodity to the prison population. Vermont, the first state to outlaw smoking, had to lift its ban after offenders began soliciting staff members and even having sex with other inmates for cigarettes (Blood, 1996; Silverman, 2001). There is no question that a few officers have been tempted by inmates to smuggle contraband into penal facilities.

Unethical Behaviors and the Prison Guard Subculture

Although there is very little literature pertaining to the types of unethical behaviors in which correctional employees engage, much more research has examined and been published on prison guard subcultures. This literature may give invaluable insights into the unethical behaviors of correctional officers. The prison guard subculture, like the police subculture, manufactures negative images of the “client” (Kauffman, 1988). Irwin (2005) contended that the most crucial aspect of the guard subculture is the hatred and moral superiority that most keepers have toward the kept. Even though the guard workforce has become much more diverse, most correctional employees view inmates as “worthless, untrustworthy, manipulative, and disreputable deviants” (Irwin, 2005, p. 64).

Like the police subculture, the prison guard subculture may also provide officers with rationalizations for behaving unethically. Pollock (2007) contended that veteran guards initiate newer officers into the subculture. Kauffman (1988) argued that new officers quickly learn from other guards not to be a “rat” (a prison employee who informs on his or her coworkers). Prison custodians are taught by other staff members to never cooperate with superiors by participating in any activities that would be detrimental to another officer (Kauffman, 1988). Pollock (2007) also believes there are sanctions if an officer is viewed as a rat by his fellow employees. Some scholars have argued that because of this guard subculture a tremendous amount of employee misconduct, such as theft and brutality, tends to go unreported in prison agencies (Irwin, 2005; Souryal, 2006). Other research indicates that the tendency for officers not to “rat” also contributes to an enormous amount of sexual abuse that is prevalent in female institutions and committed by male guards (Human Rights Watch Women’s Rights Project, 1996).

There is clearly an abundance of literature devoted to the correctional officer subculture. By examining this, scholars may be able to better appreciate why some correctional officers behave unethically.

Ethics and Probation and Parole Officers

As previously mentioned, unethical acts are committed by employees in virtually every type of law enforcement endeavor. This is true even in the field of probation and parole, where employees are presumed to have one of the highest levels of education and job training (Souryal, 2006). Probation and parole officers have the potential to engage in many different types of unscrupulous behaviors. Some probation and parole officers, for example, may conduct personal business on state time. This can include anything from grocery shopping to getting a haircut while on duty. There are also employees in community corrections who claim that they make field visits when in fact they do not (Souryal, 2006).

In addition to these types of unprofessional behaviors, probation and parole officers may also act in an unethical manner by discriminating against clients solely on the basis of race, gender, or age (Souryal, 2006). Also, probation and parole employees may engage in sexual deviance. One type of sexual deviance, for example, may include sexual harassment that occurs in the workplace. Recently, an Alaskan probation officer filed a lawsuit against his female superior alleging that she permitted a sexually charged, hostile work environment (Carroll, 2005). He maintained that one of his female coworkers had pinched his nipples repeatedly, even after being told to stop. In addition to engaging in sexual harassment, probation and parole employees may also behave unethically by having sexual relationships with either their clients or their clients’

family members (Souryal, 2006). Like police officers, prison guards, and court employees, these practitioners also have the potential to behave unethically during the course of their careers.

Conclusion

Based on social contract theory, criminal justice professionals have been given a certain authority and power by the government, as its agents, to protect the inhabitants within a particular jurisdiction in exchange for a few liberties given up by these residents. This sets them apart from the general populace. Armed with the responsibility to guard the populace, criminal justice professionals are expected to have higher moral standards so that the people can trust them with the power they have to protect. Occasionally, instead of honoring the position and trust given to them, these professionals get distracted and use their discretion as they deem fit. This leads to a collapse of the social contract theory, often leading to disastrous consequences.

When the consequences of a decision are bad, the teleological or consequentialist ethical system does not support it. Oftentimes such decisions are motivated by personal gain following the ethical system best characterized as egoism. Because the essence of criminal justice is the service and protection of society, this is definitely at odds with the concept of egoism. The police officer, or the probation officer, or the judge who accepts bribes and gratuities, or engages in sexual relations with clients, begins his or her moral career that leads to higher forms of corruption and unethical behaviors (Pollock, 2007). Such corruption is engaged in solely for the purpose of personal gain and is condemned by most ethical systems, such as ethical formalism (deviating from duty), utilitarianism (not good for the majority), teleological (bad consequences), deontological (the act itself is bad), natural law (aimed at personal happiness rather than self-preservation), religious ethics (not supported by God), Plato's *summum bonum* (against the principle of the ultimate good), Aristotle's ethics of virtue (not a virtue or excellence), the Golden Rule (the corrupt would not want to be a victim of corruption), and the ethics of care (corruption does not show care). The only ethical system that justifies the unethical behavior of criminal justice professionals is egoism, which is focused on the self and happiness for oneself. Just as no act can be absolutely selfless (e.g., even charity gives self-satisfaction), no selfish act can bring ultimate happiness to the doer. As such, unethical behavior is going to cause more pain than pleasure in the long run, according to Bentham's hedonistic calculus (Pollock, 2007).

On one final note, it is important to mention that there is at least one additional type of unethical behavior in which criminal justice professionals engage that can be explained as corruption for the good of the organization and not for

personal gain. An instance of this might be an excessive use of force, as when a police officer tries to catch a crook by whatever means necessary or a when a correctional officer who uses it to teach a criminal a lesson. Another example could include a prosecutor who uses dubious evidence when he or she is convinced that someone has committed a crime and should not be allowed to be free. Even though these are guided by a noble cause—to rid society of the “bad guys”—such behavior might be problematic (Kleinig, 2008). Nevertheless, such corruption is often tolerated by individual departments. Other than civil litigation, the only way to check such unethical behavior within the agencies is to have ethical leaders who will not tolerate such actions by their subordinates. In sum, it is a matter of concern that unethical behavior is prevalent in all areas of criminal justice, be it among police officers, court personnel, or corrections officers. A strict adherence to the ethical codes, an ethical leadership, and a pride in their professions and the spirit it upholds are important steps toward addressing this issue.
